Document Version:

Publisher's PDF, also known as Version of record

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

Protein supplementation as a dietary strategy to improve glycemic control in type 2 diabetes

Ralph Manders, 14 November 2008

1. The defects in the postprandial insulin response in type 2 diabetes patients is mainly attributed to a reduced sensitivity of the pancreatic β -cell to glucose, and not to an overall defect in the capacity to produce and secrete insulin. *(dit proefschrift)*
2. The branched chain amino acid leucine is a compound of special interest as it can stimulate endogenous insulin release and might also help to enhance β -cell function through the maintenance of β -cell mass. *(dit proefschrift)*
3. Postprandial hyperglycemia is an underestimated problem in type 2 diabetes. *(dit proefschrift)*
4. Current standard determinants of glycemic control do not accurately assess the prevalence of hyperglycemia. *(dit proefschrift)*
5. The statement that: "Diabetes can be cured within 12 hours" although bold, underlines the pivotal role that nutrition can play in the treatment of type 2 diabetes.
(Frank Q. Nuttall & Mary C. Gannon. J Am Coll Nutr 26:83-04, 2007)
6. Hyperglycemia interferes with many daily activities of people with type 2 diabetes by its adverse effects on cognitive function and mood.
(Adapted from: Andrew J. Sommerfield et al. Diabetes Care 27:2335-2340, 2004)
7. The historical pattern of famine occurrence is incompatible with the central premise of the thrifty gene hypothesis. *(John R. Speakman. Diabetes Vasc Dis Res 3:7-11, 2006)*
8. Schrijven is schrappen - Schrappen doet pijn - Schrijven is pijn. *(F.M. van Cassel)*
9. The most exciting phrase to hear in science, the one that heralds new discoveries, is not 'Eureka!' but 'That's funny ...' *(Isaac Asimov)*
10. The trouble with the rat race is that even if you win you are still a rat! *(Lilly Tomlin)*
11. De medische wetenschap werkt, vanuit een Darwinistisch oogpunt, niet in het voordeel van de soort.
