<sup>88</sup> *Contra* see Peter Van den Bossche, ‘Looking for Proportionality in WTO Law’, *Legal Issues of Economic Integration* 35 (3), 2008, 283–294, 289. Peter Van den Bossche distinguishes between three elements of the proportionality principle as applied in the EC legal order and in WTO law, namely (1) an assessment of the suitability of the measure to achieve the ends pursued; (2) the determination of the availability of a less-trade restrictive alternative that is at least equally effective in achieving the ends pursued; and (3) an assessment of whether the effects of the measure are disproportionate or excessive in relation to the interests involved. The third element he terms ‘proportionality *strictu sensu*’. *Ibid.*, 285. Van den Bossche argues that since the weighing and balancing of factors conducted in *Korea – Various Measures on Beef* was explicitly comprehended in the determination of the availability of a less WTO-inconsistent alternative, it is part of the second element of the proportionality test rather than an indication of an assessment of proportionality *strictu sensu*. *Ibid.*, 289.

alternatives, which may be less trade restrictive while providing an equivalent contribution to the achievement of the objective. This comparison should be carried out in the light of the importance of the interests or values at stake. It is through this process that a panel determines whether a measure is necessary.<sup>89</sup>

This ‘weighing and balancing’ of the three relevant factors seems to reflect the proportionality test established in the previous case law. However, the Appellate Body went further to note that:

Another key element of the analysis of the necessity of a measure under Article XX(b) is the contribution it brings to the achievement of its objective. A contribution exists when there is a genuine relationship of ends and means between the objective pursued and the measure at issue. To be characterized as necessary, a measure does not have to be indispensable. However, its contribution to the achievement of the objective must be material, not merely marginal or insignificant, especially if the measure at issue is as trade restrictive as an import ban.<sup>90</sup>

By setting a threshold for the degree of contribution of a measure to the achievement of its objective, this finding appears to go even further in allowing a ‘strong proportionality’ test into the necessity requirement of Article XX(b) of the GATT 1994.<sup>91</sup>

Despite the Appellate Body’s assertion of the ‘undisputed’ right of WTO Members to determine the level of protection that they consider appropriate in a given context,<sup>92</sup> which has also been called ‘the fundamental principle’ by the Appellate Body, the proportionality test seems to undermine this right.<sup>93</sup> The level of protection chosen by a Member is not sacrosanct in the weighing and balancing interpretation of the ‘necessary’ requirement. Instead, not only is the measure at issue scrutinised with respect to its trade-restrictiveness and suitability to meet its objective, but also the importance or value of the objective pursued is assessed and weighed against the effect of the measure chosen to achieve it. In so doing, the possibility is created that a panel might find that the trade-restrictive effect of the chosen measure is excessive in relation to the importance of the objective it pursues. However, the importance which a Member attaches to a particular health objective

---

<sup>89</sup> Appellate Body Report, *Brazil – Retreaded Tyres*, para. 178.

<sup>90</sup> Appellate Body Report, *Brazil – Retreaded Tyres*, para. 210.

<sup>91</sup> Van den Bossche states: ‘In these last sentences, the Appellate Body seems to suggest that the determination of ‘necessity’ under Article XX(b) of the GATT 1994 ... goes beyond determining whether there is a less trade restrictive measure which is reasonably available. If the contribution of the measure at issue to the policy objective is marginal or insignificant, this measure cannot, according to the Appellate Body in *Brazil – Retreaded Tyres*, be justified under Article XX(b) even when there would be no less trade restrictive alternative measure to achieve the policy objective the Member concerned pursues and the level of protection it has set. Further, when the Appellate Body stated that ‘the contribution of the measure has to be weighed against its trade restrictiveness, taking into account the importance of the interests or the values underlying the objective pursued by it’, it seems to introduce a proportionality *strictu sensu* assessment.’ Peter Van den Bossche, ‘Looking for Proportionality in WTO Law’, *Legal Issues of Economic Integration* 35 (3), 2008, 283-294, 294. However, Van den Bossche doubts whether the Appellate Body intended to introduce such a strict proportionality test into the necessity test. *Ibid.*

<sup>92</sup> Appellate Body Report, *EC – Asbestos*, para. 168.

<sup>93</sup> Appellate Body Report, *Brazil – Retreaded Tyres*, para. 210.

is reflected in the level of protection it chooses as appropriate and the measure it imposes to achieve this level. Subjecting the importance of the health objective to review thus undercuts the policy space of a Member in this regard.

Once a measure has been shown to meet the requirements of Article XX(b), it must be determined whether it complies with the disciplines of the *chapeau* of Article XX. The *chapeau* provides that measures, provisionally justified under one of the paragraphs of Article XX, must not be applied in a manner that would constitute arbitrary or unjustifiable discrimination or a disguised restriction on trade. The *chapeau* of Article XX was seen by the drafters of the GATT 1947 as a means to see to it that the exceptions of Article XX are not abused for protectionist purposes.<sup>94</sup> This role of the *chapeau* has been confirmed in GATT and WTO case law.<sup>95</sup> As held by the Appellate Body in *US – Shrimp*, the task of interpreting and applying the *chapeau* is ‘the delicate one of locating and marking out a line of equilibrium between the right of a Member to invoke an exception under Article XX and the rights of other Members under varying substantive provisions ... of the GATT 1994.’<sup>96</sup>

As noted by the GATT Panel in *US – Spring Assemblies*, it is the application of a measure and not the measure itself that must be examined under the *chapeau*.<sup>97</sup> To determine whether the application of a measure amounts to arbitrary or unjustifiable discrimination, the Appellate Body has had regard to various considerations, such as the fact that the discrimination resulting from the measure was not inadvertent but could have been foreseen;<sup>98</sup> the failure of the measure to take account of the different conditions prevailing in the exporting countries, by imposing the rigid requirement that exporting Members adopt the same regulatory programme as the importing Member;<sup>99</sup> and the failure of the importing Member to adequately explore a multilateral or bilateral solution to the problem before applying a unilateral measure.<sup>100</sup> In *Brazil – Retreaded Tyres*, the Appellate Body referred to its previous case law and noted that:

---

<sup>94</sup> In the discussions regarding the relationship between Article XX(b) and the *chapeau* in the Geneva Session of the Preparatory Committee (the committee established to elaborate a draft Charter for an International Trade Organisation, which work eventually resulted in the GATT 1947), it was noted that the protection for exporting countries against *abuse* of the exception ‘is afforded one by the headnote to the Article.’ After agreeing to delete a clarification in Article XX(b) specifying the requirement that domestic safeguards under similar conditions exist in the importing country, it was stated: ‘In view of the misuses which have been made in the past of sanitary regulations, and of damages caused in this way to exporting countries, it would be regrettable if we were to renounce any clarification of the provisions of sub-paragraph (b). However, the discussion which was raised here shows clearly that this Committee is against any possibility of this provision being used as a measure of protection in disguise.’ EPCT/A/PV/30, 13, cited in WTO Secretariat, *Analytical Index: Guide to GATT Law and Practice*, 6th ed., vol. 1 (World Trade Organization, Geneva), 1995, 565.

<sup>95</sup> GATT Panel Report, *US – Spring Assemblies*, para. 56; GATT Panel Report, *US – Section 337*, para. 5.9; Appellate Body Report, *US – Gasoline*, 20-21; and Appellate Body Report, *US – Shrimp*, para. 156.

<sup>96</sup> Appellate Body Report, *US – Shrimp*, para. 159.

<sup>97</sup> This was confirmed in Appellate Body Report, *US – Gasoline*, 20.

<sup>98</sup> Appellate Body Report, *US – Gasoline*, 27.

<sup>99</sup> Appellate Body Report, *US – Shrimp*, para. 177. In *US – Shrimp (Article 21.5 – Malaysia)*, the Appellate Body noted that there is an important difference between conditioning market access on the adoption of essentially the same regulatory programme, and on the adoption of a programme comparable in effectiveness. The latter gives the exporting Member sufficient latitude to adopt a regulatory programme suitable to its domestic conditions, and thus avoids ‘arbitrary and unjustifiable discrimination’. Appellate Body Report, *US – Shrimp (Article 21.5 – Malaysia)*, para. 144.

<sup>100</sup> Appellate Body Report, *US – Shrimp*, paras 116 and 172; and Appellate Body Report, *US – Shrimp (Article*

[a]nalyzing whether discrimination is arbitrary or unjustifiable usually involves an analysis that relates primarily to the cause or the rationale of the discrimination.<sup>101</sup>

It explained that even discrimination that results from a rational decision may be ‘arbitrary or unjustifiable’ if it is explained by a rationale that bears no relation to the objective of a measure provisionally justified under one of the subparagraphs of Article XX, or goes against that objective.

The determination of whether a measure is applied so as to constitute a disguised restriction on trade is made on the basis of the same type of considerations as are taken into account to determine whether there is arbitrary or unjustifiable discrimination.<sup>102</sup> While the GATT Panel in *US – Tuna (Canada)* found that the US import ban at issue could not be considered as a disguised restriction on trade as it had been ‘taken as a trade measure and publicly announced as such’,<sup>103</sup> the Appellate Body held in *US – Gasoline* that ‘concealed or unannounced restriction’ does not exhaust the meaning of ‘disguised restriction’.<sup>104</sup> Rather, ‘disguised restriction’ encompasses measures amounting to arbitrary or unjustifiable discrimination that are taken ‘under the guise of a measure formally within the terms of an exception listed in Article XX.’<sup>105</sup> Similarly, the Panel in *EC – Asbestos* found that a measure which complies with the requirements of Article XX(b) will be a disguised trade restriction ‘if such compliance is in fact only a disguise to conceal the pursuit of trade-restrictive objectives.’<sup>106</sup> As it is difficult to determine the objective of a measure, it has been held that the protective application of a measure ‘can most often be discerned from its design, architecture and revealing structure.’<sup>107</sup>

This brief examination of the provisions of the GATT of particular relevance to SPS measures, and the clarification that has been provided to their rather rudimentary terms in the GATT and WTO case law, serves two purposes in establishing the background to the *SPS Agreement*. First, it indicates the ambit of the GATT provisions and their limitations in disciplining SPS regulation by striking an appropriate balance between trade and health objectives. This elucidates the reasons why new disciplines were considered necessary. Second, it serves to illustrate the background to some of the specific provisions of the *SPS Agreement*, which in many cases reflect the developments in the case law giving content to the relevant GATT provisions.

<sup>106</sup> Panel Report, *EC – Asbestos*, para. 8.236. This approach was also taken in Panel Report, *US – Shrimp (Article 21.5 – Malaysia)*, paras 5.138-5.144.

<sup>107</sup> Panel Report, *EC – Asbestos*, para. 8.236. The Panel here referred to the finding of the Appellate Body in *Japan – Alcoholic Beverages II* in respect of Article III:4 of the GATT 1994, and stated that it saw no reason why this approach should not be applicable in other circumstances where it is necessary to establish whether a measure is being applied for protective purposes.

### 1.1.2 The Tokyo Round Standards Code

The early negotiating rounds under the auspices of the GATT 1947 focused on tariff negotiations, and were quite successful in reducing tariff levels. As a result, the relative importance of standards and regulations as trade barriers increased. At the same time, growing consumer awareness of health and environmental issues was leading to a proliferation of regulations and standards in these areas, particularly in developed countries.<sup>108</sup> A new awareness of the importance of non-tariff barriers to trade arose. After the Kennedy Round, a notification exercise was carried out which confirmed the increasing multiplicity of national standards.<sup>109</sup> Basic data on the incidence of SPS regulation was collected and updated through counter-notifications by Contracting Parties that considered themselves to be adversely affected.<sup>110</sup> This data highlighted the importance of SPS measures as trade barriers.

Working Group 4 of the Agriculture Committee, in the run-up to the Tokyo Round, began work on examining possible approaches to non-tariff barriers to agricultural trade that take the form of SPS regulations.<sup>111</sup> This work was taken up by the Agriculture Committee

<sup>108</sup> A few instances in which SPS issues arose between GATT Contracting Parties are mentioned in the background note drafted by the GATT Secretariat in the context of the Uruguay Round negotiations on SPS issues. These are a 1959 consultation with Australia on its agricultural policies, including its strict SPS regime (GATT Secretariat, *Expansion of Trade – Agricultural Policy – Report of Committee II on the Consultation with Australia*, L/1055, circulated on 7 October 1959, para.40); Uruguay's recourse to Article XXIII:2 of the GATT against 15 Contracting Parties with regard to their sanitary measures on meat, which ended without a panel ruling (Twentieth Session of the CONTRACTING PARTIES, *Report of the Panel on Uruguayan Recourse to Article XXIII*, L/1923 and Corr.1 and 2, circulated on 15 November 1962, Annex I); a 1962 discussion in the Group on Meat on the discriminatory effects of phytosanitary restrictions (CG/3); a 1969 French notification arguing that its restrictions on animal semen and live plants were in conformity with Article XX(b) of the GATT (GATT Secretariat, *Notifications of Import Restrictions Applied Inconsistently with the Provisions of GATT and Not Covered by Waivers – Addendum – France*, L/3212/Add.12, circulated on 22 August 1969, 2); and a 1980 recourse to Article XXIII:2 of the GATT by the US regarding the UK's implementation of EEC Directives on poultry imports, claiming, *inter alia*, a violation of Article XX(b) of the GATT (GATT Secretariat, *EEC – Imports of Poultry from the United States – Recourse to Article XXIII:2 by the United States*, L/5033, circulated on 29 September 1980. This complaint was withdrawn without a panel being established). See further Negotiating Group on Agriculture, *Sanitary and Phytosanitary Regulations Affecting Trade in Agriculture. Background Note by the Secretariat*, MTN.GNG/NG5/W/41, circulated on 2 February 1988, paras 3-4, available at: [http://www.wto.org/gatt\\_docs/English/SULPDF/92030210.pdf](http://www.wto.org/gatt_docs/English/SULPDF/92030210.pdf), visited on 11 May 2008.

<sup>109</sup> Committee on Trade in Industrial Products, *Examination of Part 3 of the Inventory of Non-Tariff Barriers (Spec(69)51) – Standards Involving Imports and Domestic Goods – Note by the Secretariat*, COM.IND/W/13, circulated on 19 October 1969; Committee on Trade in Industrial Products, Working Group 5, *Examination of the Inventory of Non-Tariff Barriers – Supplemental and Replacement Cards*, COM.IND/W/20, circulated on 9 January, 20 March and 9 November 1970; Committee on Trade in Industrial Products, *Report to the Council*, L/3496 circulated on 10 February 1971; Committee on Trade in Industrial Products, *Report to the Council*, L/3756, circulated on 24 October 1972. These are referred to in Gabrielle Marceau and Joel Trachtman, 'GATT, TBT and SPS: A Map of WTO Law of Domestic Regulation of Goods', in *The WTO Dispute Settlement System 1995–2003*, F. Ortino and E-U Petersmann (eds.), vol. 18 (Kluwer Law International, Deventer), 2004, 275-340, 278.

<sup>110</sup> A compilation of such counter-notifications was maintained by the GATT Secretariat under GATT document series COM.AG/W/68/Add.4/\* . See Negotiating Group on Agriculture, *Sanitary and Phytosanitary Regulations Affecting Trade in Agriculture. Background Note by the Secretariat*, MTN.GNG/NG5/W/41, circulated on 2 February 1988, para. 7, available at: [http://www.wto.org/gatt\\_docs/English/SULPDF/92030210.pdf](http://www.wto.org/gatt_docs/English/SULPDF/92030210.pdf), visited on 11 May 2008.

<sup>111</sup> Agriculture Committee, *Report to the Council*, L/3472, circulated on 18 December 1970, Annex IV. This

itself, and by the Working Group on Techniques and Modalities.<sup>112</sup> The proposed approaches elaborated through this work focused on the establishment of a code of conduct for good practices in SPS regulation; the creation of procedures for notification of SPS measures and consultations thereon; arrangements for negotiations on specific SPS regulations; and the elaboration of the disciplines of Article XX(b) of the GATT.<sup>113</sup> No consensus was achieved on these issues, but there was general agreement that the proposed approaches were not necessarily mutually exclusive.<sup>114</sup>

In view of the general agreement on the need to address this issue, in the Tokyo Round of trade negotiations there was a shift in focus towards tackling non-tariff barriers to trade, including SPS regulations.<sup>115</sup> Four Codes on this form of trade barrier were adopted. One of these was the *Agreement on Technical Barriers to Trade*,<sup>116</sup> commonly known as the ‘*Standards Code*’. The negotiating group which had been tasked by the Trade Negotiating Committee with continuing work on SPS regulation in the Tokyo Round, focused its work on examining the applicability of the then-draft *Standards Code* to SPS measures.<sup>117</sup> The result of these negotiations was that the *Standards Code* was made applicable to both industrial and agricultural products.<sup>118</sup>

As was the case with the other Tokyo Round Codes, the *Standards Code* was not binding on all GATT Contracting Parties but only on those Contracting Parties that were Parties to it.<sup>119</sup> Originally 23 GATT Contracting Parties were Parties to the *Standards Code*.<sup>120</sup>

<sup>117</sup> This group, later called ‘Group Agriculture’ first examined various alternatives for negotiating rules on SPS measures, including strengthening Article XX(b) of the GATT; drawing up a Code of Conduct to reduce the adverse trade effects of SPS measures; examining the possibility of arbitral procedures; and examining the possible applicability of the draft *Standards Code* to SPS measures. In the later stages of the Round, Group Agriculture focused its work on the last option, as part of the more general issue of the applicability of the *Standards Code* to agriculture. The outcome of this work is that the *Standards Code* was made applicable to both industrial and agricultural products. Negotiating Group on Agriculture, *Sanitary and Phytosanitary Regulations Affecting Trade in Agriculture. Background Note by the Secretariat*, MTN.GNG/NG5/W/41, circulated on 2 February 1988, paras 13-16, available at: [http://www.wto.org/gatt\\_docs/English/SULPDF/92030210.pdf](http://www.wto.org/gatt_docs/English/SULPDF/92030210.pdf), visited on 11 May 2008.

<sup>118</sup> Article 1.3 of the *Standards Code*.

<sup>119</sup> The relationship between the Tokyo Round Codes and the GATT 1947 was discussed above, Part I, Section 1.5, note 176.

<sup>120</sup> By February 1982, the number of signatories to the *Standards Code* had increased to 36 and by December 1995 to 44. Of the signatories by 1982, 15 were developing-country Contracting Parties and of those in 1995,

The *Standards Code* did not focus specifically on measures for the protection of human, plant or animal life or health, but was aimed broadly at all technical regulations, standards and conformity assessment procedures, as is currently the Uruguay Round *Agreement on Technical Barriers to Trade (TBT Agreement)*. The *Standards Code* was primarily intended to discipline industrial regulations and standards, such as those relating to quality and performance levels of products. However, as many SPS measures take the form of technical regulations or standards on agricultural or industrial products (e.g. processed food), they fell within the scope of application of the *Standards Code*.

The *Standards Code* reiterated the GATT obligation of national treatment of like imported products.<sup>121</sup> However, unlike the GATT, it applied also to non-discriminatory measures, laying down disciplines for the elaboration and application of standards and regulations, also where they applied indistinctly to domestic and imported products. Under the *Standards Code*, signatories agreed to adopt only standards and regulations that were necessary to achieve a legitimate aim, such as the protection of public health, and not to apply these measures in a manner that would constitute a disguised restriction on trade or create unnecessary obstacles to trade.<sup>122</sup> More importantly, the Code required signatories to apply relevant international standards where they existed, unless these were deemed inappropriate to meet the goal aimed at,<sup>123</sup> thus introducing the first reference to harmonised standards in the international trade regime. In addition (and perhaps the main achievement of the *Standards Code*) it introduced transparency requirements for the adoption of regulations and standards that were not ‘substantially the same’ as international standards.<sup>124</sup>

The *Standards Code* did not directly apply to PPMs that were not reflected in the product itself. The definition in the *Standards Code* of a measure that would fall under its disciplines was: ‘A specification contained in a document which lays down the characteristics of a product such as levels of quality, performance, safety or dimensions’.<sup>125</sup> This

---

24 were developing-country Contracting Parties. WTO Secretariat, *World Trade Report 2007: Six Decades of Multilateral Trade Cooperation: What Have We Learnt?* (World Trade Organization, Geneva), 2007, 235, available at: [http://www.wto.org/english/res\\_e/booksp\\_e/anrep\\_e/wtr07-2d\\_e.pdf](http://www.wto.org/english/res_e/booksp_e/anrep_e/wtr07-2d_e.pdf), visited on 7 June 2008.

<sup>121</sup> Article 2.1 of the *Standards Code* provided, in relevant part: ‘products imported from the territory of any Party shall be accorded treatment no less favourable than that accorded to like products of national origin and to like products originating in any other country in relation to such technical regulations or standards.’

<sup>122</sup> This is reflected in the 6<sup>th</sup> paragraph of the Preamble to the *Standards Code*. Article 2.1 provides in relevant part: ‘Parties shall ensure that technical regulations and standards are not prepared, adopted or applied with a view to creating obstacles to international trade. .... They shall likewise ensure that neither technical regulations nor standards themselves nor their application have the effect of creating unnecessary obstacles to international trade.’

<sup>123</sup> Article 2.2 of the *Standards Code* provided: ‘Where technical regulations or standards are required and relevant international standards exist or their completion is imminent, Parties shall use them, or the relevant parts of them, as a basis for the technical regulations or standards except where, as duly explained upon request, such international standards or relevant parts are inappropriate for the Parties concerned, for *inter alia* such reasons as national security requirements; the prevention of deceptive practices; protection for human health or safety, animal or plant life or health, or the environment; fundamental climatic or other geographical factors; fundamental technological problems.’

<sup>124</sup> Articles 2.5 to 2.8 of the *Standards Code* contained detailed publication and notification obligations, including the requirement to notify draft measures in advance, in order to allow interested parties to become acquainted with them and to provide comments.

<sup>125</sup> Annex 1, paragraph 1 of the *Standards Code*. This paragraph contains the definition of a technical specification which is the basis for both the definitions of technical regulations and technical standards in paragraphs 2 and 3 of Annex 1.

implicitly excludes process and production requirements to the extent that they are not reflected in the product characteristics themselves. However, under Article 14.25 of the *Standards Code*, a signatory could challenge a PPM-related measure under the *Standards Code* where it considered that the requirements had been drafted in the form of regulations on PPMs in order to avoid the *Standards Code*'s disciplines.

The *Standards Code* included a dispute-settlement mechanism, which a Party could resort to if it believed that 'any benefit accruing to it, directly or indirectly, under [the *Standards Code*] [was] being nullified or impaired, or that the attainment of any objective of this Agreement [was] being impeded, by another Party or Parties, and that its trade interests [were] significantly affected.'<sup>126</sup> This process commenced with consultations between the parties to the dispute. If no solution could be reached through consultations, the Committee on Technical Barriers to Trade could be requested by either party to meet to facilitate the achievement of a mutually satisfactory solution.<sup>127</sup> If no solution was achieved within three months, any party that considered that the issues under dispute involved questions of a technical nature could request the Committee on Technical Barriers to Trade to establish a technical expert group to examine the matter.<sup>128</sup> This established a possibility for review of technical regulations, standards or conformity assessment procedures that could have 'the effect of creating unnecessary obstacles to international trade'. Thus, a Party could challenge the regulations or standards of another signatory on the grounds that they violated a provision of the *Standards Code*. Despite the fact that no formal dispute-settlement proceeding was ever conducted under the Code, it did assist in the resolution of a few trade disputes involving industrial standards.<sup>129</sup>

### 1.1.3 Insufficiency of the GATT 1947 and the Standards Code

The rules of the GATT 1947 were inadequate in several respects to address the problem of the increasing use of SPS measures in ways that restricted trade in agricultural and food products. At the same time, these rules insufficiently recognised the right of governments to regulate against SPS risks. This made the GATT 1947 an inappropriate tool to achieve an acceptable balance between the often competing objectives of the liberalisation of food and agricultural trade on the one hand and the protection of human, animal or plant life or health on the other.

These shortcomings are due to the following aspects of the applicable GATT rules. Firstly, as set out above, GATT disciplines on national regulations focus on prohibiting discrimination between domestic and 'like' imported products. Thus, the rules do not catch non-discriminatory SPS measures that have trade-restrictive effects. Typically, however, most SPS regulations apply to all products containing a particular SPS risk, both imports and domestic products. For this reason, SPS regulations often escape the

---

<sup>126</sup> Article 14.2 of the *Standards Code*.

<sup>127</sup> Article 14.4 of the *Standards Code*.

<sup>128</sup> Article 14.9 of the *Standards Code*.

<sup>129</sup> David Vogel discusses a few cases where agreement was reached in bilateral consultations following a challenge on the basis of the *Standards Code*. David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 152-153.

GATT non-discrimination disciplines. Since the Appellate Body's decision in *Dominican Republic – Import and Sale of Cigarettes*, another loophole in the Article III:4 discipline exists. As held in that case, discriminatory regulations will not fall foul of Article III:4 where the detrimental effect of the regulation on the competitive opportunities of the imported product is explained by factors other than the foreign origin of the product.<sup>130</sup> As a result, measures whose detrimental effect is due to the SPS risk, or even perceived SPS risk, contained in the imported product, will escape Article III:4. SPS regulations that amount to prohibitions or restrictions on importation (i.e. that affect the competitive opportunities of imports to enter the market) would be caught by the prohibition on quantitative restrictions in Article XI:1 of the GATT. However, most SPS measures take the form of internal regulations that apply both to domestic and to imported products, even if they are sometimes enforced at the border. As a result, they would often fall outside the scope of Article XI.

Secondly, the exception provided in Article XX(b) of the GATT from the usual GATT rules for measures necessary to protect human, animal or plant life or health does not contain detailed rules disciplining the adoption or use of such measures. While panels and the Appellate Body have gradually developed a complex set of disciplines through their interpretation of the 'necessary' requirement of Article XX(b) and their clarification of the meaning of the *chapeau* of Article XX, as set out above, these provisions were not particularly crafted with SPS regulation in mind and they therefore fail to establish adequate controls for the avoidance of protectionism. For example, no risk assessment is required as a basis for the relevant measure,<sup>131</sup> nor are Members required to avoid arbitrary distinctions in the levels of protection they choose in comparable situations. In addition, particular procedural disciplines, such as the requirement that Members publish their draft measures in advance to allow for comments or that they allow an adaptation period for exporting industries to adjust to the new requirements, are absent.<sup>132</sup> As such, the exception of Article XX(b) is rather a blunt tool when it comes to disciplining measures as complex as those used in SPS regulation.

Lastly, but by no means least importantly, there is no recognition in the GATT of the *right* of governments to enact regulations for the protection of human, animal and plant life or health in their territories. Instead, health measures that either amount to restrictions or prohibitions on importation under Article XI or discriminate against imports under Article III:4 are prohibited in principle, but are seen as potentially justified under a 'limited and conditional'<sup>133</sup> *exception* to the usual GATT disciplines. Thus the Member

<sup>130</sup> Appellate Body Report, *Dominican Republic – Import and Sale of Cigarettes*, para. 96, followed in Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2514.

<sup>131</sup> It should be recalled, as discussed above, that while the Appellate Body in *EC – Asbestos*, has read an obligation to scientifically establish a health risk into Article XX(b) of the GATT 1994, it stopped short of requiring a 'risk assessment' within the meaning of the term in the *SPS Agreement*.

<sup>132</sup> It should be noted that notification obligations of relevance to SPS measures are present in the GATT. Article X of the GATT requires prompt publication of, *inter alia*, laws, regulations and administrative rulings pertaining to restrictions or prohibitions on imports or exports or affecting their sale, distribution, processing or other use. However, this obligation does not extend to prior notification of draft measures in order to allow other Members to provide comments, nor does it require an adaptation period to be granted, where possible, to allow adjustment to the new requirements.

<sup>133</sup> GATT Panel Report, *US – Section 337*, para 5.9. Although this case dealt with Article XX(d), the principle that exceptions under Article XX of the GATT are limited to those listed in paragraphs (a) to (j) of this Article

imposing the measure bears the burden of proving that it falls within the scope of the exception provided in Article XX(b) of the GATT 1994 and meets the requirements of the *chapeau* of this Article. This rule-exception relationship and its concomitant allocation of the burden of proof on the respondent Member have important implications for the regulatory autonomy of Members. It is doubtful whether this bias towards trade liberalisation is appropriate in the case of measures aiming at protection against SPS risks, particularly when those risks include risks to human life or health.

The *Standards Code* also had certain inherent shortcomings, which limited its effectiveness in disciplining the use of regulations for the protection of human, animal and plant life or health as barriers to trade. First, it was only binding on its parties, which meant that most GATT Contracting Parties did not have to comply with its rules.<sup>134</sup> Second, as it did not directly apply to measures addressing PPMs that were not reflected in the product itself, regulations on how a specific product was produced fell outside its scope and were dealt with in terms of the usual GATT disciplines. Third, its disciplines were not regarded as effective in promoting harmonisation around international standards, as they did not specify in what cases an international standard could be seen as ‘inappropriate’ for a party, thereby leaving considerable room for divergent measures. Fourth, the dispute settlement mechanism created in the *Standards Code*, like that in the GATT 1947, required consensus among its parties for the establishment of a panel or technical expert group to review a complaint. It was thus possible for a party whose regulation was being challenged to block the establishment of such a panel or review group. Further, even if review of the measure was not blocked, the findings of the relevant panel or review group had to be adopted by consensus of the parties to the *Standards Code* in the Committee on Technical Barriers to Trade in order to become binding. This created a second possibility for a signatory to block the dispute settlement process. Finally, no enforcement mechanism existed to ensure compliance with adopted dispute settlement reports, and thus compliance depended on the good faith of the party involved and the shaming effect of the ruling.

The recognition of the need to improve the disciplines applicable to SPS measures is evinced by the recommendation of the CONTRACTING PARTIES in the Committee on Trade in Agriculture, in 1984, that:

Sanitary and phytosanitary regulations . . . , including related administrative requirements, are brought within the ambit of improved procedures aimed at minimizing the adverse effects that those measures have on trade in agriculture.<sup>135</sup>

---

and are subject to the conditions contained in those paragraphs and the *chapeau* of Article XX, applies to all the Article XX exceptions.

<sup>134</sup> As noted above, the *Standards Code* originally had only 23 parties, increasing to 44 by December 1994. All developed countries except Australia, Iceland and Israel were parties. It is interesting to note that none of the developing-country Members selected as illustrations in this book (namely Mauritius, Jamaica and Bangladesh) were parties to the *Standards Code*.

<sup>135</sup> Fortieth Session of the GATT CONTRACTING PARTIES, *Trade in Agriculture. Action Taken on 30 November 1984*, L/5753, circulated on 20 December 1984. This document contains the set of recommendations relating to trade in agriculture adopted at this Session.

The weakness of the trade disciplines that existed prior to the *SPS Agreement* is illustrated by the fact that by 1986, the year the Uruguay Round negotiations were launched, almost 90 percent of food imports into the US were affected by non-tariff barriers to trade. In 1966, this had been only 56 percent.<sup>136</sup> This sharp escalation in the use of non-tariff barriers in this sector resulted in an awareness of the urgent need for new rules.

The inability of the existing rules to effectively address SPS barriers to trade was further highlighted and brought to the forefront of attention of Uruguay Round negotiators by the history of the well-known dispute regarding the EC's ban on hormone-treated beef.<sup>137</sup> This dispute arose in the 1980s between the US and the EC. In response to public outcry following premature sexual development in Italian schoolchildren, in 1977,<sup>138</sup> and Italian babies, in 1980, which had respectively been fed school lunches and baby food containing veal and milk from hormone-treated cows, the EC had imposed a ban on the use of two hormonal substances in cattle.<sup>139</sup> A scientific investigation was initiated into the safety of five additional growth hormones (three natural hormones and two synthetic hormones), which found that the hormones were not harmful to human health, when administered in accordance with good veterinary practice and within maximum dose limits.<sup>140</sup> Nevertheless, in 1985, due to strong political pressure from consumers,<sup>141</sup>

<sup>136</sup> These figures are reported in David Vogel, *Trading up, Consumer and Environmental Regulation in the Global Economy* (Harvard University Press, Cambridge/London), 1995, 150.

<sup>137</sup> A detailed account of the origins and development of the hormones dispute is provided in David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 154-171. This is used as the basis for the summary provided here.

<sup>138</sup> Sara Pardo Quintillán, 'Free Trade, Public Health Protection and Consumer Information in the European and WTO Context: Hormone Treated Beef and Genetically Modified Organisms', *Journal of World Trade* 33 (6), 1999, 147-197, footnote 43.

<sup>139</sup> The original ban in 1981 covered thyrostatics and stilbenes, including dimethyl stilbenes (DES) which were the hormones used in dairy production that had been found in Italian baby food. Although the link between this hormone and the premature development in Italian babies was never conclusively shown, as dimethyl stilbene is considered a carcinogen, its use had been banned in most dairy producing countries including the US. David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 154.

<sup>140</sup> The investigation, carried out by the Scientific Working Group on Anabolic Agents in Animal Production, established by the European Commission, examined the safety of three natural hormones and two synthetic hormones. For the natural hormones, it concluded that the natural hormones presented no danger to human health when administered in conditions of good animal husbandry and maximum dose limits. There was insufficient scientific evidence for a conclusion to be drawn with regard to the safety of the two artificial hormones. However, a subsequent enquiry in 1984 and 1985 established that also the two artificial hormones were safe. The final report of the Working Group was never issued, however, as European Commission put a stop to its work following a resolution by the European Parliament rejecting a proposal to authorise the three natural hormones, and endorsing a ban on the two synthetic hormones. Dale E. McNeil, 'The First Case under the WTO's Sanitary and Phytosanitary Agreement: The European Union's Hormone Ban', *Virginia Journal of International Law* 39, 1998, 89-134, 104. See also David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 155.

<sup>141</sup> Vogel reports that a 'vigorous campaign' was waged by consumer- and environmental-interest groups in the EC in the first half of the 1980s, the focal point of which was the European Parliament. As a result, the European Parliament opposed a Commission proposal to allow, under strict conditions, the use of the three natural hormones. It also opposed a compromise that would have allowed Member States to keep their national regulations in place for some of the hormones at issue. David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 156-157.

as well as the need to prevent the distortions in intra-Community trade caused by divergent Member State regulations in this area,<sup>142</sup> the Council of Ministers of the EC voted to adopt a Directive extending its ban to the five additional hormones when used for growth-promotion purposes in livestock farming, and on imports of hormone-treated beef.<sup>143</sup> An exception was made for the use of the three natural hormones for therapeutic or zootechnical purposes. The ban was originally planned to come into force on 1 January 1987, but was delayed by two years by the granting of transition periods.<sup>144</sup>

In the US, all five of the hormones banned by the EC were permitted to be used in beef production,<sup>145</sup> and were crucial to the US beef industry, enabling beef cattle raised in feedlots to reach their ideal weight faster and produce leaner beef.<sup>146</sup> The US Food and Drug Administration had found that the natural hormones left no residue differentiable from naturally-occurring hormones in cows. They had set rather conservative maximum residue levels for both the natural and the synthetic hormones.<sup>147</sup> In the mid-1980s, the US

---

<sup>142</sup> In the absence of harmonised EC regulation on growth hormones, Member States could decide for themselves how to regulate their use. Vogel notes that half of the Member States banned all five hormones at issue, while the other half authorized at least one of them. The border controls necessitated by this difference in regulatory approach undermined the creation of a single European Market. *Ibid.*, 155-156. See also Grace Skogstad, 'The WTO and Food Safety Regulatory Policy Innovation in the European Union', *Journal of Common Market Studies* 39 (3), 2001, 485-505, 491-492.

<sup>143</sup> Council of Ministers, *Council Directive 85/649 Prohibiting the Use in Livestock Farming of Certain Substances Having a Hormonal Action* of 31 December 1985, O.J. (L.382) 228. The ban was successfully challenged before the European Court of Justice and annulled on procedural grounds. The ban was again proposed by the Commission and adopted by the Council of Ministers in 1988 (Council Directives 88/146 and 88/299). It was further strengthened in 1996 with the adoption of Council Directive 96/22, replacing the two Directives of 1988. For details of the various EC Directives and proposals on this issue as well as this history of this dispute, see Dale E. McNeil, 'The First Case under the WTO's Sanitary and Phytosanitary Agreement: The European Union's Hormone Ban', *Virginia Journal of International Law* 39, 1998, 89-134, 99-107; Sara Pardo Quintillán, 'Free Trade, Public Health Protection and Consumer Information in the European and WTO Context: Hormone Treated Beef and Genetically Modified Organisms', *Journal of World Trade* 33 (6), 1999, 147-197, 156-159; David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 154-161.

<sup>144</sup> First, a one year transitional period was provided to allow the sale of stocks of hormone-treated beef already in the EC, and to conduct additional negotiations with the US. Another year's grace was provided only for non-EC producers following protests in December 1987. David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 161.

<sup>145</sup> Dale McNeil notes that the approval of growth hormones in the US beef industry began in the 1950s with the approval of the use of DES in cattle. In the late 1970s, DES was found to be carcinogenic and banned. In 1956, implants of estradiol benzoate and progesterone were approved, and in 1977 melengestrol acetate (MGA), a synthetic hormone, was allowed as a feed additive. Subsequently a range of other hormones, including Zeranol, Trenbolone acetate (both synthetic hormones) and estradiol 17 $\beta$  were approved for implants in calves for growth-promotion purposes. Dale E. McNeil, 'The First Case under the WTO's Sanitary and Phytosanitary Agreement: The European Union's Hormone Ban', *Virginia Journal of International Law* 39, 1998, 89-134, 99-100.

<sup>146</sup> The US Department of Agriculture has estimated that: 'the increased production efficiency combined with the high lean meat percentage gave the farmer an economic benefit of \$80 per head.' Vogel notes that this would be an estimated benefit of \$650 million per year. David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 160.

<sup>147</sup> Vogel points out that the maximum residue level set, namely 1% of daily production of the relevant hormone, was conservative as humans actually only absorb 10% of hormones they ingest. *Ibid.*, 159.

was the largest beef exporter to the EC. Of the US beef exports to the EC, less than ten percent were produced without hormones. In addition, US beef exports to the EC centred mainly on 'varietal' meats, such as kidneys, hearts, tongues and livers, in which hormone levels tend to be relatively high.<sup>148</sup> As a result, the EC ban on hormone-treated beef had the effect of sharply reducing, by almost 80 percent, US beef exports to the EC.<sup>149</sup>

The US turned to international fora to address this problem. Towards the end of 1986, it raised the issue at the CAC. The FAO/WHO Joint Expert Committee on Food Additives (JECFA) established maximum residue levels and acceptable daily intake levels for the two synthetic hormones and found that no such levels needed to be set for the natural hormones since these were 'unlikely to pose a hazard to human health' when used in accordance with good veterinary and animal husbandry practice.<sup>150</sup> Both the Codex Committee on Residues of Veterinary Drugs in Food and the Codex Committee of Food Additives and Contaminants agreed there was no scientific basis to the EC's ban, and approved the JECFA recommendations. However in July 1991, the CAC, after much debate, voted not to adopt the proposed maximum residue levels.<sup>151</sup>

---

<sup>148</sup> These varietal meats, as reported by Vogel, were used to produce European specialties such as blood pudding, pate, kidney pies etc. as their tenderness was prized by European consumers, and their standard size was useful for producers to standardise their production processes. It was not economically feasible for US producers to adapt to the EC requirements as varietal meats form only a small part of the meat of each cow (about \$25 worth) and the varietal meat prices in the EC were not high enough to justify the investment needed to produce hormone-free meat. *Ibid.*, 160.

<sup>149</sup> As noted by Vogel, other trading partners of the EC which authorized the use of hormones in beef production, such as Brazil, Australia and Canada, also formally opposed the ban. However, the economic consequences of the ban for these countries were limited. Brazil had authorized the use of only one hormone, so adaptation to the new EC requirements was not difficult. Australia had authorized all five hormones, but as most of Australian cattle were raised on grassland without the use of hormones, and the Australian government had an effective system in place to monitor and certify hormone-free beef, producers were hardly affected by the EC requirements. In addition Australia's beef exports to the EC were modest. Canada also exported very limited amount of beef to the EC (less than 0.02% of its total beef production) and was therefore not greatly affected by the ban.

<sup>150</sup> Joint FAO/WHO Expert Committee on Food Additives, *Summary and Conclusions of the Thirty Second Meeting* (Food and Agriculture Organization and World Health Organization, Rome), 15 - 23 June 1987.

<sup>151</sup> The vote was called by the Netherlands. The outcome of the vote was 12 in favour of adoption; 27 against adoption; and 9 abstentions. Codex Alimentarius Commission, *Report of the Nineteenth Session*, ALINORM 91/40 (Joint FAO/WHO Food Standards Programme, Rome), 1-10 July 1991, paras 161-162, available at: <http://www.fao.org/docrep/meeting/005/t0490e/t0490e00.htm>, visited on 13 May 2008. Vogel ascribes the refusal to adopt the proposed MRLs to the reluctance of the CAC to become embroiled in the conflict between the EC and the US. David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 165. The vote taken by the CAC on this issue was seen as politically motivated, and resulted in work on 'proposals to base Codex standards and other recommendations on scientific principles and the extent to which other factors needed to be taken into account'. Codex Alimentarius Commission, *Report of the Nineteenth Session*, ALINORM 91/40 (Joint FAO/WHO Food Standards Programme, Rome), 1-10 July 1991, para. 403, available at: <http://www.fao.org/docrep/meeting/005/t0490e/t0490e00.htm>, visited on 13 May 2008. This work led to the development of a set of statements of principle, for the establishment of Codex food safety standards by the CAC Executive Committee. Codex Alimentarius Commission, *Report of the Twenty-First Session*, ALINORM 95/37 (Joint FAO/WHO Food Standards Programme, Rome), 3-8 July 1995, Appendix 2, available at: <http://www.fao.org/docrep/meeting/005/v7950e/v7950e00.htm>, visited on 13 May 2008. These are discussed above, Part II, Section 3.2.1.4. See also Dale E. McNeil, 'The First Case under the WTO's Sanitary and Phytosanitary Agreement: The European Union's Hormone Ban', *Virginia Journal of International Law* 39, 1998, 89-134, 108.

In 1987, consultations on this dispute were held between the US and the EC under the *Standards Code*, and lasted six months.<sup>152</sup> Some of the issues on which there was disagreement were the following. Firstly, the EC regarded its ban as outside the scope of the *Standards Code* since a ban on the use of hormones in beef production amounted to a regulation on a PPM rather than a product characteristic.<sup>153</sup> According to the US, the EC was attempting to circumvent the *Standards Code* by framing its measure as a regulation on PPMs, when its real purpose was to ensure that only hormone-free beef was marketed in the EC.<sup>154</sup> Secondly, the EC argued that the US had to show that its ban was adopted ‘with a view to creating obstacles to international trade’<sup>155</sup> in order for it to violate the *Standards Code*. As the hormone ban was neither discriminatory on its face nor intended to restrict imports, it did not violate the *Standards Code*, according to the EC. The US, on the contrary, noted that the *Standards Code* caught not only discriminatory measures, but all measures that have the effect of creating unnecessary obstacles to international trade.<sup>156</sup> Thirdly, the EC and US disputed whether the hormones ban could be regarded as an ‘unnecessary’ obstacle to international trade, contrary to the obligations of the *Standards Code*.<sup>157</sup> According to the US, the absence of scientific evidence that US beef production methods resulted in unsafe beef indicated that the EC ban was not ‘necessary’ to protect human life or health. The EC’s counter-argument was that in the absence of conclusive scientific proof that hormone-treated beef was safe, the ban was justified as ‘necessary’.

As the consultations were unsuccessful in resolving the dispute, the US requested that the matter be referred to a technical expert group under the *Standards Code*. As noted above, such a decision had to be taken by consensus in the Committee on Technical Barriers to Trade. The EC used the possibility provided by this consensus requirement to block the establishment of this expert group. Therefore the conflict remained unresolved. On 1 January 1989, the EC ban came into effect and the US responded by increasing tariffs by 100 percent on a range of EC exports to the US.<sup>158</sup> This ongoing dispute served to highlight the insufficiency of the existing rules with respect to the use of measures for the protection of human, animal or plant life or health in ways that restrict international trade. David Vogel notes that:

---

<sup>152</sup> These consultations were requested in January 1987, which was when the hormones ban was originally supposed to come into force. David Vogel, ‘Food Safety and International Trade’, in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 165.

<sup>153</sup> As pointed out by Vogel, the wording of the Directive at issue specifies that its prohibition applies to the use of hormones for growth promotion purposes. The Directive does not prohibit the sale or importation of meat containing hormone residues. Its focus is therefore the production process rather than the characteristics of the product. *Ibid.*

<sup>154</sup> *Ibid.*, 165-166.

<sup>155</sup> Article 2.1 of the *Standards Code* provides in its first sentence: ‘Parties shall ensure that technical regulations and standards are not prepared, adopted or applied with a view to creating obstacles to international trade.’

<sup>156</sup> Article 2.1 of the *Standards Code*, in its last sentence, requires Parties to: ‘ensure that neither technical regulations nor standards themselves nor their application have the effect of creating unnecessary obstacles to international trade.’

<sup>157</sup> As noted above, Article 2.1 of the *Standards Code* prohibited measures that had the effect of creating ‘unnecessary obstacles to international trade.’

<sup>158</sup> The US action was taken under Section 301 of the Trade Act of 1974. The EC threatened to counter-retaliate but an escalation of the dispute was prevented by an ‘interim’ agreement reached between the EC and the US according to which the EC allowed some US beef exports to the EC (beef intended for pet food as well as beef certified as hormone-free) while the US reduced its retaliation measures correspondingly.

[i]t was in large measure the frustration of the United States over the inability of the Standards Code to resolve its complaint against the EC that led the United States to propose a strengthening of the GATT's discipline over sanitary and phytosanitary Standards in the Uruguay Round.<sup>159</sup>

Although the intractable hormones dispute is the best known SPS dispute predating the *SPS Agreement*, it was certainly not the only dispute of its kind. In the 1990s, the EC was faced with barriers to its French and Italian wine exports in the form of a US ban.<sup>160</sup> This ban resulted from the fact that these wines contained residues of procymidone, a fungicide used on about 20 percent of French grapes and 10 percent of Italian grapes. The ban was imposed under US legislation which prohibits chemicals in food for which safe maximum residue levels have not been established. As procymidone was not used in the US, no tolerance levels had been determined for its residues. While procymidone in high doses produces cancer in rodents, no scientific evidence had established a health risk from the low residue levels found in wine. However, pressure from US consumer and environmentalist groups led the US Environmental Protection Agency to keep the ban in place,<sup>161</sup> against vigorous protests from the EC wine industry.<sup>162</sup> The conflict was defused the following year when the Environmental Protection Agency set an interim tolerance level for procymidone in grapes grown before 1990 for the next four years.<sup>163</sup> Another such SPS dispute concerned Japan's import prohibition on US apples, due to concerns with the introduction of harmful pests from the US. Japan justified this measure with reference to the fact that as an island country it has to implement stricter quarantine requirements than other countries, to avoid introducing previously unknown pests that would threaten its agricultural production. Apple producers in Washington State had spent over ten years adapting 3,500 acres of orchards to Japanese requirements by 1993, but Japan maintained its import ban. After producers lobbied the US government to apply trade sanctions against Japan, the latter agreed to allow importation of US apples. This commenced in 1995.<sup>164</sup> A third SPS trade conflict concerned Chilean grape exports to the

<sup>159</sup> David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 153.

<sup>160</sup> This example is discussed by David Vogel and Marsha Echols. *Ibid.*, 174-175; Marsha A. Echols, 'Sanitary and Phytosanitary Measures', in *The World Trade Organization: The Multilateral Trade Framework for the 21st Century and U.S. Implementing Legislation*, Terence P. Stewart (ed.) (American Bar Association, Washington, D.C.), 1996, 191-222, 197. The summary of this dispute presented here is based on these discussions.

<sup>161</sup> Some of these pressure groups relied on the 'Delaney Clause', a 1958 amendment to the Federal Food, Drug and Cosmetic Act that establishes a zero tolerance policy for all carcinogens in food.

<sup>162</sup> Vogel reports that the CAC established a maximum residue level for procymidone of 5 parts per million, which is over ten times higher than the highest residue level found in EC wines. This CAC standard was adopted in the course of the Uruguay Round negotiations and it prompted the EC to support stronger harmonization disciplines in the *SPS Agreement*. David Vogel, 'Food Safety and International Trade', in *Trading Up: Consumer and Environmental Regulation in a Global Economy* (Harvard University Press, Cambridge/London), 1995, 150-195, 174.

<sup>163</sup> The interim tolerance level was 7 parts per million. According to the EPA administrator at the time, as cited by Vogel, the available data indicated that the level of procymidone residues found in wine 'should not pose a serious risk to consumers.' *Ibid.*, 175.

<sup>164</sup> This dispute reared its head again in 2000 when the strict quarantine requirements applied by Japan to prevent the introduction of fire blight from US apple imports were challenged by the US under the *SPS Agreement*. The findings in this dispute are discussed as relevant to the interpretation of the provisions of the

US. A food-safety scare broke out when cyanide was found in two Chilean grapes at the port in Philadelphia. This led to the impounding of Chilean grape imports at all US points of entry, a marketing recall, and an official consumer warning regarding all fruit from Chile. In addition an import ban on Chilean grapes was imposed for 11 days.<sup>165</sup> These and other similar disputes<sup>166</sup> evinced the lack of adequate trade disciplines to resolve conflicts involving the sensitive issues around SPS risk and agricultural trade. They formed the impetus for including the issue on the agenda for the Uruguay Round negotiations.

## 1.2 The Uruguay Round negotiations on the SPS Agreement

### 1.2.1 Background to the negotiations

The Uruguay Round of trade negotiations, which lasted from 1986 to 1994, was marked by a new readiness on the part of developing countries to engage in trade liberalisation.<sup>167</sup> A record number of 76 developing countries participated in the Uruguay Round,<sup>168</sup> and some of these countries played an active role in the negotiations. A new resolve to become effective participants in the multilateral trade regime was evident in their willingness to make reciprocal concessions and undertake to comply with all the negotiated disciplines.<sup>169</sup>

One very important aim of the Uruguay Round negotiations was the liberalisation of the agricultural sector. This sector had remained subject to much protectionism, despite the existing GATT rules.<sup>170</sup> The need to take steps to ensure the liberalisation of trade in agriculture was one of the main driving forces behind the launching of the Uruguay

---

*SPS Agreement* below, in Part III.

<sup>165</sup> Chilean exporters and US importers unsuccessfully brought a civil suit and the Chilean government tried to get the matter resolved through arbitration. Marsha A. Echols, 'Sanitary and Phytosanitary Measures', in *The World Trade Organization: The Multilateral Trade Framework for the 21st Century and U.S. Implementing Legislation*, Terence P. Stewart (ed.) (American Bar Association, Washington, D.C.), 1996, 191-222, footnote 35. Marsha Echols notes that this episode is currently regarded as an example of government overreaction to risk.

<sup>166</sup> Other examples of SPS disputes are those between the EC and the US with regard to the EC's ban on bovine somatotrophin (BST), a hormone used in milk production, and with regard to the EC's allegedly discriminatory application of a directive on the processing of poultry meat. In these disputes the EC argued that the *Standards Code* was not applicable to PPMs.

<sup>167</sup> See the discussion above, Part I, Section 1.6.

<sup>168</sup> WTO Development Division, *Developing Countries and the Multilateral Trading System: Past and Present. Background Document for the High Level Symposium on Trade and Development* (World Trade Organization, Geneva), 17-18 March 1999, 5, available at: [http://www.wto.org/english/tratop\\_e/devel\\_e/tr\\_dvbdoc\\_e.doc](http://www.wto.org/english/tratop_e/devel_e/tr_dvbdoc_e.doc), visited on 25 June 2007.

<sup>169</sup> Edwini Kwame Kessie, 'Developing Countries and the World Trade Organization: What Has Changed?' *World Competition* 22 (2), 1999, 83-110, 84. Kessie notes that developing countries hoped that by undertaking extensive commitments, they would 'send a positive signal to the international community that they were serious about economic reform.'

<sup>170</sup> As noted by Breen, agriculture was seen as a 'special case' in GATT rules. In some cases GATT rules were drafted in accordance with agricultural policies prevailing in the major Contracting Parties, in others waivers, reservations in accession agreements or informal 'grandfather' agreements protected agricultural policies from the full bite of GATT rules. John M. Breen, 'Agriculture', in *The GATT Uruguay Round: A Negotiating History (1986-1992)*, Terence P. Stewart (ed.), vol. I: Commentary (Kluwer, Deventer), 1993, 125-254, 134.

Round of trade negotiations in September 1986. The agenda for these negotiations was set out in the Punta Del Este Declaration.<sup>171</sup> The Declaration called for the liberalisation of trade in agricultural products and for bringing ‘...all measures affecting import access...under strengthened and more operationally active GATT rules and disciplines’ by, *inter alia*, ‘minimising the adverse effects that sanitary and phytosanitary regulations and barriers can have on trade in agriculture, taking into account the relevant international agreements.’<sup>172</sup>

During the Uruguay Round negotiations on agricultural trade liberalisation and on what would eventually become the *Agreement on Agriculture*, negotiators were very aware of the possibility that the progress achieved towards lowering trade barriers in the agricultural sector, could be made ineffective by the increased use of SPS measures for protectionist purposes. The growing number of disputes involving market access barriers to agricultural products in the form of SPS measures made these concerns concrete. Thus special disciplines for SPS measures were seen as crucial and inherently linked to the attempts to liberalise the agricultural sector.<sup>173</sup> The main impetus for the negotiations on strengthened disciplines for SPS measures came from the US.<sup>174</sup> It was strongly supported in this by other agriculture exporting nations, including both developed and developing countries. As noted by Gretchen Stanton, ‘Agricultural exporters were the principal champions of the SPS negotiations.’<sup>175</sup> At the same time, she notes, these same negotiators were well aware of the need to recognise the *right* of countries to legitimately regulate for the protection against SPS risk. Consumer groups, environmental groups and those domestic industries whose marketing strategies involved claims of a high level of health protection formed an effective lobby in this regard.<sup>176</sup>

Originally, the idea was to negotiate strengthened provisions in Article XX(b) of the GATT and/or the *Standards Code* with respect to SPS measures, in order to address the

---

<sup>171</sup> Special Session of the GATT CONTRACTING PARTIES, *Ministerial Declaration on the Uruguay Round of 20 September 1986*, GATT MIN.DEC, BISD 33S/19, circulated on 25 September 1986.

<sup>172</sup> *Ibid.*, 6.

<sup>173</sup> This link was recognised in the Punta Del Este Declaration (as set out above) and is also reflected in Article 14 of the *Agreement on Agriculture*, which provides: ‘Members agree to give effect to the Agreement on the Application of Sanitary and Phytosanitary Measures’. This provision is in fact redundant, since all WTO Members are bound to all the multilateral agreements reached in the Uruguay Round. It only serves to emphasise the perceived threat to agricultural liberalisation by SPS measures and to the role of the *SPS Agreement* in addressing this threat.

<sup>174</sup> In 1988, the US submitted a communication to the Negotiating Group on Agriculture, proposing the establishment of a separate Working Group on SPS issues, which it argued were not well suited to multilateral negotiation due to their technical nature. Negotiating Group on Agriculture, *Communication from the United States on a Health and Sanitary Working Group*, MTN.GNG/NG5/77, circulated on 13 September 1988. The task of the Working Group, according to the US proposal, would be to strengthen the disciplines of Article XX(b) of the GATT by developing parameters for acceptable SPS measures, the degree of equivalency or mutual recognition to be accorded to SPS regulations, the role of international standard-setting organisations in drafting science-based guidelines for the harmonisation of national SPS requirements, and the framework for notification and consultation procedures. John M. Breen, ‘Agriculture’, in *The GATT Uruguay Round: A Negotiating History (1986–1992)*, Terence P. Stewart (ed.), vol. I: Commentary (Kluwer, Deventer), 1993, 125–254, 176.

<sup>175</sup> Gretchen Stanton, *Food Safety and the SPS Agreement* (Standards and Trade Development Facility, Geneva), 2000, 1, available at: [www.standardsfacility.org/files/foodsafety&sps.pdf](http://www.standardsfacility.org/files/foodsafety&sps.pdf), visited on 13 December 2000.

<sup>176</sup> *Ibid.*

inadequacies of these agreements.<sup>177</sup> However, as negotiations progressed, the issue of SPS measures was seen as meriting special attention, apart from the larger genus of technical standards. Reasons that have been suggested for this view are the close link between agricultural trade and SPS standards, the importance of the beef hormone dispute and the fact that SPS measures were thought to raise problems different from those linked to other technical standards, for example the greater importance of scientific risk assessment, the greater divergence in national approaches to SPS regulation and the regulatory autonomy of national authorities in deciding on the need for regulation and the measures to be taken.<sup>178</sup> In the course of discussions on SPS issues in the Committee on Trade in Agriculture, several participants pointed out that the scope for improved disciplines to minimise the adverse trade effects of SPS measures would be conditioned by factors specific to this area, such as the technical nature of the issues involved; the differences in the geographic, climatic and production conditions prevailing in different countries; and the fact that the assessment of the existence of a threat to human, plant or animal health as well as the determination of preventive measures considered necessary, were matters within the competence of national regulatory authorities.<sup>179</sup> Despite these constraints, it was felt that SPS measures should be brought under appropriate procedures relating to notification, transparency, consultation and dispute settlement.<sup>180</sup> The importance of ensuring an appropriate level of technical expertise in any procedures for review, consultation and dispute settlement was noted.<sup>181</sup> It was suggested that a counter-notification process, whereby particularly trade-disruptive SPS measures could be identified by the countries

---

<sup>177</sup> At the first meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers, much of the discussion centred on the need to reinforce GATT rules, particularly Article XX(b), to discipline SPS measures effectively. However, some participants expressed the view that the possibilities for providing greater clarity and precision to this Article were limited. Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the First Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/1, circulated on 28 October 1988, para. 8. At the second meeting of the Working Group, the Chairman raised the question whether the negotiations with regard to SPS measures would result in improvements to the *Standards Code* or in a separate agreement. Participants expressed the view that the *Standards Code* was relevant to the work on SPS measures, but that it had proven unsatisfactory in addressing SPS barriers to trade. Therefore strengthened rules were needed. Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Second Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/2, circulated on 14 November 1988, paras 11-12. Work proceeded on this basis. See for example, the Nordic Group's submission addressing the deficiencies of the *Standards Code* and possible ways of strengthening this Code. Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Applicability of the Agreement on Technical Barriers to Trade to Sanitary and Phytosanitary Regulations and Barriers: Note Submitted by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/5, circulated on 22 May 1989.

<sup>179</sup> Committee on Trade in Agriculture, *Summary of Points Raised at the Meeting of the Committee Held on 2-3 April 1985. Note by the Secretariat*, AG/W/13, circulated on 4 September 1985, para. 2.

<sup>180</sup> *Ibid.* See also Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the First Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/1, circulated on 28 October 1988, para. 11.

<sup>181</sup> *Ibid.*, para. 7.

adversely affected by them, and reviewed, would be useful, and that the Committee itself might provide a permanent forum for periodic review of these measures.<sup>182</sup>

By the mid-term review of the Uruguay Round in December 1988, five areas of priority had been agreed upon for SPS disciplines, namely harmonisation of SPS measures around standards set by international organisations; the establishment of an effective notification procedure for SPS measures to improve transparency; the creation of a consultative mechanism for resolving disputes bilaterally; the improvement of the multilateral dispute settlement system; and the creation of a possibility of obtaining scientific input and expertise, relying on the international organisations.<sup>183</sup> A separate Working Group on Sanitary and Phytosanitary Regulations and Barriers was created in 1988, under the Negotiating Group on Agriculture, which was open to all 124 governments which participated in the Uruguay Round negotiations.<sup>184</sup> Due to the technical nature of SPS issues, negotiators in this Working Group included representatives from agricultural and trade ministries as well as SPS regulatory agencies.<sup>185</sup> In addition, in order to better understand the operation of the CAC, OIE and IPPC, representatives from these bodies/treaty were invited to participate as observers in the Working Group meetings.<sup>186</sup> Negotiations in the Working Group proceeded on the basis of the agreed priorities.

The Working Group on Sanitary and Phytosanitary Regulations and Barriers drew up a draft text of the *SPS Agreement* in November 1990.<sup>187</sup> The most important points of

<sup>182</sup> *Ibid.* It is interesting to note the similarity between this early proposal and the current system of raising 'specific trade concerns' with notified SPS measures before the SPS Committee, for discussion. This is discussed below, Part IV, Section 2.1.2.

<sup>186</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the First Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/1, circulated on 28 October 1988, para. 19. These bodies submitted written statements in the course of the negotiations. Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Statement by the Representative of the Codex Alimentarius Commission at the Second Meeting of the Working Group (3 November 1988)*, MTN.GNG/NG5/WGSP/W/3, circulated on 30 November 1988; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Statement by the Representative of the International Plant Protection Convention at the Second Meeting of the Working Group (3 November 1988)*, MTN.GNG/NG5/WGSP/W/4, circulated on 30 November 1988; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Comments by the International Office of Epizootics (OIE): Meeting of 2-3 April 1990*, MTN.GNG/NG5/WGSP/W/19, circulated on 4 May 1990.

<sup>187</sup> Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Draft Text on Sanitary and Phytosanitary Measures*, MTN.GNG/NG5/WGSP/7, circulated on 20 November 1990. Breen notes that this Working Group was the only one among the agriculture Working Groups to succeed in producing a draft text in November 1990. John M. Breen, 'Agriculture', in *The GATT Uruguay Round: A Negotiating History (1986-1992)*, Terence P. Stewart (ed.), vol. I: Commentary (Kluwer, Deventer), 1993, 125-254, 200.

agreement in this 1990 draft were that: (1) SPS measures should be non-discriminatory and should not constitute disguised barriers to trade; (2) SPS measures should be harmonised in accordance with generally accepted scientific principles; (3) developing-country constraints in meeting SPS requirements should be given special consideration; (4) procedures for transparency in setting SPS regulations and in resolving disputes concerning such measures were needed; and (5) an international committee should be created as a forum for consultations on SPS measures.<sup>188</sup> Significant areas of disagreement still remained, however. In particular, these dealt with:<sup>189</sup> (1) whether, and if so, under what conditions, Parties could impose measures stricter than international standards;<sup>190</sup> (2) whether ‘other economic considerations and genuine consumer concerns’ were factors that could be taken into account in a risk assessment;<sup>191</sup> and (3) what disciplines should be imposed on control, inspection and approval systems.<sup>192</sup>

In the last months of 1990, however, the Uruguay Round negotiations as a whole faltered and the Brussels Meeting in December 1990 at which the Round should have been completed ended in deadlock. The deadlock was largely due to disagreement on issues relating to the liberalisation of agricultural trade. To break the deadlock, the then Director-General of the GATT tabled in December 1991 what is now known as the Dunkel Draft,<sup>193</sup> embodying an overall compromise position. With respect to the *SPS Agreement* the Dunkel Draft closely followed the text of the December 1990 draft prepared by the Working Group on Sanitary and Phytosanitary Regulations and Barriers,<sup>194</sup> and this formed the basis for the final text of the *SPS Agreement*.<sup>195</sup>

<sup>188</sup> This summary is provided in John M. Breen, ‘Agriculture’, in *The GATT Uruguay Round: A Negotiating History (1986–1992)*, Terence P. Stewart (ed.), vol. I: Commentary (Kluwer, Deventer), 1993, 125–254, 200–201.

<sup>189</sup> This list of points is provided *ibid.*, 201.

<sup>190</sup> The EC and the US supported flexibility in the harmonisation provision, allowing Members to apply stricter measures than those embodied in international standards. The Cairns group opposed such flexibility as undermining the harmonisation effort. *Ibid.*

<sup>191</sup> This issue was controversial due to the ongoing disputes regarding the EC’s bans on hormones in beef and dairy production, discussed above. These bans were seen as contrary to the weight of scientific evidence, and motivated by consumer fears and market surpluses in the EC. *Ibid.*, footnote 381.

<sup>192</sup> The issue of disciplines on systems for prior approval of food additives, and for control and inspection of products and PPMs to assess conformity with SPS requirements was extremely controversial, as reflected in the fact that the draft text provided four different options, one of which was the complete omission of the provision on this issue. *Ibid.*, 201.

<sup>193</sup> Trade Negotiations Committee, *Draft Final Act Embodying the Results of the Uruguay Round of Multilateral Trade Negotiations*, MTN.TNC/W/FA, circulated on 20 December 1991.

<sup>194</sup> John M. Breen, ‘Agriculture’, in *The GATT Uruguay Round: A Negotiating History (1986–1992)*, Terence P. Stewart (ed.), vol. I: Commentary (Kluwer, Deventer), 1993, 125–254, 213. Breen points out that negotiations on SPS measures continued to make faster progress than those on other sectors within the agriculture negotiations.

<sup>195</sup> Some significant differences between the Dunkel Draft and the final version of the *SPS Agreement* were: (1) the addition of a footnote clarifying what is meant by the ‘scientific justification’ required when an SPS measure deviates from an international standard; (2) the change in the initial requirement in Article 5.6 that SPS measures be least restrictive to trade, to specify that they must be no more trade restrictive than required to achieve a Member’s appropriate level of protection; (3) the indication in Article 5.3 that the requirement that account be taken of economic factors in a risk assessment does not extend to situations of risk to human health; and (4) the extension of the transitional period for the implementation of the *SPS Agreement* from two to five years for least-developed-country Members. John M. Breen, ‘Agriculture’, in *The GATT Uruguay Round: A Negotiating History (1986–1992)*, Terence P. Stewart (ed.), vol. IV: The End Game (Kluwer, The Hague/London/Boston), 1999, 41–45, Annex 2.

As a result of the distinct mandate of the Working Group on Sanitary and Phytosanitary Regulations and Barriers, two separate agreements on technical barriers to trade emerged from in the Uruguay Round: firstly, the *Agreement on Technical Barriers to Trade*<sup>196</sup> (*TBT Agreement*), applicable to technical regulations, standards and conformity assessment procedures other than SPS measures; and, secondly, the *Agreement on the Application of Sanitary and Phytosanitary Measures*<sup>197</sup> (*SPS Agreement*), applicable only to SPS measures.<sup>198</sup>

It is interesting to examine in more detail the main actors in the negotiation of the *SPS Agreement* and the positions they took. This provides some background to understanding the concerns that different countries had in the negotiation process and casts some light on the way in which the provisions of the Agreement were framed. In particular, it goes some way towards explaining why the disciplines in the *SPS Agreement* applicable to the SPS regulatory process so closely resemble the regulatory regimes in developed countries.

In the negotiations that led to the conclusion of the *SPS Agreement* the leading role was taken by the US,<sup>199</sup> the EC,<sup>200</sup> the Nordic countries (Norway, Sweden, Iceland and Finland)<sup>201</sup>

<sup>196</sup> 'Agreement on Technical Barriers to Trade', in *The Results of the Uruguay Round of Multilateral Trade Negotiations: The Legal Texts* (World Trade Organization, Geneva), 1994, 138-162, 6-18. This Agreement elaborated on and replaces the Tokyo Round *Standards Code* of 1979. The *TBT Agreement* goes further than the *Standards Code* in that it applies to both mandatory standards and recommendations and extends not only to products but also related processes and production methods.

<sup>197</sup> 'Agreement on the Application of Sanitary and Phytosanitary Measures', in *The Results of the Uruguay Round of Multilateral Trade Negotiations: The Legal Texts* (World Trade Organization, Geneva), 1994, 69-84.

<sup>198</sup> The scope of application of the *SPS Agreement* and its relationship to the *TBT Agreement* are discussed below, Part III, Section 2.4.1.

<sup>199</sup> Negotiating Group on Agriculture, *Submission of the United States on Comprehensive Long-Term Agricultural Reform*, MTN.GNG/NG5/W/118, circulated on 25 October 1989; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Communication from the United States Regarding the International Office of Epizootics*, MTN.GNG/NG5/WGSP/W/12, circulated on 16 February 1990.

<sup>200</sup> Negotiating Group on Agriculture, *Communication from the European Communities. Working Paper. Drafting of an Appropriate Framework of Rules for Sanitary and Phytosanitary Regulations*, MTN.GNG/NG5/W/56, circulated on 20 April 1988; Negotiating Group on Agriculture, *Submission of the European Communities on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/146, circulated on 20 December 1989.

<sup>201</sup> The Nordic countries were particularly proactive in the negotiations, submitting detailed proposals for the text of a new Agreement, originally based on the text of the *Standards Code*. Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Applicability of the Agreement on Technical Barriers to Trade to Sanitary and Phytosanitary Regulations and Barriers: Note Submitted by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/5, circulated on 22 May 1989; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Note Submitted by the Nordic Delegations with Respect to Some Elements of the Work Programme*, MTN.GNG/NG5/WGSP/W/7, circulated on 31 October 1989; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Form and Disposition of the Agreement on Sanitary and Phytosanitary Regulations and Barriers (SPS Measures). Note by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/10, circulated on 12 February 1990; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Harmonization and Transparency: Note by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/9, circulated on 30 January 1990; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Dispute Settlement Procedures: Note by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/11, circulated on 12 February 1990; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers,

and those countries that account for the largest share of agricultural trade, namely the Cairns Group of agriculture exporting countries (at the time of the Uruguay Round negotiations, the Cairns Group was composed of Argentina, Australia, Brazil, Canada, Chile, Colombia, Hungary, Indonesia, Malaysia, New Zealand, the Philippines, Thailand and Uruguay). These countries submitted several written proposals to the Negotiating Group on Agriculture and later the Working Group on Sanitary and Phytosanitary Regulations and Barriers. Other developed countries that also submitted written proposals, as part of their agriculture position papers, were Japan, Israel and Austria.<sup>202</sup> In addition, proposals on SPS issues were made by developing countries in the context of their positions in the general agriculture negotiations, including by Korea; Morocco; Brazil and Colombia (acting jointly); and Egypt, Jamaica, Mexico and Peru (acting jointly).<sup>203</sup> An examination of the proposals contained in these submissions provides an indication of the areas of agreement and the points of contention in the negotiations.<sup>204</sup> It also evinces the extent of participation of the various countries in the negotiation process, and is useful in determining whether the new engagement of developing countries in the Uruguay Round negotiations in general was also carried through to their participation in the negotiations that led to the *SPS Agreement*. The summaries of the discussions in the meetings of the Working Group on Sanitary and Phytosanitary Regulations and Barriers very often do not specify which country made the various statements referred to, so it is not possible to gauge the extent of active participation in the meetings of various participants, or to identify the positions they supported. However, the content of these discussions does serve to clarify some of the positions taken and the concerns raised. It is therefore referred to where relevant in the description below.

<sup>204</sup> A useful summary of the main proposals relating to key concepts was prepared by the GATT Secretariat, and is referred to here as appropriate. Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Synoptic Table of Proposals Relating to Key Concepts: Note by the Secretariat. Revision*, MTN.GNG/NG5/WGSP/W/17/Rev.1, circulated on 29 May 1990. For a discussion of some of the proposals, see Maury E. Bredahl and Kenneth W. Forsythe, 'Harmonizing Phyto-Sanitary and Sanitary Regulations', *The World Economy* 12, 1989, 189-206.

### 1.2.2 Positions of the developed-country participants and the Cairns Group

Most active in the negotiations regarding disciplines on SPS measures were, as mentioned above, several developed countries and the Cairns Group, which included the main developed- and developing-country exporters of agricultural products. While their positions converged in certain areas, in other respects their particular circumstances or concerns resulted in divergent positions. The key components of some of the proposals of these participants are outlined below.

The scope of application of the new disciplines being negotiated on SPS measures was discussed in a few proposals. The product coverage of the new rules was seen as linked to the product coverage of the new *Agreement on Agriculture*, being negotiated at the same time. However, it was proposed that the products of fisheries and forestry be included, regardless of their inclusion or exclusion in the *Agreement on Agriculture*.<sup>205</sup> In addition, there was some debate in the Working Group regarding whether measures aimed at the protection of the environment in general should be covered by the new disciplines. The Cairns Group proposed that as SPS measures may legitimately protect not only commercial products but also natural fauna and flora, such measures should fall under the new disciplines.<sup>206</sup> It clarified, however, that measures for the conservation of natural resources other than fauna and flora should not be covered by the new rules. Not all participants were of the same view, however, and the 1990 draft text on the *SPS Agreement* still contained bracketed text with two options, either expressly including or expressly excluding measures aimed at the protection of the environment in the definition of an ‘SPS measure’. Both these texts were omitted in the Dunkel Draft, so that the definition of an ‘SPS measure’ is silent on the question whether measures to protect the environment *per se* are among the measures covered. Questions also arose with regard to whether health regulations on non-agricultural products, such as pesticides, cigarettes and veterinary drugs, should be covered.<sup>207</sup> However, overall the prevailing view among negotiators seemed to focus on the link between SPS measures and liberalising trade in agricultural products (in the broad sense), thus limiting the product coverage to primary or processed agricultural products and natural fauna and flora.

More problematic was the question whether regulations addressing PPMs, and especially non-product related PPMs, such as regulations concerning animal welfare, consumer preferences, fair trade and religious concerns, should be covered by the new SPS

<sup>205</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Synoptic Table of Proposals Relating to Key Concepts: Note by the Secretariat. Revision*, MTN.GNG/NG5/WGSP/W/17/Rev.1, circulated on 29 May 1990, Table 2; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Seventh Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/22, circulated on 31 May 1990, para. 4.

<sup>206</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Sixth Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/18, circulated on 4 May 1990, para. 4.

<sup>207</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Seventh Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/22, circulated on 31 May 1990, para. 4.

disciplines. The Nordic Group and the Cairns Group proposed that the new disciplines should apply equally to SPS measures addressing product characteristics and those addressing product-related PPMs.<sup>208</sup> The Nordic Group noted that one of the main weaknesses of the *Standards Code* was its very limited coverage of PPMs, whereas SPS regulations are very often based on PPMs rather than product specifications.<sup>209</sup> It proposed a discipline providing that, as far as possible, SPS measures should be based on product characteristics rather than PPMs.<sup>210</sup> The EC proposal, instead, stressed that by contrast to industrial products, for agri-food products the regulation of PPMs plays an important role in ensuring the safety of the resulting product. A simple extension of new disciplines on SPS product requirements to PPM requirements, as proposed by other participants,<sup>211</sup> would in the view of the EC disregard the different character of the two regulatory systems. While conformity with product requirements can easily be checked by the importer, checking conformity of PPMs, which take place in the exporting country, requires the cooperation of the country concerned. An appropriate framework suited to this special situation should be drafted, according to the EC.<sup>212</sup> A more vexed question was that of the application of the new disciplines to non-product-related PPMs. The Cairns Group proposal stated that only issues directly related to human, animal or plant life or health should be covered, not consumer preferences, animal welfare, and religious or moral issues.<sup>213</sup> The EC also distinguished between considerations regarding the protection of life and health, which it considered SPS considerations, and other considerations such as those regarding fair trade, quality and fraud prevention, which it did not regard as SPS considerations.<sup>214</sup> Similarly, the Nordic Group proposed that regulations based on moral or ethical considerations would fall outside the scope of application of the new rules.<sup>215</sup>

---

<sup>208</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, paras 23-24. The Cairns group saw particular scope for applying the rules on the recognition of equivalence to PPMs.

<sup>209</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Applicability of the Agreement on Technical Barriers to Trade to Sanitary and Phytosanitary Regulations and Barriers: Note Submitted by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/5, circulated on 22 May 1989, para. 10. As has been seen in Part II, process-based SPS regulations are prevalent in developed countries. Less developed countries tend to rely on product-based regulation as this is easier to control. See above, Part II, Section 1.3.

<sup>210</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Note Submitted by the Nordic Delegations with Respect to Some Elements of the Work Programme*, MTN.GNG/NG5/WGSP/W/7, circulated on 31 October 1989, para. 1.D.

<sup>212</sup> Negotiating Group on Agriculture, *Communication from the European Communities. Working Paper. Drafting of an Appropriate Framework of Rules for Sanitary and Phytosanitary Regulations*, MTN.GNG/NG5/W/56, circulated on 20 April 1988, 3.

<sup>213</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, para. 6.

<sup>214</sup> Negotiating Group on Agriculture, *Submission of the European Communities on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/146, circulated on 20 December 1989, 1-2.

<sup>215</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Form and Disposition of the Agreement on Sanitary and Phytosanitary Regulations and Barriers (SPS Measures). Note by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/10, circulated on 12 February 1990, 3.

In response to concerns raised by other participants, in discussions in the Working Group, that it would be a mistake to exclude such measures, which were already being used for protectionist purposes, from the reinforced disciplines being negotiated, it was stated that Article XX(b) could be used to discipline such measures.<sup>216</sup> The draft text on the *SPS Agreement* drawn up by the Working Group in 1990 still contained bracketed text with two options, one expressly including measures aimed at consumer preferences and information, animal welfare and ethical and moral considerations from the definition of an ‘SPS measure’ and another expressly excluding measures aimed at such considerations.<sup>217</sup> In the Dunkel draft, both were omitted.

The question of the scope of application of the new rules addressed in several proposals also covered the issue of personal scope of application – i.e. to which entities do the new rules apply? This question was regarded as important as it was recognised that SPS standards are often developed by local government bodies (such as states, länder, and cantons), regional bodies (such as regulatory bodies of a customs union)<sup>218</sup> and non-governmental bodies (such as independent bureaus of standards). The Cairns Group stated that it was necessary to ensure that all levels of government, including national, sub-national and supra-national bodies, be covered by the new rules.<sup>219</sup> The Nordic proposal noted that the *Standards Code* applied directly to central government bodies, but its obligations for local and regional government bodies as well as non-government bodies were of a ‘best endeavour’ or ‘second level’ nature. It suggested that the latter obligations be strengthened.<sup>220</sup> In a later proposal, the Nordic Group required parties to ensure compliance with the new disciplines by central and local government bodies, and to take such reasonable measures as may be available to them to ensure compliance by regional and non-governmental bodies, and not to require or encourage such bodies to act inconsistently with these disciplines.<sup>221</sup> Some participants were concerned that the Nordic proposal was too stringent in this regard and could lead to constitutional difficulties.<sup>222</sup> Interestingly, the issue

<sup>216</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Eighth Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/24, circulated on 2 July 1990, para. 3. It is not stated in the report which countries participated in this discussion. The assertion that Article XX(b) would discipline measures aimed at consumer preferences and ethical and religious concerns is not correct as the scope of this exception is limited, as explained above, Part III, Section 1.1.1. Currently, the *TBT Agreement* would apply to such measures if they take the form of technical regulations or standards. See further below, Part III, Section 2.4.1.

<sup>217</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Draft Text for a Decision by the CONTRACTING PARTIES on Sanitary and Phytosanitary Measures*, MTN.GNG/NG5/WGSP/W/26, circulated on 1 October 1990, 8.

<sup>218</sup> A current example of a regional SPS regulatory body is Food Standards Australia New Zealand, discussed above, Part II, Section 2.4.2.2.

<sup>219</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, 41.

<sup>220</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Applicability of the Agreement on Technical Barriers to Trade to Sanitary and Phytosanitary Regulations and Barriers: Note Submitted by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/5, circulated on 22 May 1989, paras 11 and 13.

<sup>221</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Draft Agreement on Sanitary and Phytosanitary Measures: Note by the Nordic Countries*, MTN.GNG/NG5/WGSP/W/21, circulated on 28 May 1990, 5.

<sup>222</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers,

of private sector standards was not raised at all in proposals or discussions concerning the scope of application of the *SPS Agreement*.<sup>223</sup> This was due to the fact that, at the time of the negotiations, private-sector standards in the SPS area were not yet as pervasive as they are today. In fact, while private sector standards were then already used extensively in the area of technical specifications, the prevailing view was that safety standards were a matter for government regulation rather than private action. As noted by Digby Gascoine and others, the proliferation of private sector standards to respond to consumer demands with regard to issues such as animal welfare, environmental issues, and food safety is a development that postdates the negotiation of the *SPS Agreement*, and goes hand-in-hand with the domination of the food market by large supermarket chains.<sup>224</sup>

There was general consensus among the EC, US and Cairns Group on the inclusion of a non-discrimination principle and a requirement that the measure not constitute a disguised restriction on trade, familiar from the existing GATT disciplines, in the disciplines on SPS measures.<sup>225</sup> However, it was observed that SPS measures often result in differing treatment of products due to differences in SPS conditions in different countries. Therefore, a strict national treatment obligation would not be acceptable. Instead, a prohibition on *arbitrary or unjustifiable* differences in treatment, as contained in the *chapeau* of Article XX of the GATT, was deemed more appropriate.<sup>226</sup> In addition, the idea that SPS measures should be the least-trade-restrictive measures available that ensure the level of health protection chosen by the importing country, taken over from the 'necessary' requirement of Article XX(b) of the GATT, had wide support.<sup>227</sup>

---

*Summary of Main Points Raised at the Eighth Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/24, circulated on 2 July 1990, para. 6.

<sup>223</sup> Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, para. 25 and footnote 13. This report relies upon the recollections of Gretchen Stanton who chaired almost all the negotiations sessions on SPS issues, and Digby Gascoine, who represented Australia throughout the negotiations.

<sup>224</sup> *Ibid.*, para. 25.

<sup>225</sup> The US proposal simply incorporated the national treatment rule of Article III:4 of the GATT Negotiating Group on Agriculture, *Submission of the United States on Comprehensive Long-Term Agricultural Reform*, MTN.GNG/NG5/W/118, circulated on 25 October 1989, 11. The EC proposal referred to the non-discrimination rule in Articles III:4 of the GATT and in the *chapeau* of Article XX of the GATT. However, it emphasised the need to work out more precisely how these would apply when different health conditions or systems of protection exist in different countries. Negotiating Group on Agriculture, *Communication from the European Communities. Working Paper. Drafting of an Appropriate Framework of Rules for Sanitary and Phytosanitary Regulations*, MTN.GNG/NG5/W/56, circulated on 20 April 1988, para. 3. The Cairns group proposed including the national treatment principle in respect of SPS regulations, and extending its application to inspection systems. Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Communication from the Cairns Group*, MTN.GNG/NG5/W/112, circulated on 2 October 1989, paras 11-12; Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, para. 25.

<sup>226</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Seventh Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/22, circulated on 31 May 1990, para. 11.

<sup>227</sup> Negotiating Group on Agriculture, *Communication from the European Communities. Working Paper. Drafting of an Appropriate Framework of Rules for Sanitary and Phytosanitary Regulations*, MTN.GNG/NG5/W/56, circulated on 20 April 1988, 2. The Nordic countries proposed the incorporation of the national treatment and most-favoured-nation obligations and to include under their application to risk assessment procedures and the choice of level of protection. Negotiating Group on Agriculture, Working Group on Sanitary

From the start of the negotiations, the proposals of the US, the Cairns Group, the Nordic Group, Japan and the EC all supported harmonisation of SPS measures around the standards set by the Codex Alimentarius Commission (CAC), the International Office of Epizootics (OIE) and the International Plant Protection Convention (IPPC) or, for matters not covered by these organisations, around standards set by other relevant international organisations open for full participation by Parties.<sup>228</sup> However, the proposals differed with respect to the strength of the harmonisation provision. The US and the Cairns Group envisaged a presumption of consistency with either the requirement of sound scientific evidence,<sup>229</sup> or with the disciplines of Article XX(b) of the GATT,<sup>230</sup> for SPS measures based on international standards. The Cairns Group went even further, requiring Parties that impose more stringent standards to bear the burden of proving that their measure was consistent with sound scientific evidence or the relevant GATT provisions.<sup>231</sup> By contrast, the Nordic countries and Japan proposed that parties should adhere to, or base their SPS measures on, international standards unless these were inappropriate, for reasons such as differences in geographical conditions or dietary customs.<sup>232</sup> Japan suggested that international bodies might more appropriately develop guidelines rather than standards.<sup>233</sup> Allowing for even more flexibility, the EC saw international standards as constituting only a ‘principal source of scientific or technical advice when considering the sanitary and phytosanitary aspects of international trade’ and emphasised the need ‘to provide for

and Phytosanitary Regulations and Barriers, *Draft Agreement on Sanitary and Phytosanitary Measures: Note by the Nordic Countries*, MTN.GNG/NG5/WGSP/W/21, circulated on 28 May 1990, 7.

<sup>228</sup> Negotiating Group on Agriculture, *Submission of the United States on Comprehensive Long-Term Agricultural Reform*, MTN.GNG/NG5/W/118, circulated on 25 October 1989, 9; Negotiating Group on Agriculture, *Communication from the European Communities. Working Paper: Drafting of an Appropriate Framework of Rules for Sanitary and Phytosanitary Regulations*, MTN.GNG/NG5/W/56, circulated on 20 April 1988, para. 1; Negotiating Group on Agriculture, *Submission of the European Communities on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/146, circulated on 20 December 1989, 1; Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, para. 16; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Draft Agreement on Sanitary and Phytosanitary Measures: Note by the Nordic Countries*, MTN.GNG/NG5/WGSP/W/21, circulated on 28 May 1990, 7; Negotiating Group on Agriculture, *Supplementary Submission of Japan on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/156, circulated on 7 March 1990, para. 1.

<sup>229</sup> Negotiating Group on Agriculture, *Submission of the United States on Comprehensive Long-Term Agricultural Reform*, MTN.GNG/NG5/W/118, circulated on 25 October 1989, 10. The US proposal envisaged the inclusion into Article XX(b) of a proviso that the measures justified there under be ‘consistent with sound science and recognise the principle of equivalency.’ Thus, in effect, the US proposal also came down to a presumption of compliance with Article XX(b) of measures conforming to international standards.

<sup>230</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, para. 19.

<sup>231</sup> *Ibid.*, para. 20.

<sup>232</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Draft Agreement on Sanitary and Phytosanitary Measures: Note by the Nordic Countries*, MTN.GNG/NG5/WGSP/W/21, circulated on 28 May 1990, 7-8; Negotiating Group on Agriculture, *Negotiating Group on Agriculture: Submission by Japan*, MTN.GNG/NG5/W/131, circulated on 6 December 1989, para. 2. The Japanese proposal noted that where sanitary, dietary and geographic differences had to be considered, harmonisation should be effectuated by guidelines rather than standards. The Nordic proposal required only that parties not basing their SPS measures on international standards must, upon request, explain the reasons therefore. No scientific justification was required.

<sup>233</sup> Negotiating Group on Agriculture, *Negotiating Group on Agriculture: Submission by Japan*, MTN.GNG/NG5/W/131, circulated on 6 December 1989, para. 2.

countries that have reached a high health status to be able to continue to apply standards more stringent than the international standards, where appropriate.<sup>234</sup> A convergence in positions emerged during the negotiations when the EC was confronted with US restrictions to its wine exports due to the presence of the fungicide procymidone, while an international standard setting a maximum residue level for this pesticide was in the process of adoption by the Codex Alimentarius Commission.<sup>235</sup> This development led to a realisation by the EC and others of the potential benefits of harmonised standards and a strengthening of support for a stricter provision on harmonisation.<sup>236</sup> The idea arose that scientific justification should be required for SPS measures that were stricter than international standards. There was disagreement on who should bear the burden of proof in such cases.<sup>237</sup> It is interesting that in the discussions on the harmonisation proposals, several participants made the point that panels should not be able to question the validity of international standards, but could only review whether the standard was being appropriately applied.<sup>238</sup>

The role of science in SPS regulation was addressed in several proposals, most of which required that SPS measures be based on ‘sound science’.<sup>239</sup> Many proposals stated that measures based on international standards would be deemed to be based on sound

<sup>234</sup> Negotiating Group on Agriculture, *Submission of the European Communities on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/146, circulated on 20 December 1989. In this regard the EC pointed to the fact that international standards have a voluntary character and are intended to apply to a wide range of countries with differing circumstances, and therefore tend not to be very stringent.

<sup>235</sup> Marsha A. Echols, ‘Sanitary and Phytosanitary Measures’, in *The World Trade Organization: The Multilateral Trade Framework for the 21st Century and U.S. Implementing Legislation*, Terence P. Stewart (ed.) (American Bar Association, Washington, D.C.), 1996, 191-222.

<sup>236</sup> In 1990, in discussions at the Working Group on Sanitary and Phytosanitary Regulations and Barriers, the EC emphasised the importance of harmonisation. It proposed that existing international and regional standards be examined and a list be made of those agreed to for use in a GATT context. Countries complying with such standards would be presumed to comply with their GATT obligations. Countries applying stricter standards could be found in violation of the GATT if the exporting country could prove that the measures were maintained against sound scientific evidence. This EC proposal therefore differs from those of the US and the Cairns group in that it places the burden of proof on the exporting country rather than the regulating country. This allocation of the burden of proof was controversial in the negotiations. In addition, the EC’s idea that a list of relevant standards be drawn up was criticised. Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Fifth Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/13, circulated on 19 March 1990, paras 8-9.

<sup>237</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Seventh Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/22, circulated on 31 May 1990, para. 8.

<sup>238</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Third Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/6, circulated on 17 October 1989, para. 9.

<sup>239</sup> See for example Negotiating Group on Agriculture, *Negotiating Group on Agriculture: Submission by Austria*, MTN.GNG/NG5/W/144, 19 December 1989, para. 5; Negotiating Group on Agriculture, *Communication from Israel Expressing Views on Certain Elements in the Negotiation on Agriculture*, MTN.GNG/NG5/W/153, 13 February 1990, para. VI; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Draft Agreement on Sanitary and Phytosanitary Measures: Note by the Nordic Countries*, MTN.GNG/NG5/WGSP/W/21, circulated on 28 May 1990, 4; Negotiating Group on Agriculture, *Supplementary Submission of Japan on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/156, circulated on 7 March 1990, para. 3.

scientific evidence, whereas measures not so based would have to be scientifically justified.<sup>240</sup> The EC proposal required that parties ‘consider’ available scientific evidence so that their measures are not maintained against sound science.<sup>241</sup> The EC also proposed that in taking SPS measures a party be obliged to conduct a risk assessment, although it did not explicitly use the term. It proposed a balancing approach to this assessment, between allowing the maximum trade opportunities and ensuring the protection of life and health in a broad sense.<sup>242</sup> The Nordic Group proposed that SPS measures should be based on adequate risk assessment procedures, ‘where appropriate’.<sup>243</sup> The Cairns Group was more strongly in support of scientific disciplines, in the form of a risk assessment, on SPS measures.<sup>244</sup> It proposed that SPS measures should be based on verifiable scientific evidence on matters such as risk of entry, establishment or spread of pests and diseases and the potential biological consequences or the risk to human health from excessive contaminants in food. In discussions on the factors that could appropriately be taken into account in a risk assessment, many participants supported the view that economic considerations (such as the impact of the introduction of pests or diseases into the importing country) had to be considered. However, it was emphasised that the effect of import competition on domestic production was not a legitimate consideration.<sup>245</sup> Recognition was also present among negotiators regarding inappropriateness of the strict use of scientific disciplines in situations where the science is not yet conclusive. In discussions in the Working Group it was also observed that sometimes countries need to impose SPS measures in the absence of conclusive scientific evidence. As the ‘precautionary principle’ was at the time not yet at the forefront of discussions on SPS regulation, it was not expressly mentioned in the negotiations on this point. In the discussions, it was proposed that, to deal with the problem of inconclusive science, instead of requiring that SPS measures be based on scientific evidence, they should *not* be maintained *against* scientific evidence.<sup>246</sup>

<sup>240</sup> See for example, Negotiating Group on Agriculture, *Negotiating Group on Agriculture: Submission by Japan*, MTN.GNG/NG5/W/131, circulated on 6 December 1989, para. 2.

<sup>241</sup> Negotiating Group on Agriculture, *Submission of the European Communities on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/146, circulated on 20 December 1989, 2.

<sup>242</sup> *Ibid.* The EC referred to the requirement to assess the appropriate level of SPS protection, instead of the risk. However the elaboration of the factors that must be considered in this assessment shows that it was in fact referring to a risk assessment. The confusion may be due to the fact that in the discussions negotiators used the terms ‘acceptable level of risk’ and ‘acceptable level of protection’ interchangeably.

<sup>243</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Draft Agreement on Sanitary and Phytosanitary Measures: Note by the Nordic Countries*, MTN.GNG/NG5/WGSP/W/21, circulated on 28 May 1990, 8.

<sup>244</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, para. 8.

<sup>245</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Third Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/6, circulated on 17 October 1989, para. 3.

<sup>246</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Seventh Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/22, circulated on 31 May 1990, para. 5. This wording is reflected in the EC and Nordic proposals. Negotiating Group on Agriculture, *Submission of the European Communities on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/146, circulated on 20 December 1989, 2; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Draft Agreement on Sanitary and Phytosanitary Measures: Note by the Nordic Countries*, MTN.GNG/NG5/WGSP/W/21, circulated on 28 May 1990, 8.

The Cairns Group suggested that where verifiable scientific evidence is insufficient, a temporary level of protection be determined on the basis of all available relevant information, and that parties obtain the necessary information for a more objective assessment of the risk and accordingly review their SPS measures within a reasonable period of time.<sup>247</sup> This proposal was not controversial and was taken up almost unchanged in the draft text of the *SPS Agreement*.<sup>248</sup>

Differing views were held on the question of the disciplines that should apply to a country's choice of the appropriate level of protection from SPS risks it wants to ensure on its territory. Some participants were of the view that although the acceptable level of risk was for the importing country to decide, it should be subject to international scrutiny, and must have a rational basis in the effects of the introduction of the pest or disease into the country.<sup>249</sup> The Cairns Group proposed that a country's acceptable level of risk should not be different for the same product from different origins or between domestic and imported products.<sup>250</sup> In addition, it proposed that parties adopt the least stringent level of risk adopted by other parties in similar circumstances.<sup>251</sup> In early discussions in the Working Group, no clear distinction was made between risk assessment and risk management and the terms 'appropriate level of risk' and 'risk assessment' were sometimes used interchangeably.<sup>252</sup> Some participants noted that risk assessment is based not only on sound scientific evidence but also on ethical and political considerations.<sup>253</sup> In later discussions

---

Further, the Nordic group proposed that where scientific evidence is inconclusive, the burden of proof should shift to the exporting country.

<sup>247</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, para. 8.

<sup>248</sup> As noted by Doaa Motaal, if this provision were to be negotiated today, it would be ten times more difficult to reach agreement, due to the scientifically controversial disputes that have been heard at the WTO. Doaa Abdel Motaal, 'The "Multilateral Scientific Consensus" And the World Trade Organisation', *Journal of World Trade* 38 (5), 2004, 855-876, 863.

<sup>249</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Third Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/6, circulated on 17 October 1989, para. 7.

<sup>250</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, para. 9.

<sup>251</sup> *Ibid.* In addition the Cairns group stated that the acceptable level of SPS risk chosen should allow the maximum trade opportunities consistent with the objective, which seems to embody a least-trade-restrictive requirement. Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, para. 7.

<sup>252</sup> For example, in discussions in the Working Group, concerns were raised about misunderstandings regarding the meaning of the terms 'acceptable level of risk' and 'risk assessment' and a preference for using instead the term 'acceptable level of protection' was noted. However, risk assessment does not have the same meaning as the other two terms, since the determination of an acceptable level of protection or of risk is a risk management decision, taken on the basis of a risk assessment and other considerations. Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Sixth Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/18, circulated on 4 May 1990, para. 4; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Seventh Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/22, circulated on 31 May 1990, para. 9.

<sup>253</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Third Meeting of the Working Group on Sanitary and Phytosanitary*

it was suggested that a distinction be made between the evaluation of risk, which could be carried out on a scientific basis, and the acceptable level of risk (or appropriate level of protection), which was a national sovereign decision for each party to decide for itself, subject to the requirement of non-discrimination.<sup>254</sup> Japan emphasised that Parties should maintain the right to opt for a ‘zero-risk’ level of protection.<sup>255</sup> This was disputed by other participants, which noted that zero-risk is ‘virtually impossible and unacceptable’.<sup>256</sup>

Support was present in the proposals of the US, the EC, Japan, the Nordic Countries and the Cairns Group for the inclusion of disciplines regarding the recognition of equivalence of different SPS measures, for cases where harmonisation is not feasible.<sup>257</sup> The US proposal required that SPS measures that are not identical but have the same effect in ensuring an acceptable level of protection be deemed equivalent.<sup>258</sup> Likewise, the EC proposal recommended the development of suitable principles of equivalence to enable countries to meet the appropriate level of protection of an importing country using different SPS measures that achieve similar results.<sup>259</sup> The Cairns Group also proposed the recognition of the principle of equivalence, which it defined as: ‘Different parties may use different regulations, techniques and procedures, which are judged to be equal to the extent that they achieve acceptably similar results including meeting the acceptable level of risk.’<sup>260</sup> It noted that when different possibilities exist for meeting a particular level of protection, a party has the right to choose the approach most suited to its circumstances, provided that it can prove the effectiveness of this approach to the satisfaction of the importing country.<sup>261</sup> The fact that the burden of proof is on the exporting country to provide scientific information to show equivalence was stressed in Japan’s proposal.<sup>262</sup> The Nordic proposal

required that parties, when appropriate, negotiate bilateral and multilateral agreements on mutual recognition of specific SPS measures.<sup>263</sup>

The idea of 'regionalisation', i.e. adaptation of SPS requirements to the specific pest- or disease-status of region of origin of the product, gained wide support in various proposals. The need to adapt SPS regulations to the specific SPS status of particular areas, rather than an entire country, was noted by the EC.<sup>264</sup> The Cairns Group proposal also recommended the recognition of pest- or disease- free areas, as well as areas of low pest- or disease-prevalence, based on factors such as geography, epidemiological surveillance, and SPS control and verifiable by scientific evidence.<sup>265</sup> It stated that the burden of proof that an area is free of a pest or disease (or has low pest/disease prevalence)<sup>266</sup> is on the party in which the area is located, and that importing parties should have the right to check this by inspection or testing.<sup>267</sup> It further noted the role of the international organisations in assisting the establishment and recognition of pest- and disease-free areas by developing criteria for such recognition, maintaining lists of countries that have notified their pest- or disease-free status, and nominating experts to provide scientific advice on pest- or disease-free status and the adequacy of controls in place to maintain such status.<sup>268</sup> A similar detailed proposal on regionalisation is contained in the Nordic proposal.<sup>269</sup>

In addition, the importance of ensuring transparency by means of effective notification procedures was strongly supported by the US, EC and the Cairns Group. The EC and US transparency proposals coupled a prior notification obligation with a framework for consultations on SPS measures, to achieve an early resolution of potential disputes on technical level. Suggestions by the US for these notification and consultation procedures included: the requirement of notification of *draft* SPS measures that could have a significant effect on trade, allowing for a 60-day comment period on such drafts; the creation of a duty on the GATT Secretariat to circulate such notifications, drawing the attention of developing countries to those affecting products of particular interest to them; the obligation to take comments on notified draft measures into account and discuss them upon request; the obligation to establish an enquiry point responsible for notifications and responses to requests for documents and information; a mechanism for consultations on SPS measures with a view to reaching a mutually satisfactory solution, including a pos-

<sup>269</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Draft Agreement on Sanitary and Phytosanitary Measures: Note by the Nordic Countries*, MTN.GNG/NG5/WGSP/W/21, circulated on 28 May 1990, 4-5.

sibility to request good offices from an appropriate individual or body (in particular the CAC, OIE or IPPC).<sup>270</sup> The EC proposal also suggested prior notification of draft new or amended SPS measures that do not conform to international standards, except in cases of urgency, and a minimum consultation period, where requested. It recommended that the notification and consultation procedures of the *Standards Code* be used as a basis, but that *ad hoc* bilateral negotiations on particular SPS issues should be incorporated into these procedures.<sup>271</sup> It saw such negotiations as a way to facilitate trade for example by making differing national measures compatible through the recognition of equivalence of alternative measures, and by creating an opportunity to consider providing technical assistance to developing countries to assist their exports.<sup>272</sup> The Nordic Group supported the creation of a notification system, including prior notification of draft SPS measures limited to ‘essential trade issues’.<sup>273</sup> The Cairns Group proposal on transparency, while supporting ‘a high degree of transparency’,<sup>274</sup> was more modest as it was concerned with reducing costs and avoiding duplication with existing transparency mechanisms. It proposed that all parties be required to maintain a central enquiry point, responsible for providing information, upon request, regarding their SPS legislation, pest- and disease-status, inspection and certification systems, and bilateral or regional *SPS Agreements*.<sup>275</sup> It regarded that further consideration was needed as to whether a system of notification, and in particular prior notification, was necessary.<sup>276</sup>

Another issue that arose in the negotiations was the discipline that should be applied to national procedures for control, inspection and approval. In discussions in the Working Group, it was stressed that even if SPS regulations are harmonised, procedures for inspection, sampling and testing could create trade barriers, and thus needed to be covered by the new disciplines.<sup>277</sup> The Nordic Group’s proposal addressed conformity assessment procedures, setting out disciplines such as national treatment, the avoidance of undue delay, limitation of requirements to what is reasonable and necessary and respect for confidentiality. This proposal relied on those disciplines in this area contained in the *Standards*

<sup>276</sup> *Ibid.*, para. 36. The Cairns group also added the proviso that the transparency obligations should not require a party to disclose confidential information that would impede law enforcement or affect the legitimate commercial interests of particular enterprises. *Ibid.*, para. 37.

<sup>277</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Seventh Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/22, circulated on 31 May 1990, para. 13.

*Code*.<sup>278</sup> The proposed disciplines were included in the Dunkel Draft version of the *SPS Agreement* in Annex C.<sup>279</sup> More problematic, however, were systems requiring prior approval of products before importation. While the *Standards Code* had covered conformity assessment procedures, it did not extend to systems of prior approval of products. Such systems are, in effect, provisional import bans maintained until the safety of the product is proven and are thus not in line with the proposed disciplines requiring that all SPS measures be based on ‘sound science’. The US had complex prior approval systems in place, on federal and state level, for pharmaceuticals and pesticides. It proposed that any Member wishing to challenge such a system be required to first have attempted to obtain approval or certification of their product in accordance with the rules of the system. The only limitations envisaged by the US on such systems were that they use reasonable and science-based procedures and evidentiary standards, and respect the obligation of national treatment.<sup>280</sup> In the October 1990 draft text of the *SPS Agreement*,<sup>281</sup> a bracketed text on prior approval systems is to be found in the main body of the draft Agreement, separate from the remaining disciplines on control, inspection and approval procedures in Annex C of that draft.<sup>282</sup> This bracketed text expressly states the right of Contracting Parties to establish and operate systems for the prior approval or registration of substances that are the subject of SPS measures, but stipulates that such systems must be ‘non-discriminatory, transparent, based on sound science and result in a timely approval or registration decision.’<sup>283</sup> In addition, it stipulates that if an international standard exists for the product, substance or process subject to prior approval and the exporting country complies with this standard, the Contracting Party imposing the system must bear the entire cost of the approval procedure. However, notwithstanding these requirements, in the absence of the required approval, the text provides that the Contracting Party may restrict market access for the relevant product. Continuing disagreement on this issue is evinced by the December 1990 draft text of the Agreement, which included four bracketed alternatives for the provision on prior approval systems of varying strictness.<sup>284</sup> One option was to omit the provision entirely. The second option was to include a provision similar to that in the October 1990 text but omitting the reference to international standards. A third alternative was to include the October 1990 text and elaborate its reference to international standards by prohibiting a market access restriction based solely on the absence of

<sup>284</sup> John M. Breen, ‘Agriculture’, in *The GATT Uruguay Round: A Negotiating History (1986–1992)*, Terence P. Stewart (ed.), vol. IV: The End Game (Kluwer, The Hague/London/Boston), 1999, 41-45, 233-234.

approval if a relevant international standard exists with which the product conforms and nine months have passed since the complete approval application was submitted and the international standard was adopted. The fourth option was to prohibit a restriction of market access based on the fact that an approval procedure had not been completed, unless that procedure was consistent with the disciplines of the *SPS Agreement*. Additionally if a relevant international standard existed, the fourth option would prohibit a market access restriction for products conforming to that international standard for longer than four months from the application for approval, unless the importing Member introduced a 'standard' that differed from the international standard in accordance with the harmonisation disciplines of the Agreement. By the time the Dunkel Draft was issued in 1991, this provision had been removed from the main text of the Agreement and replaced by a short paragraph in Annex C, obliging importing Parties that operate systems for prior approval of food additives or for the establishment of tolerances for contaminants to 'consider' basing market access on a relevant international standard until a final determination is made.<sup>285</sup>

In the negotiations, there was widespread recognition of the particular difficulties faced by developing countries in the field of SPS regulation. The US, EC, the Cairns Group and the Nordic countries all indicated the need for technical assistance and special and differential treatment with regard to developing countries. However, these proposals varied in scope and strength. The US proposal suggested that Parties should evaluate its probable impact on developing countries of the enhanced rules on SPS measures, and if warranted should approach the appropriate international organisations (such as the FAO) for technical assistance to strengthen developing countries' SPS regulatory systems.<sup>286</sup> With regard to special and differential treatment for developing countries, in all agriculture disciplines including SPS, the US proposed that the need for exceptional treatment of a particular less-developed country be demonstrated according to criteria related to its level of agricultural and overall development, and that the flexibility granted to such country be commensurate with the demonstrated needs.<sup>287</sup> The EC proposal agreed that an assessment of the need of developing countries for technical assistance should proceed without delay and noted that proposed rules on transparency and harmonisation would, in themselves, benefit developing countries.<sup>288</sup>

The Cairns proposal went further in calling for phased introduction of new SPS measures, longer time frames for compliance by developing countries and assistance for SPS dispute settlement. Further, in situations where new SPS measures require substantial investments, it called for developed countries to accord additional market access opportunities for the product involved on a most-favoured-nation basis.<sup>289</sup> In addition, it suggested that

compensation, equivalent to the market loss from the SPS measure, be extended to a developing country where SPS measures more stringent than necessary or not supported by scientific evidence were applied to developing-country products.<sup>290</sup> In discussions on this compensation proposal, it was suggested that compensation be used as a follow-up to dispute settlement proceedings, to address lost export opportunities.<sup>291</sup> The Cairns Group proposal stated that parties should actively facilitate the provision of technical assistance to developing countries and other countries that may be in need of such assistance, in the form of advice, credits, donations training and equipment, to adjust and comply with SPS measures on their export markets.<sup>292</sup>

The Nordic countries submitted a detailed and very far-reaching proposal on technical assistance and special and differential treatment for developing countries, based on the provisions contained in the *Standards Code*.<sup>293</sup> However, the Nordic countries made an important point in the introduction to their proposal, stating that perhaps *more important* than special provisions for developing countries was the content of the new disciplines for SPS measures, as this would facilitate trade and minimise conflict to the benefit of all parties, not least the developing countries. The Nordic proposal went on to suggest that an obligation be created on parties to advise other parties, especially developing countries, if requested on the preparation of SPS measures, the establishment of an SPS institutional and legal framework, participation in international standard setting bodies, and compliance with SPS requirements. In addition, an obligation to provide technical assistance on such matters, on mutually agreed terms, was proposed.<sup>294</sup> Extensive provisions on special

<sup>290</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Communication from the Cairns Group*, MTN.GNG/NG5/W/112, circulated on 2 October 1989, paras 13-14; Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, paras 26-28. The call for compensation for the adverse trade effects of SPS measures was already made by the Cairns group in its 1988 proposal. Negotiating Group on Agriculture, *Time for Action. A Proposal for a Framework Approach to Agriculture. Submission by the Cairns Group Comprising Argentina, Australia, Brazil, Canada, Chile, Colombia, Hungary, Indonesia, Malaysia, New Zealand, the Philippines, Thailand and Uruguay*, MTN.GNG/NG5/W/69, circulated on 13 July 1988, para. 22, available at: [http://www.wto.org/gatt\\_docs/English/SULPDF/92050128.pdf](http://www.wto.org/gatt_docs/English/SULPDF/92050128.pdf), visited on 11 May 2008. The compensation proposal is much more limited than the early proposals by developing countries in discussions at the Committee on Trade in Agriculture that SPS measures be regarded as a kind of 'safeguard' measure, for which compensatory adjustment must be made by means of concessions in other areas to a level equivalent to the adverse trade effects of the measure. These early proposals were not limited to illegitimate SPS measures, but saw all SPS measures as requiring compensatory adjustment. Committee on Trade in Agriculture, *Summary of Points Raised at the Meeting of the Committee Held on 2 – 3 April 1985. Note by the Secretariat*, AG/W/13, circulated on 4 September 1985, para. 3.

<sup>291</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Fourth Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/8, circulated on 6 December 1989, para. 3. This suggested compensation possibility would seem to go further than the current possibility in WTO dispute settlement to provide (agreed) compensation for a measure found to be in violation of WTO rules by a panel or the Appellate Body, pending compliance with the ruling. The proposed compensation covers lost export opportunities and would seem therefore to address past damage.

<sup>292</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Communication from the Cairns Group*, MTN.GNG/NG5/W/112, circulated on 2 October 1989, para. 15.

<sup>293</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Technical Assistance to Other Parties and Special and Differential Treatment of Developing Countries. Note by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/14, circulated on 20 April 1990.

<sup>294</sup> *Ibid.*, paras A.1-A.2. The Nordic countries also proposed that priority be given to least-developed countries in providing advice and technical assistance. Negotiating Group on Agriculture, Working Group on

and differential treatment are contained in the Nordic proposal. An obligation to take into account the special development, financial and trade needs of developing countries in the implementation of the new Agreement was proposed. Further, the recognition that developing countries should not be expected to base their SPS measures on international standards which are not appropriate to their development needs was incorporated.<sup>295</sup> The proposal obliges parties to take reasonable measures to ensure that the international standard-setting bodies operate in a way that facilitates active and representative participation by all parties, taking into account the special problems of developing countries, and that these bodies, upon request of developing countries, examine the possibility of, and if possible prepare, international standards of special interest to developing countries.<sup>296</sup> Parties, in this proposal, are obliged to provide technical assistance to developing countries to ensure that SPS measures and testing, inspection and approval procedures do not create unnecessary obstacles to the expansion and diversification of trade of developing countries. The terms and conditions for such assistance must take account of the stage of development of the requesting country, thus recognising the need for differentiation.<sup>297</sup> Implementation problems that developing countries may have are taken into account by providing a possibility for the SPS Committee to grant specified, time-limited exceptions from some or all the obligations of the Agreement, taking into account the particular SPS constraints of the requesting country, its development and trade needs and its stage of technological development.<sup>298</sup>

To ensure the enforcement of the new disciplines, proposals addressed the question of bringing the new Agreement under effective dispute settlement procedures. The need for technical expertise in such procedures was repeatedly raised. The proposal of Austria differed from other proposals in that it suggested that disputes on technical issues be examined by the relevant international organisations, and only if the measure was found to have no sound scientific basis and was not removed in time, a ‘trade-related’ dispute should be brought before a GATT panel.<sup>299</sup> The EC, on the contrary, argued that both technical and legal issues in a dispute should be addressed by a single panel.<sup>300</sup> During the discussion of the Austrian proposal, the CAC, OIE and IPPC pointed out that they had no, or no adequate, dispute settlement system to undertake this task, participants were

<sup>300</sup> Negotiating Group on Agriculture, *Submission of the European Communities on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/146, circulated on 20 December 1989, 3. The EC noted that the separation of technical and legal issues had rendered the dispute settlement procedure under the *Standards Code* unworkable in certain situations.

of the view that it was better to submit SPS disputes to strengthened GATT dispute settlement procedures, using the expertise of the relevant international organisations.<sup>301</sup> In view of the fact that a strengthened and enforceable dispute settlement mechanism was being negotiated at the same time in the Uruguay Round, the Cairns Group proposed that the resolution of SPS disputes be brought under this system.<sup>302</sup> While convergence was achieved on this point, the importance of providing for technical expertise in the settlement of disputes was repeatedly noted. Thus the need to create a possibility for a panel to consult technical experts from the relevant international organisations or independent experts agreed upon by the parties to a dispute, was stressed in all the relevant proposals.<sup>303</sup> However, the Cairns Group clarified the supportive role to be given to international organisations and their scientific experts and the final responsibility to resolve a dispute lay with the panel. It stated:

[A]lthough these organizations may be consulted by GATT dispute settlement panels, the GATT is solely responsible for the conduct of its dispute settlement procedures. Additionally, experts nominated by these organizations would be individuals, known because of their expertise in the relevant field, but would not be representing the organizations.<sup>304</sup>

As stated above, few changes were made to the draft text of the *SPS Agreement* included in the Dunkel Draft in the final stages of the negotiations. However, some limited but crucial changes were needed to secure the agreement of some developed countries.<sup>305</sup> In

---

<sup>301</sup> The CAC pointed out that it had no dispute settlement mechanism, the OIE reported that it was still in the process of developing a dispute settlement procedure for technical disputes and the IPPC noted that although it had dispute settlement procedures in place, these had never been used by its parties, due to the difficulty of reaching agreement on scientific issues. The discussion on this point is reported in Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Fifth Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/13, circulated on 19 March 1990, para. 6. The fact that in the negotiations in the Working Group, most participants preferred bringing SPS disputes under GATT dispute settlement procedures is reported in Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Seventh Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/22, circulated on 31 May 1990, para. 16. This report notes also the concerns raised with regard to the fact that a GATT panel would not be able to judge the scientific value of an SPS measure.

<sup>302</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, paras 38-39.

<sup>303</sup> *Ibid.*, para. 40; Negotiating Group on Agriculture, *Submission of the European Communities on Sanitary and Phytosanitary Regulations and Measures*, MTN.GNG/NG5/W/146, circulated on 20 December 1989, 4; Negotiating Group on Agriculture, *Negotiating Group on Agriculture: Submission by Japan*, MTN.GNG/NG5/W/131, circulated on 6 December 1989, para. 3; Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Dispute Settlement Procedures: Note by the Nordic Delegations*, MTN.GNG/NG5/WGSP/W/11, circulated on 12 February 1990, para. B.4. The Nordic group's proposal outlined a detailed set of rules on a separate dispute settlement mechanism for the *SPS Agreement*.

<sup>304</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Issues: Supplementary Communication from the Cairns Group*, MTN.GNG/NG5/W/164, circulated on 18 April 1990, para. 40.

<sup>305</sup> A side-by-side comparison of the draft text of the *SPS Agreement* in the Dunkel Draft and the final text of the *SPS Agreement* in the Uruguay Round Final Act can be found in John M. Breen, 'Agriculture', in *The GATT Uruguay Round: A Negotiating History (1986-1992)*, Terence P. Stewart (ed.), vol. IV: The End Game (Kluwer, The Hague/London/Boston), 1999, 41-45, Annex 2.

particular, the US raised concerns with the possibility that the draft *SPS Agreement's* harmonisation disciplines could require developed countries to lower their SPS requirements to comply with international standards.<sup>306</sup> This led to some adjustments to the text of the Agreement. For example, in the Preamble, the paragraph stating the desire of Members to further the use of harmonised measures on the basis of international standards was amended by adding the words: 'without requiring Members to change their appropriate level of protection of human, animal or plant life or health'.<sup>307</sup> In addition, a footnote was added to clarify the requirement in Article 3.3 of the *SPS Agreement* of scientific justification for SPS measures more stringent than international standards. It specified that such 'scientific justification' exists 'if on the basis of an examination and evaluation of available scientific information ... a Member determines that the relevant international standards ... are not sufficient to achieve its appropriate level of protection.'<sup>308</sup>

Another last minute change to the Dunkel Draft version of the *SPS Agreement*, also in response to concerns of countries with high levels of protection, was with regard to Article 2.2. The original text of Article 2.2 *inter alia* required SPS measures to be based on scientific principles and not to be maintained against scientific evidence. This was amended by requiring instead that SPS measures not be maintained 'without sufficient scientific evidence' and by the addition of the proviso 'except as provided for in paragraph 7 of Article 5.' Article 5.7 embodies the precautionary principle for purposes of the *SPS Agreement*.<sup>309</sup> Thus, this change to Article 2.2 aims to ensure that the scientific disciplines of Article 2.2 do not undermine the extent to which Parties can take provisional measures in situations where scientific evidence is insufficient.

The emphasis of developed countries on the need for additional flexibility in the risk assessment disciplines in cases where human health is at stake, and the need to respect the right of Members to determine for themselves the level of SPS protection that they deem appropriate in their territories, is reflected in another late amendment to the draft text. The provision that is currently Article 5.3 of the *SPS Agreement* lists certain economic factors that Members must consider when conducting a risk assessment. A change was made to this provision to specify that these economic considerations are only required in the assessment of risks to animal or plant life or health, so *not* in the assessment of risks to human health.<sup>310</sup> In addition, it was amended to omit the requirement that these economic factors be considered by a Member when determining its *level of SPS protection*, and to replace it with the requirement to consider these factors in the *choice of SPS measure* to be applied to achieve the level of protection deemed appropriate by the Member. Similar reasons motivated the change in the initial requirement in Article 5.6 of the *SPS Agreement* that SPS measures be least restrictive to trade, to specify that they must be no more trade restrictive than required to *achieve a Member's appropriate level of protection*. These additional changes secured the agreement of countries with high levels of SPS

<sup>306</sup> These concerns were based on arguments of consumer and environmental lobbies claiming that many SPS measures of developed countries would be inconsistent with the draft *SPS Agreement*. *Ibid.*, 42.

<sup>307</sup> *Ibid.*, 44.

<sup>308</sup> Footnote 2 to Article 3.3 of the *SPS Agreement*. See further below, Part III, Section 4.2.3.

<sup>309</sup> For a discussion of the precautionary principle, see above Part II, Section 1.5. For an analysis of Article 5.7 of the *SPS Agreement* and the extent to which it reflects the precautionary principle, see below, Part III, Sections 3.2.3.2 and 5.2.5.1.

<sup>310</sup> Article 5.6 of the *SPS Agreement* is discussed below, Part III, Section 5.2.4.

protection to the draft text, as they diminished limitations on policy choices made in the exercise of regulatory autonomy.

### 1.2.3 Positions of the developing-country participants

Apart from those developing countries that were members of the Cairns Group at the time of the Uruguay Round negotiations,<sup>311</sup> developing-country participation in the negotiation of the *SPS Agreement* was rather limited. Still, although the group of developing countries in the agriculture negotiations was not as identifiable as the Cairns Group, John Breen reports that they still often ‘spoke with one voice’.<sup>312</sup> This group was led by India, Jamaica and Egypt. Other participants in this group were Morocco, Nigeria, Mexico and Peru. This group of developing countries made statements and actively participated in the discussions in the meetings of the Working Group on Sanitary and Phytosanitary Regulations and Barriers and addressed SPS issues as part of their position papers in the Negotiating Group on Agriculture.<sup>313</sup> Cairns Group members Brazil and Colombia submitted a separate proposal, elaborating on the ideas of the Cairns Group with regard to special and differential treatment for developing countries in agriculture, including in the area of SPS.<sup>314</sup> They also addressed this issue in their individual proposals.<sup>315</sup> On behalf of the least-developed countries, Bangladesh touched upon SPS issues in its agriculture proposal.<sup>316</sup> In addition, Korea, which claimed that despite its industrial strength it had an under-developed agricultural sector, participated as a developing country in these negotiations, calling for special and differential treatment.<sup>317</sup>

<sup>311</sup> Negotiating Group on Agriculture, *Time for Action. A Proposal for a Framework Approach to Agriculture. Submission by the Cairns Group Comprising Argentina, Australia, Brazil, Canada, Chile, Colombia, Hungary, Indonesia, Malaysia, New Zealand, the Philippines, Thailand and Uruguay*, MTN.GNG/NG5/W/69, circulated on 13 July 1988, para. <sup>316</sup> Negotiating Group on Agriculture, *Proposals on Behalf of the Least-Developed Countries. Communication from Bangladesh*, MTN.GNG/NG5/W/126, circulated on 13 November 1989.

<sup>317</sup> Korea pointed to factors such as its overpopulated farmland, small-scale farming, and under-developed infrastructure to support its claim that its agricultural sector was at a very low stage of development. Negotiating Group on Agriculture, *Proposal for Negotiations on Agriculture: Submitted by the Republic of Korea*, MTN.

These developing-country proposals generally emphasised the importance of transparency, harmonisation of SPS measures on the basis of standards set by the international standard-setting bodies as well as technical assistance and special and differential treatment for developing countries.

In the proposal of the Developing Country Group in the agriculture negotiations, submitted by Egypt, Jamaica, Mexico and Peru, and supported by Morocco and Nigeria, the issue of SPS measures briefly addressed.<sup>318</sup> This proposal called for clear rules and disciplines on SPS measures as part of the strengthened GATT disciplines. In addition, it emphasised the importance of improvements in transparency. It proposed that a technical group be convened to identify and analyse those SPS measures that could constitute trade barriers and make recommendations for disciplines on SPS measures, including the possibility for harmonisation and equivalence. However, it expressed concern that ‘the immediate application of international standards may serve as unintended barriers to trade among developing countries.’<sup>319</sup> In addition, the establishment of a programme of technical assistance was recommended. Jamaica submitted a more detailed proposal to further clarify these suggestions. It noted the substantial work done in the CAC, United Nations Economic Commission for Europe (UNECE), OECD and others on SPS trade barriers that could be fruitfully used by a GATT technical group to address the issue. It therefore called for prompt commencement of this work.<sup>320</sup> It again emphasised the importance of special rules on transparency, noting that experience in Jamaica had shown that outdated information on SPS measures was itself an important trade barrier, including between developing countries. It called for a programme of technical assistance and support for developing countries to be defined, to ensure trade expansion, including between developing countries.<sup>321</sup> On behalf of the Developing Country Group, Jamaica submitted another proposal, noting their concern with the fact that the Working Group on Sanitary and Phytosanitary Regulations and Barriers was focusing on long-term action rather than also on short term measures to address SPS barriers to trade. Although they considered long-term action, for example the creation of disciplines on harmonisation and equivalence, necessary, these countries were convinced of the scope for short term measures to increase the transparency of SPS measures and resolve SPS disputes promptly. They therefore proposed the designation of national enquiry points for information on SPS measures, the identification of existing SPS regulations, a prior notification system for draft SPS measures coupled with consultations with major developing-country suppliers, the negotiation of bilateral or multilateral mutual recognition agreements for products

<sup>321</sup> *Ibid.*

of export interest to developing countries, and training courses for developing-country exporters.<sup>322</sup>

Some individual proposals by Developing Country Group members also touched upon SPS issues. An earlier proposal by Jamaica emphasised the need for harmonisation of SPS measures, as far as possible, and their non-discriminatory application. It stated that SPS measures should be subject to clearly defined multilateral disciplines.<sup>323</sup> India, in its proposal for a framework for integrating trade in agriculture into a strengthened GATT regime, called for the reduction or elimination of the trade distortive effect of SPS measures.<sup>324</sup> Nigeria proposed that SPS measures should be harmonised as some of them are ‘deliberately created at variance with relevant provisions of the [GATT]’, but recognized the need for a ‘safety valve for the health of food, plants, animals and the environment’ subject to a non-discrimination requirement.<sup>325</sup> Morocco’s proposal recommended harmonisation of SPS measures and risk assessment methods around international standards set by the CAC, OIE and IPPC. At discussions in the Working Group, Morocco clarified that it proposed that Parties *exclusively* use the methodologies and techniques developed by the OIE and IPPC and the pesticide residue levels established by the CAC.<sup>326</sup> It further stated that technical assistance to developing countries for the elaboration and implementation of SPS regulations should be a ‘central concern’ in the negotiations.<sup>327</sup>

Two developing-country members of the Cairns Group, Brazil and Colombia, submitted very similar individual proposals and a joint proposal addressing their concerns with the impact SPS measures on developing countries. All these proposals called for an elimination of the discriminatory SPS treatment of developing countries.<sup>328</sup> Colombia additionally noted the great importance of establishing procedures for the recognition of pest- and disease free regions.<sup>329</sup> The joint proposal called for the harmonisation of SPS

measures.<sup>330</sup> The remainder of both proposals focused on special and differential treatment of developing countries, proposing longer time frames for compliance with SPS measures for developing countries, and compensation of developing countries for export losses caused by SPS measures applied without scientific basis.<sup>331</sup> In addition, Brazil and Colombia submitted a joint proposal on special and differential treatment clarifying their suggestions further. They pointed out that Parties frequently change their SPS measures, requiring from developing countries considerable resources to adapt to new requirements; and that without sound scientific evidence Parties apply stricter SPS measures to developing-country products than to products from other countries, resulting in a reduction of the market share of developing countries or their exclusion from the relevant market. In such cases they proposed that it should be possible to claim equitable compensation in dispute settlement.<sup>332</sup> This suggestion reflects early discussions at the Negotiating Group on Agriculture, when several comments made by participants called for the creation of a system of compensation for the adverse effects of SPS measures on developing countries.<sup>333</sup>

Similarly, Honduras, El Salvador and Guatemala proposed longer periods for compliance by developing countries with SPS measures and adequate technical assistance to facilitate compliance. In addition, they suggested compensation for any SPS discrimination against developing countries.<sup>334</sup>

Korea's proposals noted the need to harmonise SPS measures with international standards, and to ensure transparency and national treatment in their application.<sup>335</sup> However, it called for recognition of the fact that dietary patterns, natural and ecological condi-

tions and the level of SPS technologies may differ from country to country.<sup>336</sup> It further proposed that technical assistance to developing countries be provided by the GATT Secretariat.<sup>337</sup>

Bangladesh submitted a proposal on behalf of the least-developed countries in which it called in general for special consideration for the needs of least-developed countries including for technical assistance within the framework of any agreement on SPS measures.<sup>338</sup>

In discussions in the Working Group on Sanitary and Phytosanitary Regulations and Barriers, the question was raised whether longer compliance periods would not be counter-productive, even in situations where the nature of the SPS risk involved allowed for phased introduction of SPS measures. It was suggested that the impression would be created among consumers in developed countries that products from developing countries generally are less safe, thus affecting consumer acceptance of these products.<sup>339</sup> The idea that compensation should be provided for the adverse effects of SPS measures was firmly rejected by other negotiators.<sup>340</sup> It was felt that countries have the right to regulate to protect against SPS risks, and should not have to pay to protect their disease-free status.<sup>341</sup> In addition, in response to the suggestion that compensation be provided for in case of panel findings of unjustified SPS measures affecting developing countries, the concern was raised that this would create the risk that such panel reports would be unlikely to be adopted.<sup>342</sup> Instead, it was felt that SPS disputes should not be treated differently from other disputes in this regard.

The lack of capacity of many developing countries to adequately assess risks was raised as a concern when discussing the proposed scientific disciplines at meetings of the Working Group on Sanitary and Phytosanitary Regulations and Barriers. The importance of technical assistance in this regard was emphasised and the role of the international standard-setting bodies in identifying technical assistance needs was noted.<sup>343</sup> In this regard, the

<sup>342</sup> As these discussions took place before the conclusion of negotiations on the new *Dispute Settlement Understanding*, they were based on the prevailing dispute settlement system which required a consensus decision among Contracting Parties for the adoption of a panel report.

<sup>343</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Fifth Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/13, circulated on 19 March

FAO submitted a paper expressing concerns that strict rules requiring sound scientific evidence for regulation would be beyond the compliance capacity of many developing countries, and that very substantial technical assistance would be required.<sup>344</sup> Again, at a later stage of the negotiations, concerns were raised by some participants regarding the proposed requirement of scientific justification for SPS measures. They noted that developing countries seldom used scientific evidence as a basis for national SPS regulation as they often simply copied the SPS requirements of the EC or US in order to gain access to their markets. They therefore argued that at best, such countries could be asked to provide an explanation for the introduction of SPS measures that were more stringent than international standards, but not scientific evidence.<sup>345</sup>

Nevertheless, the disciplines on SPS measures that were the outcome of these negotiations contained rigorous scientific disciplines for SPS measures, including the requirement of scientific justification for measures stricter than international standards. The draft text's provisions on special and differential treatment and technical assistance, by contrast, were either hortatory or embodied 'best endeavour' commitments. No obligation of compensation for adverse trade effects of SPS measures was included. In the last stages of the negotiations, only one change that was made to the draft text of the *SPS Agreement* reflects the interests of developing countries. This change is the extension of the transition period granted to least-developed-country Members to implement the provisions of the *SPS Agreement* from two years to five years.

The lack of broader and more proactive participation from developing countries in the negotiations leading to the drafting of the *SPS Agreement* can be attributed to their limited resources and the wish to focus these resources on participation in those aspects of the Uruguay Round negotiations that they perceived as being most directly relevant to them (such as the negotiations on agriculture and textiles). The technical nature of the negotiations on disciplines on SPS measures may have further discouraged their participation, as they lacked the necessary technical expertise in this area. They were therefore unable to propose detailed regulatory disciplines that reflected their own capabilities and constraints, and that would thus be workable for them both in respect of meeting their commitments under the new Agreement and in respect of being able to use the new rules to gain market access. Instead, they focused on making proposals for special and differential treatment and technical assistance.

However, the new approach of developing countries to trade negotiations in the Uruguay Round, discussed above,<sup>346</sup> was reflected also in their proposals on special and differential treatment in the SPS negotiations. Unlike in past negotiating rounds,<sup>347</sup> in the Uruguay

<sup>345</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Eighth Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/24, circulated on 2 July 1990, para. 7. This meeting report does not specify which participants raised this issue, but from its content it would appear to have been raised by developing-country participants in the Working Group.

<sup>346</sup> See above, Part I, Section 1.6.

<sup>347</sup> Edwini Kessie notes that developing countries' participation in the negotiation of the Tokyo Round Codes

Round developing countries did not insist on special and differential treatment in the form of broad exemptions from negotiated disciplines. Instead, they accepted being bound by wide-ranging obligations, including in areas of behind-the-border regulatory policy. To assist them in complying with these new obligations, they called for more limited forms of special and differential treatment and technical assistance, namely longer timeframes for implementation of their obligations and consideration for their special position, as well as improved technical assistance. However, expectations with regard to special and differential treatment and technical assistance have not been met.<sup>348</sup> As noted by Finger and Schuler:

[T]he developing countries have taken on bound commitments to implement in exchange for unbound commitments of assistance.<sup>349</sup>

In the Uruguay Round, negotiators chose for a ‘single undertaking’<sup>350</sup> approach to the outcome of the negotiations, contained in the *WTO Agreement*<sup>351</sup> and its Annexes.<sup>352</sup> As explained by the Appellate Body in *Brazil – Desiccated Coconut*:

The *WTO Agreement* is fundamentally different from the GATT system which preceded it. The previous system was made up of several agreements, understandings and legal instruments, the most significant of which were the GATT 1947 and the nine Tokyo Round Agreements .... Each of these major

---

was limited to the last stages, where they demanded the inclusion of special and differential treatment provisions in their favour. Thus the general disciplines in the Codes themselves do not reflect developing-country concerns. Instead, the special constraints faced by developing countries in complying with these new rules were to some extent recognized by means of the special and differential treatment provisions in these Codes. Edwini Kwame Kessie, ‘Developing Countries and the World Trade Organization: What Has Changed?’ *World Competition* 22 (2), 1999, 83-110, 91.

<sup>348</sup> As stated by the UNCTAD Secretariat, ‘Since the integration into the [international trading system (ITS)] of developing countries has increasingly involved aligning their policies and standards with those of developed countries, there a number of expectations have been implicit in the participation of developing countries in the ITS: (a) that their development, financial and trade needs and circumstances would be fully ‘integrated’ into the framework of rights and obligations; [and] (b) that adequate international support and assistance, technical and financial, would be readily available, as structural and adjustment support...’ United Nations Conference on Trade and Development, *UNCTAD XI – the Spirit of Sao Paulo*, TD/L.382 (United Nations, Sao Paulo), 17 June 2004, para. 6, available at: [www.unctad.org/en/docs/TDL382\\_en/pdf](http://www.unctad.org/en/docs/TDL382_en/pdf), visited on 1 June 2005.

<sup>349</sup> J. Michael Finger and Philip Schuler, ‘Implementation of Uruguay Round Commitments: The Development Challenge’, *The World Economy* 23 (4), 2000, 511-525, 514.

<sup>350</sup> On the single undertaking approach in the Uruguay Round negotiations, see above, Part I, Section 1.6. See also Gabrielle Marceau and Joel P. Trachtman, ‘GATT, TBT and SPS: A Map of WTO Law of Domestic Regulation of Goods’, in *The WTO Dispute Settlement System 1995-2003*, F. Ortino and Ernst-Ulrich Petersmann (eds.) (Kluwer Law International, Deventer), 2004, 275-340, footnote 5.

<sup>351</sup> ‘Marrakesh Agreement Establishing the World Trade Organization’, in *The Results of the Uruguay Round of Multilateral Trade Negotiations: The Legal Texts* (World Trade Organization, Geneva), 1994, 6-18. The *WTO Agreement* contains the institutional and procedural rules of the WTO.

<sup>352</sup> The substantive rules of the WTO are contained in the four Annexes to the *WTO Agreement*. Annex 1A contains all the multilateral agreements on trade in goods, including the GATT 1994, the *SPS Agreement*, and the *TBT Agreement*; Annex 1B contains the *General Agreement on Trade in Services* (GATS); Annex 1C contains the *Agreement on Trade-Related Aspects of Intellectual Property Rights* (TRIPS Agreement); Annex 2 contains the *Understanding on Rules and Procedures Governing the Settlement of Disputes* (DSU); Annex 3 contains the *Trade Policy Review Mechanism* (TPRM); and Annex 4 contains the plurilateral agreements, the only agreements that are still outside the single undertaking.

agreements was a treaty with different membership, an independent governing body and a separate dispute settlement mechanism. ...

Unlike the previous GATT system, the *WTO Agreement* is a single treaty instrument which was accepted by the WTO Members as a “single undertaking”. Article II:2 of the *WTO Agreement* provides that the Multilateral Trade Agreements in Annexes 1, 2 and 3 are “integral parts” of the *WTO Agreement*, binding on all Members. Annex 1A contains thirteen multilateral agreements relating to trade in goods, including the GATT 1994 which was incorporated by reference into that Annex.

Within this framework, all WTO Members are bound by all the rights and obligations in the *WTO Agreement* and its Annexes 1, 2 and 3.<sup>353</sup>

The ‘single undertaking’ approach therefore meant that all countries wishing to be Members of the newly-established WTO were obliged to sign on to all the multilateral trade agreements. They could not pick and choose among them, as had been the practice in previous rounds.<sup>354</sup> As aptly put by Silvia Ostry with regard to the single undertaking:

The deal was pretty much take it or leave it for the Southern countries. So they took it but, it is safe to say, without a full comprehension of the profoundly transformative implications of this new trading system.<sup>355</sup>

The package of agreements resulting from the Uruguay Round included the *Dispute Settlement Understanding* (DSU), which creates an integrated, strengthened and enforceable dispute settlement system for all disputes arising under any of the ‘covered agreements’. The *SPS Agreement* is among the ‘covered agreements’ and its obligations are therefore enforceable in binding dispute settlement procedures. Consequently, the new rules on SPS measures negotiated in the Uruguay Round and embodied in the *SPS Agreement* have far-reaching implications.

### 1.3 Conclusion

The inadequacy of existing rules, both in the GATT 1947 and in the Tokyo Round *Standards Code*, to deal effectively with trade barriers in the form of SPS measures, as exemplified in the hormones dispute, led GATT Contracting Parties to agree to place this

---

<sup>353</sup> Appellate Body Report, *Brazil – Desiccated Coconut*, 177.

<sup>354</sup> There were only four plurilateral agreements that did not form part of the ‘single undertaking’, namely those on civil aircraft, government procurement, dairy and bovine meat. The latter two have since been terminated.

<sup>355</sup> Sylvia Ostry, ‘The Uruguay Round North-South Grand Bargain: Implications for Future Negotiations’, in *The Political Economy of International Trade Law. Essays in Honor of Robert E. Hudec*, Daniel L. M. Kennedy and James D. Southwick (eds.) (Cambridge University Press, Cambridge), 2002, 285-310, 287. Finger, an economist (previously of the World Bank) who is renowned for his work on trade and development issues, agrees with this evaluation. See J. Michael Finger, ‘The Uruguay Round North-South Bargain: Will the WTO Get over It?’ in *The Political Economy of International Trade Law. Essays in Honor of Robert E. Hudec*, Daniel L. M. Kennedy and James D. Southwick (eds.) (Cambridge University Press, Cambridge), 2002, 301-310, 308.

issue on the agenda for the Uruguay Round negotiations. In particular, it was recognised that the use of SPS measures for protectionist purposes threatened to undermine any gains in the liberalisation of agricultural trade that would be achieved in the negotiations. Strengthened disciplines were therefore negotiated, first in the Negotiating Group on Agriculture, and later in a special body established for purposes of this area of negotiation, the Working Group on Sanitary and Phytosanitary Regulations and Barriers. While initially the idea was to improve the provisions in the GATT and/or the *Standards Code*, in the course of the negotiations the realisation arose that the special character of SPS measures necessitated particular rules. These led to the drafting of a separate agreement, the *Agreement on the Application of Sanitary and Phytosanitary Measure (SPS Agreement)*.

The negotiations on SPS measures were very successful in reaching agreement on new rules. Alone among the various Working Groups negotiating under the auspices of the Negotiating Group on Agriculture, the Working Group on Sanitary and Phytosanitary Regulations and Barriers managed to submit a detailed draft text in November 1990. This text was incorporated into the Dunkel Draft, and eventually, with very few changes, became the final text of the *SPS Agreement*. The success of these negotiations can largely be ascribed to the proactive approach taken by the key participants in the negotiations, in particular the Nordic Group, the Cairns Group, the EC and the US. Detailed texts were proposed at an early stage of the negotiations and common ground emerged on key issues. In particular, the promotion of harmonisation of SPS measures, subject to the possibility to apply stricter requirements, as well as the focus on science as a justificatory tool, were aspects of the new disciplines strongly supported by the main participants in the negotiations.

While some developing countries, particularly those that were part of the Developing Country Group, participated in the SPS negotiations, it may be questioned whether this participation was effective in ensuring that their interests were adequately reflected in the resulting text. As has been seen above, the input of developing countries, aside from those that were part of the Cairns Group, with regard to disciplines on SPS measures was limited to very general proposals for non-discrimination, harmonisation and transparency. The specific form which these disciplines should take was not addressed. While they agreed with the developed countries on the importance of these issues, they sometimes raised concerns in the discussions noting their capacity constraints, particularly with respect to providing scientific justification for deviation from harmonised standards. However, they did not make concrete proposals that would enable their regulatory realities to be reflected in the new rules. This may have been due to the fact that their national SPS regulatory systems were rather rudimentary and they lacked the technical expertise to contribute effectively to the elaboration of regulatory disciplines. Proposals instead focused on the need for special and differential treatment, especially in the form of longer compliance periods, and technical assistance. The possibility of differentiated provision of technical assistance or special and differential treatment, taking into account stage of development of SPS capacity, was not provided for in these proposals. In addition, many proposals called for compensation for the adverse effects of unjustified SPS measures on developing countries.

Consequently, as will be seen from the following discussion of the provisions of the *SPS Agreement*, the final disciplines incorporated into this Agreement closely reflect the more detailed proposals made by the developed countries and the Cairns Group in the Uruguay Round negotiations on SPS issues. As these proposals necessarily embody the concerns of these countries, and mirror their approach to SPS regulation, the disciplines of the *SPS Agreement* can be said to reflect best regulatory practices in developed countries in this area. To the extent that these proposals, especially those of the Cairns Group and the Nordic Group, took account of developing-country constraints, these are taken up, mostly in hortatory terms, in the rules on special and differential treatment and technical assistance in the *SPS Agreement*. Little mention is made in the latter provisions of the specific stage of development, trade interests or SPS regulatory regime of the Member concerned, thus excluding the possibility of differentiation.

The rules of the *SPS Agreement* are binding on all WTO Members as part of the ‘single undertaking’ resulting from the Uruguay Round negotiations. This means that all multilateral WTO agreements apply equally and are binding on all WTO Members. Developing countries can therefore no longer, as many of them did with the Tokyo Round *Standards Code*, opt out of the application of one of these agreements. As a result, developing-country Members are bound, equally with all other WTO Members, to comply with the obligations set out in the *SPS Agreement* and are entitled equally to the rights contained therein. However, unlike the case with obligations on traditional trade barriers such as tariffs and quotas,<sup>356</sup> the impact of obligations on regulatory systems such as those contained in the *SPS Agreement* differs according to the particular situation of a Member. More specifically, the stage of development of a Member, including its economic level, the extent of diversification of its exports and the sophistication of its SPS regulatory regime, plays a role in determining the costs and benefits entailed by the *SPS Agreement* for that Member. This makes a detailed examination of the negotiated provisions of the *SPS Agreement*, as interpreted in the case law, useful in establishing the consequences of these rules for Members at different levels of development.

---

<sup>356</sup> Finger has pointed out that in the case of tariff reductions, even though from a mercantilist perspective such reductions are seen as ‘concessions’, there are positive economic effects for both the giver and the receiver of the reduction in real economic terms and there is therefore no need for a cost-benefit analysis of the negotiation results. On the contrary, there are no assurances that the results of negotiations in the new areas covered by the Uruguay Round, involving disciplines on regulatory policy, will bring benefits to the concession-giver as these new obligations result in significant implementation costs and in many cases the policy changes involved have negative impacts. J. Michael Finger, ‘The Uruguay Round North-South Bargain: Will the WTO Get over It?’ in *The Political Economy of International Trade Law. Essays in Honor of Robert E. Hudec*, Daniel L. M. Kennedy and James D. Southwick (eds.) (Cambridge University Press, Cambridge), 2002, 301-310, 304.

## CHAPTER 2

### Scope of application of the SPS Agreement

The impact of the new disciplines for SPS measures negotiated in the Uruguay Round and contained in the *SPS Agreement* is limited to the situations that are within the ambit of the coverage of this Agreement. Therefore, before examining the substantive provisions of the *SPS Agreement*, it is necessary to determine what falls within the scope of application of this Agreement.

As seen from Chapter 1, the rigorous new disciplines were negotiated in the Uruguay Round to address a particular type of circumstance, involving interaction between two highly sensitive and important policy areas – the protection of human, plant or animal life and health on the one hand, and the liberalisation of agricultural trade, on the other. The new rules attempt to achieve a balance between these two, often conflicting, objectives. As stated in the Preamble to the *SPS Agreement*, WTO Members:

*Reaffirm[ed]* that no Member should be prevented from adopting or enforcing measures necessary to protect human, animal or plant life or health, ... [and]

*Desir[ed]* the establishment of a multilateral framework of rules and disciplines to guide the development, adoption and enforcement of sanitary and phytosanitary measures in order to minimize their negative effects on trade;...<sup>357</sup>

To demarcate the category of situations to which the *SPS Agreement* would apply, and limit it to those involving this particular need for balance, detailed provisions on the coverage of the Agreement were drafted. These provisions, contained in Article 1.1 read together with the definition in Annex A.1, address the substantive scope of application of the *SPS Agreement*. They are discussed in Section 2.1 of this Chapter, in the light of the interpretation given to them in the case law.

A wide array of SPS measures were already in place in WTO Members at the time of coming into force of the *SPS Agreement*. Section 2.2 therefore examines the question whether these pre-existing measures are covered by the *SPS Agreement* and have to be brought into conformity with its provisions. Although this issue was not explicitly addressed in the Agreement itself, it has been subject to an Appellate Body ruling. This decision and its implications are briefly discussed in this Section.

In addition, the fact that SPS regulation is very often in the hands of bodies other than central government was recognised in the drafting of the *SPS Agreement*. To ensure that, as far as possible, the new disciplines would apply to these bodies, a provision on the personal scope of application of the *SPS Agreement* was included. This is contained in Article 13 of the *SPS Agreement*, discussed in Section 2.3 of this Chapter.

The *SPS Agreement* cannot be viewed in isolation. It is part of the indivisible package of agreements resulting from the Uruguay Round negotiations, and is included in the ‘single undertaking’ agreed to by Members of the WTO. Therefore, Section 2.4 proceeds

---

<sup>357</sup> First and fourth preambular statements to the *SPS Agreement*.

to examine the relationship between the *SPS Agreement* and other relevant WTO agreements. In particular, the extent to which the GATT 1994, the *TBT Agreement* and the *Agreement on Agriculture* may be relevant to SPS measures is discussed, by briefly examining the scope of application of these agreements and the rules that apply in case a measure falls within the coverage of more than one agreement. It is also interesting to take note of the other relevant WTO agreements since they establish disciplines on measures that fall outside the scope of application of the *SPS Agreement*. This framework of differing, but complementary, obligations should be borne in mind when examining the *SPS Agreement's* scope of application.

Section 2.5 concludes by discussing the implications of the coverage of the *SPS Agreement* for Members at different levels of development.

## 2.1 Substantive scope of application

The substantive scope of application of the *SPS Agreement* is set out in Article 1.1, which provides that the *SPS Agreement* applies to ‘all sanitary and phytosanitary measures which may, directly or indirectly, affect international trade.’

Thus, as set out by the Panel in *EC Hormones*, two requirements need to be fulfilled for the *SPS Agreement* to apply:

- (i) the measure in dispute is a sanitary or phytosanitary measure; and
- (ii) the measure in dispute may, directly or indirectly, affect international trade.<sup>358</sup>

### 2.1.1 The concept of an SPS measure

Not all measures imposed for the protection of health are SPS measures for purposes of the *SPS Agreement*. The term SPS measure is defined in Annex A, paragraph 1 of the *SPS Agreement*, which provides in relevant part that an SPS measure is:

any measure applied:

- (a) to protect animal or plant life or health within the territory of the Member from risks arising from the entry, establishment or spread of pests, diseases, disease-carrying organisms or disease causing organisms;
- (b) to protect human or animal life or health within the territory of the Member from risks arising from additives, contaminants, toxins or disease-causing organisms in foods, beverages or feedstuffs;
- (c) to protect human life or health within the territory of the Member from risks arising from diseases carried by animals, plants or products thereof, or from the entry, establishment or spread of pests; or
- (d) to prevent or limit other damage within the territory of the Member from the entry, establishment or spread of pests.

---

<sup>358</sup> Panel Report, *EC – Hormones (US)*, para. 8.36; Panel Report, *EC – Hormones (Canada)*, para. 8.39.

Sanitary or phytosanitary measures include all relevant laws, decrees, regulations, requirements and procedures including, *inter alia*, end product criteria; processes and production methods; testing, inspection, certification and approval procedures; quarantine treatments including relevant requirements associated with the transport of animals or plants, or with the materials necessary for their survival during transport; provisions on relevant statistical methods, sampling procedures and methods of risk assessment; and packaging and labelling requirements directly related to food safety.

As correctly identified by the Panel in *EC – Approval and Marketing of Biotech Products*, the *purpose* of the measure, as enumerated in sub-paragraphs (a) to (d), is crucial to the classification of a measure as an SPS measure under this definition. This list is exhaustive, designed to limit the application of the *SPS Agreement* to a specific category of measures, broadly speaking those that aim to protect human, animal or plant life or health, or the territory of a Member, from specified risks in *food or feed* or risks from *pests or diseases*. More specifically, the *SPS Agreement* applies to measures aimed to protect *human* or *animal* life or health from risks in food or feed (from additives, contaminants, toxins or disease-causing organisms); measures aimed to protect *animal* or *plant* life or health from risks from pests, diseases or disease-carrying or disease-causing organisms; measures aimed to protect *human* health from risks from pests or diseases carried by plants or animals;<sup>359</sup> and measures aimed to prevent or limit *other damage* to the territory of a Member from the entry, establishment or spread of pests. Footnote 4 to Annex A clarifies that the term ‘pests’ include weeds and the term ‘contaminants’ includes residues of pesticides and veterinary drugs and extraneous matter. Measures to address other health risks, such as risks from cigarettes, toxic plastics or asbestos fibres, are thus not covered by the *SPS Agreement*.

While implicit in the definition of an SPS measure is a focus on regulations affecting plants, animals and their products (including processed products such as food, feed and beverages), rather than industrial products (such as pesticides, cigarettes and asbestos) no express limitation on the product coverage of the *SPS Agreement* is stated in this definition. Instead, there is only a clarification which indicates that the product coverage is *not* limited to agricultural products as defined for purposes of the *Agreement on Agriculture*. To give effect to the concern of negotiators to ensure that the new disciplines should include products of fisheries and forestry as well as natural fauna and flora, footnote 4 to the Annex A definitions specifies that in these definitions ‘animal’ includes fish and wild fauna, and ‘plant’ includes forests and wild flora. The extension of the product coverage to more than purely agricultural products reflects the realisation of negotiators that measures to protect the wild plants and animals can, as much as measures to protect crops and farm animals, affect agricultural trade.

The definition’s focus on the *purpose* of the relevant measure, reflected in the words ‘applied to protect’ or ‘applied to prevent’, makes the determination of such purpose the key

---

<sup>359</sup> Infectious diseases carried by animals that can be transferred to humans are known as zoonoses. Examples of zoonoses are Creutzfeldt-Jakob disease that can be contracted by consuming meat of cattle infected with bovine spongiform encephalopathy (BSE), and highly-pathogenic H5N1 avian influenza (bird flu) that can be transferred from birds to humans through extensive contact with infected birds.

to the applicability of the *SPS Agreement*. These words, at first sight, would seem to leave open the possibility that the applicability of the *SPS Agreement* could be dependent on the purpose ascribed to the measure by the Member using it, in other words, on the subjective intent of the Member.<sup>360</sup> If this were the case, a Member could avoid the application of the agreement by denying that the purpose of its measure is one of those falling within the Annex A.1 definition. This would be a strange result.<sup>361</sup> A better interpretation of the definition of SPS measures would be to determine the regulatory goal by looking at the measure itself (for example, at the legislative text) and surrounding circumstances, rather than trying to determine the subjective intent of the regulating Member. This approach would introduce more objectivity into the determination of the aim of the measure for purposes of the application of the *SPS Agreement*.<sup>362</sup> It would also be in line with case law under the GATT 1994 where the purpose of a measure is determined by examining its design, structure and architecture rather than by trying to ascertain the subjective intent of the Member.<sup>363</sup>

In *Australia – Salmon*, the Panel examined whether an Australian ban on imports of dead salmon fell within the definition of an SPS measure under Annex A, paragraph 1(a), or Annex A, paragraph 1(b), as claimed by Australia. Although in either case the *SPS Agreement* would apply, the classification of the measure as one aimed at risks from food or feed or as one aimed at risks from pests or diseases is important because, as will be discussed later,<sup>364</sup> the type of risk assessment required in each of these two cases differs. The Panel did not rely purely on Australia's statement of the regulatory objectives of its measure, but examined the legislation at issue and other relevant documents to find:

<sup>360</sup> Dale E. McNeil, 'The First Case under the WTO's Sanitary and Phytosanitary Agreement: The European Union's Hormone Ban', *Virginia Journal of International Law* 39, 1998, 89-134, 112.

<sup>361</sup> Dale McNeil speculates on whether, if the EC had justified its ban on hormone-treated meat in *EC – Hormones* on legitimate grounds other than the protection of public health, such as the harmonisation of regulations within the EC or consumer concerns, it could then have argued that the *SPS Agreement* did not apply. In this particular case it would have been difficult for the EC to support this argument since it had justified its hormones regime on health grounds for the past 15 years and had established a Scientific Working Group to determine whether the use of the relevant hormones for growth purposes created a threat for human health. McNeil argues that in such a case a Member would be estopped from denying that the purpose of its measure is the protection of health. *Ibid.*, 115.

<sup>362</sup> On the issue of a subjective versus objective test of regulatory purpose, see Joost Pauwelyn, 'The WTO Agreement on Sanitary and Phytosanitary (SPS) Measures as Applied in the First Three SPS Disputes: *EC – Hormones, Australia–Salmon and Japan–Varietals*', *Journal of International Economic Law* 2 (4), 1999, 641-664, 641.

<sup>363</sup> In *Japan – Alcoholic Beverages II*, when addressing the purpose or objective of a measure (in the context of a determination whether a tax measure was applied 'so as to afford protection' under Article III:2 of the GATT 1994), the Appellate Body held that 'although it is true that the aim of a measure may not be easily ascertained, nevertheless its protective application can most often be discerned from the design, the architecture, and the revealing structure of a measure.' Appellate Body Report, *Japan – Alcoholic Beverages II*, 29. See also Appellate Body Report, *Chile – Alcoholic Beverages*, paras 62 and 71-72; Appellate Body Report, *US – Offset Act (Byrd Amendment)*, para. 259; Panel Report, *Canada – Periodicals*, para. 5.38; Panel Report, *Korea – Alcoholic Beverages*, para. 10.101. In *Brazil – Retreaded Tyres*, in determining whether Brazil's ban on imports of retreaded tyres fell under Article XX(b), the Panel noted that the design of the measure was 'consistent with Brazil's declared objective of reducing the further accumulation of waste tyres in its territory by avoiding the importation of short-lifespan tyres.' Panel Report, *Brazil – Retreaded Tyres*, para. 7.331.

<sup>364</sup> See below, Part III, Section 5.1.1.

In the circumstances at hand, we consider that the definition of a “sanitary measure” in paragraph 1(a) encompasses the coverage sought by Australia under the definition in paragraph 1(b). The definition in paragraph 1(a) deals with risks arising from “the entry, establishment or spread of pests, diseases ... or disease-causing organisms” in general. In the context of disease-causing organisms, the definition in paragraph 1(b) is limited in the sense that it only addresses risks arising from “disease-causing organisms in foods, beverages or feedstuffs” (hereafter also referred to as food-borne risks). We are of the view that, even though both definitions of a “sanitary measure” invoked by Australia might be applicable to the measure in dispute, the objectives for which that measure is being applied are more appropriately covered by the definition in paragraph 1(a). These objectives have been clearly expressed by Australia on several occasions.<sup>365</sup>

It therefore appears that the Panel conducted an objective examination of the aims of the measure as stated in the legislative text to determine whether the measure fell within the definition in Annex A.1(a) or that in Annex A.1(b) of the *SPS Agreement*.<sup>366</sup> It referred to the subjective intent as expressed by the regulating Member only to support its conclusion. This approach has been followed by the Panel in *US – Continued Suspension* and *Canada – Continued Suspension*, which examined the stated purpose of the EC ban on hormone-treated meat, as set out in the relevant directive, and concluded that this measure fell within the definition of an SPS measure in Annex A.1(b).<sup>367</sup>

In *EC – Approval and Marketing of Biotech Products*, the Panel went further in its scrutiny to determine the purpose of the measure at issue. While it began its examination by looking at the stated objectives of the EC legislation at issue,<sup>368</sup> it then proceeded to verify that this was indeed the objective of the measure by determining whether there

<sup>365</sup> Panel Report, *Australia – Salmon*, para. 8.34.

<sup>366</sup> As pointed out by Scott, the examination of the Panel did not go beyond the stated objectives in the language of the relevant texts, ‘but it did at least seek to ensure that scrutiny would proceed on the basis of the measures’ stated objectives, rather than on the basis of expedient governmental whim.’ Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 17.

<sup>367</sup> Panel Report, *US – Continued Suspension*, paras 7.431-7.432; Panel Report, *Canada – Continued Suspension*, paras 7.421-7.422. EC Directive 2003/74/EC stated, in Article 1 thereof, that the purpose of the ban on the six hormones at issue was to prevent meat and meat products from cattle treated with such hormones for growth promotion purposes from being placed on the EC market. The Panel recalled the finding in *EC – Approval and Marketing of Biotech Products* that a substance which a human being or an animal consumes for nutritional reasons may be classified as a ‘food’ and notes that ‘contaminants’ are defined in the footnote to Annex A as including veterinary drug residues, such as the residues of the hormones subject to the EC ban.

<sup>368</sup> The Panel examined the EC legislation relevant to the approval of biotech products, namely Directives 90/220 and 2001/18, the stated objective of which is the protection of human health and the environment from the adverse effects that might arise from the deliberate release into the environment or the placing on the market of genetically modified organisms. While the Directives do not specifically set out which risks for human health or the environment they aim at, the Panel identified a series of such risks from their provisions on information requirements and risk assessment coverage. It found that all the risks aimed at by the Directives were covered by one or more sub-paragraphs of Annex A.1. With regard to Regulation 258/97, the Panel noted that it had three stated purposes, namely, to prevent novel foods and food ingredients (which include foods and food ingredients containing or consisting of GMOs and those produced from, but not containing, GMOs) from presenting a danger to the consumer, misleading the consumer, and being nutritionally disadvantageous to the consumer. It found the first purpose to fall under Annex A.1(b), but the other two purposes not to be covered by any of the sub-paragraphs of Annex A.1.

was a ‘rational relationship’ between the measure and its stated objective.<sup>369</sup> Similarly, in its examination of the bans applied by certain EC Member States to biotech products that had been approved at EC level (known as safeguard measures) the Panel noted that nothing in the *SPS Agreement* would ‘bar a panel from considering purposes which were not articulated by the member States when they adopted their safeguard measures’.<sup>370</sup> At the same time, it clarified that this did not mean it had to ‘accept at face value assertions of purposes which are implausible in the light of all relevant circumstances’.<sup>371</sup> The Panel referred to the Appellate Body’s findings in *Japan – Alcoholic Beverages II*,<sup>372</sup> to state:

[O]ur approach is consistent with the view expressed by the Appellate Body that in identifying the purposes of a measure, panels need not seek to determine the subjective intent of the legislators or regulators who adopted the measure. According to the Appellate Body, the purposes of a measure may and should rather be ascertained on the basis of objective considerations, for instance by examining whether there is an objective relationship between the stated purposes and the text and structural features of the relevant measure.<sup>373</sup>

After objectively establishing the purpose of a measure, a Panel must determine whether this purpose falls within the definition of Annex A.1. In order to do so, the panel has to examine, and possibly clarify, the list of relevant purposes contained in sub-paragraphs (a) to (d) of Annex A.1 since this list demarcates the scope of application of the *SPS Agreement*.

The first time a panel was confronted with the need to clarify the meaning of sub-paragraphs (a) to (d) was in *EC – Approval and Marketing of Biotech Products*, as in previous cases the purposes of the contested measures clearly fell within the terms of one or more of these sub-paragraphs.<sup>374</sup> In this dispute, the EC had claimed that the issues arising out of the existence of biotech products and addressed in its approval legislation went ‘beyond the risks envisaged and regulated by the *SPS Agreement*’.<sup>375</sup> Therefore it argued that the *SPS Agreement* was relevant to only some issues assessed by EC authorities in the course of approval procedures for biotech products, whereas others fell outside the scope of the Agreement.<sup>376</sup> The Panel was faced with the task of examining whether all the various objectives of the EC legislation at issue fell within the purposes listed in

<sup>369</sup> The Panel stated that where a measure is rationally related to its stated purpose, a panel ‘may and should presume that the requirement is intended to serve the purpose articulated in the Directive.’ Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.385.

<sup>370</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2558.

<sup>371</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, footnote 1691.

<sup>372</sup> These findings are cited above in this Section, note 7.

<sup>373</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2558.

<sup>374</sup> Although, as stated above, the Panel in *Australia – Salmon* had to determine whether Australia’s measure fell under sub-paragraph (a) or sub-paragraph (b) of Annex A.1, as this measure aimed at preventing the introduction of fish diseases by disease-carrying organisms, it fell squarely within the terms of sub-paragraph (a). Therefore the Panel did not need to clarify the wording used in the relevant subparagraphs.

<sup>375</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.185.

<sup>376</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.186. The EC argued, for example, that a biotech product is not infected nor is it an infection; therefore it cannot be ‘a disease’. Neither is a biotech product a ‘disease-carrying organism’ or a ‘pest’. Further, it claimed that biotech seeds destined to be planted cannot be considered as ‘food’ or ‘feed’. Similarly, a biotech crop that is intended to be processed into food or feed is not in itself ‘food’ or ‘feed’.

sub-paragraphs (a) to (d) of the definition of an ‘SPS measure’.<sup>377</sup> Its interpretation of the coverage of these sub-paragraphs was so wide, however, that the scope of application of the *SPS Agreement* is thereby significantly extended.<sup>378</sup>

To name but a few examples, the Panel considered that in sub-paragraph (a) the term ‘animal or plant life of health’ includes non-target micro-organisms;<sup>379</sup> the term ‘establishment or spread of pests’ includes risks of the development of resistance in already existing target pests;<sup>380</sup> and the term ‘pests’ includes cultivated GM plants if they are growing where they are undesired, cross-breeds that result from unintentional gene-flow between GM plants and other plants if they have undesired introduced traits, and pesticide-resistant target or non-target organisms that result from exposure to pesticide-producing GM plants.<sup>381</sup> Similarly, in sub-paragraph (b) the Panel regarded the term ‘food, beverages or feedstuffs’ as including GM crops not intended to be eaten by humans or animals but nevertheless consumed by them, as well as GM plants that are not eaten as such but are processed into food or feed;<sup>382</sup> the word ‘additives’ as encompassing genes intentionally added for technological purposes to a GM plant that is eventually eaten or processed into food;<sup>383</sup> and the term ‘contaminants’ as including proteins produced by GM plants through the unintended expression of modified genes.<sup>384</sup> With regard to sub-paragraph (c),

---

<sup>377</sup> The methodology of the Panel in its examination on this point is rather unexpected. Instead of examining whether the various purposes of the measures at issue that it had identified fell within sub-paragraphs (a) to (d) of Annex A.1, the Panel examined the meaning of each of the sub-paragraphs to determine whether their meaning could cover the various risks addressed at by the legislation at issue. Christiane R. Conrad, *PPMs, the EC–Biotech Dispute and Applicability of the SPS Agreement: Are the Panel’s Findings Built on Shaky Ground?*, Research Paper No. 8-06 (International Law Forum of the Hebrew University of Jerusalem, Jerusalem), August 2006, 17, available at: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=920742#PaperDownload](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=920742#PaperDownload), visited on 12 May 2008.

<sup>378</sup> See further in this respect, Jacqueline Peel, ‘A GMO by Any Other Name ... Might Be an SPS Risk! Implications of Expanding the Scope of the WTO Sanitary and Phytosanitary Measures Agreement’, *European Journal of International Law* 17 (5), 2006, 1009-1031; Christiane R. Conrad, *PPMs, the EC–Biotech Dispute and Applicability of the SPS Agreement: Are the Panel’s Findings Built on Shaky Ground?*, Research Paper No. 8-06 (International Law Forum of the Hebrew University of Jerusalem, Jerusalem), August 2006, available at: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=920742#PaperDownload](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=920742#PaperDownload), visited on 12 May 2008.

<sup>379</sup> The EC had argued that GMOs could affect ecosystems without affecting animals or plants by affecting micro-organisms in soil or water that are specialised in biophysical or biochemical processes. The Panel considered that the fact that a footnote to Annex A.1 clarifies that the words ‘animal’ and ‘plant’ include wild fauna and wild flora indicates that the phrase ‘animal or plant life or health’ is intended to be comprehensive in coverage, encompassing micro-organisms and non-target organisms. Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.219-7.220.

<sup>380</sup> The Panel considered that the development of resistance could lead to the existing pest becoming established or spreading to new areas. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.232.

<sup>381</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.241 and 7.244.

<sup>382</sup> The EC had argued that food and beverages are things intentionally ingested by humans for nutritional purposes, and a feedstuff is something animals are intentionally permitted to ingest for nutritional purposes. The Panel, instead, held that a GM crop not grown as food for animals but which is nevertheless eaten by animals (including wild animals), or the pollen of which is consumed by insects, can be considered to be feedstuff. Further, it held that GM seeds intended for sowing that are spilt and eaten by birds are also animal feedstuff. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.292.

<sup>383</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.295-7.301.

<sup>384</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.313.

the Panel regarded ‘pests’ as covering intentionally cultivated allergenic GM plants that have already been harvested.<sup>385</sup>

Particularly controversial is the Panel’s finding that measures aimed at environmental protection, other than plant or animal life or health, are included in the definition of Annex 1.A.<sup>386</sup> The EC had argued that those aspects of its measures dealing with the effects of biotech products on the non-living components of the environment, such as biogeochemistry, carbon and nitrogen recycling, soil micro-organisms etc., fell outside the scope of the *SPS Agreement*. It pointed to the negotiating history of the *SPS Agreement* where discussions took place on whether to include environmental protection measures under the definition of an ‘SPS measure’, the outcome of which was the omission of the proposed text expressly including such measures.<sup>387</sup> According to the EC, this indicates that measures to address environmental damage *per se* do not fall within the scope of the *SPS Agreement*.<sup>388</sup> The Panel interpreted ‘other damage’ in sub-paragraph (d) as a very broad, residual category, which could include not only economic damage or damage to property, but also damage to the non-living components of the environment (i.e. damage other than to the life or health of plants or animals) encompassing adverse effects on biodiversity, population dynamics of species or geochemical cycles.<sup>389</sup>

In coming to its broad interpretations of sub-paragraphs (a) to (d), the Panel often went beyond the internationally-agreed upon definitions of the pertinent terms developed by the relevant international standard-setting bodies referred to in the *SPS Agreement*.<sup>390</sup> It

<sup>385</sup> At issue here was the potential of GM plants to produce allergenic effects other than as foods, for example in persons working with or otherwise coming into contact with GMOs. The Panel found that pests need not be living, so that GM plants that cause harmful effects in persons handling them during harvesting, transport or processing, can be regarded as pests. Panel Reports, *EC – Approval and Marketing of Biotech Products* para. 7.351.

<sup>386</sup> With regard to environmental measures that do, even if indirectly, protect plant or animal life or health as part of their purpose of protecting the environment (such as measures to protect biogeochemical cycles in the soil and thereby prevent threats to soil micro-organisms or measures to protect genetic diversity), the Panel held that these are covered by sub-paragraphs (a) or (b) which address measures to protect animal or plant life of health.

<sup>387</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products* para. 7.199.

<sup>388</sup> According to the EC, those opposed to the inclusion of environmental measures under the coverage of the *SPS Agreement* stressed that the rules on SPS measures would not necessarily be appropriate to deal with environmental risks as the latter were of a different nature than SPS risks. Here the EC referred to Negotiating Group on Agriculture, *Report of the Chairman of the Working Group on Sanitary and Phytosanitary Regulations and Barriers*, MTN.GNG/NG5/WGSP/6, circulated on 15 October 1990. This report notes that an area where distinct differences in views remained was whether measures for the protection of, *inter alia*, the environment be defined as SPS measures and be disciplined under the new agreement. The EC also referred to a GATT Secretariat background note of 16 April 1993, that stated with regard to the draft *SPS Agreement* that: ‘Measures for environmental protection, per se, or to protect the *European Communities – Measures Affecting the Approval and Marketing of Biotech Products. Second Written Submission by the European Communities*, (Geneva), 19 July 2004, para. 58 and footnotes 34-35, available at: <http://brode-info.ccc.eu.int/doclib/html/121611.htm>, visited on 14 July 2005.

<sup>389</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products* para. 7.369-7.373.

<sup>390</sup> For example, the Panel found the IPPC definition of a pest as something ‘injurious’ to other plants to be informative but not dispositive of the meaning and scope of the term ‘pest’ used in the *SPS Agreement*. Instead, it preferred to refer to the dictionary meaning of pest to find that the term includes not only an animal/plant that causes harm to the life or health of humans, animals or plants or causes other damage, but also ‘a troublesome or annoying animal or plant’. This allowed the Panel to find that a biotech plant that is merely growing where it is undesired is a ‘pest’. Panel Reports, *EC – Approval and Marketing of Biotech Products*

also did not seem to follow the general rule of treaty interpretation codified in Article 31 of the *Vienna Convention on the Law of Treaties*,<sup>391</sup> which requires that the words of a treaty be interpreted according to the ordinary meaning of the words used, in their context and in the light of the object and purpose of the treaty. While relying extensively on dictionary definitions, the meaning given by the Panel to the terms of sub-paragraphs (a) to (d) seems exceedingly strained and inappropriate. The Panel did not seem to take into account the context of provisions examined. Had it done so, one would have expected it to consider the scope of application of the *SPS Agreement* in the context of the other WTO agreements, in particular the *TBT Agreement* and the GATT 1994, within whose scope of application some aspects of the EC measure more appropriately fall.<sup>392</sup> In this regard, the Panel did not explain the implications of the fact that the *TBT Agreement* expressly mentions environmental protection as a legitimate objective that may be pursued by measures under its coverage,<sup>393</sup> for the applicability of the *SPS Agreement* to environmental measures.<sup>394</sup> Further, the object and purpose of the *SPS Agreement* as reflected in its Preamble is to respect the right of Members to take measures to protect human, animal or plant life or health while subjecting such measures to disciplines to minimise their negative trade effects. One cannot reasonably argue that it is in accordance with the object and purpose of the *SPS Agreement* to subject to its disciplines measures aimed at preventing, for example, changes to carbon and nitrogen recycling in the soil due to the presence of transgenes; or changes to genetic diversity in the population of species due to alterations in the competitive advantage of particular plants. Indeed, one may wonder if this extensive interpretation is appropriate, as it results in broadening the application of the exacting disciplines of the *SPS Agreement* to a range of situations quite far removed from those covered by the ordinary meaning of the words used, in their context, in the light of the object and purpose of the Agreement.

Aside from the stretching of the meaning of the terms in sub-paragraphs (a) to (d), the Panel further expanded the coverage of these sub-paragraphs by establishing a criterion of a 'rational relationship' between the measure at issue and one of the enumerated purposes in the sub-paragraphs i.e. the risk to be averted. For example, in deciding whether

---

para. 7.238-7.241. For other examples of a similar disregard by the Panel for definitions developed by the international standard-setting bodies of terms that are used in Annex A.1 of the *SPS Agreement*, see *ibid.*, paras 7.301, 7.277 and 7.313. See further on the Panel's use of international standard reference sources in its interpretation, below, Part IV, Section 2.2.4.

<sup>391</sup> *Vienna Convention on the Law of Treaties*, concluded in Vienna on 23 May 1969, U.N. Doc A/CONF.39/27 (1969), 8 I.L.M. 679. Articles 31 and 32 of this convention, which set out the rules of treaty interpretation, are regarded as having attained the status of customary international law. Article 3.2 of the DSU provides that the WTO dispute settlement system serves to clarify the provisions of the covered agreements 'in accordance with customary rules of interpretation of public international law.' It is established case law that this provision refers to Articles 31 and 32 of the *Vienna Convention*. Appellate Body Report, *US – Gasoline*, 16; Appellate Body Report, *Japan – Alcoholic Beverages II*, 104.

<sup>392</sup> On the scope of application of the *TBT Agreement* and the GATT 1994, and their relationship with the *SPS Agreement* see below, Part III, Sections 2.4.1 and 2.4.2.

<sup>393</sup> Article 2.2 of the *TBT Agreement*. The coverage of the *TBT Agreement* is not defined according to the purpose of the measures at issue, but rather according to their form (as technical regulations, standards or conformity assessment procedures).

<sup>394</sup> The Panel merely stated in response to the EC's argument on this point that this reference to environment in the *TBT Agreement* did not preclude it from interpreting the term 'other damage' in sub-paragraph (d) to include damage to the environment other than damage to the life or health of plants and animals. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.209.

the EC approval legislation applicable to biotech products could be seen as preventing harm to human, animal or plant life or health from ‘pests’ under Annex A.1(a), (c) or (d), the Panel did not find it necessary to decide if biotech plants are ‘pests’. Instead, it found that cross breeds resulting from unintentional gene transfer from biotech plants to non-biotech plants could be regarded as ‘pests’ to the extent that they have undesired introduced traits (such as herbicide- or pesticide-resistance).<sup>395</sup> Recognising that the EC legislation at issue was concerned with biotech products rather than their cross breeds, the Panel found that it is not necessary for the product subject to the SPS measure at issue (for example the biotech plant) to be itself the pest that gives rise to the SPS risk which the measure aims to protect against (e.g. the risk of establishment of cross-breeds with herbicide resistance). Instead, it is sufficient if there is a ‘rational relationship’ between the measure (e.g. controlling the release into the environment of biotech plants that might cross breed) and the purpose of protecting human, animal or plant life or health from the risk of establishment or spread of pests (*in casu* the cross breed with undesired traits).<sup>396</sup> According to the Panel:

[T]he phrase “arising from” in Annex A(1) is broad and unqualified. There is nothing in Annex A(1)(a) which indicates that potential risks to animal or plant life or health must necessarily be the direct or immediate result of, *e.g.*, the spread of a pest. Notably, Annex A(1) does not say that only risks “arising directly and immediately from”, *e.g.*, the spread of a pest, are covered. We therefore do not consider that measures taken to protect animal or plant life or health from risks that arise indirectly or in the longer term from pests, diseases, disease-carrying organisms or disease-causing organisms fall outside the scope of Annex A(1) (a). Accordingly, the reference in Annex II of Directive 2001/18 to indirect and delayed adverse effects does not, by itself, remove that Directive from the scope of Annex A(1)(a).<sup>397</sup>

In so doing, the Panel read the words ‘directly or indirectly’ into the list of purposes in Annex A.1, so that measures that have the *indirect* effect of preventing a risk that falls under the list of purposes in sub-paragraphs (a) to (d), are also covered by the disciplines of

<sup>395</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.255.

<sup>396</sup> *Ibid.*, para. 7.258. The Panel made a similar finding with regard to the situation where pesticide-producing biotech plants lead to the development of pesticide resistance in target and non-target organisms (i.e. insect populations). Although the approval legislation governs biotech plants, not pesticide resistant insects, the Panel held that there was a ‘rational relationship’ between controlling the release into the environment of biotech plants and protecting animal or plant life or health from risks arising indirectly from the entry, establishment or spread of pests (*in casu* the pesticide resistant insects). *Ibid.*, para. 7.265. Similar ‘rational relationships’ were found to exist between the approval legislation and other ‘indirect effects’ of biotech plants (*inter alia*, changes in pesticide-use practices and the establishment of antibiotic resistance in pathogens). For these and other examples, see *ibid.*, paras 7.275, 7.284, 7.359. For a critical discussion of the Panel’s ‘rational relationship’ test with regard to the purpose of SPS measures, see Christiane R. Conrad, *PPMs, the EC–Biotech Dispute and Applicability of the SPS Agreement: Are the Panel’s Findings Built on Shaky Ground?*, Research Paper No. 8-06 (International Law Forum of the Hebrew University of Jerusalem, Jerusalem), August 2006, 11-14, available at: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=920742#PaperDownload](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=920742#PaperDownload), visited on 12 May 2008. See also Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 15.

<sup>397</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products* para. 7.226.

the *SPS Agreement*.<sup>398</sup> While it is clear that the product regulated by an SPS measure need not be itself the ‘contaminant’, ‘pest’ or ‘disease’ which the measure aims to prevent (for example, an import ban on mangoes may aim to prevent the introduction of fruit flies), one would expect that there should at least be a close link between the measure and one of the enumerated purposes in order for the measure to be an ‘SPS measure’. If a panel is willing to travel far enough down the chain of causality, as the Panel in this case was prepared to do, it is likely to find a risk that is indeed within those listed in sub-paragraphs (a) to (d).<sup>399</sup> This however, does not mean that the measure at issue was ‘applied to protect’ against such a risk.

The extension of the scope of application of the *SPS Agreement* to measures aimed at purposes that are arguably not those it was drafted to cover, has far-reaching consequences. As pointed out by Doaa Motaal, and supported by the negotiating history of the *SPS Agreement*, the *SPS Agreement* is ‘intended to deal with a limited set of measures’.<sup>400</sup> It is this limited scope of application that enabled Members to agree to the inclusion of strict scientific disciplines.<sup>401</sup> SPS measures, in the classical sense, most often directly regulate food or agricultural products, thus accounting for the need for strong disciplines to prevent protectionist abuses. Other measures, aimed at broader concerns such as biodiversity and other environmental issues, in many cases have only incidental effects on trade in agricultural products. In addition, such other measures embody societal values of a different nature than those reflected in ‘SPS measures’ as traditionally understood. Whereas SPS measures address health protection at national level, environmental measures often address harm which has a long-lasting global impact.<sup>402</sup> Further, the appropriateness of the scientific disciplines of the *SPS Agreement* for the evaluation of environmental regulation is exceedingly doubtful. As convincingly argued by Jacqueline Peel, in contrast to the strong reliance in SPS regimes on a scientific basis for regulation, ‘environmental

---

<sup>398</sup> The duty of a treaty interpreter is to interpret and apply the words actually used in the treaty, not the words it believes should have been used. A panel is therefore not permitted to read words into an agreement that were not used. On this issue see Appellate Body Report, *EC – Hormones*, para. 181 and Appellate Body Report, *India – Patents (US)*, paras 46-47. See further below, in this Section, note 67.

<sup>399</sup> Conrad argues that this approach of the Panel ‘seems to qualify all trade-related environmental measures as SPS measures, since hypothetically, [e]ffects on the environment can easily result at some point in diseases, and certainly environmental regulations intend to prevent those.’ Christiane R. Conrad, *PPMs, the EC–Biotech Dispute and Applicability of the SPS Agreement: Are the Panel’s Findings Built on Shaky Ground?*, Research Paper No. 8-06 (International Law Forum of the Hebrew University of Jerusalem, Jerusalem), August 2006, 13, available at: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=920742#PaperDownload](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=920742#PaperDownload), visited on 12 May 2008.

See also Jacqueline Peel, ‘A GMO by Any Other Name ... Might Be an SPS Risk! Implications of Expanding the Scope of the WTO Sanitary and Phytosanitary Measures Agreement’, *European Journal of International Law* 17 (5), 2006, 1009-1031, 1014.

<sup>401</sup> Jacqueline Peel, ‘A GMO by Any Other Name ... Might Be an SPS Risk! Implications of Expanding the Scope of the WTO Sanitary and Phytosanitary Measures Agreement’, *European Journal of International Law* 17 (5), 2006, 1009-1031, 1016.

<sup>402</sup> Conrad suggests a normative approach which would recognise the existence of ‘a different and possibly higher category of value’ that an environmental measure seeks to protect. Christiane R. Conrad, *PPMs, the EC–Biotech Dispute and Applicability of the SPS Agreement: Are the Panel’s Findings Built on Shaky Ground?*, Research Paper No. 8-06 (International Law Forum of the Hebrew University of Jerusalem, Jerusalem), August 2006, 18, available at: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=920742#PaperDownload](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=920742#PaperDownload), visited on 12 May 2008.

regimes invariably couple a requirement for reliance on scientific information with an instruction to act with caution in the face of scientific uncertainty.<sup>403</sup> This broad acceptance of precautionary action in the field of environmental protection is in marked contrast to the weak and limited scope for precautionary measures in the *SPS Agreement*.<sup>404</sup> This variance in the role of science in these two regimes reflects ‘the different nature of available scientific knowledge regarding most environmental problems, as opposed to those associated with quarantine pests or diseases, or toxins of concern for human health.’<sup>405</sup>

The implications of the Panel’s extremely broad interpretation of the purposes covered by the definition of an SPS measure, and of the relationship between the measure and such purpose, for Members at lower levels of development should not be underestimated.<sup>406</sup> For example, those developing-country Members that are trying to establish a regulatory regime for biotech products are now faced with the situation that their biotech regulations, often motivated by environmental concerns in general<sup>407</sup> and, more pragmatically, by the need to ensure that their agricultural products continue to have access to the EC market, may now unexpectedly be subject to the strict scientific disciplines of the *SPS Agreement*.<sup>408</sup> For all Members, but particularly for those that face capacity constraints in the area of scientific risk assessment, such a result may have an inhibiting effect on regulatory initiatives. A similar concern can be raised with regard to efforts by developing-country Members to implement their obligations under multilateral environmental agree-

<sup>403</sup> Jacqueline Peel, ‘A GMO by Any Other Name ... Might Be an SPS Risk! Implications of Expanding the Scope of the WTO Sanitary and Phytosanitary Measures Agreement’, *European Journal of International Law* 17 (5), 2006, 1009-1031, 1017.

<sup>404</sup> Unlike the *SPS Agreement*, environmental regimes do not limit the possibility for precautionary measures to cases of insufficient scientific evidence, but cover a broad range of situations of scientific uncertainty. For a brief discussion of the precautionary principle, see above, Part II, Section 1.5. On the scope for precautionary measures under the *SPS Agreement*, see below, Part III, Sections 3.2.3.2 and 5.2.5.1.

<sup>405</sup> Jacqueline Peel, ‘A GMO by Any Other Name ... Might Be an SPS Risk! Implications of Expanding the Scope of the WTO Sanitary and Phytosanitary Measures Agreement’, *European Journal of International Law* 17 (5), 2006, 1009-1031, 1017. Peel points to the extensive and well developed nature of scientific research on food safety risks and risks from quarantine pests or diseases with the potential to cause economic losses to agricultural production, ‘knowledge of ecosystems interactions and other environmental problems is more often patchy.’ *Ibid.*

<sup>406</sup> This issue has been addressed in Alice Palmer, *The WTO GMO Dispute: Implications for Developing Countries and the Need for an Appeal* (GeneWatch UK, The RSPB, Forum for Biotechnology and Food Security and the GM Freeze, Buxton), November 2006, available at: [http://www.genewatch.org/uploads/f03c6d66a9b-354535738483c1c3d49e4/WTO\\_Biotech\\_case\\_dcsummaryfinal\\_1.pdf](http://www.genewatch.org/uploads/f03c6d66a9b-354535738483c1c3d49e4/WTO_Biotech_case_dcsummaryfinal_1.pdf), visited on 19 May 2008; Maria Julia Oliva and Simonetta Zarrilli, *WTO Panel Report on The “EC–Biotech” Case: Considerations for Trade and Development*, TD/B.COM.1/CRP.4 (Trade and Development Board, Commission on Trade in Goods and Services, and Commodities, Geneva), 19-23 March 2007.

<sup>407</sup> Gregory Jaffe has pointed out that: ‘many developing countries are focusing their Biosafety systems on environmental issues surrounding release of GMOs into the environment and have not established clear pathways for the food-safety assessment and approval process surrounding GMOs.’ Gregory Jaffe, ‘Biosafety Regulation in the North and South’, in *Proceedings of the Eighth International Symposium on the Biosafety of Genetically Modified Organisms* (International Society for Biosafety Research, Montpellier, France), 2004, 190-194, 191, available at: [http://www.isbr.info/symposia/docs/proceedings\\_montpellier2004.pdf](http://www.isbr.info/symposia/docs/proceedings_montpellier2004.pdf), visited on 19 May 2008.

<sup>408</sup> For example, a regulation on traceability and segregation of biotech products to prevent their adventitious presence in non-biotech food exports to the EC, and thereby secure access for these exports to the EC market, may be deemed, indirectly, to prevent a risk from a ‘contaminant’ in food if some of those food products are also sold on the domestic market. This despite the fact that such a regulation may not be imposed to prevent food-safety risks at all, but only indirectly have that effect.

ments, such as the *Basel Convention on Hazardous Waste* and the *Cartagena Protocol on Biosafety*. Measures to implement these environmental treaties may have trade effects, and may now fall under the expanded definition of SPS measures. Although poorly suited to this purpose, the *SPS Agreement* would then discipline these measures. Most Members would be hard pressed to defend such environmental measures from a challenge under the scientific obligations of the *SPS Agreement*, but this would be even more notably the case for Members at lower levels of development.

Another complicating factor in the determination of whether a measure is an SPS measure is the fact that sometimes a measure has protection of human, plant or animal life or health as only one of several objectives.<sup>409</sup> Consumer information, environmental protection and ethical concerns are examples of additional objectives which particular measure could pursue. Could the Member imposing the measure argue that the other aims predominate and the measure thus falls outside the definition of SPS measures or is the very existence of one of the listed health objectives sufficient to trigger the application of the *SPS Agreement*? This question had not received any attention in the case law, until the recent *EC – Approval and Marketing of Biotech Products* case. In all previous cases, the Member defending its measure claimed that its purpose was the protection of health, or at least did not dispute this fact.<sup>410</sup> In *EC – Approval and Marketing of Biotech Products*, however, the EC claimed that its approval procedures for the deliberate release of biotech products into the environment (contained in Directive 90/220 and subsequently Directive 2001/18) and for the approval of novel foods and food ingredients (in Regulation 258/97) fell in part within the scope of the *SPS Agreement* and in part outside its scope. In particular, the EC argued that the *SPS Agreement* has a limited scope of application, determined by the objective or purpose of the measure at issue, and therefore that the environmental and related objectives of its approval legislation were not governed by the *SPS Agreement* but rather by the *TBT Agreement*.<sup>411</sup>

The Panel in *EC – Approval and Marketing of Biotech Products* held that a single measure that has more than one autonomous *raison d'être* which would provide an independent basis for imposing it, can be 'deemed to embody two, if not more, distinct measures which fall to be assessed under different WTO agreements.'<sup>412</sup> Therefore, it agreed with the EC's view and held:

[T]o the extent the requirement in the consolidated law is applied for one of the purposes enumerated in Annex A(1), it may be properly viewed as a measure which falls to be assessed under the *SPS Agreement*; to the extent it is applied for

<sup>409</sup> See Joost Pauwelyn, 'The WTO Agreement on Sanitary and Phytosanitary (SPS) Measures as Applied in the First Three SPS Disputes: *EC–Hormones, Australia–Salmon and Japan–Varietals*', *Journal of International Economic Law* 2 (4), 1999, 641–664, 643.

<sup>410</sup> Panel Report, *EC – Hormones (US)*, para. 8.22; Panel Report, *EC – Hormones (Canada)*, para. 8.25; Panel Report, *Australia – Salmon*, para. 8.32; Panel Report, *Japan – Agricultural Products II*, para. 8.12; Panel Report, *Japan – Apples*, para. 8.73.

<sup>411</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.151–7.154. According to the EC, where a measure pursues both SPS and non-SPS objectives, the *SPS Agreement* applies to the extent that SPS objectives are pursued and the *TBT Agreement* applies to the extent that non-SPS objectives are pursued. It is not clear in what way this argument serves the EC, since it results in subjecting its approval procedures to more than one WTO agreement.

<sup>412</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.166.

a purpose which is not covered by Annex A(1), it may be viewed as a separate measure which falls to be assessed under a WTO agreement other than the *SPS Agreement*.<sup>413</sup>

Such a requirement, according to the Panel, would simultaneously embody an SPS measure and a ‘non-SPS measure’. A single requirement would therefore fall under the disciplines of both the *SPS Agreement* and another WTO agreement, such as the *TBT Agreement* or the GATT 1994.

It is important to note that the definition in Annex A specifies that the measures must aim to protect human, animal or plant life or health ‘within the territory of the Member.’ Avoiding the lack of clarity under the GATT with regard to the position of extra-territorial measures,<sup>414</sup> the *SPS Agreement*, is explicit in its exclusion of extra-territorial measures from its application. Thus measures aiming at the extra-territorial application of domestic SPS requirements will instead fall under the disciplines of the GATT 1994 or the *TBT Agreement*.<sup>415</sup> This issue should be distinguished from the related question of the applicability of the *SPS Agreement* to product-related PPMs. As noted above, negotiators of the *SPS Agreement* recognised that in many cases SPS regulations lay down requirements on PPMs rather than requirements on the final product.<sup>416</sup> Particularly in developed countries with sophisticated SPS regulatory regimes, there has been a movement away from product requirements towards a systems-wide (or farm-to-fork) approach to SPS regulation.<sup>417</sup> This approach focuses on setting out process requirements, such as the application of HACCP in the production process,<sup>418</sup> which prevent the introduction of risks at vulnerable stages of this process and thereby ensure the safety of the final product. These PPM requirements can be regarded as ‘product-related PPMs’ as they aim to ensure that the imported product is risk free, rather than to address non-product related concerns such as animal welfare and labour standards. Therefore, despite the fact that such regulations on PPMs are directed at activities carried out outside the territory of the regulating Member, the health risks they aim to prevent are *within the territory* of this Member.<sup>419</sup> These measures therefore meet the territorial requirement in the definition of an SPS measure and thus are not excluded from the scope of application of the *SPS Agreement*. In fact, among the illustrative list of SPS measures that would fall within the definition in Annex A.1, provided in the second paragraph of this definition, PPMs are explicitly mentioned.

---

<sup>413</sup> *Ibid.*, para. 7.165.

<sup>414</sup> See the discussion of this issue under the GATT, above, Part III, Section 1.1.1.

<sup>415</sup> Note that the lack of clarity regarding the position of extra-territorial measures under the GATT 1994 does not relate to whether these measures are caught by the obligations of the GATT 1994, but rather to whether they can be justified under one of the exceptions in Article XX(b) of the GATT 1994. Thus, it is still correct to say that these measures fall under GATT disciplines. See above, Part III, Section 1.1.1.

<sup>416</sup> See above, Part III, Section 1.2.2.

<sup>417</sup> This development is discussed in Chapter 2 of Part II of this book. See above, Part II, Section 1.3.

<sup>418</sup> For an explanation of the HACCP system, see above, Part II, Section 1.3.

<sup>419</sup> See further on this point Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 11; Gabrielle Marceau and Joel P. Trachtman, ‘GATT, TBT and SPS: A Map of WTO Law of Domestic Regulation of Goods’, in *The WTO Dispute Settlement System 1995–2003*, F. Ortino and Ernst-Ulrich Petersmann (eds.) (Kluwer Law International, Deventer), 2004, 275–340, 325.

The second paragraph of the definition in Annex A.1 states that SPS measures ‘include all relevant laws, decrees, regulations, requirements and procedures’ and gives an illustrative list of such measures. This provides a broad coverage for different types of legal measures, clearly intended to catch all measures aimed at achieving one of the above-mentioned purposes, whether in legislation, administrative regulation or procedural rules.

Contrary to previous cases, which focused on the closed list of purposes to find that the measure at issue was an SPS measure, and recognised the broad coverage of different forms of measures reflected in the illustrative list of the second paragraph of the definition, the Panel in *EC – Approval and Marketing of Biotech Products* found that there are three elements in the definition of an SPS measure: (1) the *purpose* of the measure, as enumerated in sub-paragraphs (a) to (d); (2) the legal *form* of the measure, as described in the second paragraph (‘all relevant laws, decrees, [and] regulations’); and (3) the *nature* of the measure, also set out in the second paragraph (‘requirements and procedures, including...’).<sup>420</sup> According to the Panel, all three elements must be present for a measure to be an ‘SPS measure’ under Annex A.1. Thus, after its extensive examination of the ‘purpose’ element of the definition, the Panel proceeded to determine whether the ‘form’ and ‘nature’ elements were present.

According to the Panel, the ‘form’ element, which indicates that SPS measures include ‘all relevant laws, decrees [and] regulations’, suggests that no particular legal form is prescribed.<sup>421</sup> Instead, SPS measures may take a variety of legal forms. However, the ‘nature’ element was seen by the Panel as requiring that all SPS measures have the nature of either a ‘requirement’ or a ‘procedure’.

The Panel’s identification of two additional separate elements (form and nature) in the definition of an SPS measure in the second paragraph of Annex A.1 is rather surprising. There seems to be no obvious reason to break the relevant sentence up in this artificial way. In fact, in order to do so, the Panel had to insert the word ‘and’ between ‘decrees’ and ‘regulations’,<sup>422</sup> which seems contrary to the principle that a treaty interpreter must interpret the words actually used in the treaty, rather than add words it considers should have been used.<sup>423</sup> It would seem more in line with the natural meaning of the text to regard the second paragraph as providing a broad illustrative list of five types (or in the Panel’s word *forms*) of measures that would be considered SPS measures, namely, all relevant laws, decrees, regulations, requirements and procedures. That this list is non-exhaustive

<sup>420</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.149. Much of the following discussion on this point is taken from Denise Prévost, ‘Opening Pandora’s Box: The Panel’s Findings in the EC-Biotech Products Dispute’, *Legal Issues of Economic Integration* 34 (1), 2007, 67-101, 71-78.

<sup>421</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1334.

<sup>422</sup> *Ibid.*, para. 7.422.

<sup>423</sup> As the Appellate Body held in *India – Patents (US)*: ‘The duty of a treaty interpreter is to examine the words of the treaty to determine the intentions of the parties. This should be done in accordance with the principles of treaty interpretation set out in Article 31 of the *Vienna Convention*. But these principles of interpretation neither require nor condone the imputation into a treaty of words that are not there or the importation into a treaty of concepts that were not intended.’ Appellate Body Report, *India – Patents (US)*, para. 45. This principle was reiterated in *EC – Hormones* where the Appellate Body stated, ‘The fundamental rule of treaty interpretation requires a treaty interpreter to read and interpret the words actually used by the agreement under examination, not words the interpreter may feel should have been used.’ Appellate Body Report, *EC – Hormones*, para. 181.

is indicated by the use of the word 'include'. The purpose of the list, rather than to limit the scope of the *SPS Agreement* by adding specific form and nature requirements, seems to be to make clear the broad reach of the Agreement to all types of measures, whether legislative, administrative or otherwise, once it is established that they are imposed for one of the four purposes listed in the sub-paragraphs. The further list of various measures ('including, *inter alia*, end product criteria...') is again a non-exhaustive illustration, this time of the types of specific SPS measures that would be regarded as 'laws, decrees, requirements, regulations and procedures' under this definition.<sup>424</sup>

The Panel's approach had practical implications for the application of the *SPS Agreement* to the measures in dispute.<sup>425</sup> While the Panel recognised the broad ambit of the 'form' element as encompassing a variety of legal forms,<sup>426</sup> it relied on the 'nature' element it had read into Annex A.1, and which it regarded as 'key' to its determination,<sup>427</sup> to find that the EC general *de facto* moratorium on biotech approvals did not fall under the definition of an SPS measure. The Panel regarded the general *de facto* moratorium as neither a 'requirement' nor a 'procedure' but rather as the 'application' of approval procedures.<sup>428</sup>

<sup>424</sup> The Panel regarded this illustrative list of specific SPS measures in the last part of Annex A.1 as relating only to the words 'requirements and procedures' and as setting out 'a number of relevant substantive requirements (prescribed end product criteria, prescribed quarantine treatments, certain packaging and labelling requirements, etc.) and procedures (testing procedures, inspection procedures, certification procedures, approval procedures, etc.)'. The Panel did note that the term 'requirements' is broad in scope, including both an authorisation to market a particular product and a ban on marketing a particular product. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1334.

<sup>425</sup> The Panel readily found that the EC approval procedures in the relevant Directives and Regulation were SPS measures. As discussed above, the Panel interpreted the objectives laid down in sub-paragraphs (a)-(d) of Annex A.1 broadly to cover the aims of these approval procedures. As the relevant Directives and Regulation were legislative acts that were legally binding and attributable to the EC, the Panel regarded them as 'laws' meeting the 'form' requirement it had identified. Since they laid down approval procedures (as clarified in Annex C.1 to the *SPS Agreement*), they met the Panel's 'nature' requirement (Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.422-7.431). However, the Complainants did *not* challenge the approval procedures as laid down in the Directives and Regulation, but rather challenged the general *de facto* moratorium, the product specific measures and the Member States safeguard measures. It is interesting that the pre-marketing approval system itself was not challenged (as noted by the Panel more than once, see Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.1353 and 7.1693) despite the fact that approval procedures are expressly named among the examples of SPS measure listed in Annex A.1 and the fact that pre-marketing approval requirements sit uncomfortably with the disciplines of the *SPS Agreement*. The *SPS Agreement* requires that a risk assessment must exist on which the relevant SPS measure (such as a marketing prohibition) is based. A pre-marketing approval system, however, prohibits the marketing of a product until such time as its safety is proven by means of a risk assessment. It can be seen as a provisional ban pending a risk assessment. However, as most countries maintain pre-marketing approval systems for particular products, it is possible that the Complainants wished to avoid opening this can of worms.

<sup>426</sup> The Panel noted the use of the word 'include' and found that, 'the reference to "laws, decrees [and] regulations" should not be taken to prescribe a particular legal form'. Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.422.

<sup>427</sup> *Ibid.*, para. 7.1338.

<sup>428</sup> The Panel found that the general moratorium should be characterised as a decision to delay the decision on final approval of specific applications until certain conditions were met. It rejected the argument that the moratorium should be seen as an across-the-board marketing ban on biotech products requiring approval, and thus as a 'requirement'. The Panel correctly noted that the pre-marketing approval system itself imposes a provisional ban on biotech products for which approval is sought, pending the final approval decision, yet the Complainants chose not to challenge the pre-marketing approval system. The Panel also disagreed that the moratorium could be seen as itself a 'procedure' by setting out a particular mode or course of action to be followed by the Commission and Group of Five Member States delaying applications. Instead, the Panel

As the second paragraph of Annex A.1 does not refer to the ‘application’ of requirements and procedures, the Panel saw its way clear to conclude that the moratorium was not an SPS measure.<sup>429</sup> Similarly, the Panel regarded the product-specific measures challenged as ‘the alleged failure by the [EC] to consider particular applications for final approval.’<sup>430</sup> As this was seen by the Panel to be neither a ‘procedure’ nor a ‘requirement’ but rather the ‘application’ of an approval procedure, it did not meet the Panel’s ‘nature’ criterion and therefore did not fall under the definition of Annex A.1.<sup>431</sup> This construction served a useful purpose for the Panel in this dispute in that it allowed the Panel to limit its analysis of the moratorium and the product-specific measures at issue to those procedural rules of the *SPS Agreement* that refer to the ‘application’ of SPS measures rather than apply the substantive disciplines to these measures.<sup>432</sup> This permitted the Panel to steer clear of controversial questions such as the scientific basis for the *de facto* moratorium and product specific measures and the question whether biotech products are ‘like’ their conventional counterparts.<sup>433</sup> However, the strained interpretation of the Panel may have unexpected far-reaching effects beyond this dispute.

These unintended effects lie in the consequences of the Panel’s approach for future disputes, if not overturned by the Appellate Body in another case. Under the Panel’s interpretation of Annex A.1, the determination of whether a measure falls within the *SPS Agreement* now turns on the rather technical criteria of its form and, more especially, its nature, rather than the more substantive (and arguably more important) criterion of its purpose. The limited list of objectives of SPS measures has been interpreted so broadly as to be practically all encompassing, reducing it to inefficacy as a limitation on the coverage

---

found that the EC continued to apply its existing approval procedures, but intentionally did not make full use of these procedures to complete the approval process. Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.1338-7.1378

<sup>429</sup> *Ibid.*, para. 7.1382.

<sup>430</sup> *Ibid.*, para. 7.1690. It should be noted that the Panel did address the substantive disciplines of the *SPS Agreement* in its examination of the claims regarding the safeguard measures applied by six EC Member States. This examination was less controversial as the scientific committees of the EC itself had evaluated the potential risks prior to granting approval to the biotech products at issue at EC level, and had subsequently reviewed the arguments and scientific evidence submitted by these Member States in support of their safeguard measures and found them insufficient to call into question its earlier conclusions.

<sup>431</sup> The Panel rejected the argument that the failure to consider particular applications for final approval amounted to a ban, and was thus a ‘requirement’ under Annex A.1. It also disagreed with the allegation that the EC’s failure to consider particular applications for final approval was in itself a ‘procedure’ as it modified the approval procedure with respect to the biotech product in question. Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.1690-7.1697 (with regard to the US claim). The Panel rejected the claims of Canada and Argentina in this regard on the same reasoning. *Ibid.*, paras 7.1701-7.1704 and 7.1711-7.1712.

<sup>432</sup> However, this result could arguably have been achieved without reading separate form and nature requirements into Annex A.1 by simply finding that the legislation containing approval procedures was covered by the broad description of possible legal forms of SPS measures in the second paragraph of Annex A.1 (specifically an approval procedure), and that the moratorium amounted to an application of such procedures rather than a separate SPS measure (law, decree, regulation, requirement or procedure) itself.

<sup>433</sup> The Panel made sure to point out in its conclusions and recommendations that it had not examined these questions. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 8.3. Other questions which the Panel pointed out it had also not examined in the dispute, such as whether biotech products are safe or not, whether the risk assessments of the EC’s scientific committees conformed with the scientific disciplines of the *SPS Agreement* and whether a Member has a right to have a pre-marketing approval system in place, had not been raised by the parties.

of the *SPS Agreement*. By contrast, the Panel seems to disregard the inclusive nature of the illustrative list in the second paragraph of Annex A.1 and, in effect, it requires all SPS measures to have the ‘nature’ of either ‘requirements’ or ‘procedures.’ The result of the focus in interpretation on form rather than substance is that Members may be encouraged to frame their measures in such a way as to avoid having the ‘nature’ of a requirement or procedure. As discussed above, this approach does not seem to rest comfortably with the text of Annex A.1, which instead appears to restrict the purpose of an SPS measure to only the listed objectives, yet allow for the measures aiming at these objectives to be given a wide range of legal forms, providing only an illustrative list of possibilities to be included. This seems in keeping with the object and purpose of the *SPS Agreement*. It is entirely unclear what the drafters’ objective would have been in excluding measures that do not have the nature of requirements or procedures from the rules of the *SPS Agreement*. This formalistic criterion would only create incentives to draft legislation in a manner that avoid meeting this ‘nature’ test. As this Panel Report was not appealed, the Appellate Body has not had the opportunity to consider this interpretation of the Annex 1.A definition. This interpretation has already been followed by the Panel in *US – Continued Suspension* and *Canada – Continued Suspension*, which recalled the three-pronged test, read into the definition of an SPS measure by the Panel in *EC – Approval and Marketing of Biotech Products*, and applied it to the matter before it.<sup>434</sup>

While in the *EC – Approval and Marketing of Biotech Products* dispute, the broad interpretation of the enumerated purposes under which a measure will be regarded as an ‘SPS measure’ was tempered by the Panel’s unexpected insertion of a ‘nature’ criterion into the definition, resulting in a limited impact of the substantive disciplines of the *SPS Agreement* on the measures at issue, this may not be the case in future disputes. SPS measures at issue in future disputes are likely to have the ‘nature’ of requirements or procedures, particularly in view of the broad interpretation of given by the Panel to the word ‘requirements’ in its analysis of whether the EC Member States’ safeguard measures met the third element of the definition. In this regard the Panel recalled that:

... the reference in [Annex A.1] to “requirements” is broad and unqualified. Hence, both an authorization to market a particular product and a ban on the marketing of a particular product may be considered as “requirements”. The second example would constitute a negative requirement.<sup>435</sup>

Noting that each safeguard measure prohibited the marketing of the biotech product at issue, the Panel expressed its view that:

... a prohibition on the marketing of a particular product (within a particular territory) may be considered a “requirement” for the purposes of Annex A(1).<sup>436</sup>

Therefore the nine safeguard measures were found to be ‘SPS measures’ within the meaning of the definition in Annex A.1 of the *SPS Agreement*. This was also the case in *US –*

<sup>434</sup> Panel Report, *US – Continued Suspension*, para. 7.429; Panel Report, *Canada – Continued Suspension*, para. 7.420.

<sup>435</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2599. This finding was reiterated with regard to each of the nine safeguard measures.

<sup>436</sup> *Ibid.*, para. 7.2599. Again, this finding was reiterated with regard to each of the nine safeguard measures.

*Continued Suspension and Canada – Continued Suspension*, where the Panel noted that a ban may be considered a requirement under the ‘nature’ element of this test to find that the EC’s ban on hormone-treated meat was an ‘SPS measure’.<sup>437</sup> Clearly, therefore, normally the ‘nature’ criterion will often not have much restraining effect on the applicability of the *SPS Agreement*.<sup>438</sup> In such cases, an overly broad interpretation of the listed purposes delimiting the concept of an SPS measure may lead to an invasive application of the rigorous disciplines of the *SPS Agreement* to areas not intended to fall within its ambit.<sup>439</sup>

### 2.1.2 Effect on international trade

The second requirement set in Article 1.1 for the application of the *SPS Agreement* is that the measure at issue must be a measure that ‘may directly or indirectly affect international trade’. This is not an empirical standard, necessitating proof that the measure has led to a reduction in trade flows, but rather a theoretical standard, met by showing that the measure applies to imports and can therefore be presumed to have a negative impact on trade.<sup>440</sup> This requirement is thus easy to fulfil.

Moreover, as pointed out by the Panel in *EC – Approval and Marketing of Biotech Products*, Article 1.1 only requires that the measure *may* affect international trade. Thus, ‘it is not necessary to demonstrate that an SPS measure has an actual effect on trade.’<sup>441</sup> In that dispute, the Panel noted that it was uncontested that the EC’s approval procedures for biotech applied to biotech products or foods containing or consisting of biotech products produced outside the EC and that would therefore be imported upon approval. These approval procedures were applied to check conformity with SPS requirements the satisfaction of which was necessary to obtain marketing approval. In addition, the procedures themselves, according to the Panel, may have a direct or indirect effect on international trade as their completion takes time and they impose information and documentation requirements. Therefore, the Panel found that the EC’s approval procedures were measures that ‘may directly or indirectly affect international trade’.

Hygienic practices requirements for street food vendors is arguably an example of an SPS measure which does not fall within the scope of application of the *SPS Agreement* because it does not, actually or potentially, affect international trade.

---

<sup>437</sup> Panel Report, *US – Continued Suspension*, para. 7.443 and Panel Report, *Canada – Continued Suspension*, para. 7.424.

<sup>438</sup> While this would normally be the case, it should be borne in mind, as argued above, that Members may seek to avoid this broad application of the *SPS Agreement* by artificially drafting their SPS measures so that they do not meet the formal requirement of having the ‘nature’ of a requirement or procedure.

<sup>439</sup> Christiane Conrad argues convincingly in this regard that in view of the fact that the *SPS Agreement* imposes stricter disciplines on health measures than those applicable under the GATT 1994 and the *TBT Agreement*, the interpretative principle *in dubio mitius* would require an interpretation of ambiguous terms in the definition of SPS measures in a narrow way so as to limit the applicability of the *SPS Agreement* in favour of the application of the ‘softer’ disciplines of the GATT 1994 or *TBT Agreement*. Christiane R. Conrad, *PPMs, the EC–Biotech Dispute and Applicability of the SPS Agreement: Are the Panel’s Findings Built on Shaky Ground?*, Research Paper No. 8-06 (International Law Forum of the Hebrew University of Jerusalem, Jerusalem), August 2006, 29-30, available at: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=920742#PaperDownload](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=920742#PaperDownload), visited on 12 May 2008.

<sup>441</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.435.

## 2.2 Personal scope of application

The personal scope of application of the *SPS Agreement* refers to the question of which entities are covered by its rules. This issue has arisen because the adoption and implementation of SPS requirements is increasingly in the hands of bodies *other* than central government. Some of these bodies involve governmental action at sub-national level, such as local government regulators (states, provinces, or cantons) or at supra-national level, such as regulatory bodies under regional agreements (for example the FSANZ).<sup>442</sup> Others may involve both governmental and non-governmental actors, such as national bureaus of standards, which may be public or private bodies that set non-mandatory standards but whose standards are often relied upon by governments in enacting regulations.<sup>443</sup> In addition, increasingly SPS requirements are imposed by private sector actors, such as supermarkets.<sup>444</sup>

This development away from central government regulation, towards local, supra-national and private governance structures in the area of SPS should be seen in the context of the broader discussion around the contemporary shifts in the locus of governance,<sup>445</sup> and the role of the WTO in addressing soft law norms created by different non-state actors. It has been argued that:

The emergence of regional and local governments on the world scene, coupled with an aggressive trade agenda encompassing politically sensitive areas to some degree under the control of these local entities, increases the potential for disguised restrictions on trade and other protectionist measures which could thwart trade liberalization.<sup>446</sup>

---

<sup>442</sup> The FSANZ (Food Standards Australia New Zealand) is the regulatory body for food established under a regional agreement between Australia and New Zealand. For more details on this body, see above, Part II, Section 2.4.2.1.

<sup>443</sup> Examples of such bodies, with different levels of government involvement, are Standards Australia, the Mauritius Standards Bureau, the Bureau of Standards of Jamaica and the Bangladesh Standards and Testing Institute. See above, Part II, Sections 2.4.2.1, 2.5.2.1, 2.6.2.1 and 2.7.2.1.

<sup>444</sup> Examples of private sector standards imposed by supermarket chains are Tesco's Nature's Choice and the British Retail Consortium Global Standard – Food. For a discussion of the proliferation of private sector standards, see above, Part II, Section 1.3.

<sup>445</sup> Joanne Scott refers to the rise of private sector standards as a key element in the 'transformation of the governance landscape'. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 302. In 1997, Anne-Marie Slaughter developed the theory of the 'disaggregated state' which addresses the idea of the transfer of power from central government authorities to subnational levels of government. Slaughter emphasises the rise of 'global governance' through the networking of functionally distinct parts of the disaggregated state with their counterparts abroad. Anne-Marie Slaughter, 'The Real New World Order', *Foreign Affairs* 76 (5), 1997, 183-197, 184. An example of the attention currently given in academic research to the move from traditional state-based governance to new forms of governance where public functions are carried out by local, regional and private bodies, is the 'Shifts in Governance' project of the Dutch Organisation for Scientific Research (NWO) which addresses issues of 'governance beyond the state' and 'governance without government'. See the website for this project, available at: [http://www.nwo.nl/nwo-home.nsf/pages/NWOP\\_5T8L5H](http://www.nwo.nl/nwo-home.nsf/pages/NWOP_5T8L5H), visited on 25 May 2008.

<sup>446</sup> Edward T. Hayes, 'Changing Notions of Sovereignty and Federalism in the International Economic System: A Reassessment of WTO Regulation of Federal States and the Regional and Local Governments within Their Territories', *Northwestern Journal of International Law & Business* 25 (1), 2004, 1-36, 10.

According to Joost Pauwelyn, in failing to address the increasingly important ‘non-traditional’ patterns of regulation, such as those reflected in ‘soft norms’ created by non-state actors, WTO law risks being ‘under-inclusive’.<sup>447</sup> The question thus arises whether the *SPS Agreement* can be applied in such a way as to take account of this shift in governance.

The applicability of the disciplines in the *SPS Agreement* to bodies other than the central government is addressed in Article 13 of the *SPS Agreement*. This provision states:

Members are fully responsible under this Agreement for the observance of all obligations set forth herein. Members shall formulate and implement positive measures and mechanisms in support of the observance of the provisions of this Agreement by other than central government bodies. Members shall take such reasonable measures as may be available to them to ensure that non-governmental entities within their territories, as well as regional bodies in which relevant entities within their territories are members, comply with the relevant provisions of this Agreement. In addition, Members shall not take measures which have the effect of, directly or indirectly, requiring or encouraging such regional or non-governmental entities, or local governmental bodies, to act in a manner inconsistent with the provisions of this Agreement. Members shall ensure that they rely on the services of non-governmental entities for implementing sanitary or phytosanitary measures only if these entities comply with the provisions of this Agreement.

Thus, Members are fully responsible for the implementation of the Agreement, which includes a certain level of responsibility for the actions of bodies other than central government. They must enact and implement *positive measures* to support the observance of its rules by bodies other than central government bodies. In addition, Members must take all *reasonable measures* available to them to ensure that regional bodies in which their entities are members as well as non-governmental bodies in their territories comply with the *SPS Agreement*. Further, Members are prohibited from requiring or encouraging non-compliance with the Agreement by local, regional or non-governmental bodies. Members may not rely on non-governmental bodies to implement their SPS measures unless these bodies comply with the *SPS Agreement*. Thus the rules contained in the *SPS Agreement* will have an impact not only on the central government bodies of a Member but indirectly also on other bodies under its responsibility which are active in the area of sanitary and phytosanitary protection. It is the task of the Member to promote the compliance by these bodies with the disciplines of the *SPS Agreement*.

The limits of this responsibility are, however, not clear. In particular, the types of entities that are covered by this provision and the extent of action required of a Member demand clarification. The only dispute in which the interpretation of Article 13 of the *SPS Agreement* was at issue is *Australia – Salmon (Article 21.5 – Canada)*. The Panel in that

<sup>447</sup> Joost Pauwelyn, ‘Non-Traditional Patterns of Global Regulation: Is the WTO ‘Missing the Boat’?’ presented at the *Conference on Legal Patterns of Transnational Social Regulations and Trade* (European University Institute, Florence) 24-25 September 2004, 19-21, available at: <http://eprints.law.duke.edu/1311/1/6Sept04.pdf>, visited on 25 May 2008. Pauwelyn notes that the WTO exemplifies the traditional focus of international law on hard law, centred on states. However, he points out that today’s normative governance patterns are quite different, involving non-state actors and soft law norms. *Ibid.*, 2.

case held that the sanitary measures taken by the government of Tasmania, an Australian state, fell under the responsibility of Australia, both under WTO law and under general international law,<sup>448</sup> and were thus subject to the *SPS Agreement*. It found as follows:

Article 13 of the *SPS Agreement* provides unambiguously that: (1) ‘Members are fully responsible under [the SPS] Agreement for the observance of all obligations set forth herein’; and (2) ‘Members shall formulate and implement positive measures and mechanisms in support of the observance of the provisions of this Agreement by other than central government bodies’. Reading these two obligations together, in light of Article 1.1 of the *SPS Agreement* referred to earlier, we consider that sanitary measures taken by the Government of Tasmania, being an ‘other than central government’ body as recognized by Australia, are subject to the *SPS Agreement* and fall under the responsibility of Australia as WTO Member when it comes to their observance of SPS obligations.<sup>449</sup>

This finding is not controversial. It embodies the now generally accepted view that measures by various organs of state, including local government bodies, are considered as measures attributable to a WTO Member and therefore falling under its responsibility.<sup>450</sup> Under the GATT 1994, this principle is reflected in the *Understanding on the Interpretation of Article XXIV of the GATT*,<sup>451</sup> which clarifies that Article XXIV:12 of the

<sup>448</sup> The Panel, *inter alia*, referred to Article 27 of the *Vienna Convention on the Law of Treaties* which states that a party may not invoke provisions of its internal law for its failure to perform a treaty. Howard Latin, ‘Ideal Versus Real Regulatory Efficiency: Implementation of Uniform Standards And “Fine Tuning” Regulatory Reforms’, *Stanford Law Review* 37, 1985, 1267-1332. It also referred to Article 22.9 of the DSU which states that the dispute settlement provisions of the covered agreements can be invoked in respect of measures by regional or local governments or authorities within the territory of a Member.

<sup>449</sup> Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.13. Canada had also made a claim in this case that Australia had violated its obligation under Article 13 of the *SPS Agreement* to formulate and implement positive measures and mechanisms in support of the observance of the provisions of the Agreement by other than central government bodies. The Panel found that Canada had not substantiated this claim. *Ibid.*, para. 7.162.

<sup>450</sup> A similar finding was recently made by the Panel in *Brazil – Retreaded Tyres* which found that measures taken by Rio Grande do Sul, a state of the Federative Republic of Brazil, were attributable to Brazil as a WTO Member and therefore should be considered as ‘measures’ for purposes of Article 3.3 of the DSU. It stated: ‘regardless of the relationship between these states [sic] laws and the federal laws based on the jurisdictions covered by the respective law within its domestic legal system, the Brazilian government is ultimately responsible for ensuring that its constituent states respect Brazil’s obligations under the WTO...’ Panel Report, *Brazil – Retreaded Tyres*, para. 7.406.

<sup>451</sup> See para. 14 of the ‘Understanding on the Interpretation of Article XXIV of the General Agreement on Tariffs and Trade’, in *The Results of the Uruguay Round of Multilateral Trade Negotiations: The Legal Texts* (World Trade Organization, Geneva), 1994, 31-34. Article XXIV:12 of the GATT 1994 requires each Member to ‘take such reasonable measures as may be available to it’ to ensure observance with the GATT by regional and local governments and authorities in its territory. This could be understood as limiting a Member’s responsibility for subnational levels of government, in view of possible constitutional limitations on their authority over such subnational entities. The Understanding clarifies that, instead, a Member can be challenged in dispute settlement in respect of measures taken by regional or local governments or authorities. This is more in line with the approach in international law to the issue of state responsibility for the acts of subnational levels of government. As noted by Edward Hayes, the early doubts as to whether Article XXIV:12 of the GATT reflects an intention to opt out of the customary international law principle of state responsibility for subnational levels of government have been removed by the Understanding and ‘there is now no question that federal GATT/WTO Members remain fully responsible for the actions of their component governmental units.’ Edward T. Hayes, ‘Changing Notions of Sovereignty and Federalism in the International Economic

GATT 1994 entails that dispute settlement proceedings may be invoked against a Member in respect of measures taken by regional or local government or authorities within its territory.<sup>452</sup> This principle is embodied in Article 29 of the *Vienna Convention on the Law of Treaties*, which provides:

Unless a different intention appears from the treaty or is otherwise established, a treaty is binding upon each party in respect of its entire territory.

This has been taken to mean that in federal states, the state party to the treaty is responsible not only for the acts of its central government but also for those of local government bodies in its territory. In addition, Article 27 of the *Vienna Convention on the Law of Treaties* provides that a party may not invoke provisions of its internal law for its failure to perform a treaty. Thus the constitutional limits of the authority of central government over sub national levels of government cannot be used as an excuse for the violation of treaty obligations by lower levels of government. Similarly, Article 4 of the International Law Commission's (ILC) *Articles on Responsibility of States for Internationally Wrongful Acts* of 2001 provides that:

The conduct of any State organ shall be considered an act of that State under international law, whether the organ exercises legislative, executive, judicial or any other functions, whatever position it holds in the organization of the State, and whatever its character as an organ of the central Government or of a territorial unit of the State.<sup>453</sup>

The ILC's Commentary to this Article emphasises the long-established nature of the principle of state responsibility for acts of local government bodies. It further notes that:

It does not matter for this purpose whether the territorial unit in question is a component unit of a federal State or a specific autonomous area, and it is equally irrelevant whether the internal law of the State in question gives the federal parliament power to compel the component unit to abide by the State's international obligations.<sup>454</sup>

System: A Reassessment of WTO Regulation of Federal States and the Regional and Local Governments within Their Territories', *Northwestern Journal of International Law & Business* 25 (1), 2004, 1-36, 20.

<sup>452</sup> On this issue see further Thomas Cottier and Krista Nadakavukaren Schefer, 'The Relationship between World Trade Organization Law, National Law and Regional Law', *Journal of International Economic Law* 1 (1), 1998, 83-122, 85-86; Edward T. Hayes, 'Changing Notions of Sovereignty and Federalism in the International Economic System: A Reassessment of WTO Regulation of Federal States and the Regional and Local Governments within Their Territories', *Northwestern Journal of International Law & Business* 25 (1), 2004, 1-36.

<sup>453</sup> Article 4 of the Jay Michealson, 'Rethinking Regulatory Reform: Toxics, Politics and Ethics', *Yale Law Journal* 105, 1996, 1891-1925. These *Articles* were taken note of in Resolution 56/83 adopted by the General Assembly of the UN on 12 December 2001 and are to be found in the Annex to General Assembly Resolution 56/83 of 12 December 2001, corrected by document A/56/49 (Vol. I)/Corr.4. *Official Records of the General Assembly, Fifty-Sixth Session, Supplement No. 10 (A/56/10)*, chp.IV.E.1. The *Articles* aim to formulate, through codification and progressive development, the basic international law rules concerning the responsibility of States for their internationally wrongful acts.

<sup>454</sup> Wendy E. Wagner, 'The Science Charade in Toxic Risk Regulation', *Columbia Law Review* 95, 1995, 1613-1723, para. 9.

It is therefore clear that WTO Members will be held directly responsible not only for the acts and omissions of their central government bodies, but also for acts and omissions of lower levels of government. Such local government bodies must therefore comply fully with the *SPS Agreement*. To facilitate such compliance, the second sentence of Article 13 of the *SPS Agreement* requires Members to implement *positive measures* to support compliance by other than central government bodies with the *SPS Agreement*.<sup>455</sup> A Member is thus obliged to assist proactively its local government bodies in their compliance.

More contentious is the question whether Article 13 of the *SPS Agreement* extends the application of the Agreement to private sector standards. While, as discussed above,<sup>456</sup> this issue did not arise during the negotiation of the *SPS Agreement* due to the fact that safety regulation was then typically still in the hands of governments, with the proliferation of private sector SPS standards since the mid-1990s,<sup>457</sup> the issue has come to the forefront of attention. Currently, private sector standards are no longer limited to technical specifications, ethical standards or quality requirements,<sup>458</sup> but also cover safety issues such as maximum levels for pesticide residues, requirements for the traceability of food products, and process standards such as HACCP. Most often, these private sector standards are stricter than national SPS regulations and lay down complex PPM requirements rather than product specifications.<sup>459</sup> Although private sector standards are voluntary in

---

<sup>455</sup> At first sight the applicability of this obligation in respect of ‘other than central government bodies’ would seem to extend to all bodies that are not central government bodies, thereby including non-governmental bodies and regional bodies in which entities of a WTO Member are members. However, when seen in the context of the rest of Article 13, a narrower interpretation of this provision is clearly called for, limiting it to *government* bodies other than at central government level. The third sentence of Article 13 addresses a Member’s responsibility with regard to compliance by non-governmental and regional bodies. To read *both* the second and third sentences as covering these types of bodies would not make sense due to the two different obligations contained in each. With respect to government bodies other than at central government level, the second sentence of Article 13 requires positive measures to support compliance. The fact that the acts of local government bodies are considered acts of the relevant Members, and that Members are obliged to comply with the *SPS Agreement*, explains why Members are not required to take measures to ‘ensure’ the compliance of local government bodies, but only to support it. Even in the absence of an omission to take positive supportive measures, a Member can be found to violate the *SPS Agreement* if acts of its subnational levels of government are not in conformity with the *SPS Agreement*.

<sup>456</sup> See above, Part III, Section 1.2.2.

<sup>457</sup> WTO Secretariat notes that there are over 400 private sector standard schemes currently in operation. Some of these are developed by individual firms (for example Tesco Nature’s Choice), others are developed collectively by national retailers (for example, the British Retail Consortium Global Standard – Food) or by international consortia (such as GLOBALGAP, which was previously EUREPGAP). Committee on Sanitary and Phytosanitary Measures, *Private Standards and the SPS Agreement. Note by the Secretariat, G/SPS/GEN/746*, circulated on 24 January 2007, para. 5. As reported by Henson, in 1999 the British Retail Consortium Global Standard was used by less than 500 UK processors, but by 2005 it was in use by 5500 processors in 64 countries. Spencer Henson, ‘The Role of Public and Private Standards in Regulating International Food Markets’, presented at the *IATRC Summer Symposium on Food Regulation and Trade: Institutional Framework, Concepts of Analysis and Empirical Evidence*, (Bonn) May 28-30 2006, 20, available at: [http://www.ilr1.uni-bonn.de/iatrc/iatrc\\_program/Session%204/Henson.pdf](http://www.ilr1.uni-bonn.de/iatrc/iatrc_program/Session%204/Henson.pdf), visited on 27 May 2008.

<sup>458</sup> Note that many private sector standards, such as those addressing animal welfare and fair labour practices, would not meet the definition of an SPS measure since they do not aim to protect human, animal or plant life or health within the territory of the importing Member. However, increasingly food-safety issues are addressed in private standards, making the question of the applicability of the *SPS Agreement* particularly relevant.

<sup>459</sup> In a 2006 OECD study, Lisa Fulponi notes that over 85% of leading retailers reported that their required standard was higher than the government regulatory standard, and about 50% reported that it was significantly

nature, the wide-scale application of such standards as purchasing requirements by large supermarket chains, which dominate the market for food and agricultural products,<sup>460</sup> has the effect of excluding non-conforming suppliers from this market. As a result, these standards take on *de facto* binding force.<sup>461</sup> Several empirical studies have been carried out that confirm the significant impact of private sector standards on the agri-food sector in general, and on developing-country producers in particular.<sup>462</sup> It has been noted that the impact of these standards on developing-country producers is disproportionate.<sup>463</sup> In particular, the challenge of complying with private sector standards has the effect of excluding small-scale producers in developing countries from participating in the export market for high-value agricultural products.<sup>464</sup>

---

higher. Linda Fulponi, *Final Report on Private Standards and the Shaping of the Agro-Food System*, AGR/CA/APM(2006)9/FINAL (Organisation for Economic Co-operation and Development, Paris), 31 July 2006, para. 50, available at: [http://www.oelis.oecd.org/olis/2006doc.nsf/43bb6130e5e86e5fc12569fa005d004c/4e3a2945ffec37eec12571bc00590ce3/\\$FILE/JT03212398.PDF](http://www.oelis.oecd.org/olis/2006doc.nsf/43bb6130e5e86e5fc12569fa005d004c/4e3a2945ffec37eec12571bc00590ce3/$FILE/JT03212398.PDF), visited on 27 May 2008.

<sup>460</sup> For example, EUREPGAP membership included the 30 largest retailers across 12 EC Member States, accounting for 85% of the Western European fresh produce market. Grace Chia-Hui Lee, *Private Food Standards and Their Impacts on Developing Countries* (European Commission, DG Trade, Unit G2, Brussels), 2006, 13, available at: [http://trade.ec.europa.eu/doclib/docs/2006/november/tradoc\\_127969.pdf](http://trade.ec.europa.eu/doclib/docs/2006/november/tradoc_127969.pdf), visited on 26 May 2008. The fact that the oligopolistic nature of food retailing enables large retailers to require suppliers to be certified for compliance with private standards is noted by Hatanaka *et al.* Maki Hatanaka *et al.*, 'Third-Party Certification in the Global Agrifood System', *Food Policy* 30, 2005, 354 - 369, 358-359.

<sup>461</sup> As noted by the WTO Secretariat: '...the choice of whether or not to comply with a voluntary standard becomes a choice between compliance or exit from the market. In this way, the distinction between private voluntary standards and mandatory "official" or "public" requirements can blur.' Committee on Sanitary and Phytosanitary Measures, *Private Standards and the SPS Agreement. Note by the Secretariat*, G/SPS/GEN/746, circulated on 24 January 2007, para. 9. On the blurring distinction between public and private regulation and mandatory and voluntary norms, see also David Vogel, who argues that rather than seeing these as sharp dichotomies, they should be seen as the ends of a continuum to avoid hiding the changing relations of power in international relations. David Vogel, 'Private Global Business Regulation', *Annual Review of Political Science*, 11, 2008, 261-282, 265.

<sup>462</sup> See for example, Grace Chia-Hui Lee, *Private Food Standards and Their Impacts on Developing Countries* (European Commission, DG Trade, Unit G2, Brussels), 2006, available at: [http://trade.ec.europa.eu/doclib/docs/2006/november/tradoc\\_127969.pdf](http://trade.ec.europa.eu/doclib/docs/2006/november/tradoc_127969.pdf), visited on 26 May 2008; Spencer Henson, 'The Role of Public and Private Standards in Regulating International Food Markets', presented at the *IATRC Summer Symposium on Food Regulation and Trade: Institutional Framework, Concepts of Analysis and Empirical Evidence*, (Bonn) May 28-30 2006, available at: [http://www.ilr1.uni-bonn.de/iatrc/iatrc\\_program/Session%204/Henson.pdf](http://www.ilr1.uni-bonn.de/iatrc/iatrc_program/Session%204/Henson.pdf), visited on 27 May 2008; Linda Fulponi, *Final Report on Private Standards and the Shaping of the Agro-Food System*, AGR/CA/APM(2006)9/FINAL (Organisation for Economic Co-operation and Development, Paris), 31 July 2006, available at: [http://www.oelis.oecd.org/olis/2006doc.nsf/43bb6130e5e86e5fc12569fa005d004c/4e3a2945ffec37eec12571bc00590ce3/\\$FILE/JT03212398.PDF](http://www.oelis.oecd.org/olis/2006doc.nsf/43bb6130e5e86e5fc12569fa005d004c/4e3a2945ffec37eec12571bc00590ce3/$FILE/JT03212398.PDF), visited on 27 May 2008; Steven Jaffee *et al.*, *Food Safety and Agricultural Health Standards: Challenges and Opportunities for Developing Country Exports*, 31207 (World Bank, Poverty Reduction & Economic Management Trade Unit and Agriculture and Rural Development Department, Washington D.C.), 10 January 2005, 26-29, available at: [http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016\\_20050125093841/Rendered/PDF/31207.pdf](http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016_20050125093841/Rendered/PDF/31207.pdf), visited on 18 May 2008.

<sup>463</sup> Committee on Sanitary and Phytosanitary Measures, *Considerations Relevant to Private Standards in the Field of Animal Health, Food, Safety and Animal Welfare: Submission by the World Organization for Animal Health (OIE)*, G/SPS/GEN/822, circulated on 25 February 2008, paras 5-8.

<sup>464</sup> Spencer Henson *et al.*, 'Private Food Safety and Quality Standards for Fresh Produce Exporters: The Case of Hortico Agrisystems, Zimbabwe', *Food Policy* 30, 2005, 371 - 384, 373. Henson *et al.* argue that there is evidence of this exclusionary effect of private standards and refer to the example of the Kenyan fresh vegetable industry. They report that the participation of small-scale producers in the Kenyan export supply chain for fresh vegetables decreased sharply from 45% of these exports in the mid-1980s, to an estimated 18% by 1998.

Among the main concerns raised by developing countries with regard to private sector standards are the great variety of such standards<sup>465</sup> and the non-recognition of equivalent standards set by other bodies.<sup>466</sup> In addition, most often certification of conformity with such standards by a specified independent (or ‘third party’) body is required.<sup>467</sup> As usually these conformity assessment bodies are not local but foreign bodies, their rates are not affordable for local producers.<sup>468</sup> Private sector standards are even more burdensome in cases where they are developed without consultation of producers.<sup>469</sup> In addition, often there is no scientific justification for the stricter standard.<sup>470</sup> The ability of private SPS

<sup>465</sup> For example, as reported by Grace Chia-Hui Lee, in the meat industry alone, many different certification schemes are in place in different countries such as the Dutch *Integrale Ketten Beheersing*, the Belgian *Certus*, the British Assured British Meat, the French *Label Rouge* and the German *Qualität und Sicherheit*. Grace Chia-Hui Lee, *Private Food Standards and Their Impacts on Developing Countries* (European Commission, DG Trade, Unit G2, Brussels), 2006, 10, available at: [http://trade.ec.europa.eu/doclib/docs/2006/november/tradoc\\_127969.pdf](http://trade.ec.europa.eu/doclib/docs/2006/november/tradoc_127969.pdf), visited on 26 May 2008. It should be noted, however, that some effort is being made to coordinate various private sector standards, either through consortia of retailers adopting a harmonised set of private standards (e.g. EUREPGAP) or by the practice of ‘benchmarking’ which entails setting out key criteria against which various private sector standards are assessed (e.g. the Global Food safety Initiative). *Ibid.*, 13-14. Henson however argues that it is unlikely that a harmonised private sector standard will emerge. He states: ‘as fast as collective private standards are evolving, leading food retailers are introducing their own proprietary standards in particular spheres of food safety and/or quality to retain scope of product differentiation.’ Spencer Henson, ‘The Role of Public and Private Standards in Regulating International Food Markets’, presented at the *IATRC Summer Symposium on Food Regulation and Trade: Institutional Framework, Concepts of Analysis and Empirical Evidence*, Bonn) May 28-30 2006, 17, available at: [http://www.ilr1.uni-bonn.de/iatrc/iatrc\\_program/Session%204/Henson.pdf](http://www.ilr1.uni-bonn.de/iatrc/iatrc_program/Session%204/Henson.pdf), visited on 27 May 2008.

<sup>466</sup> Since private sector standards are often introduced to create marketplace differentiation between products that are in fact equivalent in sanitary terms, as a means to create a competitive advantage for a product, commercial considerations argue against recognising the standards of other private bodies as equivalent. The issue of the recognition of equivalence between private sector schemes was among those addressed in the recent information session on private standards organised by the Standards and Trade Development Facility. Committee on Sanitary and Phytosanitary Measures, *Report of the STDF Information Session on Private Standards (26 June 2008)*. Note by the Secretariat, G/SPS/50, circulated on 24 July 2008, para. 2.

<sup>467</sup> The fact that small-scale producers often find the costs of compliance certification prohibitive was pointed out by the representative of International Certification and Risk Services (CMi), the largest independent certifier of compliance with GLOBALGAP standards for fresh produce, and the sole certifier of Tesco’s Nature’s Choice, at the information session on private standards organised by the Standards and Trade Development Facility (STDF) in 2008. *Ibid.*, para. 9.

<sup>468</sup> Maki Hatanaka *et al.*, ‘Third-Party Certification in the Global Agrifood System’, *Food Policy* 30, 2005, 354 - 369, 355 and 364. Hatanaka *et al.* point out that the drive towards the use of third party certification is based on its ‘appeal to technoscientific values such as independence, objectivity and transparency in an attempt to increase trust and legitimacy among ... customers and to limit liability.’ However, they note that the high costs of third-party certification requirements have the capacity to exclude small and medium sized suppliers, especially those in developing countries, from global markets. A similar point is made by Gascoine *et al.* who note further, referring to a 2005 USAID study, that certification costs cannot be passed on by producers down the supply chain because of the competitive environment where there are so few buyers and so many suppliers. Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, para. 13.

<sup>469</sup> This results in private sector standards that ignore variations in production conditions, which accentuates the difficulties of compliance with private sector standards faced by developing countries according to the Managing Director of CMi. This statement was made in the context of his presentation during the information session on private sector standards organised by the STDF in 2008. Committee on Sanitary and Phytosanitary Measures, *Report of the STDF Information Session on Private Standards (26 June 2008)*. Note by the Secretariat, G/SPS/50, circulated on 24 July 2008, para. 9.

<sup>470</sup> Chia-Hui Lee reports that certain major retailers (including Aldi, Lidl, Metro and Rewe) required that all Ivory Coast pineapple producers be EUREPGAP certified by 1 January 2006, but imposed an additional

standards to escape the disciplines of the *SPS Agreement* therefore risks undermining the Agreement's achievements in improving market access.<sup>471</sup>

The question here is *not* whether private actors, such as supermarkets, retail consortia and third party certifiers, can be bound directly to the *SPS Agreement*. The *SPS Agreement*, like other WTO agreements, binds only WTO Members.<sup>472</sup> Therefore only actions (or omissions) by WTO Members,<sup>473</sup> or attributable to them,<sup>474</sup> can be challenged in dispute settlement proceedings under the covered agreements.<sup>475</sup> The question is instead in which cases a Member can be held responsible for the actions of private parties in its territory or of regional bodies in which entities in its territory are members. This question has received some academic attention in recent years.<sup>476</sup> It has also been extensively discussed at meetings of the SPS Committee, since it was first raised in 2005.

---

requirement that pesticide residue levels be limited to a third of the maximum levels permitted by the EU. Gascoine *et al.* point out that either the retailers involved were ignorant of the fact that EU residue levels are established at the lowest level achievable by good agricultural practice, or they intended to deceive consumers by claiming that their products were safer due to this more stringent private standard. Grace Chia-Hui Lee, *Private Food Standards and Their Impacts on Developing Countries* (European Commission, DG Trade, Unit G2, Brussels), 2006, 27, available at: [http://trade.ec.europa.eu/doclib/docs/2006/november/tradoc\\_127969.pdf](http://trade.ec.europa.eu/doclib/docs/2006/november/tradoc_127969.pdf), visited on 26 May 2008; Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, footnote 10.

<sup>471</sup> At the meeting of the SPS Committee in 2005, where the issue of private sector standards was first raised, Argentina pointed out that international disciplines have been negotiated to limit the trade restrictive effects of SPS measures and that Members have devoted time and financial and human resources to attending all the international meetings where standards were discussed, developed and implemented. It noted that if the private sector could impose unnecessarily trade restrictive standards, and Members 'had no forum in which to advocate some rationalization of these standards, twenty years of discussions in international fora would have been wasted.' Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 29–30 June 2005. Note by the Secretariat. Revision*, G/SPS/R/37/Rev.1, circulated on 18 August 2005, para. 20.

<sup>472</sup> As noted by the WTO Secretariat in its not on private standards and the *SPS Agreement*, while the definition of 'SPS measures' in Annex A.1 of the *SPS Agreement* is not explicitly limited to government measures, the provisions of the *SPS Agreement* explicitly refer to the rights and obligations of 'Members'. Committee on Sanitary and Phytosanitary Measures, *Private Standards and the SPS Agreement. Note by the Secretariat*, G/SPS/GEN/746, circulated on 24 January 2007, para. 15.

<sup>473</sup> In *US – Corrosion Resistant Steel Sunset Review* the Appellate Body held that '[i]n principle, any act or omission attributable to a WTO Member can be a measure of that Member for purposes of dispute settlement proceedings.' Appellate Body Report, *US – Corrosion Resistant Steel Sunset Review*, para. 81.

<sup>474</sup> Referring to the abovementioned finding in *US – Corrosion Resistant Steel Sunset Review* (although it incorrectly called the dispute *US – Carbon Steel*) the Panel in *EC – Approval and Marketing of Biotech Products* noted that for the EC's general *de facto* moratorium on the approval of biotech products to be a challengeable measure, it must be attributable to the EC. The Panel held that the 'common plan or course of action' followed by the EC Commission and a group of five EC Member States in order to prevent the final approval of applications regarding biotech products was a measure challengeable under the *SPS Agreement* as, according to the Panel, the Commission and five EC Member States are organs of the EC, from the perspective of international law. Thus, their actions were held to be attributable to the EC. Panel Report, *EC – Approval and Marketing of Biotech Products*, para. 7.1294.

<sup>475</sup> As held by the Panel in *Japan – Film*: 'As the WTO Agreement is an international agreement, in respect of which only national governments and separate customs territories are directly subject to obligations, it follows by implication that the term *measure* in Article XXIII:1(b) [of the GATT 1994] and Article 26.1 of the DSU, as elsewhere in the WTO Agreement, refers only to policies or actions of governments, not those of private parties.' Panel Report, *Japan – Film*, para. 10.52.

<sup>476</sup> Rex J Zeladis, 'When Do the Activities of Private Parties Trigger WTO Rules?', *Journal of International Economic Law* 10 (2), 2007, 335–362; Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006.

An examination of some of the comments by Members on this issue illustrates the lack of clarity that exists with regard to the role of the *SPS Agreement* in addressing private sector standards. The issue was raised before the SPS Committee for the first time in 2005 by Saint Vincent and the Grenadines with regard to the application of EUREPGAP standards to bananas by UK supermarkets.<sup>477</sup> Jamaica raised a similar concern with regard to EUREPGAP requirements for fresh fruit and vegetables.<sup>478</sup> The EC responded that EUREPGAP was not an EC body, and that its standards could not be seen as EC requirements.<sup>479</sup> Peru then raised the question of the interpretation of the reference in Article 13 of the *SPS Agreement* to non-governmental entities in the territory of a Member.<sup>480</sup> Mexico expressed the view that it is only when SPS measures were adopted by governmental authorities that a Member is obliged by Article 13 to ensure that governmental and non-governmental entities implement them properly. Mexico suggested that the SPS Committee look at Annex 3 of the *TBT Agreement* which establishes a Code of Good Practice applicable to non-governmental standard-setting institutions developing food quality standards.<sup>481</sup> From these comments it is clear that there is a need for clarification of three main issues. First, it is necessary to examine in which cases actions by private bodies might be regarded as measures by a Member, challengeable under the *SPS Agreement*. Second, Article 13 of the *SPS Agreement* must be examined to determine whether, and if so how, Members are required to discipline private sector bodies that develop, impose or implement SPS standards in their territories.<sup>482</sup> Third, there is a need for an examination of the possible role of a Code of Good Practice such as the one that exists in the *TBT Agreement*.

The question of when an action by a private entity is deemed an action by a WTO Member is important, as a Member is fully responsible for compliance with all the obligations of the *SPS Agreement*. Examples of situations where this question might arise, as noted by the WTO Secretariat, are where a government regulator decides to incorporate a standard developed by a private body into its SPS regulation. In addition, a government could condition the granting of import permits on third party certification of compliance with its own, or even private sector, SPS requirements.<sup>483</sup> If such actions are allowed to escape the disciplines of the *SPS Agreement*, Members would be encouraged to delegate tasks

<sup>478</sup> *Ibid.*, para. 17.

<sup>479</sup> *Ibid.*, para. 18.

<sup>480</sup> *Ibid.*, para. 19.

<sup>481</sup> *Ibid.*

<sup>482</sup> In its 2007 paper on the issue of private standards under the *SPS Agreement*, the WTO Secretariat listed some issues for possible consideration by the SPS Committee in this regard, including what 'positive measures and mechanisms' and what 'reasonable measures' Members can take to ensure compliance with the *SPS Agreement* by non-governmental entities. Committee on Sanitary and Phytosanitary Measures, *Private Standards and the SPS Agreement. Note by the Secretariat*, G/SPS/GEN/746, circulated on 24 January 2007, paras 17 and 26.

<sup>483</sup> *Ibid.*, para. 17.

in this area to private bodies to evade their obligations.<sup>484</sup> This issue is, however, not limited to the field of SPS regulation, but has arisen under other WTO agreements.<sup>485</sup> In *Japan – Film*, the Panel noted that, ‘what appear on their face to be private actions may nonetheless be attributable to a government because of some governmental connection to or endorsement of those actions.’<sup>486</sup> The Panel further held that private party action may be deemed governmental ‘if there is sufficient government involvement with it.’<sup>487</sup> However, it recognised that no bright-line rules can be established to determine whether there is sufficient government involvement, and a case-by-case examination is necessary.<sup>488</sup> This idea is to some extent expressly incorporated into Article 13 of the *SPS Agreement*. Where government involvement takes the form of measures requiring or encouraging non-governmental bodies or regional bodies to act inconsistently with its rules, Article 13 of the *SPS Agreement* explicitly prohibits such measures. Similarly, Article 13 prohibits reliance by Members on the services of non-complying non-governmental bodies for implementing SPS measures. Such actions by a Member would be, in themselves, a violation of Article 13. However, in the light of the attribution case law developed under the GATT, one could argue that there is likely to be a sufficient nexus between the inconsistent action by the private body and the Member that requires, encourages or relies on such action to attribute the action to the Member involved. As such, the private action becomes a measure by a Member subject to all the disciplines of the *SPS Agreement* and can be challenged as such, independently of the Article 13 challenge. Similarly, there can be cases beyond those mentioned in the last two sentences of Article 13, where a private body’s action is attributable to a Member. For example, where a Member relies on a private body not for the implementation of its SPS measures (as covered by Article 13) but for the elaboration thereof. A typical example is that of independent national bureaus of standards, whose food safety standards are often relied upon by government regulators. As the standard becomes an SPS measure of a Member, the manner in which it was elaborated must comply with the disciplines of the *SPS Agreement*, for example with regard to its basis in a risk assessment, transparency etc. In this way, Members are prevented from outsourcing their regulatory tasks to private bodies in order to evade their obligations under the *SPS Agreement*.

<sup>484</sup> The Panel in *Japan – Film* noted this risk. Panel Report, *Japan – Film*, para. 10.328.

<sup>485</sup> Under the GATT 1947, for example, the GATT Panel in *Canada – FIRA* found that the term ‘laws, regulations or requirements’ in Article III:4 included a written purchase undertakings by private investors, which once they were accepted, became part of the conditions under which the investment proposals were approved, in which case compliance could be legally enforced. GATT Panel Report, *Canada – FIRA*, para. 5.4. Under the GATS, the definition of the ‘measures by Members’ that fall within the scope of application of the Agreement includes ‘measures taken by: ... non-governmental bodies in the exercise of powers delegated by central, regional or local governments or authorities.’ Article I:3 of the GATS. The issue is also addressed in customary international law. Article 5 of the ILC *Draft Articles on Responsibility of States for Internationally Wrongful Acts* provides: ‘The conduct of a person or entity which is not an organ of the State under article 4 but which is empowered by the law of that State to exercise elements of the governmental authority shall be considered an act of the State under international law, provided the person or entity is acting in that capacity in the particular instance.’

<sup>486</sup> Panel Report, *Japan – Film*, para. 10.52. The issue was already addressed by the GATT Panel in *Review Pursuant to Article XVI:5*, which found that private party subsidy schemes that were dependent for their enforcement on some form of government action, were subject to the notification obligation in Article XVI:1 of the GATT 1947. GATT Panel Report, *Review Pursuant to Article XVI:5*, para. 12.

<sup>487</sup> Panel Report, *Japan – Film*, para. 10.56.

<sup>488</sup> *Ibid.*

To the extent that actions by private bodies cannot be attributed to a Member, in the absence of a sufficient level of government intervention, the question arises whether Article 13 of the *SPS Agreement* nevertheless makes Members responsible for ensuring the conformity of such actions with the provisions of the Agreement. This issue is addressed by the third sentence of Article 13, which obliges Members to ‘take such reasonable measures as may be available to them’ to ensure compliance with the *SPS Agreement* by non-governmental entities within their territories and by regional bodies in which entities in their territories are members. It must first be determined whether private entities that set, implement or check conformity with SPS standards, either on national level (e.g. the British Retail Consortium) or on regional level (e.g. EUREP) are covered by this provision. If so, it would require WTO Members to take the *reasonable measures* available to them to ensure that these private bodies in their territories or regional bodies in which entities in their territory participate comply with the *SPS Agreement*. This raises the additional question of what is meant by ‘such reasonable measures as may be available’.<sup>489</sup>

The terms ‘non-governmental entities’ and ‘regional bodies’ are not defined in the *SPS Agreement*. There is also no case law under Article 13 of the *SPS Agreement* that addresses the question whether this Article’s reference to ‘non-governmental entities’ and ‘regional bodies’ brings under its scope private sector bodies that set, implement, or check conformity with, SPS standards at national and regional level. In view of the discussion during the negotiation of the *SPS Agreement* it appears that negotiators wanted to prevent the evasion of the disciplines of the *SPS Agreement* by Members, through allowing more and more SPS requirements to be developed or implemented through independent agencies or regional networks of regulators. By minimising the level of government intervention in such national or transnational bodies, the Member concerned might be able to avoid the attribution of their actions to it. In light of these concerns to prevent the evasion by Members of the new disciplines, and in view of the fact that at the time of negotiation of the *SPS Agreement* private sector SPS standards were rare, it is likely that the reference to ‘non-governmental entities’ in Article 13 of the *SPS Agreement* was intended by negotiators to refer to bodies such as national standards bureaus, which in many Members operate independently of government, but whose standards in the area of food safety are frequently incorporated in national regulation. Some indication of the meaning of ‘regional bodies’ is given by the specification in Article 13 that they are bodies in which entities in a Member’s territory are members. In other words, unlike the meaning of ‘regional’ in Article XXIV:12 of the GATT, these are not sub-national government authorities. Instead, they are transnational bodies in which entities within the relevant Member participate. The word ‘regional’ indicates that these bodies are open for membership by the relevant entities of some but not all WTO Members. This is the same meaning found in the definition of ‘regional body or system’ in the *TBT Agreement*, and there seems to be no reason why this meaning would not be apt in the SPS context. It is likely that for purposes of the *SPS Agreement* this term was intended to refer to SPS regulatory bodies established under regional agreements, such as FSANZ,<sup>490</sup> or to transnational coopera-

<sup>489</sup> Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, 74-77 and 80-81.

<sup>490</sup> Note that the term ‘regional bodies’ does not encompass the EC for purposes of Article 13 of the *SPS Agreement*. The EC, in its own right, is a Member of the WTO. It is directly bound by the obligations of the *SPS Agreement* and its actions are considered analogous to acts of a ‘central government body’. Thus no

tive networks in which SPS regulatory agencies of Members participate. In other words, it would appear that the scope of the third sentence of Article 13, as originally intended, was limited to those bodies that had some link to government regulatory agencies, which while insufficient for attribution of their actions to the Member concerned could provide some possibility for evasion of SPS disciplines.

While this narrow meaning of non-governmental and regional bodies was most likely intended by the drafters of the *SPS Agreement*, the question arises whether a ‘good faith’ interpretation of these terms, as required by Article 31 of the *Vienna Convention on the Law of Treaties* would today require consideration of the changed circumstances in SPS governance. It is to some extent arguable that an evolutive interpretation is called for,<sup>491</sup> in the light of the fact that private sector bodies at subnational and transnational level (such as Wal-Mart or GLOBALGAP) currently play such an important role in elaborating, implementing and assessing conformity with private sector SPS standards, to the extent that the distinction between public and private sector SPS requirements loses much of its meaning for producers of food and agricultural products.<sup>492</sup> Such an evolutive interpreta-

---

reliance on Article 13 is necessary with regard to acts by EC organs. This interpretation is supported by the fact that under the *TBT Agreement* an explanatory note to the definition of a ‘central government body’ notes that ‘[i]n the case of the European Communities the provisions governing central government bodies apply.’ This explanatory note clarifies, however, that where regional bodies are created within the EC, these would fall under the provisions on ‘regional bodies’. There is no reason to expect a different interpretation under the *SPS Agreement*. In fact, in the disputes under the *SPS Agreement* involving the EC, no recourse to Article 13 was needed and the provisions of the *SPS Agreement* were simply applied to the actions of the EC directly.

<sup>491</sup> A contrary argument is made by Steven Bernstein and Erin Hannah with respect to standards set by ‘non-state market driven governance systems’, which they propose should be kept outside the ambit of WTO disciplines, even if they are explicitly adopted or implicitly supported by Members. According to these authors, a ‘transnational regulatory space’ should be preserved for such systems from WTO disciplines, as they serve to embed societal values in the global marketplace. To open the door for WTO challenges to such systems would threaten the legitimacy of the WTO, in their view. Steven Bernstein and Erin Hannah, ‘Non-State Global Standard Setting and the WTO: Legitimacy and the Need for Regulatory Space’ *Journal of International Economic Law*, 11(3), 2008, (advance access) 1-34, 4-5. It is argued here, in respect of private sector SPS standards, that while regulatory space should be respected to enable private firms to respond to consumer demands for higher safety levels, some level of procedural discipline is certainly called for. The legitimacy of some private sector SPS standards can be questioned due to the non-participatory and untransparent nature of the standard-setting process. In fact the GLOBALGAP partnership of food retailers has faced criticism regarding the legitimacy of its standards, which are seen as focused on retailer interests and lacking in stakeholder participation and transparency. This differs from the trend among non-state standard setters in the areas of environmental or labour standards, such as the Fairtrade Labelling Organisations and the Rainforest Alliance, which work towards ensuring the legitimacy of their standards by aligning themselves with best practice standards in standard setting as developed by the International Social and Environmental Accreditation and Labelling (ISEAL) Alliance. In view of the absence of such a trend in the area of private sector SPS standards, and their importance as *de facto* barriers to trade, a certain level of discipline would not be misplaced.

<sup>492</sup> Such an evolutive interpretation goes a step further than that applied by the Appellate Body in *US – Shrimp*. In the latter dispute, the Appellate Body interpreted the term ‘exhaustible natural resources’ in Article XX(g) of the GATT 1994 in an ‘evolutive’ manner to include living resources (such as turtles). In that case, the Appellate Body noted that the treaty provision had been crafted over 50 years before. The ‘contemporary concerns of the community of nations’ as embodied in international environmental treaties, according to the Appellate Body, showed that both living and non-living resources were to be considered natural resources. The Appellate Body referred to *Namibia (Legal Consequences) Advisory Opinion* (1971) I.C.J. Rep., p. 31, where the International Court of Justice stated that in the case of concepts embodied in a treaty that are by definition, evolutionary, their ‘interpretation cannot remain unaffected by the subsequent development of law... Moreover, an international instrument has to be interpreted and applied within the framework of the

tion, while going further than the original intention of the drafters, seems justifiable due to the fact that it is in accordance with the ordinary meaning of the terms of Article 13 of the *SPS Agreement*, which in no way limit the scope of ‘non-governmental entities’ or ‘regional bodies’ to bodies with some link to government regulatory agencies.<sup>493</sup> In addition, it would be in keeping with the purpose of Article 13, namely to take account of the reality of shifts in SPS governance by requiring Members to take reasonable steps to discipline non-governmental and regional actors in the field, to extend its coverage to the new, and arguably most important, actors in these categories. This interpretation would give the third sentence of Article 13 a wide ambit. However, this does not mean that Members would thereby be responsible for every act of a private body that does not conform to the provisions of the *SPS Agreement*.

It is necessary to examine what are the *limits* of the obligations of Members under the third sentence of Article 13 of the *SPS Agreement*. In the first place, the nature of the obligation in this sentence should be noted. It is an obligation of conduct (a so-called ‘best-endeavour’ obligation) rather than an obligation of result. Members are not required actually to ensure compliance by non-governmental entities and regional bodies, but only to take such reasonable measures as may be available to them to ensure such compliance. As a result, non-compliance with the rules of the *SPS Agreement* by a non-governmental body will not necessarily entail the responsibility of a Member under Article 13. Only the failure of the Member to take the required reasonable measures would be challengeable. It would seem that such a challenge can be brought independently of a claim of violation by a private entity of a particular provision of the *SPS Agreement*.

From the cautious terms in which the third sentence of Article 13 is framed, it appears that the extent of the obligations of Members in respect of compliance by non-governmental and regional bodies is rather limited. Members are not obliged to take all measures possible within their legal system to ensure compliance by such bodies, but only to take ‘such reasonable measures as may be available’ to them to do so. It is useful to examine the ordinary meaning of the words used, in the light of their context and the object and purpose of the Agreement in order to try to obtain clarity as to the meaning of Article 13.<sup>494</sup> The applicable definition of ‘reasonable’ in the *Concise Oxford Dictionary* is ‘within the

---

entire legal system prevailing at the time of the interpretation.’ Appellate Body Report, *US – Shrimp*, paras 129-130 and footnote 109. By contrast, the proposed interpretation of ‘non-governmental entities’ and ‘regional bodies’ in Article 13 of the *SPS Agreement* is based on changes in the normative framework of SPS requirements that occurred over a much shorter period (less than a decade) due to the exponential increase in private sector SPS standards. In addition, these changes do not relate to the ‘subsequent development of law’ or the ‘legal system prevailing at the time of the interpretation’, but rather to the development of *de facto* binding force of private sector standards due to the concentration of large retailers and their dominance of the food and agricultural market.

<sup>493</sup> By way of contrast, see the definition of ‘non-governmental body’ in Annex 1.7 of the *TBT Agreement*: ‘Body other than a central government body or a local government body, including a non-government body which has legal power to enforce a technical regulation.’ See also the definition of ‘measures by Members’ in Article 1.3 of the GATS which refers to measures taken by ‘non-governmental bodies in the exercise of powers delegated by central, regional or local governments or authorities.’

<sup>494</sup> Article 31 of the *Vienna Convention on the Law of Treaties* provides: ‘A treaty shall be interpreted in good faith in accordance with the ordinary meaning to be given to the terms of the treaty in their context and in the light of its object and purpose.’ As noted by the Panel in *US – Section 301 Trade Act*, the elements of Article 31 constitute a holistic rule of interpretation rather than a sequence of separate tests to be applied in a hierarchical order. Panel Report, *US – Section 301 Trade Act*, para. 7.22.

limits of reason; not greatly less or more than might be expected.<sup>495</sup> The same dictionary defines ‘available’ as ‘capable of being used, at one’s disposal.’<sup>496</sup> While it is clear that Article 13 does not oblige Members to take *all* measures at their disposal, these dictionary definitions leave open the question of which measures at a Member’s disposal it ‘might be expected’ to use to discipline the actions of different types of ‘non-governmental’ and ‘regional’ bodies. As has been held by the Appellate Body, dictionary definitions are not dispositive of the ordinary meaning of treaty terms but must be seen in the light of the surrounding circumstances.<sup>497</sup> It seems logical that what is ‘reasonable’ in one set of circumstances is not necessarily so in another. In particular, while a relatively high level of government intervention may be regarded as reasonable with respect to independent national standards bureaus and regional networks of regulators in which governmental agencies of a Member participate, this is not the case with regard to private economic actors such as supermarkets and retail consortia. In a free market economy, the level of government intervention in normal competitive behaviour of economic actors is limited to what is necessary to pursue public policy objectives such as consumer protection and prevention of anticompetitive practices. It is doubtful whether preventing food companies from responding to consumer demands for a higher level of food safety falls within these limits.

The context for the interpretation of Article 13 of the *SPS Agreement* includes other WTO agreements. The phrase ‘such reasonable measures as may be available’ is also found in Article XXIV:12 of the GATT 1947 with regard to local and regional government bodies and was interpreted to require a ‘serious, persistent, and convincing effort’ by a Contracting Party to ensure compliance.<sup>498</sup> In addition, it was held that in determining which measures are ‘reasonable’ for purposes of this Article, the consequences of the non-observance of the provisions of the GATT by local government for trade relations with other Contracting Parties ‘are to be weighed against the domestic difficulties of securing compliance.’<sup>499</sup> These cases dealt with measures by local government bodies,

---

<sup>495</sup> *Concise Oxford Dictionary*, 9th ed. (Oxford University Press, Oxford), 1995. The definition includes other meanings of reasonable that are not applicable to this context (e.g. having sound judgement or inexpensive). Only the relevant part of the definition is quoted here.

<sup>496</sup> *Ibid.*

<sup>497</sup> As noted by the Appellate Body in *EC – Chicken Cuts*: ‘The Appellate Body has observed that dictionaries are a “useful starting point” for the analysis of “ordinary meaning” of a treaty term, but they are not necessarily dispositive. The ordinary meaning of a treaty term must be ascertained according to the particular circumstances of each case. Importantly, the ordinary meaning of a treaty term must be seen in the light of the intention of the parties “as expressed in the words used by them against the light of the surrounding circumstances”.’ Appellate Body Report, *EC – Chicken Cuts*, para. 175. Here the Appellate Body referred to its earlier case law in Appellate Body Report, *US – Softwood Lumber IV*, para. 59; Appellate Body Report, *US – Offset Act (Byrd Amendment)*, para. 248; and Appellate Body Report, *US – Gambling*, para. 166.

<sup>498</sup> GATT Panel Report, *Canada – Provincial Liquor Boards (US)*, para. 5.37. Note that this dispute was decided before the *Understanding on the Interpretation of Article XXIV of the General Agreement on Tariffs and Trade* was adopted in the Uruguay Round, limiting the flexibility allowed by this provision with regard to local and regional government bodies, as discussed above.

<sup>499</sup> GATT Panel Report, *Canada – Gold Coins*, para. 69. The GATT Panel relied, for its interpretation of ‘reasonable’, on the Note *Ad Article III:1 of the GATT* which clarifies what ‘reasonable measures’ in Article XXIV:12 would mean for purposes of legislation of local governments imposing internal taxes. The Panel stated: ‘According to this note the question of whether the repeal of such enabling legislation would be a reasonable measure required by Article XXIV:12 should be answered by taking into account the spirit of the inconsistent local tax laws, on the one hand, and the administrative or financial difficulties to which the repeal of the

in respect of which it is arguable that much more can be regarded as ‘reasonable’ than in respect of private economic actors, as discussed above. Examples of reasonable measures that may be available to Members to ensure compliance by national and transnational private bodies with the *SPS Agreement* could be:<sup>500</sup> the dissemination of information or provision of training on the Agreement to private sector bodies; agreement of Memoranda of Understanding with private sector bodies in which these bodies commit to comply with the relevant disciplines of the Agreement;<sup>501</sup> the provision of financial incentives for private sector bodies to comply with these provisions; and the development of a national policy in this regard. It does not seem, however, that the ‘reasonable measures as may be available’ required of Members extend to the enactment of legislation obliging private sector bodies to comply with the disciplines of the *SPS Agreement*.<sup>502</sup> If this was required, it is more likely that the sentence would read ‘Members shall take *all* measures available to them...’ or even ‘Members shall ensure...’ An interpretation of the third sentence of Article 13 to require legislative action imposing the rules of the *SPS Agreement* on private entities would disregard the qualifiers ‘reasonable’ and ‘may be available’ entirely, contrary to the principle of effective treaty interpretation.<sup>503</sup>

In fact, such an interpretation would seem to be a step too far. The provisions of the *SPS Agreement* were clearly not drafted with private sector standards in mind. They apply disciplines pertaining to best regulatory practices that address aspects of the risk analysis process carried out by national regulators. As a result, the extent of intervention in private economic activity that would result if Article 13 were interpreted to require Members actually to ensure that private sector standards comply with all these disciplines seems inappropriate. Of course, arguments based on the negotiating history of the *SPS Agreement* are not dispositive.<sup>504</sup> They could be countered by a call for an evolutive interpretation of the Agreement to take account of the current reality where the difference between public and private standards for exporters has blurred. More importantly than the negotiating history, however, the object and purpose of the *SPS Agreement* militates against an interpretation to the effect that Members would have to ensure compliance with its provisions by private entities through legislative means. The aim of the *SPS Agreement* is to achieve a balance between the sovereign right of Members to protect health in their territories and the need to prevent protectionism under the guise of SPS regulation. The application of

---

enabling legislation would give rise, on the other.’ *Ibid.*

<sup>500</sup> These examples are identified, with regard to the *TBT Agreement*, by Gascoine *et al.* Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, paras 11 and 66.

<sup>501</sup> Such a Memorandum of Understanding exists with regard to the *TBT Agreement* between the Commonwealth of Australia and Standards Australia, an independent national standard-setting agency. See further above, Part II, Section 2.4.2.1.

<sup>502</sup> Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, para. 66.

<sup>503</sup> As held by the Appellate Body in *US – Gasoline*, a treaty may not be interpreted in such a way that clauses would be reduced to redundancy or inutility. Appellate Body Report, *US – Gasoline*, 21.

<sup>504</sup> In terms of Article 32 of the *Vienna Convention on the Law of Treaties* recourse may be had to supplementary means of interpretation of treaties, including the preparatory work of the treaty and the circumstances of its conclusion, in order to confirm the meaning resulting from the application of the general rule of interpretation contained in Article 31. In that function, the negotiating history of the *SPS Agreement* is useful to consider as it confirms the interpretation arrived at through a consideration of the wording, object and purpose and context of the Agreement.

its disciplines to private sector bodies would not seem to further this objective. Private sector bodies that develop, impose and assess conformity with private standards are not motivated by a responsibility for health protection, but rather by commercial interests.<sup>505</sup> Neither can they be accused of protectionism since their activities are in most cases of a global nature and dependant on imports. Rather, their actions raise concerns in the area of anti-competitive practices such as abuse of a dominant position.<sup>506</sup> This is not a problem that the *SPS Agreement* is designed to address. Therefore it seems inappropriate to oblige Members to enact legislation to ensure that private sector bodies comply with the *SPS Agreement*. While legislation directed at private bodies is a tool ‘at the disposal’ of Members, it does not seem to be a ‘reasonable measure’ in this context. It is arguably sufficient that a Member provide information and create incentives for private sector bodies at national and transnational level to respect the provisions of the *SPS Agreement* that are relevant to them.

While the current regulatory disciplines of the *SPS Agreement* are not suitable for application to private sector standards, the reality of the fact that such standards are a significant obstacle to trade in food and agricultural products cannot be ignored. This is particularly so due to the disproportionate burden these standards place on developing-country producers, and in particular on small-scale producers in these countries. The development impact of private sector standards therefore merits serious attention. The issue is how best this matter can be addressed.

The question then arises whether an approach to private sector standards such as the one embodied in the *TBT Agreement* would be the best way forward. The *TBT Agreement* was negotiated in full awareness of the importance of the private sector in setting, applying and assessing conformity with technical standards. It therefore has more elaborate provisions to address actions by non-governmental bodies. The term ‘non-governmental body’ is defined in Annex 1.8 of the *TBT Agreement* to mean a ‘[b]ody other than a central

---

<sup>505</sup> Even though private SPS standards may aim at food safety and thus at the protection of human health, this cannot be taken to mean that private bodies are *responsible*, in the way sovereign governments are, for the protection of health. Consequently, the considerations that play a role in the activities of private bodies in this area differ significantly from those that underlie governmental regulatory activity. Government regulation has a normative foundation in the sovereign duty to ensure the rights to life, health and safe food, and incorporate considerations of distributional equity. The standards elaborated or implemented by private bodies are instead a way to increase profits through responding to affluent consumers’ willingness to pay a price premium for higher levels of safety, and to reduce costs from liability for damage from unsafe products. To require private bodies to behave as governmental regulators in this area, for example by making sure that there are no arbitrary or unjustifiable distinctions in the level of protection they aim at in similar situations and to harmonise their measures around international standards unless the need for a stricter measure can be scientifically justified, would be to disregard this important difference.

<sup>506</sup> Gascoine *et al.* recommend, as a possible way forward, an examination of domestic competition issues that arise from the use of private standards as a means of collusion or abuse of a dominant position by retailers. Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, para. 17(ii). The role of national governments to ensure that private sector standards do not constitute or conceal anti-competitive practices is also noted in Steven Jaffee *et al.*, *Food Safety and Agricultural Health Standards: Challenges and Opportunities for Developing Country Exports*, 31207 (World Bank, Poverty Reduction & Economic Management Trade Unit and Agriculture and Rural Development Department, Washington D.C.), 10 January 2005, 9, available at: [http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016\\_20050125093841/Rendered/PDF/31207.pdf](http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016_20050125093841/Rendered/PDF/31207.pdf), visited on 18 May 2008.

government body or a local government body, including a non-governmental body which has legal power to enforce a technical regulation'. A literal reading of this rather vague provision, particularly of the word 'including', seems to indicate that both bodies with and bodies without the power to enforce technical regulations are covered. However, it could also be argued that the specific mention of bodies with enforcement power means, *a contrario*, that bodies lacking such power are not covered by this term. Such a limited interpretation would negate the possibility to bring private sector standards under the *TBT Agreement*, a consequence to be avoided.

Similar to the situation under the *SPS Agreement*, as well as under the Tokyo Round *Standards Code*, the *TBT Agreement* contains 'second level' obligations with respect to non-governmental bodies. In particular, Members are required to take such reasonable measures as may be available to them to ensure that these bodies comply with the disciplines of the *TBT Agreement* with respect to the preparation, adoption and implementation of technical standards and the implementation of conformity assessment procedures.<sup>507</sup> However, the *TBT Agreement* goes further than this. In respect of voluntary standards it establishes a Code of Good Practice for the Preparation, Adoption and Application of Standards (the Code of Good Practice). This Code of Good Practice lays down obligations for standardising bodies, whether central or local government bodies, regional bodies or non-governmental bodies. These obligations include non-discrimination, avoidance of unnecessary barriers to trade, the use of international standards as a basis for standards unless they would be ineffective or inappropriate, avoidance of duplication of work, publication of a work programme every six months, prior notification of draft standards with provision of a comment period and a requirement to take into account and respond to comments, and prompt publication of adopted standards.<sup>508</sup>

With regard to non-governmental and regional bodies, Members are obliged to take reasonable measures to ensure that these bodies accept and comply with the Code of Good Practice.<sup>509</sup> However, whether or not the standardising body has accepted the Code of Good Practice, the Member's obligation to take reasonable measures to ensure compliance therewith applies. This should not create the impression that direct challenges are possible against non-governmental bodies that have accepted but not complied with the Code of Good Practice. The obligations of the *TBT Agreement* bind Members only, and it is the relevant Member that is responsible if it has not taken the 'reasonable measures' available to it to ensure compliance.

It is arguable that the Code of Good Practice in the *TBT Agreement* covers also entities that set private sector SPS standards, and that Article 8 thereof covers private entities that assess conformity with SPS standards. If 'non-governmental body' under the *TBT Agreement* is understood to include non-governmental bodies with no official enforcement power, it would cover private bodies that develop, implement and assess conformity with private SPS standards. In addition, although SPS measures are excluded from

---

<sup>507</sup> Article 3.1 of the *TBT Agreement* with regard to technical regulations and Article 8.1 of the *TBT Agreement* with regard to conformity assessment procedures.

<sup>508</sup> It is interesting to note that the ISEAL Alliance's Code of Good Practices for Setting Social and Environmental Standards takes up several elements of the TBT Code of Good Practice.

<sup>509</sup> Article 4.1 of the *TBT Agreement*.

the scope of application of the *TBT Agreement*,<sup>510</sup> it can be argued that this does not apply to private SPS standards as they are not ‘SPS measures’ for purposes of the *SPS Agreement*. While the definition of an SPS measure in Annex A.1 of the *SPS Agreement* is not explicitly limited to governmental measures, unlike the *TBT Agreement*, the *SPS Agreement* does not contain any provisions specifically applicable to voluntary standards or conformity assessment procedures carried out by private bodies. It would therefore be strange to view such standards and procedures as SPS measures. This conclusion would be further reinforced if one were to follow the (arguably mistaken) approach of the Panel in *EC – Approval and Marketing of Biotech Products*, discussed above, requiring that to be an ‘SPS measure’ a measure must take the ‘form’ of a law, decree or regulation, all of which are by definition government measures.<sup>511</sup> This approach to the applicability of the Code of Good Practice and Article 8 of the *TBT Agreement* has the benefit of bringing some discipline to bodies setting, implementing and assessing conformity with private sector standards, without the need for negotiating new rules or guidelines. Be that as it may, it appears that WTO Members do not regard private SPS standards as falling under the *TBT Agreement’s* disciplines for standards and in particular the Code of Good Practice. Of all the non-governmental entities that have notified their acceptance of the Code of Good Practice, none are active in the area of SPS standards.<sup>512</sup> Further, when Members were asked by Chair of the TBT Committee if they wanted to discuss the issue of private SPS standards under the *TBT Agreement*, they did not indicate any interest to do so. In the view of the Chairman, this was due to the fact that the SPS element of private standards schemes was perceived by Members as more problematic than other elements.<sup>513</sup> It appears that particular disciplines are regarded as necessary by Members to address private SPS standards, different to those in the *TBT Agreement*.

The suggestion that a separate Code of Good Practice for the Preparation, Adoption and Application of Standards should be developed for the *SPS Agreement*, similar to that in Annex 3 to the *TBT Agreement*, has some merit. This would enable Members to draft disciplines that are appropriate for private sector bodies that set, apply and assess conformity with SPS standards.<sup>514</sup> In particular, these disciplines could target those practices of

<sup>510</sup> The relationship between the *SPS Agreement* and the *TBT Agreement* is discussed below, Part III, Section 2.4.1.

<sup>511</sup> See above, Part III, Section 2.1.1.

<sup>512</sup> Under Article 4.2 of the *TBT Agreement*, acceptance must be notified to the ISO/IEC Information Centre in Geneva, not to the WTO. Note, as reported by Gascoine *et al.* that the list of standardising bodies that notified their acceptance of the Code of Good Practice by January 2006 included no non-governmental standard setting bodies concerned with SPS standards. Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, para. 24. This was still the case in February 2008, when 160 standardizing bodies from 116 Members had notified acceptance of the Code of Good Practice, including 84 central governmental standardizing bodies, 65 non-governmental standardizing bodies, three statutory bodies, two parastatal bodies, three non-governmental regional bodies, one central governmental/non-governmental body, one central governmental/local governmental body and one autonomous body. The list is updated regularly and the latest version can be found in Committee on Technical Barriers to Trade, *List of Standardizing Bodies That Have Accepted the Code of Good Practice for the Preparation, Adoption and Application of Standards since 1 January 1995. Note by the Secretariat. Revision*, G/TBT/CS/2/Rev.14, circulated on 20 February 2008.

<sup>513</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting of 18–19 October 2007. Note by the Secretariat*, G/SPS/R/46, circulated on 2 January 2008, para. 140.

<sup>514</sup> This suggested Code of Good Practice would therefore extend further than that of the *TBT Agreement* in that the disciplines for conformity assessment procedures conducted by private bodies would be incorporated

private bodies that developing-country Members have identified as particularly problematic, such as lack of transparency,<sup>515</sup> absence of prior consultation to allow for input from producers,<sup>516</sup> undue burden from costly and complex conformity assessment procedures and non-recognition of equivalence.<sup>517</sup> This Code of Good Practice should stop short of requiring private sector bodies to base their measures on international standards, conduct risk assessments for their measures, or undertake any other activities inherent to the national regulatory process but inappropriate to the activities of private bodies. Members could then undertake to take reasonable measures available to ensure compliance with the SPS Code of Good Practice.<sup>518</sup>

It should be noted, however, that the agreement needed to adopt such a Code of Good Practice for the *SPS Agreement*, whether in the form of guidelines adopted by the SPS Committee in terms of its competence under Article 12.1 of the *SPS Agreement*,<sup>519</sup> or in the form of an amendment to the *SPS Agreement* agreed to by the Ministerial Conference under Article X of the *WTO Agreement*,<sup>520</sup> is very unlikely to be reached. Powerful lobbies of large retail conglomerates and consumer interest groups in developed-country

---

therein.

<sup>515</sup> Private standards of retail chains are often proprietary as they are part of a firm's competitive strategy. As a result, suppliers not in a relationship with the retailer are not informed of the requirements to be met.

<sup>516</sup> Some private standards, such as EUREPGAP, are developed by technical committees that include representatives not only of retailers but also of suppliers from different countries, thus including broad based stakeholder consultations. However, many others are developed with little producer involvement, resulting in standards compliance with which may be beyond the capacity of producers in developing countries, as they do not take account of local conditions or risk mitigation approaches.

<sup>517</sup> Benchmarking possibilities, such as the one for EUREPGAP, provides a possibility for the recognition of the equivalence of the GAP standards elaborated in developing countries. For example MexicoGAP, developed by the Mexican Ministry of Agriculture, and ChileGAP, developed by a private fruit industry body, have been successfully benchmarked to EUREPGAP. However, as reported by UNCTAD, benchmarking is not a viable option in many developing countries as the national standard, to be recognised, must comply with all control points and compliance criteria in the EUREPGAP standard, not merely result in the same level of safety. Unlike the equivalence regime in the *SPS Agreement* which depends on the equivalence of *outcomes*, benchmarking relies on the equivalence of *processes*. Committee on Sanitary and Phytosanitary Measures, *Private Sector Standards and Developing Country Exports of Fresh Fruit and Vegetables. Communication from the United Nations Conference on Trade and Development (UNCTAD)*, G/SPS/GEN/761, circulated on 26 February 2007, paras 37-40. For a discussion of the equivalence regime of the *SPS Agreement*, see below, Part IV, Section 1.1.

<sup>518</sup> The limited and appropriate nature of such disciplines coupled with the pervasiveness of private standards schemes seems to argue for a stronger interpretation of reasonable measures that may be available as in this case it would be reasonable to take all measures available within the legal system of the Member concerned to ensure compliance.

<sup>519</sup> Article 12.1 of the *SPS Agreement* mandates the SPS Committee to carry out the functions necessary to implement the provisions of the *SPS Agreement* and to further its objectives. The SPS Committee has used this competence already to adopt guidelines to further the implementation of other Articles of the *SPS Agreement*. All decisions of the SPS Committee must be made by consensus. It is important to note that the SPS Committee is not empowered to amend the *SPS Agreement* or to adopt binding interpretations thereof. Instead, its guidelines are voluntary. Nevertheless, as they embody a 'subsequent agreement between the parties regarding the interpretation of the treaty or the application of its provisions' within the meaning of Article 31.3(a) of the *Vienna Convention on the Law of Treaties*, they must be taken into account by WTO panels and the Appellate Body when interpreting the relevant provisions of the *SPS Agreement* together with the context.

<sup>520</sup> Simply put, Article X:1 of the *WTO Agreement* provides that, if consensus cannot be reached on a proposal to amend a WTO agreement, the Ministerial Conference may take a decision with a two-thirds majority. However, in practice it is very exceptional for WTO bodies to vote. Instead, the GATT practice of decision-making by consensus has been continued under the WTO.

Members can be expected to exert pressure on their governments to oppose any such development.<sup>521</sup> In such a situation, a next-best solution would be to address private sector standards under the existing TBT Code of Good Practice, and third party conformity assessment procedures under the disciplines of Article 8 of the *TBT Agreement*, by following the interpretation suggested above. It is to be hoped that a panel confronted by a challenge against the omission by a Member to use the measures reasonably available to it to ensure that private bodies comply with the TBT Code of Good Practice in elaborating and applying private SPS standards, or to ensure that private conformity assessment bodies comply with Article 8 of the *TBT Agreement*, would be willing to hold that such actions fall within the scope of application of the *TBT Agreement*.

By disciplining the procedural aspects of the activities of the relevant private bodies, including by requiring prior notification and consultation, and by promoting the recognition of equivalence between different private standards regimes, the provisions of a Code of Good Practice, whether that of the *TBT Agreement* or in an ideal situation a new one for the *SPS Agreement*, may go a long way to reducing the trade-restrictive effect of private sector SPS standards. This would, however, still leave private sector entities free to condition market access, *de facto*, on compliance with standards stricter than those contained in national regulations or international standards, without scientific justification.<sup>522</sup> It is doubtful whether requiring state intervention in this regard would be reconcilable with the free market system, as stricter private standards may be a legitimate response by economic operators to consumer demands,<sup>523</sup> and to the shift in liability regimes towards placing the onus for food safety on retailers.<sup>524</sup>

What is needed instead is effective technical assistance to facilitate compliance with private sector standards.<sup>525</sup> Already examples abound of successful adjustment of develop-

<sup>521</sup> Gascoine *et al.* note that Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, para. 7.

<sup>522</sup> Gascoine *et al.* therefore argue that it can be expected that the improvements at procedural level that could be achieved by a Code of Good Practice would 'ultimately not make much difference to the burden of compliance borne by exporters.' *Ibid.*, para. 44. However, as is argued in Part IV of this book where the procedural arrangements under the *SPS Agreement* are discussed, it is often the procedural disciplines that achieve most in terms of reducing the trade restrictive effect of SPS requirements and conformity assessment procedures. This is likely to hold true also for procedural disciplines on private sector standards. See below, Part IV, Chapter 1.

<sup>523</sup> Of course, this freedom is not absolute, but is limited in most countries by consumer protection rules, which prohibit misleading consumers, for example by false health claims.

<sup>524</sup> Gascoine *et al.* report that among the justifications given by supermarket chains for their use of private sector standards are that such standards are a legitimate response to consumer demands for food that is safer than what can be achieved through official regulations; that as the burden of ensuring that food is safe is firmly on retailers, and official regulations may not always be effective, they are justified in applying private standards; and that the large investments they have made in their brand reputation justifies strict measures to protect that reputation from damage caused by food safety problems. Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, paras 35-37.

<sup>525</sup> Wit reference to the challenges of adjustment to the stricter requirements set by private sector standards, Henson *et al.* note: 'Indeed, the scale of the challenge faced by small-scale producers in complying with stricter food safety and quality requirements invariably requires some form of external support to not only provide the required expertise and resources, but also to bring about the necessary changes to supply chain organisation and operation. In many cases, this is provided by the exporters, ... while in others non-governmental organisations (NGOs) may play a leading role.' Spencer Henson *et al.*, 'Private Food Safety and

ing-country producers to private standards where technical and financial assistance has been provided. Most often, this assistance is provided by large export firms that source their products from local producers and therefore have an interest in ensuring that these producers are able to meet the private sector standards of retail conglomerates.<sup>526</sup>

However the current practice with regard to technical assistance leaves much to be desired. Currently much of the assistance provided is dependant on contractual relationships between vertically integrated companies and their preferred suppliers. These arrangements have negative implications in that they create dependant relationships of producers with dominant buyers, which open the door for abuse, and in that they result in the further marginalisation of those small-scale suppliers that are not among the 'preferred suppliers'. This has significant implications for poverty alleviation in rural areas.<sup>527</sup> For example, a recent report of the Danish Institute for International Studies with regard to the organic spice trade of Tanzania points out that although almost all spice production in Tanzania is organic (due to farmers' inability to meet the costs of pesticides and fertilisers)<sup>528</sup> certified organic farming entails high compliance costs.<sup>529</sup> In the absence of government services to support organic farming and ensure conformity with organic certification requirements, small spice producers rely on two major vertically integrated companies which buy organic spices for export. These companies undertake organic certification and meet all certification and inspection fees.<sup>530</sup> However, these companies often do not observe

---

Quality Standards for Fresh Produce Exporters: The Case of Hortico Agrisystems, Zimbabwe', *Food Policy* 30, 2005, 371 - 384, 373.

<sup>526</sup> A case study that illustrates this point is provided in *Ibid.* Henson *et al.* examine the practices of the large Zimbabwean fresh produce exporter, Hortico Fresh Produce Ltd., which supplies high-value fresh vegetables to supermarkets in the UK, the Netherlands and South Africa. This exporting company relies on small-scale producers for labour intensive products such as fine beans and baby corn. It has established standards and procedures that the producers it contracts with must meet, in order to comply with the private standards applied by the foreign supermarkets it supplies. In order to ensure that small-scale producers can meet these standards, Hortico provides (through its subsidiary Agrisystems) training and on-going advice regarding production process requirements, pest control, fertiliser application, crop handling etc. It also provides the required inputs on credit to its contracted producers and maintains strict systems of inspection and control at its own cost. Despite an initial step learning curve, small-scale producers have performed as well as large-scale producers in meeting the exacting private sector standards applied by Hortico due to the financial and technical assistance provided by Hortico.

<sup>527</sup> Uruguay reports that 80% of agricultural production in Uruguay is in the hands of small, family-run enterprises. Private standards are too burdensome for such producers, thereby excluding them from export markets. Uruguay argues that since economies of scale are necessary for producers to be able to absorb the costs of private standards, these standards result in an imbalance in favour of large-scale producers, thereby displacing small-scale agriculture. Comité De Medidas Sanitarias y Fitosanitarias, *Normas Privadas. Declaración De Uruguay En La Reunión De Los Días 2 - 3 De Abril De 2008*, G/SPS/GEN/843, circulated on 21 May 2008, para.6. This document has not yet been translated.

<sup>528</sup> In addition, there is little need for fertilisers and pesticides due to the high fertility level of the soil and the fact that many spices are natural insect repellents. Adam Akyoo and Evelyne Lazaro, *The Spice Industry in Tanzania: General Profile, Supply Chain Structure, and Food Standards Compliance Issues*, DIIS Working Paper no 2007/8 (Danish Institute for International Studies, Copenhagen), 2007, 8, available at: <http://www.diiis.dk/graphics/Publications/WP2007/WP%202007-8%20final.web.pdf>, visited on 23 May 2008.

<sup>529</sup> *Ibid.*, 22-24. In order to be certified as organic production, rigorous control of the production process is required, including by ensuring the use of untreated seed, training farmers with regard to organic requirements, carrying out internal and external inspections and ensuring segregation and traceability of organic produce. Farmers are required to keep careful records.

<sup>530</sup> Cultivation of spices in Tanzania is smallholder-based, almost entirely comprising farms of under one acre. Two major companies, M/S Tazop Ltd. and Zangerm Ltd. dominate the organic market for spices and all

their contracts with the spice farmers, buying less than the agreed volume of production so that the rest has to be sold at low prices on the domestic market.<sup>531</sup> In addition, the dominant companies engage in opportunistic behaviour and buyer collusion, with adverse consequences for the spice producers.<sup>532</sup> The price premium for organic production currently goes to the vertically integrated companies rather than to the spice producers.<sup>533</sup> Therefore, while the technical and financial assistance provided by the export companies for compliance with the requirements for organic certification allows smallholders to gain access to the European market, this assistance is entirely self-interested. The dependence of smallholders on dominant companies makes them vulnerable to opportunistic behaviour. Clearly, this is not the kind of technical assistance that is needed.

Improvements are necessary to ensure that technical assistance is provided by donors in a coherent and effective manner and results in enabling small-scale producers to participate in export trade in a sustainable manner. An example of such a scheme of relevance to this example is the Export Promotion of Organic Products from Africa (EPOPA) programme, established by the Swedish International Development Agency (SIDA). One of its projects aims to establish internationally recognised local organic certification bodies in Tanzania and Uganda, by working closely with local stakeholders to create systems that are locally accepted and also compatible with international standards.<sup>534</sup> One important difference between capacity building programmes such as EPOPA and technical assistance through vertically integrated companies is the objective of the assistance given, which is often determinative for its development impact. Unlike the assistance provided by the two dominant exporting companies in Tanzania, the overall objective of EPOPA is poverty alleviation and rural development, and economic growth in favour of the poor.<sup>535</sup>

---

smallholders that wish to sell certified organic spices do so through one of these two companies. M/S Trazop contracted 320 certified farmers and Zangerm contracted 700 certified farmers in 2005. Both these companies have foreign sister companies (in Germany and Switzerland) with large shareholdings in the local company. The local company ensures conformity with organic certification requirements and availability of a steady volume of the product, whereas the foreign partner meets inspection and certification fees, markets the spices abroad and secures favourable prices. *Ibid.*, 6, 9, 11.

<sup>531</sup> Since local buyers have little interest in organic certified spices, on the domestic market organic producers have to compete with low-cost producers of spices that do not comply with the certification requirements. Akyoo and Lazaro report that the two dominant spice buying companies have often reneged on contract provisions requiring them to buy the farmers' entire crop. For example only 65-70% of certified organic ginger crop is bought by the relevant company. There is no enforcement of contractual obligations. *Ibid.*, 10 and 28.

<sup>532</sup> *Ibid.*, 14.

<sup>533</sup> *Ibid.*, 24.

<sup>534</sup> See the website of EPOPA, available at: <http://www.grolink.se/epopa/>, visited on 30 June 2008. Another example of a successful technical assistance project is that in Kenya, where assistance from the government, non-governmental organisations and producers associations have enabled small scale producers of fruit and vegetables to apply for EUREPGAP certification. Committee on Sanitary and Phytosanitary Measures, *Executive Summary of a Study on Agri-Food Safety and SPS Compliance in Guinea Conakry, Mozambique and Tanzania. Communication from UNCTAD, G/SPS/GEN/567*, circulated on 17 June 2005, para. 48.

<sup>535</sup> These objectives are set out in the evaluation of the second phase of implementation of EPOPA. Kim Forss and Mikael Lundström, *An Evaluation of the Program "Export Promotion of Organic Products from Africa" – Phase II* (Swedish International Development Cooperation Agency, Strängnäs), 15 October 2004, 50, available at: <http://www.grolink.se/epopa/Publications/EPOPA-Phase-2-Evaluation-04.pdf>, visited on 30 June 2008. This evaluation report further notes that SIDA policy emphasises market-led growth and development. It argues that markets must be made to work for the poor, notes the need for a 'holistic view of development cooperation in relation to economic growth, and particularly for the role that aid can play in creating an enabling environment, not least through institutional development.' *Ibid.*

This objective affects the choice of export projects, where they are located, and how they are structured to ensure sustainability and inclusiveness of marginalised groups. More of this type of capacity building programme is called for, but on a wider scale and with more coordination between donors and within projects.<sup>536</sup>

In the meantime, a pragmatic and immediate strategy to address private sector SPS standards is essential. It is suggested that this strategy take the form of using the available, and effective, possibility for multilateral discussion and sharing of experiences that is provided by the forum of the SPS Committee.<sup>537</sup> Since it was first raised in 2005, there have been two years of 'exploratory discussions' in the SPS Committee on this issue. Various WTO Members and Observers have made use of the opportunity provided by the SPS Committee to report on their experiences with private sector standards and to air their concerns.<sup>538</sup> Some Members suggested that private sector standards were best discussed in other fora, such as UNCTAD or the WTO Committee on Trade and Development.<sup>539</sup> This idea was rejected by many other Members who expressed appreciation for the 'rich debate' at the SPS Committee and noted that in view of the important trade implications of the issue, it should not only be examined in development fora.<sup>540</sup> An information session was organised by the WTO and UNCTAD in 2007 to help Members become familiar

---

<sup>536</sup> The evaluation of EPOPA notes that delays in projects were mostly caused by SIDA, and relate to uncertainties around finance sources, lack of policy coordination between units, and the inability to take the necessary tendering and contracting decisions. *Ibid.*, 48.

<sup>537</sup> The function of the SPS Committee to provide a forum for *ad hoc* consultations and negotiations among Members on specific SPS issues, under Article 12.2 of the *SPS Agreement*, is discussed below, Part IV, Section 2.1.2.

<sup>538</sup> For instance, in February 2007, Saint Vincent and the Grenadines submitted a communication pointing to the problems faced by private sector standards for small farmers, and recommending that 'consideration should be given to compliance with the *SPS Agreement*' when private sector standards are being developed. Committee on Sanitary and Phytosanitary Measures, *Private Industry Standards. Communication from Saint Vincent and the Grenadines*, G/SPS/GEN/766, circulated on 28 February 2007, para. 6. In June 2007, Ecuador noted the adverse effects posed by private standards to developing-country producers, mentioning the example of traditionally organic production in Ecuador which now has to bear the high costs of certification as such or lose market access. Committee on Sanitary and Phytosanitary Measures, *Private and Commercial Standards. Statement by Ecuador at the Meeting of 27–28 June 2007*, G/SPS/GEN/792, circulated on 5 July 2007. At the SPS Committee meeting in April 2008, highly critical remarks were made by a group of developing-country Members, led by Uruguay and Egypt, on the impact of private sector standards on developing-country trade. The report of this meeting is not yet publicly available. The information on the discussion at the meeting of 2-3 April 2008 is taken by the WTO News Item 'Members set to agree on regionalization, improved SPS transparency', available at: [http://www.wto.org/english/news\\_e/news08\\_e/sps\\_apr08\\_e.htm](http://www.wto.org/english/news_e/news08_e/sps_apr08_e.htm), visited on 26 May 2008. The OIE Director-General Bernard Vallat noted that private sector standards could undermine the science based and multilaterally agreed standards set by the 'three sisters'. This statement was made by way of introduction to the OIE submission on private standards. This submission noted that private sector standards are 'developed to meet the needs of commercial parties (especially supermarkets) and consumers and tend towards a non-scientific, zero risk, marketing approach that is not consistent with the disciplines of the *SPS Agreement*.' Committee on Sanitary and Phytosanitary Measures, *Considerations Relevant to Private Standards in the Field of Animal Health, Food, Safety and Animal Welfare: Submission by the World Organization for Animal Health (OIE)*, G/SPS/GEN/822, circulated on 25 February 2008, para. 2.

<sup>539</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting of 18–19 October 2007. Note by the Secretariat*, G/SPS/R/46, circulated on 2 January 2008, para. 139.

<sup>540</sup> *Ibid.*, paras 143 and 153. All the developing-country Members who participated in the discussion at this meeting stated unequivocally that the issue should be kept on the agenda of the SPS Committee. *Ibid.*, paras. 142-172.

with various private sector standard schemes.<sup>541</sup> After an impasse was reached on the question whether the *SPS Agreement* has a role to play in disciplining private standards, Members agreed in April 2008 to consider setting up a small group to work on the issue of private sector standards.<sup>542</sup> This initiative was discussed at an informal meeting of the SPS Committee meeting in June 2008, on the basis of a proposal by Uruguay on the terms of reference for such a working group.<sup>543</sup> In the meantime, due to the overwhelming support for keeping the issue on the agenda of the SPS Committee, it will remain there.<sup>544</sup>

At the SPS Committee meeting of 18-19 October 2007, the Chairman noted that discussing private standards in general terms was not a fruitful approach. Instead he proposed that future discussions should address proposals on how to deal with the challenges posed by private sector standards, and should focus on concrete experiences and examples by Members of problems they face with private SPS standards.<sup>545</sup> This proposal was supported by many Members, both developed-country and developing-country Members.<sup>546</sup> However, some developing-country Members expressed concerns that this approach risked losing sight of the big picture, and not resolving the issue of the role of the *SPS Agreement* in addressing this issue.<sup>547</sup> While the frustration of these Members is understandable, in view of the slim chance that agreement can be reached on the legal frame-

---

<sup>541</sup> This information session was held on 25 June 2007, and involved presentations on various private sector standard schemes and case studies on national experiences with private sector standards. The presentations made are available at: [http://www.wto.org/english/tratop\\_e/sps\\_e/private\\_standards\\_june07\\_e/private\\_standards\\_june07\\_e.htm](http://www.wto.org/english/tratop_e/sps_e/private_standards_june07_e/private_standards_june07_e.htm), visited on 26 May 2008.

<sup>542</sup> The information on the discussion at meeting of 2-3 April 2008 is taken from the WTO News Item 'Members set to agree on regionalization, improved SPS transparency', available at: [http://www.wto.org/english/news\\_e/news08\\_e/sps\\_apr08\\_e.htm](http://www.wto.org/english/news_e/news08_e/sps_apr08_e.htm), visited on 26 May 2008.

<sup>543</sup> Committee on Sanitary and Phytosanitary Measures, *Terms of Reference for the Working Group on Private Standards. Proposal by Uruguay*, G/SPS/W/225, circulated on 18 June 2008. At the informal meeting of the SPS Committee on 23 June, the Uruguayan proposal and other ideas were discussed. The chairperson reported to the formal SPS Committee meeting that there was support by Members for the whole document or certain parts of it. Differences remained on the size of the working group and who should chair it; whether the proposed terms of reference would prejudice the results of the working group's work by seeing private standards as mainly negative; whether the group should focus on concrete examples, examine where private standards deviate from the standards of international governmental bodies, or analyse the legal position of private standards under WTO agreements. To initiate the work, the chairperson and Secretariat will send a list of questions to Members and their replies will be used to discuss how to proceed in informal consultations in October. This information on the discussion at the informal and formal meetings of the SPS Committee in June is taken from the WTO News Item 'Members turn Attention to Improving SPS Mediation', available at: [http://www.wto.org/english/news\\_e/news08\\_e/sps\\_24june08\\_e.htm](http://www.wto.org/english/news_e/news08_e/sps_24june08_e.htm), visited on 26 June 2008.

<sup>544</sup> Committee on Sanitary and Phytosanitary Measures, *Private Standards and the SPS Agreement. Note by the Secretariat*, G/SPS/GEN/746, circulated on 24 January 2007, para. 15. See also Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting of 18-19 October 2007. Note by the Secretariat*, G/SPS/R/46, circulated on 2 January 2008, para. 172.

<sup>545</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting of 18-19 October 2007. Note by the Secretariat*, G/SPS/R/46, circulated on 2 January 2008, paras 140-141.

<sup>546</sup> The view that discussions at the SPS Committee on private standards should be concrete and specific was expressed by Australia, the EC, Japan, Canada, and the US. This approach was also regarded as useful by Senegal, Uruguay, Barbados, Bolivia, Bangladesh, Zimbabwe and Argentina although some of these Members felt that a global systemic debate, in parallel, could be useful. *Ibid.*, paras 145, 149, 150, 152, 153, 156, 157, 158 and 165.

<sup>547</sup> *Ibid.*, paras 143, 155, 165 and 170. In addition, Ecuador noted that obtaining information on concrete examples may prove difficult as producers may be reluctant to share information regarding non-compliance with private standards and thereby lose market share. *Ibid.*, para. 162.

work within which private standards could be addressed at the WTO, it seems advisable to exploit fully the existing mechanism provided by the SPS Committee to bring about gradual change through the sharing of experiences at technocratic level, and drawing critical attention to problems. As noted by Gascoine *et al.* large retailers ‘acknowledge that there is a business risk associated with the negative reaction of developing countries to their private standards.’<sup>548</sup> Similarly, the EC noted at the relevant SPS Committee meeting that the discussion at the Committee on the issue of private standards had sensitised the private sector bodies to the impact of their measures on developing countries, and that real efforts were being made by these bodies to address the issue.<sup>549</sup> Several Members that participated in the discussion at the November 2007 meeting pointed to the need for technical assistance to improve capacity for compliance with private standards. It is to be hoped that placing private bodies in the limelight by subjecting their actions to critical attention in a multilateral forum will have the effect of stimulating them to improve their procedures to make them more transparent and inclusive and will spur them and other donors to provide effective technical assistance.<sup>550</sup>

An example of a concrete issue related to private sector standards was promptly raised by Ecuador at the first SPS Committee meeting in 2008. This related to the interplay between the EC’s regulatory standard for a plant growth regulator, Ethephon, and the private quality standards set by GLOBALGAP and applied by European retailers, which together have the effect of excluding Ecuadorian pineapples from the European market.<sup>551</sup> It will be interesting to see what the response of Members will be to this specific example.

---

<sup>548</sup> Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, para. 5.

<sup>549</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting of 18–19 October 2007. Note by the Secretariat*, G/SPS/R/46, circulated on 2 January 2008, para. 149.

<sup>550</sup> An example of technical assistance by a non-private sector donor in this regard was reported in the information session on private standards organised by the Standards and Trade Development Facility. This was the World Bank grant of US\$750,000 for a three year period to establish the Trade Standards Practitioners Network (TSPN), which aims to build a community of practice to actively promote the adoption of food safety and environmental standards in developing countries and to share experiences and increase learning. The TSPN has as its objectives to better enable developing countries to participate in and take advantage of standards-based markets; to arrange research policy dialogues and create a standards information clearing house; and to facilitate the identification of best practices in standards management. Committee on Sanitary and Phytosanitary Measures, *Report of the STDF Information Session on Private Standards (26 June 2008)*. Note by the Secretariat, G/SPS/50, circulated on 24 July 2008, paras 12–13.

<sup>551</sup> In 2008, Ecuador submitted a statement to the SPS Committee in which it expressed its concern that a proposed reduction in the EC’s maximum residue levels of Ethephon, a plant growth regulator, in pineapple, would preclude Ecuador from using this substance to control the pineapple ripening process. This was particularly problematic for Ecuador in view of the fact that GLOBALGAP quality standards are applied by purchasers on the EC market, requiring particular quality attributes that would be impossible for Ecuador to meet without the use of Ethephon. Committee on Sanitary and Phytosanitary Measures, *MRL for Pineapple – Ethephon*, G/SPS/GEN/841/Rev.1, circulated on 9 May 2008. Note that in this case the private sector standard referred to addresses quality requirements, such as the stage of ripeness of fruit, rather than safety requirements. Nevertheless, this example illustrates the fact that when coupled with a mandatory food safety standard, in this case an MRL for chemical residues in food, a private sector quality standard can have the effect of closing off a market for developing-country exports. In view of the debate regarding the role of *SPS Agreement* in disciplining private standards and the fact that in any case quality standards are not standards falling under the *SPS Agreement*, in its submission, Ecuador challenged the conformity of the EC’s proposed reduction in the MRL for Ethephon rather than the private standards of GLOBALGAP.

### 2.3 Temporal scope of application

The temporal scope of application of the *SPS Agreement* also deserves attention here. This issue relates to the question whether the coverage of the *SPS Agreement* extends to SPS measures that were enacted or applied before its entry into force. In *EC–Hormones* the EC argued that, as its measure predated the entry into force of the *SPS Agreement* on 1 January 1995, the *SPS Agreement* was not applicable to it. The Appellate Body agreed with the Panel’s finding that the *SPS Agreement* nevertheless governed the dispute. The Appellate Body held as follows:

If the negotiators had wanted to exempt the very large group of SPS measures in existence on 1 January 1995 from the disciplines of provisions as important as Articles 5.1 and 5.5, it appears reasonable to us to expect that they would have said so explicitly. Articles 5.1 and 5.5 do not distinguish between SPS measures adopted before 1 January 1995 and measures adopted since; the relevant implication is that they are intended to be applicable to both.<sup>552</sup>

The Panel had based its conclusion on Article 28 of the *Vienna Convention on the Law of Treaties*,<sup>553</sup> which provides that a treaty cannot apply to acts, facts or situations ceasing to exist before the treaty came into force. As the EC measure continued to exist after the entry into force of the *SPS Agreement* and since there were no provisions in the *SPS Agreement* itself limiting its temporal application, the Agreement applied to the measure in question.<sup>554</sup> The Appellate Body also pointed to Article XVI:4 of the *WTO Agreement* which obliges Members to ensure the conformity of their laws, regulations and procedures with their obligations under the annexed Agreements.<sup>555</sup> It noted that, unlike the GATT 1947, the *WTO Agreement* was accepted definitively by Members, thus there are no longer exceptions for existing legislation (so-called ‘grandfather rights’).<sup>556</sup>

This finding that the *SPS Agreement* governs all existing SPS measures that may affect international trade is not only legally sound; it is also of great practical significance. To find otherwise and exempt pre-existing SPS measures would be to drastically diminish the effectiveness of the *SPS Agreement* in bringing discipline to the SPS area. By 1995 most Members had functioning SPS regimes in place, encompassing hundreds if not thousands of SPS product requirements, process standards and conformity assessment procedures. To ‘grandfather’ such SPS measures would be to perpetuate the situation that gave rise to the negotiations on the *SPS Agreement* in the first place.

However, the flip side of this coin is of course the burden of implementation of the obligations of the *SPS Agreement* with respect to measures enacted before these obliga-

---

<sup>552</sup> Appellate Body Report, *EC – Hormones*, para. 128.

<sup>553</sup> Howard Latin, ‘Ideal Versus Real Regulatory Efficiency: Implementation of Uniform Standards And “Fine Tuning” Regulatory Reforms’, *Stanford Law Review* 37, 1985, 1267-1332. As noted above, Articles 31 and 32 of this convention are regarded as having attained the status of customary international law and must be applied by WTO panels and the Appellate Body by virtue of Article 3.2 of the DSU.

<sup>554</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.28; Panel Report, *EC – Hormones (US)*, para. 8.25.

<sup>555</sup> Appellate Body Report, *EC – Hormones*, para. 128.

<sup>556</sup> *Ibid.*

tions existed.<sup>557</sup> Particularly in less developed Members, where regulation based on risk assessment was not the norm, this entails a wide-scale revision of existing SPS measures. The Appellate Body in *EC – Hormones* recognised the difficulties that the applicability of the *SPS Agreement* to pre-existing SPS measures could cause for Members, particularly in the light of the requirement contained in the *SPS Agreement* that SPS measures be based on risk assessments. In this regard, the Appellate Body pointed to the qualification to the risk assessment obligation contained in Article 5.1 of the *SPS Agreement*, which provides a degree of flexibility by requiring only a risk assessment ‘as appropriate to the circumstances.’<sup>558</sup> It is not entirely clear how this proviso ameliorates the burden of bringing the hundreds of SPS measures that predate the entry into force of the Agreement into conformity with the risk assessment provisions. From the interpretation of Article 5.1 of the *SPS Agreement* in the case law,<sup>559</sup> it seems unlikely that the either the fact that a measure predated the *SPS Agreement* or the fact that a regulating Member faces capacity constraints will be taken into account as a ‘circumstance’ softening the strict requirements of a risk assessment in terms of the *SPS Agreement*.

Nevertheless, the value of ensuring the applicability of the *SPS Agreement* to all existing SPS measures, including those that predated the Agreement, seems to be recognised by all Members. As a result, the question of the temporal application of the *SPS Agreement* has not been an issue in any dispute since *EC – Hormones*, nor has it been used as a justification by Members against whose measures specific trade concerns have been raised in the SPS Committee.<sup>560</sup>

## 2.4 Relationship with other WTO agreements

The Uruguay Round agreements, embodied in the *WTO Agreement* including its Annexes, constitute ‘an inseparable package of rights and disciplines that have to be considered in conjunction.’<sup>561</sup> This is because the *WTO Agreement* is a ‘single undertaking’.<sup>562</sup> Article II:2 of the *WTO Agreement* provides:

The agreements and associated legal instruments included in Annexes 1, 2 and 3 (hereinafter referred to as “Multilateral Trade Agreements”) are integral parts of this Agreement, binding on all Members.

<sup>557</sup> Note that the notification obligation of the *SPS Agreement* does not apply to pre-existing SPS measures. It is limited to proposed (new or amended) SPS measures. See below, Part IV, Section 1.3.2.1.

<sup>558</sup> Appellate Body Report, *EC – Hormones*, para. 129.

<sup>559</sup> For a discussion of the case law on Article 5.1 of the *SPS Agreement*, in particular the ‘as appropriate to the circumstances’ qualification, see below, Part III, Section 5.1.2.

<sup>560</sup> On the mechanism for raising specific trade concerns before the SPS Committee, see below, Part IV, Section 2.1.2.

<sup>561</sup> Appellate Body Report, *Argentina – Footwear (EC)*, para. 81. The Appellate Body was citing with agreement the Panel’s finding on this point.

<sup>562</sup> Appellate Body Report, *Brazil – Desiccated Coconut*, 177. The ‘single undertaking’ nature of the *WTO Agreement* was reiterated by the Appellate Body in *Korea – Dairy*, which noted that this is now well-established and that therefore ‘all WTO obligations are generally cumulative and Members must comply with all of them simultaneously.’ Appellate Body Report, *Korea – Dairy*, para. 74.

As held by the Appellate Body in *Argentina – Footwear (EC)*, the various multilateral trade agreements ‘are all provisions of one treaty, the *WTO Agreement*. They entered into force as part of that treaty at the same time. They apply equally and are equally binding on all WTO Members.’<sup>563</sup> One therefore cannot analyse the *SPS Agreement* in isolation. It is important to have regard to the other elements of this ‘inseparable package’ and their relationship to the *SPS Agreement* in terms of scope of application and priority in case of conflicts. Only in this way can one ensure that these Agreements, to the extent that they may apply to the same measure, are interpreted ‘harmoniously’.<sup>564</sup>

In particular, it is necessary to look at the relationship between the *SPS Agreement* and other WTO agreements that could be of relevance to measures affecting trade in food and agricultural products. These are the *TBT Agreement*, the GATT 1994 and the *Agreement on Agriculture* all of which are part of the Multilateral Agreements on Trade in Goods, contained in Annex 1A to the *WTO Agreement*. An examination of the relationship between them is useful in sketching the framework of rules applicable to various aspects of this area of trade.

#### 2.4.1 The TBT Agreement

As discussed above, during the Tokyo Round, the first steps were taken towards addressing non-tariff barriers to trade in GATT negotiations. One of the outcomes of this Round was the conclusion of the *Agreement on Technical Barriers to Trade*, commonly referred to as the *Standards Code*,<sup>565</sup> which applied to all technical regulations and standards, including those aimed at the protection of human, plant or animal life or health. As already explained, this agreement was not very effective and its revision was therefore included on the agenda of the Uruguay Round negotiations. During the Uruguay Round negotiations it was agreed that SPS measures merited special attention, aside from the larger genus of technical measures.<sup>566</sup> This led to the drafting of two separate agreements addressing technical barriers to trade: the *SPS Agreement* and the *TBT Agreement*.<sup>567</sup> The question therefore arises which of these two Agreements applies in a particular case

The scope of application of the *TBT Agreement* is determined with reference to the *form* that a measure takes, irrespective of its purpose or its product coverage.<sup>568</sup> More specifi-

<sup>563</sup> Appellate Body Report, *Argentina – Footwear (EC)*, para. 81.

<sup>564</sup> *Ibid.* Such harmonious interpretation is particularly necessary due to the fragmented nature of the negotiations which resulted in tensions between provisions in different treaties. Marceau and Trachtman point out that although the *WTO Agreement* is a single treaty, its provisions, in the various agreements, were negotiated by 15 different working groups. There may have been insufficient coordination between them, leading to difficulty in defining ‘clearly and precisely the legal parameters of the relationships among the provisions of the WTO agreements.’ Gabrielle Marceau and Joel P. Trachtman, ‘GATT, TBT and SPS: A Map of WTO Law of Domestic Regulation of Goods’, in *The WTO Dispute Settlement System 1995–2003*, F. Ortino and Ernst-Ulrich Petersmann (eds.) (Kluwer Law International, Deventer), 2004, 275–340, 277. This article provides a very useful discussion of the respective scopes of application and disciplines of the *SPS Agreement*, the *TBT Agreement*, and the GATT 1994.

<sup>565</sup> *Agreement on Technical Barriers to Trade*, 26S/154, 1186 UNTS 276, LT/TR/A/5, 12 April 1979.

<sup>566</sup> For a more detailed discussion of the negotiating history, see above, Part III, Section 1.2.

<sup>567</sup> For a graphic representation by the WTO Secretariat of the relative scopes of application of the *SPS Agreement* and *TBT Agreement*, see Committee on Sanitary and Phytosanitary Measures, *Graphs on the Coverage of the SPS and TBT Agreements. Note by the Secretariat*, G/SPS/W/32, circulated on 10 November 1995.

<sup>568</sup> Article 1.4 of the *TBT Agreement* establishes the comprehensive nature of the product coverage of the *TBT*

cally, the *TBT Agreement* applies to three types of measures: technical regulations, standards and conformity assessment procedures. These measures are defined in Annex 1 of the *TBT Agreement*. A technical regulation is defined in Annex 1.1 as a:

[d]ocument which lays down product characteristics or their related processes and production methods, including the applicable administrative provisions, with which compliance is mandatory. It may also include or deal exclusively with terminology, symbols, packaging, marking or labelling requirements as they apply to a product, process or production method.<sup>569</sup>

Examples of technical regulations are a law requiring that processed food products be labelled as to nutrient content and permissible preservatives, or a law prohibiting the marketing of toys containing toxic plastics.<sup>570</sup>

A standard is defined in Annex 1.2 of the *TBT Agreement* as a:

[d]ocument approved by a recognised body, that provides, for common and repeated use, rules, guidelines or characteristics for products or related processes and production methods, with which compliance is not mandatory. It may also include or deal exclusively with terminology, symbols, packaging, marking or labelling requirements as they apply to a product, process or production method.<sup>571</sup>

In contrast to technical regulations, standards are voluntary in nature. Examples include GLOBALGAP standards for plant propagation material, to ensure the quality of the crop, and standards applied by supermarkets with regard to the size, shape and ripeness level of fresh fruit.

Annex 1.3 of the *TBT Agreement* defines conformity assessment procedures as:

[a]ny procedure used, directly or indirectly, to determine that relevant requirements in technical regulations or standards are fulfilled.

Examples of conformity assessment procedures are random sampling procedures to ensure that pharmaceuticals conform to safety specifications, or inspection of production facilities to determine whether the requirements for the use of the voluntary label of the FairTrade Foundation are complied with.

---

*Agreement*, which extends to include both industrial and agricultural products.

<sup>569</sup> Note that it is debated whether this definition covers measures laying down requirements for non-product-related PPMs, such as animal welfare standards or minimum labour standards, in view of the fact that it refers to product characteristics 'or their related' PPMs. With regard to labelling requirements, however, it is clear that non-product related PPMs are included by the last sentence of the definition.

<sup>570</sup> The definition of a technical regulation was clarified by the Appellate Body in *EC – Asbestos* which held that to be a technical regulation, a measure must lay down product characteristics (whether in positive or negative form), must do so in a binding manner and must be applicable to an identifiable product or group of products. Appellate Body Report, *EC – Asbestos*, paras 67-70. This was confirmed in Appellate Body Report, *EC – Sardines*, para. 176.

<sup>571</sup> The same debate with regard to the coverage of non-product-related PPMs, aside from those set out in labelling standards, exists with regard to this definition.

Clearly, many SPS measures take the form of technical regulations, standards or conformity assessment procedures. The importance of establishing whether the *TBT Agreement* or the *SPS Agreement* applies in such a case comes from the fact that the two agreements apply different disciplines to measures falling within their respective ambits. The rules in the *TBT Agreement* are arguably less strict; they are primarily aimed at ensuring that technical regulations do not constitute unnecessary barriers to trade, while recognising the right of Members to pursue legitimate objectives by means of technical regulations. In brief, the *TBT Agreement* prohibits discrimination in the preparation, adoption and application of technical regulations, standards and conformity assessment procedures, sets a Code of Good Practice for public and private standardising bodies, mandates the use of the least-trade-restrictive measure available, obliges transparency in the regulatory process and encourages the adoption of international standards. However, unlike the *SPS Agreement*, it sets no scientific requirements for the adoption of measures that do not conform to international standards. Instead it allows deviation from international standards where necessary to fulfil a legitimate objective, without requiring scientific justification for the deviation.

The choice of whether to challenge a measure under the *SPS Agreement* rather than the *TBT Agreement* is not left to the complaining Member. Instead, the *TBT Agreement* clearly provides in Article 1.5:

The provisions of this Agreement do not apply to sanitary and phytosanitary measures as defined in Annex A of the Agreement on the Application of Sanitary and Phytosanitary Measures.

As a result, pursuant to Article 1.5 of the *TBT Agreement*, SPS measures are excluded from the scope of the *TBT Agreement*, even if they take the form of technical regulations, standards or conformity assessment procedures. SPS measures are instead subject to the distinct disciplines of the *SPS Agreement*. As noted above, it is primarily the *purpose* of the measure that qualifies it as a sanitary or phytosanitary measure.

In *EC – Hormones*, the US and Canada claimed, *inter alia*, that the EC ban on hormone-treated beef was inconsistent with the *TBT Agreement*. Referring to Article 1.5 of the *TBT Agreement*, the Panel found, however, that, since this measure was an SPS measure, the *TBT Agreement* did not apply to this dispute.<sup>572</sup>

However, as discussed above,<sup>573</sup> the Panel in *EC – Approval and Marketing of Biotech Products* has held that a single requirement may simultaneously be both an SPS measure and a ‘non-SPS measure’, if it is imposed for a purpose that falls within the definition of an SPS measure as well as for a purpose not covered by this definition.<sup>574</sup> As Article 1.5 of the *TBT Agreement* does not apply to ‘non-SPS measures’, it does not operate to exclude from the scope of application of the *TBT Agreement* requirements that embody ‘non-SPS measures’. Thus, if the requirement at issue falls within the definition of a ‘technical regulation’ as defined in Annex 1.1 of the *TBT Agreement*, it would fall to be assessed under the *TBT Agreement* ‘to the extent it embodies a non-SPS measure’ even if it also embodies

---

<sup>572</sup> Panel Report, *EC – Hormones (US)*, para. 8.29; and Panel Report, *EC – Hormones (Canada)*, para. 8.32.

<sup>573</sup> See above, Part III, Section 2.1.1.

<sup>574</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.165.

an SPS measure.<sup>575</sup> Therefore, a single measure may fall within the scope of application of both the *SPS Agreement* and the *TBT Agreement*.

It means that a requirement that is an SPS measure may now also be a TBT measure and thus subject to both Agreements. It is important to note that a measure found to be in violation of the *SPS Agreement* cannot be ‘saved’ by a finding that it is, at the same time, in conformity with the *TBT Agreement*.<sup>576</sup> Instead it will be required to conform to the obligations of both Agreements and may fall foul of either.

#### 2.4.2 The GATT 1994

The GATT 1994 applies to all measures affecting trade in goods. As mentioned above, before the Uruguay Round Members could maintain measures necessary for the protection of human, plant and animal life or health that violated other GATT provisions under the exception provided therefore in Article XX(b) of GATT 1947. The insufficiency of this provision to deal with the complexities of SPS measures was one of the factors that led Members to negotiate the *SPS Agreement* in the Uruguay Round, in an attempt to flesh out Article XX(b) so as to set clear limits on the use of health measures in ways that could affect international trade. However, as already noted above, the resulting *SPS Agreement* goes further than a mere elaboration of Article XX(b). It also establishes a new, comprehensive set of norms for the adoption and maintenance of SPS measures.

The Panel in *EC – Hormones* was faced with the question whether a prior finding of violation of the GATT is necessary for the *SPS Agreement* to apply. The EC had argued that since the Preamble of the *SPS Agreement* explicitly states as one of its aims the elaboration of rules for the application of the provisions of GATT 1994 relating to SPS measures, particularly Article XX(b), the *SPS Agreement* is not an independent agreement but only an interpretation of Article XX(b). It thus only applies in cases where Articles I, III or XI of GATT 1994 has been violated and recourse could be had to the Article XX(b) exception.<sup>577</sup> The Panel rejected this argument, finding that the *SPS Agreement* is an independent agreement, imposing substantive obligations that go beyond those of the GATT.<sup>578</sup> It held:

---

<sup>575</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.167. Although the EC Regulation on novel foods was found to be both an SPS measure and a non-SPS measure, the Panel found it unnecessary to decide the claims of Canada and Argentina under the *TBT Agreement* as the product-specific measures and the safeguard measures challenged under this regulation were all found by the Panel to fall under the *SPS Agreement*. *Ibid.*, paras 7.2524 and 7.2527 (with regard to the product-specific measures) and paras 7.3412–7.3413 (with regard to the safeguard measures).

<sup>576</sup> This fact makes it difficult to understand why in this dispute the EC found it useful to argue that its approval procedures for biotech products were both SPS measures and non-SPS measures.

<sup>577</sup> Panel Report, *EC – Hormones (US)*, para. 4.4; Panel Report, *EC – Hormones (Canada)*, para. 4.3.

<sup>578</sup> The Panel based its finding on the following grounds: (1) Under the plain language of Article 1.1, which governs the applicability of the *SPS Agreement*, the only requirements are that the relevant measure is an SPS measure as defined in Annex A.1 and that it affects international trade. No prior violation of GATT is required; (2) the *SPS Agreement* does not only elaborate on GATT provisions but establishes its own substantive obligations in order to further, *inter alia*, the harmonization of SPS measures; (3) under Article 2.4 of the *SPS Agreement*, measures that conform to the *SPS Agreement* are deemed to comply with GATT provisions, in particular Art. XX(b); (4) Article 3.2 of the *SPS Agreement* states that measures conforming to international standards are presumed consistent with GATT 1994. These presumptions imply that the *SPS Agreement* contains at least as many and probably more obligations than Article XX(b) of the GATT 1994. Panel Report,

It is clear that some provisions of the *SPS Agreement* elaborate on provisions already contained in GATT, in particular Article XX(b). The final preambular paragraph of the *SPS Agreement* provides, indeed, that the Members desired “to elaborate rules for the application of the provisions of GATT 1994 which relate to the use of sanitary or phytosanitary measures, in particular the provisions of Article XX(b)”. Examples of such rules are, arguably, some of the obligations contained in Article 2 of the *SPS Agreement*. However, on this basis alone we cannot conclude that the *SPS Agreement* only applies, as Article XX(b) of GATT does, if, and only if, a prior violation of a GATT provision has been established. Many provisions of the *SPS Agreement* impose “substantive” obligations which go significantly beyond and are additional to the requirements for invocation of Article XX(b). These obligations are, *inter alia*, imposed to “further the use of harmonized sanitary and phytosanitary measures between Members”<sup>579</sup> and to “improve the human health, animal health and phytosanitary situation in all Members”.<sup>580</sup> They are not imposed, as is the case of the obligations imposed by Article XX(b) of GATT, to justify a violation of another GATT obligation (such as a violation of the non-discrimination obligations of Articles I or III).<sup>581</sup>

This finding was not appealed. It establishes that *SPS Agreement* created an autonomous set of rights and obligations, whose scope of application is independent of a finding of violation of the GATT 1994.<sup>582</sup> The scope of the *SPS Agreement* is thus broader than that of the GATT 1994 in that an SPS measure which is neither discriminatory nor a quantitative restriction,<sup>583</sup> and is thus in compliance with GATT rules, could still fall foul of the disciplines of the *SPS Agreement*, for example by not being based on a risk assessment. As stated above, the *SPS Agreement* catches all SPS measures that may have an impact on international trade.

The *SPS Agreement*, however, did not replace the relevant provisions of the GATT 1947 (now incorporated by reference in the GATT 1994) applicable to SPS measures. Nor is it subordinate to the GATT. Instead the two Agreements now operate in complement to each

<sup>579</sup> Preambular para. 6 of the *SPS Agreement* (footnote in original).

<sup>580</sup> Preambular para. 2 of the *SPS Agreement* (footnote in original).

<sup>581</sup> Panel Report, *EC – Hormones (US)*, para. 8.38 and Panel Report, *EC – Hormones (Canada)*, para. 9.41.

<sup>582</sup> Quick and Blüthner refer, for a contrary approach, to Pierre Pescatore, who argues that the *SPS Agreement* is subordinate to GATT principles and therefore the first question in a dispute should always be whether there is a violation of GATT rules which can give rise to the application of Article XX(b) and consequently to SPS rules. Pierre Pescatore, *Free World Trade and the European Union – The Reconciliation of Interests and the Revision of Dispute Resolution Procedures in the Framework of the WTO*, paper presented at the Conference of the Academy of European Law, Trier, in co-operation with the Legal Service of the European Commission, Brussels, 11-12 June 1998, at 23, referred to in Reinhard Quick and Andreas Blüthner, ‘Has the Appellate Body Erred? An Appraisal and Criticism of the Ruling in the WTO *Hormones Case*’, *Journal of International Economic Law* 2 (4), 1999, 603-639.

<sup>583</sup> The *SPS Agreement* reflects the recognition that a test based on discrimination or quantitative restriction is not an effective tool to distinguish between legitimate SPS measures and those used for protectionist purposes. It is possible for a measure that meet neither of these tests to have a negative impact on international trade, and thereby serve to protect domestic industry from foreign competition. David Hurst makes this observation with regard to the discrimination test. David R. Hurst, ‘*Hormones: European Communities - Measures Affecting Meat and Meat Products*’, *European Journal of International Law* 9 (1), 1998, 182-183, 182, available at: <http://www.ejil.org/journal/Vol9/No1/sr1g.html>, visited on 12 June 2008.

other and to the *TBT Agreement*, within their respective scopes of application. Where the measure at issue is an SPS measure as defined in Annex A of the *SPS Agreement*, it may fall within the scope of application of the *SPS Agreement* and, to the extent that it is, *inter alia*, also discriminatory or a quantitative restriction, it may be caught by the GATT 1994 as well.<sup>584</sup> Since both these Agreements may, in principle, apply to such measure, it is necessary to determine which Agreement would prevail in case of conflict.

The relationship between the GATT 1994 and the other multilateral agreements on trade in goods contained in Annex 1A to the *WTO Agreement*, including the *SPS Agreement*, is addressed in general terms by the *General Interpretative Note to Annex 1A*. It provides:

In the event of conflict between a provision of the GATT 1994 and a provision of another agreement in Annex 1A to the Agreement Establishing the WTO (referred to in the Agreements in Annex 1A as the “WTO Agreement”), the provision of the other agreement shall prevail to the extent of the conflict.

Therefore, in case of conflict between the applicable GATT rules and the *SPS Agreement*, the latter prevails. It should be borne in mind, however, that in accordance with the general international law presumption against conflicts,<sup>585</sup> panels and the Appellate Body have interpreted the concept of conflict very strictly, as ‘a situation where adherence to one provision will lead to a violation of the other provision...’<sup>586</sup> In the absence of such conflict, the ‘single undertaking’ nature of the *WTO Agreement* dictates that the provisions of the different WTO agreements are generally considered cumulative, and Members must comply with them all.<sup>587</sup>

The possibility for conflict, in this narrow sense, between GATT rules and the disciplines of the *SPS Agreement* is particularly slim. As will be seen in the following discussion of the *SPS Agreement*, its provisions take on board the relevant GATT disciplines, as interpreted in the pre-Uruguay Round case law. However, it goes further than this, by both elaborating new disciplines and balancing these against an expressly recognised *right of*

<sup>584</sup> Note that these are only the most relevant GATT obligations that an SPS measure may fall foul of. Other GATT obligations, such as those in Article X of the GATT 1994 requiring the prompt publication of generally applicable laws, regulations, decisions and rulings affecting the sale, distribution, transportation, inspection etc. of imports or exports; and the uniform, impartial and reasonable administration of these laws, regulations, etc., also catch SPS measures.

<sup>585</sup> The presumption against conflicts was applied, for example, in Appellate Body Report, *Canada – Periodicals*, 19; and Appellate Body Report, *EC – Bananas III*, paras 219-222. As held by the Panel in *Indonesia – Autos*: ‘[t]his presumption is especially relevant in the WTO context since all WTO agreements, including GATT 1994 which was modified by Understandings when judged necessary, were negotiated at the same time, by the same Members and in the same forum.’ Panel Report, *Indonesia – Autos*, para. 14.28.

<sup>586</sup> Appellate Body Report, *Guatemala – Cement I*, para. 65. The Panel in *EC – Bananas III*, found that the *General Interpretative Note to Annex 1A* covers two types of conflicts: (1) conflicts where the obligations are mutually exclusive in the sense that a Member could not comply with both obligations at the same time; and (2) the situation where a rule in one agreement prohibits what a rule in another agreement explicitly permits. Panel Report, *EC – Bananas III*, para. 7.159.

<sup>587</sup> Appellate Body Report, *Korea – Dairy*, para. 74, citing with agreement the Panel’s statement that: ‘[i]t is now well established that the WTO Agreement is a “Single Undertaking” and therefore all WTO obligations are generally cumulative and Members must comply with all of them simultaneously...’ Panel Report, *Korea – Dairy*, para. 7.38. On this point, see Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 28.

Members to regulate against SPS risks. This aims to redress the inability of GATT rules to appropriately deal with the trade/health conflict in this area. It is probably for this reason that the *SPS Agreement*, unlike the other Annex 1A agreements, contains a presumption of consistency with the GATT 1994 for measures conforming to its provisions. Article 2.4 of the *SPS Agreement* provides:

Sanitary or phytosanitary measures which conform to the relevant provisions of this Agreement shall be presumed to be in accordance with the obligations of the Members under the provisions of GATT 1994 which relate to the use of sanitary or phytosanitary measures, in particular the provisions of Article XX(b).

The issue of whether this presumption is rebuttable is not addressed in the *SPS Agreement*, nor has it been examined in the case law. If the presumption were irrebuttable, it would indicate that the relevant disciplines of the GATT, in particular Article XX(b), could be regarded as being subsumed by the *SPS Agreement*, to the extent that they would apply to SPS measures that are caught by GATT rules (for example SPS measures that are discriminatory or amount to quantitative restrictions). This approach is advocated by some authors.<sup>588</sup> Others argue, however, that the presumption in Article 2.4 of the *SPS Agreement* is rebuttable, so that a measure found to be in conformity with the *SPS Agreement* could still be found in violation of the GATT 1994, if the complainant succeeds in rebutting the presumption of conformity.<sup>589</sup> Such an interpretation would result in a cumulation of GATT and SPS obligations when an SPS measure is at issue.<sup>590</sup>

This is particularly relevant today, in light of the developments in the case law around Article XX(b) of the GATT 1994, discussed above.<sup>591</sup> While the old GATT case law's interpretation of the 'necessity' requirement in Article XX(b) required the imposition of the least trade-restrictive measure reasonably available to achieve the chosen health objective, which requirement was incorporated into Article 5.6 of the *SPS Agreement*,<sup>592</sup>

<sup>588</sup> Goh and Ziegler claim that where an SPS measure is at issue, the *SPS Agreement* should apply exclusively, making recourse to the GATT impossible. Gavin Goh and Andreas R. Ziegler, 'A Real World Where People Live and Work and Die: Australian SPS Measures after the WTO Appellate Body's Decision in the Hormones Case', *Journal of World Trade* 35 (5), 1998, 271-290. This would imply that the presumption of compatibility with the relevant GATT provisions is irrebuttable.

<sup>589</sup> In favour of this position, see Reinhard Quick and Andreas Blüthner, 'Has the Appellate Body Erred? An Appraisal and Criticism of the Ruling in the WTO *Hormones Case*', *Journal of International Economic Law* 2 (4), 1999, 603-639, 628; Gabrielle Marceau and Joel P. Trachtman, 'GATT, TBT and SPS: A Map of WTO Law of Domestic Regulation of Goods', in *The WTO Dispute Settlement System 1995-2003*, F. Ortino and Ernst-Ulrich Petersmann (eds.) (Kluwer Law International, Deventer), 2004, 275-340, 334. Note that the effect of the presumption would be to shift the burden of proof under Article XX(b) from the respondent to the complainant.

<sup>590</sup> Joost Pauwelyn points out that such a cumulation leads to the untenable situation that the obligations of WTO Members are systematically elevated above their rights. This is because a right provided under one agreement can be undermined by an obligation contained in another. He states: 'The obligations of WTO members to liberalize trade cannot systematically prevail over the rights of WTO members to restrict trade. New WTO provisions (such as the TBT, SPS or SCM Agreements) cannot only add *obligations* to liberalise trade, they may also create new *rights* to restrict trade.' Joost Pauwelyn, 'Cross-Agreement Complaints before the Appellate Body: A Case Study of the *EC-Asbestos Dispute*', *World Trade Review* 1 (1), 2002, 63-87, 80.

<sup>591</sup> See above, Part III, Section 1.1.1.

<sup>592</sup> Article 5.6 of the *SPS Agreement* provides: '...when establishing or maintaining sanitary or phytosanitary measures to achieve the appropriate level of sanitary or phytosanitary protection, Members shall ensure that such measures are not more trade restrictive than required to achieve their appropriate level of protection,

the current interpretation by the Appellate Body requires a ‘weighing and balancing’ approach.<sup>593</sup> Marceau and Trachtman argue that the proportionality test encompassed in this approach is possibly not taken up in Article 5.6 of the *SPS Agreement*, leaving a measure that complies with Article 5.6 still vulnerable under Article XX(b) of the GATT 1994.<sup>594</sup> However, it is also arguable that the requirement of ‘harmonious’ interpretation of the different parts of the *WTO Agreement* calls for an interpretation of Article 5.6 of the *SPS Agreement* that reflects the current state of the case law regarding the Article XX(b) necessity test, particularly since the ‘reasonably available’ wording on which the new case law is based in also found in the footnote<sup>595</sup> to Article 5.6.<sup>596</sup> In fact, already much ‘cross-fertilisation’ is occurring in the interpretation of the *SPS Agreement* and Article XX(b) of the GATT 1994.<sup>597</sup>

Such ‘harmonious interpretation’ through ‘cross fertilisation’ is however subject to an important limitation, inherent in the object and purpose of the *SPS Agreement*. Unlike the GATT, which sees health measures as exceptional and thus to be justified by the Member imposing them, the *SPS Agreement* aims to achieve an appropriate *balance* between trade and health. In order to do so, it recognises the *right* of WTO Members to impose the SPS measures necessary to protect human, animal or plant life or health,<sup>598</sup> but subjects this

---

taking into account technical and economic feasibility.’

<sup>593</sup> As discussed above, this approach was introduced by the Appellate Body in *Korea – Various Measures on Beef* in respect of the necessary requirement in Article XX(d) of the GATT 1994, and was subsequently applied by it in *EC – Asbestos* to the necessary requirement in Article XX(b) of the GATT 1994. See above, Part III, Section 1.1.1.

<sup>594</sup> Gabrielle Marceau and Joel P. Trachtman, ‘GATT, TBT and SPS: A Map of WTO Law of Domestic Regulation of Goods’, in *The WTO Dispute Settlement System 1995–2003*, F. Ortino and Ernst-Ulrich Petersmann (eds.) (Kluwer Law International, Deventer), 2004, 275–340, 334. Of course, as recognised by the authors, the question of conformity with Article XX(b) only arises if the measure violates another GATT provision, such as Article III:4 or Article XI.

<sup>595</sup> Footnote 3 to Article 5.6 of the *SPS Agreement* provides: ‘For purposes of paragraph 6 of Article 5, a measure is not more trade-restrictive than required unless there is another measure, reasonably available taking into account technical and economic feasibility, that achieves the appropriate level of sanitary or phytosanitary protection and is significantly less restrictive to trade.’

<sup>596</sup> Quick and Blüthner argue that an interpretation of those SPS rules which are similar to GATT disciplines (such as those in Articles 2.3 and 5.6 of the *SPS Agreement*), in a way that diverges from that given to the relevant GATT provision (Article XX(b)), would make it possible for a challenging Member who loses the case under the *SPS Agreement*, to ‘easily’ rebut the presumption of compatibility and pursue its challenge under the GATT. This result would go against the aim of the *SPS Agreement* to clarify and give further meaning to the relevant GATT provisions (while going further than GATT). Thus they argue that the panels and Appellate Body should interpret these SPS rules in the light of existing GATT jurisprudence to avoid this possibility. Reinhard Quick and Andreas Blüthner, ‘Has the Appellate Body Erred? An Appraisal and Criticism of the Ruling in the *WTO Hormones Case*’, *Journal of International Economic Law* 2 (4), 1999, 603–639, 630–632. Scott supports the idea that consistent interpretation between the Article XX(b) of the GATT and the *SPS Agreement* may be called for in light of the desire expressed in the Preamble to the *SPS Agreement* to elaborate rules for the application of the relevant GATT rules, in particular Article XX(b). However she considers that it is not clear which of the two Agreements should be considered primary and which secondary (i.e. ‘which is to lead and which to follow.’) Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 29.

<sup>597</sup> While most of this cross-fertilisation has taken the form of reading into Article XX(b) the more developed disciplines contained in the *SPS Agreement*, this should not exclude the possibility that evolution in the GATT case law on disciplines relevant to the *SPS Agreement*, particularly those that have not yet been clarified fully, could be drawn upon in the interpretation of the *SPS Agreement* where appropriate.

<sup>598</sup> Article 2.2 of the *SPS Agreement*. See further below, Part III, Section 3.2.1.

right to disciplines to minimise the negative trade effects of SPS measures. An indispensable aspect of this new approach is the recognition of the right of a Member to choose the level of protection it deems appropriate.<sup>599</sup> This broader policy space created by the *SPS Agreement* is further reflected in the fact that the Agreement encourages, but does *not* oblige Members to ‘take into account the objective of minimizing negative trade effects’ when determining their appropriate level of protection.<sup>600</sup> Any interpretation of the *SPS Agreement* in line with GATT case law is only permissible if it accords with the object and purpose of the *SPS Agreement* and its respect for the regulatory autonomy of Members with regard to their policy choices on the level of protection. To the extent that a strong proportionality test might undermine this policy space, it cannot be incorporated.<sup>601</sup> To avoid the situation that might arise in such a case where GATT disciplines may go further than those of the *SPS Agreement*, allowing for rebuttal of the presumption of conformity, it seems best to regard the presumption in Article 2.4 as irrebuttable. Not to do so would negate the careful balance crafted in the *SPS Agreement* for the special situation of SPS measures, due to the specific value conflict they entail.<sup>602</sup>

In light of the abovementioned presumption of consistency, even if held to be rebuttable, when an SPS measure is at issue it is logical to examine this measure under the *SPS Agreement* first, before turning to its conformity with GATT 1994 rules. The *SPS Agreement* could thus be seen as a kind of *lex specialis* elaborating rules applicable to SPS measures, aside from the more generally applicable rules of the GATT 1994.<sup>603</sup> This argument is borne out by the finding of the Panel in *EC – Hormones* which, when it addressed the question of which of the two Agreements to examine first, held:

The SPS Agreement specifically addresses the type of measure in dispute. If we were to examine GATT first, we would in any event need to revert to the

<sup>599</sup> Annex A.5 of the *SPS Agreement*. See further below, Part III, Section 5.2.1.

<sup>600</sup> Article 5.4 of the *SPS Agreement*. See further below, Part III, Section 5.2.2.

<sup>601</sup> On the possible limitations on the policy space of Members arising from the strong proportionality requirement read into the necessity test of Article XX(b) of the GATT 1994, see above, Part III, Section 1.1.1.

<sup>602</sup> A different solution to this problem is proposed by Joost Pauwelyn in the context of the relationship between the GATT and the *TBT Agreement* (which does not contain a presumption of conformity like that in the *SPS Agreement*). Pauwelyn advocates a broader interpretation of ‘conflict’ for purposes of the *General Interpretative Note to Annex IA* so that it is no longer limited to the unlikely situation where one WTO provision obliges a Member to do something which another provision prohibits. Instead, a conflict should be found to exist ‘where one WTO provision *prohibits* something that another WTO provision *explicitly allows for*.’ Joost Pauwelyn, ‘Cross-Agreement Complaints before the Appellate Body: A Case Study of the *EC–Asbestos Dispute*’, *World Trade Review* 1 (1), 2002, 63-87, 78. Following this approach, the *General Interpretative Note* would allow the *SPS Agreement* to prevail in cases where a GATT obligation contradicts an explicit *right* granted in the *SPS Agreement*. As the presumption against conflicts in international law argues against such a broadening of this concept in the *General Interpretative Note to Annex IA*, it may be safer in the case of the *SPS Agreement*, to rely upon the presumption of conformity in Article 2.4 and interpret it as irrebuttable. In this regard, see Gabrielle Marceau who argues against the expansion of the concept of ‘conflict’ to ensure that rights within a treaty are respected, noting that other mechanisms are available to resolve conflicts between rights in one treaty and obligations in another, such as the *lex specialis derogat generalis* principle. Gabrielle Marceau, ‘WTO Dispute Settlement and Human Rights’, *European Journal of International Law* 13 (4), 2002, 753-814, 770-772.

<sup>603</sup> Note that where more than one treaty is applicable, although a *lex specialis* must be examined first, it does not exclude the application of the *lex generalis*. In the absence of a conflict, both apply. Joost Pauwelyn, ‘Cross-Agreement Complaints before the Appellate Body: A Case Study of the *EC–Asbestos Dispute*’, *World Trade Review* 1 (1), 2002, 63-87, 82.

SPS Agreement: if a violation of GATT were found, we would need to consider whether Article XX(b) could be invoked and would then necessarily need to examine the SPS Agreement; if, on the other hand, no GATT violation were found, we would still need to examine the consistency of the measure with the SPS Agreement since nowhere is consistency with GATT presumed to be consistency with the SPS Agreement. For these reasons, and in order to conduct our consideration of this dispute in the most efficient manner, we shall first examine the claims raised under the SPS Agreement.<sup>604</sup>

In *Australia – Salmon*, the Panel also examined the *SPS Agreement* first, holding:

Canada recognizes that the *SPS Agreement* provides for obligations additional to those contained in GATT 1994, but, nevertheless, first addresses its claim under Article XI of GATT 1994. Australia invokes Article 2.4 of the *SPS Agreement*, which presumes GATT consistency for measures found to be in conformity with the *SPS Agreement*, to first address the *SPS Agreement*. We note, moreover, that (1) the *SPS Agreement* specifically addresses the type of measure in dispute, and (2) we will in any case need to examine the *SPS Agreement*, whether or not we find a GATT violation (since GATT consistency is nowhere presumed to constitute consistency with the *SPS Agreement*). In order to conduct our consideration of this dispute in the most efficient manner, we shall, therefore, first address the claims made by Canada under the *SPS Agreement* before addressing those put forward under GATT 1994.<sup>605</sup>

An added complication results from the finding of the Panel in *EC – Approval and Marketing of Biotech Products* that a measure may, in addition to being an SPS measure, also be a ‘non-SPS measure’ due to the fact that it pursues multiple objectives some of which do not fall within the list in Annex 1.A of the *SPS Agreement*. Such a measure cannot benefit from the presumption of conformity with Article XX(b) of the GATT 1994 for SPS measures that comply with the *SPS Agreement* provided for in Article 2.4 of the *SPS Agreement*. To the extent that such a measure is a ‘non-SPS measure’ it is thus also vulnerable to a GATT challenge.

### 2.4.3 The Agreement on Agriculture

The relationship between the *SPS Agreement* and the *Agreement of Agriculture* is one of complementarity. As explained above, it was clear that to the negotiators of the *Agreement on Agriculture* the special disciplines for SPS measures were crucial and inherently linked to the attempts to liberalise trade in agricultural products. This link is made explicit in Article 14 of the *Agreement on Agriculture*, which states:

Members agree to give effect to the Agreement on the Application of Sanitary and Phytosanitary Measures.

<sup>604</sup> Panel Report, *EC – Hormones (US)*, para. 8.42; and Panel Report, *EC – Hormones (Canada)*, para. 8.45.

<sup>605</sup> Panel Report, *Australia – Salmon*, para. 8.39.

This provision is legally speaking redundant, since all WTO Members are bound to give effect to all the multilateral WTO agreements, including the *SPS Agreement*. However, this provision does serve to emphasise the negotiators' recognition of the importance of the disciplines in the *SPS Agreement* in securing the gains for agricultural trade liberalisation achieved in the *Agreement on Agriculture*.

The *SPS Agreement* and the *Agreement on Agriculture* can therefore be regarded complementary to each other. Both have the common aim of enhancing liberalisation in the agricultural sector by creating disciplines on trade-restrictive measures. However, the *SPS Agreement* covers measures affecting not only agricultural products as defined in the *Agreement on Agriculture* but also products of fisheries and forestry, and processed agricultural products (food, feed and beverages). In addition, the *SPS Agreement* extends to measures for the protection of wild fauna and flora.

Despite the partial overlap in product coverage of these two Agreements, they apply to different categories of measures. While the *Agreement on Agriculture* addresses the traditional trade barriers in the agricultural sector, such as tariff barriers, domestic support and export subsidies, the *SPS Agreement* was negotiated to deal with trade barriers that are not covered by the disciplines of the *Agreement on Agriculture*, namely SPS measures.<sup>606</sup> Thus, together these two Agreements represent an important step forward in liberalising trade in food and agricultural products.

## 2.5 Conclusion

The current position of measures for the protection of health under WTO law is determined by the relevant provisions of the *SPS Agreement*, the *TBT Agreement* and the GATT 1994 within their respective spheres of application. The measure could thus be caught by any of the three agreements, depending on its objective(s), form and nature and its effect on trade. Which Agreement (or Agreements) applies in a particular case has far-reaching implications for the type of disciplines to which the measure is subjected, and in particular for the extent of policy space left to Members within which to exercise their regulatory autonomy.

The scope of application of the *SPS Agreement*, as defined in Article 1.1 read together with Annex A.1, reflects its aim to address a particular type of situation involving a conflict between two politically sensitive objectives. These are the liberalisation of trade in food and agricultural products and the protection of human, animal or plant life and health. The *SPS Agreement* aims to achieve an appropriate balance between these two objectives. The provisions delimiting its coverage therefore address those health risks that may arise from trade in primary and processed agricultural products, such as food safety risks and risks from animal or plant pests and diseases. These provisions consequently primarily focus on the *purpose* of the measure to determine whether it falls within the

---

<sup>606</sup> Although Article 4.2 of the *Agreement on Agriculture* addresses (as defined in footnote 1 to this Article), *inter alia*, quantitative import restrictions, discretionary import licensing and 'similar border measures', which could cover SPS measures, the footnote goes on to exclude measures maintained under the general, non-agriculture specific provisions of the Multilateral Agreements on Trade in Goods, one of which is the *SPS Agreement*.

ambit of the Agreement, while leaving the form that such a measure might take broadly defined by means of an illustrative list of examples.

However, from the discussion in this Chapter it is apparent that the scope of application of the *SPS Agreement*, as currently interpreted in the case law of the Panel in *EC – Approval and Marketing of Biotech Products* and followed in the two *Continued Suspension* cases but not yet vetted by the Appellate Body, is very broad. In particular, it has been held to cover measures aiming at a broad array of purposes beyond the particular situations envisaged by negotiators when drafting its strict scientific disciplines. It therefore now eats into the coverage of the *TBT Agreement* and the GATT 1994 in situations where the disciplines of those agreements would have been more appropriate. An example of such a situation is that where a measure aims at the protection of the environment *per se*, not involving a risk to plant or animal life or health. Not only do the scientific obligations of the *SPS Agreement* inordinately restrict Member's scope for regulatory action in such situations, due to the significant differences in the state of scientific knowledge and extent of uncertainty in the field of environmental protection, but there is also little to be gained for agricultural trade through their application. While many types of measures can be crammed into the definition of Annex 1.A by both stretching its terms, and travelling far down the chain of causality to find a risk with which the measure can be said to be 'rationally related', this does not seem a wise course to take. It reduces to inefficacy the list of enumerated purposes as a tool to limit the scope of application of the *SPS Agreement* to those situations most likely to entail a conflict between health protection and agricultural trade.

The artificial insertion of a limiting 'nature' element, in addition to the inclusive 'form' element, into the definition of an SPS measure by the Panel in *EC – Approval and Marketing of Biotech Products* does not ameliorate the problem caused by the expansive interpretation of the enumerated purposes in Annex A.1 (a) to (d). The term 'requirements and procedures' will normally cover most types of measures, doing little to limit the applicability of the *SPS Agreement*. However, the formalistic character of the nature requirement may create adverse incentives for Members to devise measures of another 'nature' in such a way that they escape the disciplines of the *SPS Agreement*. For example, a measure that amounts to the application of a requirement or procedure would fail to meet the 'nature' test. The distinction between the types of measures that, under this interpretation, fall within and without the *SPS Agreement* bears no relation to the objective of the Agreement and only a strained connection to its wording. Instead, the interpretation is artificial, arbitrary and open to abuse. It is to be hoped that when the Appellate Body has an opportunity to address case law it will correct this situation.

It is interesting to examine the implications of the unexpectedly extensive substantive coverage of the *SPS Agreement* for Members at different levels of development. Here, as in other areas discussed in this book, it is important to avoid the lure of broad generalisations. While it might be tempting to argue that developing-country Members benefit from as wide an application of the *SPS Agreement* as possible, to extend its strict disciplines to a broad range of situations, this view is too simplistic. It ignores the fact that the positions and interests of developing-country Members are diverse, and that these Members are not only exporters of food and agricultural products, but are also importers of these products. They, like other WTO Members, benefit from the limited application of the disciplines of

the *SPS Agreement* to the particular situations they are tailored to address. An inappropriate expansion of the application of this Agreement tilts the balance it aims to achieve and disturbs the relationship between it and the other relevant WTO agreements. It is important to bear in mind that measures not falling under the *SPS Agreement* are not undisciplined; they are merely disciplined in ways more appropriate to them.

The *SPS Agreement* together with the other WTO agreements form the ‘inseparable package’ of rights and disciplines to which Members are bound. For this reason, the *SPS Agreement* cannot be seen in isolation, but must instead be viewed in relation to the other WTO agreements that may be relevant to the position of SPS measures, namely the *TBT Agreement*, the GATT 1994 and the *Agreement on Agriculture*. In order to ensure that these Agreements, to the extent that they may apply to the same measure, are interpreted ‘harmoniously’, the question of the scope of application of the relevant Agreements and of priority in case of conflicts was addressed.

The scope of application of the *TBT Agreement* is defined with reference to the form that a measure takes. It applies to technical regulations, standards and conformity assessment procedures, as defined in Annex 1.1-1.3 thereof. In many cases, SPS measures take one of these three forms. However, the *TBT Agreement* in Article 1.5 expressly excludes SPS measures as defined in Annex A.1 of the *SPS Agreement* from its scope of application. Once a measure falls within the definition of an SPS measure, therefore, it must be examined under the *SPS Agreement* to the exclusion of the *TBT Agreement*. This relationship of mutual exclusivity is not present between the *SPS Agreement* and the GATT 1994. The GATT 1994 applies to all measures affecting trade in goods, including SPS measures. In principle, therefore, SPS measures may, in addition to being subject to the *SPS Agreement*, be caught by the disciplines of the GATT, for example the obligations of non-discrimination or the prohibition on quantitative restrictions, and fall to be justified under the requirements of the Article XX(b) exception. The *General Interpretative Note to Annex 1A* provides that in case of conflict between the GATT 1994 and a provision of another Annex 1A agreement, including the *SPS Agreement*, the latter prevails. However, in view of the narrow interpretation given to the concept of conflict in WTO law, namely that adherence to one provision would necessarily lead to a violation of another provision, in line with the general international law presumption against conflicts, it is unlikely that a conflict between the GATT 1994 and the *SPS Agreement* will arise. This is particularly the case because the *SPS Agreement* incorporates and elaborates upon existing GATT disciplines while adding new rights and disciplines. This conclusion is strengthened by the fact that the *SPS Agreement*, in Article 2.4 thereof, contains a presumption of conformity with the GATT 1994 for measures complying with its provisions. It is argued in this Chapter that this presumption should be regarded as irrebuttable to avoid the risk that the cumulative application of GATT disciplines and the disciplines of the *SPS Agreement* would narrow the policy space left to Members in the *SPS Agreement*, thereby undermining the careful trade/health balance it aims at. The relationship between the *SPS Agreement* and the *Agreement on Agriculture* is one of complementarity. Both aim to promote liberalisation of the agricultural sector, but they target different types of trade-restrictive measures. While the *Agreement on Agriculture* focuses on traditional means of agricultural protectionism, such as tariffs, domestic support and export subsidies, the *SPS*

*Agreement* addresses market access barriers for food and agricultural products that take the form of SPS measures.

The situation of the respective scopes of application of the relevant WTO agreements is complicated by the finding of the Panel in *EC – Approval and Marketing of Biotech Products* that a measure can be both an SPS measure and a ‘non-SPS measure’ when it has multiple objectives. The fact that such a measure is regarded as both an SPS measure and a ‘non-SPS measure’ has the effect of subjecting a single measure to multiple, differing disciplines. To the extent that the SPS measure at issue is also a ‘non-SPS measure’, it is not excluded from the scope of application of the *TBT Agreement* by Article 1.5 thereof, nor does it benefit from the presumption of conformity with the GATT 1994 for measures in compliance with the *SPS Agreement*. The result is that the policy space of a Member is even more greatly restricted as its measure is vulnerable to a multitude of challenges under agreements with quite different objectives. Consequently the delicate balance sought by the provisions of the relevant agreements in particular situations is undermined. This cannot be what is meant by a ‘harmonious interpretation’ of the ‘inseparable package’ of WTO agreements. It is hoped that the Appellate Body will correct this problem in future cases.

The issue of the applicability of the *SPS Agreement* to SPS requirements of bodies other than central government is one fraught with difficulty. The increasing shift of SPS norm creation and implementation to subnational and transnational levels in the last decade has brought this issue to the forefront of attention. While the idea that Members are responsible for compliance with WTO obligations by their subnational levels of government is now generally accepted, the same cannot be said for non-governmental entities. The principle of attribution to a Member of acts of private bodies in cases where there is a sufficient level of intervention by the government in the private action, only addresses the problem to a limited degree. A rapidly growing number of SPS requirements are developed and applied by private bodies free of governmental influence, in response to consumer demand, especially in affluent countries. The fact that the market for food and agricultural products, particularly in the high-value sector, is dominated by retail conglomerates which require compliance with specific private standards results in the blurring of the distinction between public and private SPS requirements in terms of their impact on exporters. Private sector standards act as significant barriers to developing-country exports, particularly those of their small-scale producers. The question thus arises to what extent Article 13 of the *SPS Agreement* may be relied upon to compel Members to discipline private sector bodies in their territories, or regional bodies in which entities on their territories are members.

It is argued here that the concepts of ‘non-governmental entities’ and ‘regional bodies’ in Article 13 should be interpreted to include private sector bodies at subnational and transnational level, to take account of the rapid proliferation of private sector standards. However, the extent of the obligation to take ‘such reasonable measures as may be available’ must be seen as limited. What is reasonable depends on the circumstances of the case, and in particular on the type of entity involved. The view espoused here is that it would not be appropriate to require Members to impose the existing disciplines of the *SPS Agreement* on private sector bodies, as they lay down requirements based on best practices of public regulatory authorities, not suitable for private sector bodies. While a

Code of Good Practice for the *SPS Agreement*, with appropriate procedural disciplines to promote transparency, consultation and the recognition of equivalence should ideally be drafted, in view of the fact that agreement is unlikely to be reached on this, the Code of Good Practice of the *TBT Agreement* should be interpreted as applicable to private sector SPS standards.

Even if a Code of Good Practice were in place to discipline the procedural aspects of private sector standards, the burden of compliance with these standards remains high. Current practices with regard to the provision of technical assistance by vertically integrated companies that source their produce in developing countries lead to dependent relationships and the potential for abuse. Instead, effective and disinterested capacity building is called for to achieve sustainable and equitable results. In the meantime, a pragmatic approach to this problem could be the continued use of the multilateral forum provided by the SPS Committee to raise concrete examples of the challenges created by private sector standards, in an effort to stimulate private bodies to be responsive to developing-country Members' needs in the elaboration and implementation of their standards, and to spur donors to provide technical assistance.

Finally, the applicability of the *SPS Agreement* to all SPS measures still in force, including those enacted before the coming into force of the Agreement, is a double edged sword. On one side, it avoids 'grandfathering' pre-existing measures which would weaken the effectiveness of the *SPS Agreement*. On the other side, it creates the obligation on Members to revise their SPS measures that predate the *SPS Agreement* in order to ensure their conformity with its new rules. In Members with less advanced SPS regulatory systems, where the conduct of risk assessments and consideration of international standards was not a matter of course, this may be a heavy burden. On balance, however, this interpretation seems to be the preferable one. It is argued here, as elsewhere in this book, that the capacity constraints of Members at lower levels of development should be addressed through capacity building initiatives rather than by weakening the disciplines of the *SPS Agreement*, including through creating a wide exemption for pre-existing measures. It is certainly not to the advantage of developing-country Members to create a safe haven for the plethora of SPS measures that were already in place on 1 January 1995, particularly in developed-country Members. The most lucrative markets for agricultural and food products are, at the same time, those on which SPS measures have a long history and a vigorous application. Holding pre-existing SPS measures to the same scientific standards as new SPS measures brings some much-needed discipline to this area.

## CHAPTER 3

### Basic principles

The basic principles of the *SPS Agreement* are laid down in Article 2 thereof. These rules are then further elaborated on in subsequent Articles. Article 2 clearly embodies the underlying aim of the *SPS Agreement*, namely to balance the sovereign right of Members to take measures to protect health in their territories against SPS risks, with the goal of promoting free trade and preventing protectionism in the food and agricultural sector. Article 2, under the heading *Basic Rights and Obligations*, provides, in part, as follows:<sup>607</sup>

1. Members have the right to take sanitary and phytosanitary measures necessary for the protection of human, animal or plant life or health, provided that such measures are not inconsistent with the provisions of this Agreement.
2. Members shall ensure that any sanitary or phytosanitary measure is applied only to the extent necessary to protect human, animal or plant life or health, is based on scientific principles and is not maintained without sufficient scientific evidence, except as provided for in paragraph 7 of Article 5.
3. Members shall ensure that their sanitary and phytosanitary measures do not arbitrarily or unjustifiably discriminate between Members where identical or similar conditions prevail, including between their own territory and that of other Members. Sanitary and phytosanitary measures shall not be applied in a manner which would constitute a disguised restriction on international trade.

Three elements of Article 2 are significant to this discussion. First, the express recognition of the right of Members to take SPS measures in Article 2.1 is a crucial aspect of the *SPS Agreement* and forms a recognisable thread that runs throughout the rest of the Agreement. Second, the incorporation of familiar GATT disciplines requiring that health measures be limited to what is ‘necessary’ to achieve their aim in Article 2.2, and prohibiting arbitrary or unjustifiable discrimination and disguised trade restrictions in Article 2.3, provides an early indication of the fact that the *SPS Agreement* does not ignore but rather builds upon existing GATT rules in this area. Third, the inclusion of new scientific disciplines in Article 2.2 introduces an innovative element of the *SPS Agreement*, namely the use of science as the touchstone against which SPS measures are to be judged. These three elements will now be discussed further.

### 3.1 Right to impose SPS measures

As mentioned above, Article 2.1 of the *SPS Agreement* explicitly recognises the *right* of Members to take SPS measures necessary for the protection of human, plant or animal life or health, provided that they conform to the provisions of the *SPS Agreement*. This is significant as it represents a movement away from the approach under the GATT 1994

---

<sup>607</sup> Only the first three paragraphs of Article 2 are cited here. The fourth paragraph of Article 2, containing the presumption of conformity of SPS measures that comply with the *SPS Agreement* with the GATT 1994, has been cited and discussed above, Part III, Section 2.4.2.

where health measures that discriminate against imports or are quantitative restrictions (including bans) are, in principle, prohibited unless they can be justified under the health exception provided in Article XX(b) of the GATT. Thus, under the GATT, the burden of proof rests on the Member imposing the measure to show that it meets the requirements of Article XX(b) and its *chapeau*. In contrast, in terms of Article 2.1 of the *SPS Agreement* it is clear that SPS measures are, in principle, *allowed* and it is for the *complaining* Member to prove that the relevant SPS measure does not comply with the disciplines of the *SPS Agreement*. This fact has important consequences for disputes under the *SPS Agreement* since these disputes typically raise difficult and complex issues of fact and scientific evidence.<sup>608</sup> Thus, the question of who bears the burden of proof could have a fundamental impact on the outcome of a dispute.<sup>609</sup>

However, the undisputed right of Members to impose SPS measures, as recognised in the *SPS Agreement*, is not unlimited but is subject to the disciplines set out in the rest of the Agreement. These disciplines can usefully be seen as falling into two categories: first, the familiar GATT trade disciplines, which are reiterated and elaborated upon in the *SPS Agreement*,<sup>610</sup> and second the new scientific disciplines on the use of SPS measures, introduced by the *SPS Agreement*.

The disciplines limiting the exercise of the right to impose SPS measures find their first reflection in paragraphs 2 and 3 of Article 2 and are further fleshed out in later provisions. Article 2 can thus be regarded as the basic rule, laying down the scientific disciplines as well as reiterating the usual GATT trade disciplines applicable to SPS measures, both of which are further specified in the rest of the *SPS Agreement*.

### 3.2 Basic limits to the exercise of the right to impose SPS measures

#### 3.2.1 Necessity

The obligation on Members, contained in the first prong of Article 2.2, to ensure that SPS measures are applied ‘only to the extent necessary to protect human, animal or plant life or health’ reflects the well-known discipline contained in Article XX(b) of the GATT 1994, requiring that a measure be ‘necessary to protect human, animal or plant life or health’ in order to be justified as an exception to other GATT rules. This requirement of Article 2.2 has not yet been addressed in dispute settlement. In most cases complaining parties in disputes under the *SPS Agreement* seem to have readily accepted that the SPS measures in dispute meet this requirement, or have addressed their challenges to the later provision of the *SPS Agreement* which could be regarded as a further specification of this rule, namely Article 5.6.<sup>611</sup> Article 5.6 embodies the ‘least trade-restrictive’ test that

<sup>608</sup> This was recognised in Appellate Body Report, *EC – Hormones*, para. 97.

<sup>609</sup> The burden of proof under the *SPS Agreement* is discussed below, Part IV, Section 2.2.2.

<sup>610</sup> The prohibition on arbitrary or unjustifiable discrimination and disguised restrictions on trade is contained in the *chapeau* of Article XX of GATT 1994 and the necessity test in paragraph (b) of that Article.

<sup>611</sup> Exceptions to this are the complaints of Argentina and Canada in *EC – Approval and Marketing of Biotech Products*, which did raise challenges to under the ‘necessary’ requirement of Article 2.2. As the Panel had found the EC’s general *de facto* moratorium and product specific measures not to be ‘SPS measures’, it found

is characteristic of the interpretation of the ‘necessary’ requirement in Article XX(b) of the GATT.<sup>612</sup> However, while the first prong of Article 2.2 refers to the *application* of SPS measures, Article 5.6 refers to the *adoption* or *maintenance* of SPS measures, thus arguably applying the ‘necessary’ requirement to different aspects of SPS regulation.

It is likely that cases decided under Article XX(b) of the GATT 1994 will usefully be examined by panels and the Appellate Body in future cases dealing with the first prong of Article 2.2 of the *SPS Agreement*, to find guidance for the interpretation of this discipline, due to the similarity in their wording.<sup>613</sup> It should, however, be borne in mind that while under the GATT Article XX(b) represents an exception to the normal disciplines, and thus the burden of proof to show that its requirements were met rests on the Member imposing the health measure, under the *SPS Agreement* this rule-exception relationship is not present. Thus, it is for the complaining Member to prove that the ‘necessary’ requirement of Article 2.2 of the *SPS Agreement* has not been complied with. This results in greater respect for the regulatory choices of a Member than is reflected in GATT rules.<sup>614</sup> In addition, and more importantly, reliance on the interpretation of GATT rules must be tempered by the realisation that the *SPS Agreement* is more than a mere clarification of Article XX(b) of the GATT. Instead the object and purpose of the *SPS Agreement* is to go further than this in creating additional disciplines, while recognising the right of Members to regulate. The careful balance achieved by the provisions of the *SPS Agreement* must not be disturbed through a wholesale incorporation of interpretations of the relevant GATT rules into the interpretation of its Articles. In each case, the suitability of the GATT interpretation must be assessed in the light of the ‘balancing act’ that is the object and purpose of the *SPS Agreement*. As argued above, an appropriate balance between trade and health in the *SPS Agreement* is in the interest of WTO Members at *all* levels of development.<sup>615</sup>

From the discussion in Chapter 1 of the requirements to prove that a measure is ‘necessary to protect human, animal or plant life or health’ in the case law under Article XX(b) of the GATT 1994,<sup>616</sup> it appears that the policy area addressed by the measure must fall within the ambit of health protection, and a scientifically identifiable risk must be present, to indicate that the measure really is ‘designed to protect human, animal or plant life or health’.<sup>617</sup> However, in the *SPS Agreement* both these elements have been elaborated

---

that Article 2.2 was not applicable to these measures. With regard to the Member States’ safeguard measures, having already found a violation of Article 5.1 of the *SPS Agreement*, the Panel exercised judicial economy with regard to the Article 2.2 claim. Panel Report, *EC – Approval and Marketing of Biotech Products*, paras 7.1430-7.1434, 7.1758-7.1759 and 7.3394.

<sup>612</sup> As discussed above, Part III, Section 1.1.1.

<sup>613</sup> The likelihood that a similar interpretation will be followed can be inferred from the presumption in Article 2.4 of the *SPS Agreement* that measures conforming to the *SPS Agreement* are in accordance with GATT obligations, in particular Article XX(b), as discussed above, Part III, Section 2.4.2. This shows the intention of the drafters to subsume the existing GATT disciplines into the *SPS Agreement*.

<sup>614</sup> Frank Garcia states with regard to the shift in burden of proof to the complaining Member in Article 2.2 of the *SPS Agreement*: ‘Shifting the burden in this manner results in a regime that is overall more protective of Member’s SPS choices.’ Frank J. Garcia, ‘The Salmon Case: Evolution of Balancing Mechanisms for Non-Trade Values in WTO’, in *Trade and Human Health and Safety*, George A. Bermann and Petros C. Mavroidis (eds.) (Cambridge University Press, Cambridge), 2006, 133-152, 140.

<sup>615</sup> See the discussion in the Introduction to this book, above.

<sup>616</sup> See above, Part III, Section 1.1.1.

<sup>617</sup> Panel Report, *EC – Asbestos*, para. 8.170.

upon in other provisions. The definition of SPS measures<sup>618</sup> ensures that the measures aim at specific health protection objectives before they will fall under the *SPS Agreement* at all.<sup>619</sup> The obligation of scientific justification for a measure is contained in the second and third prongs of Article 2.2, in Article 3.3 and in Article 5 of the *SPS Agreement*.<sup>620</sup> It would thus seem that the second element of the GATT Article XX(b) requirements, namely the ‘necessary’ test, is more significant for the interpretation of the obligation in the first prong of Article 2.2 of the *SPS Agreement* and is useful to examine for purposes of analogous interpretation of Article 2.2 of the *SPS Agreement*.

The ‘weighing and balancing’ approach developed in the case law on Article XX of the GATT 1994 in interpreting the ‘necessary’ requirement is relevant here. As discussed above,<sup>621</sup> under this approach, the importance of the protected value, the trade restrictiveness of the measure and the extent of the contribution of the measure to the objective to be achieved are weighed and balanced against each other in order to establish whether an alternative, less trade-restrictive measure is reasonably available to achieve the policy objective of the imposing Member. This introduces an element of strong proportionality-testing into the ‘necessary’ requirement. The question arises whether such a proportionality test is appropriate in the context of the *SPS Agreement*. SPS measures, by virtue of their definition, necessarily aim to protect life or health against specified risks. The importance of the objective of the measure in the case of SPS measures is always great, but it can be argued that this would be more the case when human health is at stake, than when risks to animals or plants from pests or diseases are at issue. Further, within these categories, there are also degrees of seriousness of risks. The less serious the health risk, the stricter the measure or the less it contributes to the end sought to be achieved, the easier it would be for a complaining Member to show that the extent of application of the relevant measure is not necessary under a weighing and balancing approach. However, a panel’s evaluation of the seriousness of the risk and its weighing of this against the trade restrictiveness of the application of the measure should not be allowed to undermine the policy space left by the *SPS Agreement* to Members. As will be seen below, the *SPS Agreement* allows a Member, once a risk is proven, to decide for itself how serious it regards this risk to be, and therefore what level of protection against such risk it deems appropriate on its territory. The measure it adopts is therefore only limited in Article 5.6 to the least

---

<sup>618</sup> See above, Part III, Section 2.1.1.

<sup>619</sup> This definition, contained in Annex A.1 of the *SPS Agreement*, is narrower than the general health policy objective covered by Article XX(b) of the GATT 1994. However, unlike the case with Article XX(b) of the GATT, the fact that a measure is not covered by one of the enumerated objectives in Annex A.1 of the *SPS Agreement* does not mean the measure is in violation of the Agreement, but only that it falls outside its scope.

<sup>620</sup> The scientific requirement in Article 5.1 of the *SPS Agreement* goes further than that in Article XX(b) of the GATT, in that it requires that the measure be based on a risk assessment. The Panel in *EC–Asbestos* prudently refrained from interpreting the proof of risk it read into Article XX(b) of the GATT as requiring a risk assessment, preferring ‘to confine itself to the provisions of the GATT 1994 and to the criteria defined by the practice relating to the application of Article XX.’ Panel Report, *EC – Asbestos*, para. 8.180. This approach is to be commended, since the *SPS Agreement* goes further than the GATT in creating additional disciplines applicable to a discrete set of measures, namely those defined as ‘SPS measures’ in Annex A.1. To read these additional disciplines into Article XX(b) of the GATT would go against the clear intention of the drafters to limit the scope of application of the *SPS Agreement* to the defined measures rather than make it generally applicable to all health measures.

<sup>621</sup> See above, Part III, Section 1.1.1.

trade-restrictive measure that *achieves* the level of protection *chosen by the Member*.<sup>622</sup> This has been termed a ‘weak proportionality’ requirement as this type of proportionality does not open to question a Member’s autonomy in establishing its appropriate level of protection.<sup>623</sup> Similarly, the necessity test of Article 2.2 should be interpreted as requiring that the SPS measure be applied to the least trade-restrictive extent that achieves the level of protection chosen by the Member. Such an interpretation would safeguard the balance between trade and health aimed at by the *SPS Agreement*.<sup>624</sup>

The relationship between the first prong of Article 2.2 and Article 5.6 was addressed by the Panel in *Japan – Agricultural Products II*, which found that Article 5.6 should be read together with Article 2.2.<sup>625</sup> In *EC – Approval and Marketing of Biotech Products*, the Panel also noted that the two provisions must be read together, Article 5.6 constituting a more specific application of the requirement in the first prong of Article 2.2.<sup>626</sup> This would entail that a violation of Article 5.6 necessarily implies a violation of the first prong of Article 2.2, but the reverse is not true.<sup>627</sup> However, as stated above, Article 2.2 makes the ‘necessary’ requirement applicable to the *extent of application* of an SPS measure, unlike Article 5.6 which relates to the *adoption or maintenance* of the measure. Nevertheless, it is clear that Members prefer to challenge SPS measures under the more specific later discipline of Article 5.6 of the *SPS Agreement*. It is therefore unlikely that the first prong of Article 2.2 will gain more prominence in future disputes under the *SPS Agreement*.

<sup>622</sup> Note that another example of cross fertilisation between the Article XX of the GATT and the *SPS Agreement* is the recognition that Members are free to choose their own level of protection also under GATT rules. See for example, the Appellate Body’s statement in *EC – Asbestos* that: ‘it is undisputed that WTO Members have the right to determine the level of protection of health that they consider appropriate in a given situation.’ Appellate Body Report, *EC – Asbestos*, para. 168.

<sup>623</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 159. A weak proportionality test entails an examination of the ‘suitability’ of the measure (i.e. its effectiveness in achieving its objective) and the existence of a less trade restrictive alternative that meets the objective of the measure. By contrast, a strong proportionality test involves an examination of whether the trade restrictive effects of the measure are disproportionate or excessive in relation to the importance of the objective it pursues. On the definition of proportionality and its reflection in WTO law, see Peter Van den Bossche, ‘Looking for Proportionality in WTO Law’, *Legal Issues of Economic Integration* 35 (3), 2008, 283-294.

<sup>624</sup> It is useful to recall here that, since the coming into force of the *SPS Agreement* and in line with its provisions, the ‘necessary’ test of Article XX(b) of the GATT 1994 has been interpreted not to require a Member to employ any alternative measure that would prevent it from achieving its chosen level of protection. See above, Part III, Section 1.1.1. See also Appellate Body Report, *EC – Asbestos*, para. 174; and Appellate Body Report, *Brazil – Retreaded Tyres*, para. 156. However, this may be undermined by the manner in which the weighing and balancing test has been applied, as discussed above, in the abovementioned Section.

<sup>625</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.71.

<sup>626</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1430.

<sup>627</sup> This is deduced by analogy to the finding of the Appellate Body with regard to a similar relationship between Article 2.2, third sentence, and Article 5.1 of the *SPS Agreement*, set out below, Part III, Section 3.2.3. Appellate Body Report, *EC – Hormones*, para. 180 and Appellate Body Report, *Australia – Salmon*, para. 137.

### 3.2.2 Prohibition on arbitrary or unjustifiable discrimination or disguised restrictions on trade

Another familiar trade discipline incorporated into the *SPS Agreement* is that contained in Article 2.3 of the *SPS Agreement*, cited above.<sup>628</sup> This Article embodies a general non-discrimination rule, combining the most favoured nation treatment and national treatment obligations of Articles I and III of the GATT with the prohibition on arbitrary or unjustifiable discrimination and disguised restrictions on trade of the *chapeau* of Article XX of the GATT. In this regard, the Appellate Body in *Australia – Salmon* held:

This provision takes up obligations similar to those arising under Article I:1 and Article III:4 of the GATT 1994 and incorporates part of the “chapeau” to Article XX of the GATT 1994. Its fundamental importance in the context of the *SPS Agreement* is reflected in the first paragraph of the preamble of the *SPS Agreement*.<sup>629</sup>

An important difference exists between Article 2.3 and the relevant GATT provisions. A rule-exception relationship exists between Articles I and III:4 of the GATT, on the one hand, and Article XX of the GATT, on the other, whereby discriminatory measures are prohibited in principle but may be justified under an exception provided that they are not applied so as to constitute arbitrary or unjustifiable discrimination or a disguised trade restriction. By contrast, the prohibition of Article 2.3 of the *SPS Agreement* itself incorporates flexibility for justified measures. Measures that are applied in dissimilar situations or whose discriminatory effects are justified are simply not caught by the Article 2.3 prohibition. The burden of proof is therefore on the complaining party to show that all the requirements for violation of Article 2.3 are met.

The two sentences of Article 2.3 contain separate obligations. The first sentence prohibits SPS measures that arbitrarily or unjustifiably discriminate between Members where identical or similar conditions prevail, whereas the second sentence prohibits the *application* of an SPS measure in a manner that would constitute a disguised restriction on trade.

It is necessary to examine how a violation of Article 2.3, first sentence, can be established. This issue was raised before the Panel in *Australia – Salmon (Article 21.5 – Canada)*. In that case, Canada claimed that Article 2.3, first sentence, was violated as Australia imposed import requirements for salmonids from Canada but had no internal control measures in place regarding the internal movement of dead, Australian fish, constituting discrimination between Canada and Australia. The compliance Panel identified the requirements for proof of violation of Article 2.3 as follows:

[T]hree elements, cumulative in nature, are required for a violation of this provision:

- (1) the measure discriminates between the territories of Members other than the Member imposing the measure, or between the territory of the Member imposing the measure and that of another Member;

<sup>628</sup> See above, in the introductory paragraphs of Part III, Chapter 3.

<sup>629</sup> Appellate Body Report, *Australia – Salmon*, para. 251.

- (2) the discrimination is arbitrary or unjustifiable; and
- (3) identical or similar conditions prevail in the territory of the Members compared.<sup>630</sup>

In respect of the first of these three elements, the Panel held that, given the finding of the Panel and Appellate Body in the original dispute that discrimination contrary to Article 5.5 by implication entails discrimination contrary to Article 2.3, first sentence; and that under Article 5.5 different situations including *different* products can be compared, discrimination under Article 2.3, first sentence includes discrimination between *different* products. In other words, not only discrimination between Canadian salmon and New Zealand salmon or between Canadian salmon and Australian salmon is covered but also discrimination between Canadian salmon and other Australian fish including non-salmonids.<sup>631</sup>

Therefore Article 2.3, first sentence, prohibits not only discrimination between ‘like products’ but also between different products (in this case salmonids from Canada and other dead fish from Australia). This represents a significant deviation from the position under GATT 1994, which only prohibits discrimination between ‘like’<sup>632</sup> or ‘directly competitive or substitutable’<sup>633</sup> products. The aim of this broader prohibition on discrimination is to take into account the fact that different products can pose the same or similar health risks. One could think here of the possibility that different chemicals may be equally carcinogenic, diverse fruits may be vectors for fruit flies, or various animals can be carriers of foot-and-mouth disease. As a result, one would expect a Member that truly aims to protect against a particular health risk through its SPS measure, to take similar measures to address other similar risks in comparable situations. Not to do so calls into question the reasons behind its measure. The prohibition in Article 2.3 thus does not only aim at ensuring equal opportunities for products that are in a competitive relationship on the market, but is broader, distinguishing health protection from protectionism by filtering out measures whose health protection objectives are doubtful.

The breadth of this prohibition on discrimination is tempered by the second and third cumulative requirements for a violation of the first sentence of Article 2.3, namely that the discrimination must be arbitrary or unjustifiable and that identical or similar conditions must prevail in the territories of the Members subject to different treatment. In line with the interpretation of the term ‘arbitrary or unjustifiable discrimination’ in the case law on the *chapeau* of Article XX of the GATT 1994, discussed above,<sup>634</sup> it is likely that under the second requirement for a violation of Article 2.3, first sentence, different treatment will be considered not to be arbitrary or unjustifiable where it can be explained by a rationale that is directly related to the objective of the measure in addressing SPS risks.<sup>635</sup>

<sup>630</sup> Panel Report, *Australia – Salmon (Article 21.5 Canada)*, para 7.111.

<sup>631</sup> *Ibid.*, para. 7.112.

<sup>632</sup> Article I:1 (most favoured nation treatment) and Article III:2, first sentence, and III:4 (national treatment) of the GATT 1994.

<sup>633</sup> Article III:2, second sentence of the GATT 1994, read together with the *Ad Note* thereto (in respect of taxes).

<sup>634</sup> See above, Part III, Section 1.1.1.

<sup>635</sup> Appellate Body Report, *Brazil Retreaded Tyres*, para. 227. Although the Appellate Body’s assessment of the rationale of the discrimination in this case referred to the contribution of the discrimination to the achievement of the legitimate objective provisionally found to justify the measure at issue under one of the

Likewise, pertinent differences in conditions under the third requirement should be understood in relation to the SPS risk addressed, including those relevant to the disease status of the Members compared. In this regard, the Panel in *Australia – Salmon (Article 21.5 – Canada)* expressed its doubts whether ‘identical or similar conditions’ prevailed in the territories of both Canada and Australia in respect of the situations compared, particularly in light of the ‘substantial difference in disease status between Canada and Australia’.<sup>636</sup> Consequently, the Panel found no violation of Article 2.3 in that case.<sup>637</sup> Other relevant differences are likely to include dissimilar climatic or geographical conditions that affect the incidence or spread of pests and diseases, variations in the regulatory controls in place to minimise the risks, divergent dietary habits etc.

An example of an SPS concern, frequently raised by exporting Members at lower levels of development, that is liable to escape the discipline of the first sentence of Article 2.3 is the fact that importing Members tend to apply more rigorous control and inspection requirements when it comes to products from these exporting Members. If such different treatment can be justified on the basis of the weak SPS regulatory controls in the exporting Member, it cannot be regarded as arbitrary or unjustifiable and neither can the conditions in the Members compared be regarded as ‘similar or identical’. While this makes Article 2.3 less useful in these situations, the alternative is unfeasible. SPS measures necessarily distinguish between the territories of different exporting Members or between the territory of the importing Member and other Members, in response to differences in risk. Creating an absolute prohibition on such discrimination is unthinkable, as it would undermine the ability of a Member to ensure the level of SPS protection it deems appropriate. Only where such discrimination is not motivated by factors related to the SPS objective of the measure, and where the conditions in the Members compared relevant to the SPS risk at issue are similar or identical, is the measure in violation of Article 2.3.

The second sentence of Article 2.3 embodies the prohibition on the application of SPS measure in a manner constituting a disguised restriction on trade. Like the *chapeau* of Article XX of the GATT 1994, this prohibition deals with the manner of application of a measure, rather than the measure itself. In the absence of case law on this provision, the interpretation of the similar requirement in the *chapeau* of Article XX can shed some light on its meaning. As stated above,<sup>638</sup> the Appellate Body in *US – Gasoline* held that the same kind of considerations relevant to the question whether there is arbitrary or unjustifiable discrimination may be taken into account in determining whether there is a disguised restriction on trade.<sup>639</sup> The purpose of the examination is to ascertain whether the ostensible health objective of the measure is ‘only a disguise to conceal the pursuit of trade-restrictive objectives.’<sup>640</sup> This is determined by looking at the design, structure and

---

paragraphs of Article XX of the GATT 1994, the different structure of the *SPS Agreement* entails that the rationale of the discrimination at issue should be assessed instead against the relevant SPS objective of the measure as defined in Annex A.1 of the *SPS Agreement*.

<sup>636</sup> Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.113.

<sup>637</sup> *Ibid.*, para. 7.114.

<sup>638</sup> See above, Part III, Section 1.1.1.

<sup>639</sup> Appellate Body Report, *US – Gasoline*, 23.

<sup>640</sup> Panel Report, *EC – Asbestos*, para. 8.236. Note however that unlike the *chapeau* of Article XX of the GATT 1994, which has the role of preventing abuse of the exceptions of Article XX through the application of the measures provisionally justified under one of its paragraphs, the obligations of Article 2.3 apply

architecture of the measure, rather than by trying to establish the subjective intent of the regulator.<sup>641</sup>

An example of a dispute in which Article 2.3 of the *SPS Agreement* was raised is that initiated by Ecuador in 2001 against Turkey's application of its import procedures for fresh fruit to bananas.<sup>642</sup> Ecuador alleged that the manner in which Turkey applied its Control Certificate system to bananas discriminated between domestic and imported bananas and constituted a disguised restriction on trade contrary to Article 2.3. Turkey's import procedures required an importer to obtain a Control Certificate from the Turkish Ministry of Agriculture and Rural Affairs, in order to be able to request the SPS clearance certificate necessary for market access. These Control Certificates were previously issued promptly and for the quantity requested, relying on the correctness of reports of analyses with regard to pesticide residues and phytosanitary conditions submitted by the exporters. However, since November 1999, Turkey issued Control Certificates only for limited quantities, for limited periods and with considerable delays.<sup>643</sup> Ecuador was of the view that the limited quantities were too small compared to the normal size of a banana shipment, and that the system was applied in a way designed to restrict the entry of Ecuadorian bananas into the Turkish market.<sup>644</sup> Turkey claimed instead that the new system was motivated by the fact that analyses conducted in Turkey had shown discrepancies with the analysis reports submitted by exporters, thus obliging Turkey to undertake laboratory analyses of imports. According to Turkey, the limited quantities allowed under the Control Certificates were justified by the fact that the Turkish agency with responsibility for inspection and control of food imports had only 15 laboratories at its disposal, only five of which could test for pesticide residues.<sup>645</sup> These resource constraints meant that Turkey could not verify whole shipments of bananas at once as this would occupy a laboratory for a considerable time and Turkey would face complaints from other food ex-

---

independently. Like all the disciplines of the *SPS Agreement*, they aim to balance the right of a Member to enact and apply necessary SPS measures with the need to liberalise trade in food and agricultural products.

<sup>641</sup> Panel Report, *EC – Asbestos*, para. 8.236. See also above, Part III, Section 1.1.1.

<sup>642</sup> Dispute Settlement Body, *Turkey – Certain Import Procedures for Fresh Fruit. Request for Consultations by Ecuador*, WT/DS237/1, G/L/472, G/SPS/GEN/276, G/LIC/D/33, G/AG/GEN/48, S/L/101, circulated on 10 September 2001. In its request for consultations, Ecuador also alleged violations of Article 8 and Annexes B and C of the *SPS Agreement*, as well as certain provisions of the GATT 1994, the *Agreement on Import Licensing Procedures*, the *Agreement on Agriculture*, and the GATS.

<sup>643</sup> Whereas previously Control Certificates were issued for shipments of up to a million boxes, under the new system a maximum of 52 000 boxes were covered by a Control Certificate. Committee on Sanitary and Phytosanitary Measures, *Turkish SPS Measures Applied to Importation of Bananas – Replies from Turkey*, G/SPS/GEN/275, circulated on 24 August 2001, para. 4.

<sup>644</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 14–15 March: Note by the Secretariat*, G/SPS/R/21, circulated on 22 May 2001, para. 98.

<sup>645</sup> Committee on Sanitary and Phytosanitary Measures, *Turkish SPS Measures Applied to Importation of Bananas – Replies from Turkey*, G/SPS/GEN/275, circulated on 24 August 2001, para. 4. Turkey clarified that the shipment size limitations in its Control Certificates were not intended to limit import quantities, otherwise it would not have issued many permits to the same firms, which are importing Ecuadorian bananas. In addition, Turkey pointed out that its banana imports had not dropped to a level below the average of previous years. Instead, Turkey stated that the quantities provided for in the Control Certificates were determined according to the infrastructure and capacity of existing laboratories. Committee on Sanitary and Phytosanitary Measures, *Turkish SPS Measures Applied to Importation of Bananas – Replies from Turkey*, G/SPS/GEN/275, circulated on 24 August 2001, paras 4 and 7.

porters due to delays in issuing Control Certificates.<sup>646</sup> In addition, Turkey stated that additional delays in issuing Control Certificates for Ecuadorian bananas were due to the fact that the pesticide residue reports provided by Ecuador included pesticides not covered by CAC standards or Turkish MRLs, necessitating additional testing. Turkey countered Ecuador's claim of discrimination in favour of domestic producers,<sup>647</sup> by clarifying that the same requirements with regard to pesticide levels applied to domestic bananas, but these were tested for compliance by laboratory analyses during their production process. Due to the fact that the production stages of imported products could not be monitored by Turkey, it applied controls at the importation stage. As the consultations failed to resolve the dispute, Ecuador requested the establishment of a panel.<sup>648</sup> However, a panel was never established to hear this dispute as Ecuador and Turkey were able to reach a mutually agreed solution, in which Turkey agreed to issue Control Certificates for the quantities requested by importers and for amended validity periods.<sup>649</sup> Nevertheless, had a panel heard this dispute, it does not appear from the information available that a violation of Article 2.3 would have been found. The additional requirements applied by Turkey to imported bananas in the face of the unreliable analysis reports submitted by exporters and its inability to carry out controls at foreign production sites seem justifiable. In addition, the limitations on the shipment sizes laid down in its Control Certificates cannot be seen as a disguised restriction on trade since they seem to be a consequence of its limited laboratory capacity. An example of a situation where a trade concern raised under Article 2.3 related to a measure indeed caught by this prohibition, and was successfully pursued, was provided in Part II above.<sup>650</sup> This example relates to Australia's prohibition on sauces from the Philippines containing benzoic acid. At the core of this trade concern was the Philippines argument that by prohibiting sauces containing benzoic acid from the Philippines, but allowing such sauces from New Zealand, Australia was violating Article 2.3 of the *SPS Agreement*. Australia justified its discriminatory treatment by pointing to the reason that New Zealand's sauces were granted import permission, despite their benzoic acid content. This was due to the transitional arrangements pending the finalisation of a new joint food code between Australia and New Zealand.<sup>651</sup> In response, the Philippines stated: 'There is nothing in the [SPS] Agreement which grants a grace period for discriminatory practices under "transitional arrangements"'. In our view, the only just remedy for this case is the immediate lifting of the ban.<sup>652</sup> While Australia did not immediately lift the ban, in 1999 it confirmed that the new *Australia New Zealand*

<sup>646</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 14–15 March: Note by the Secretariat*, G/SPS/R/21, circulated on 22 May 2001, para. 98.

<sup>647</sup> Ecuador had alleged that Turkey failed to apply a testing and certification requirement to domestic bananas and to allocate its laboratory capacity appropriately between domestic and foreign banana producers. According to Ecuador, Turkey's procedures were applied in a manner constituting a disguised restriction on trade. Dispute Settlement Body, *Turkey – Certain Import Procedures for Fresh Fruit. Request for the Establishment of a Panel by Ecuador*, WT/DS237/3, circulated on 14 June 2002.

<sup>648</sup> *Ibid.*

<sup>649</sup> Dispute Settlement Body, *Turkey – Certain Import Procedures for Fresh Fruit. Notification of Mutually Agreed Solution*, WT/DS237/4, circulated on 29 November 2002.

<sup>650</sup> See above, Part II, Section 2.4.2.2.

<sup>651</sup> The joint food code between Australia and New Zealand is discussed above, Part II, Section 2.4.2.1.

<sup>652</sup> Committee on Sanitary and Phytosanitary Measures, *Australian Import on Sauces Containing Benzoic Acid: Statement by Philippines at the Meeting of 11–12 November 1998*, G/SPS/GEN/106, circulated on 23 November 1998.

*Food Standards Code* would allow benzoic acid as an additive in food. In 2000, Australia reported that a tolerance level of 1000 mg/kg for benzoates in sauces had been laid down in the Code and applied to all products sold on the Australian market, regardless of their origin. The Philippines confirmed that no detention of Philippines sauces had occurred since June 2000.<sup>653</sup> This example illustrates, as correctly argued by the Philippines, that the grounds for justification of discriminatory treatment under Article 2.3 do not include considerations unrelated to the risk at issue. Therefore, transitional arrangements between Australia and New Zealand cannot be seen as eliminating the ‘arbitrary and unjustifiable’ nature of the discrimination in place.

As has been stated above, Article 2 lays down core disciplines which are further specified in later Articles. In this way, the prohibition contained in Article 2.3 is reflected again in Article 5.5, which proscribes arbitrary or unjustifiable distinctions in the levels of protection that a Member deems appropriate. The relationship between these two Articles therefore deserves attention here.

The Panel and Appellate Body in *EC – Hormones* found that Article 5.5 must be read together with the basic obligation of Members to avoid discrimination and disguised restrictions on trade in Article 2.3.<sup>654</sup> The Appellate Body in *EC – Hormones* held that an important part of the context for the interpretation of Article 5.5 is Article 2.3 of the *SPS Agreement*. It stated:

When read together with Article 2.3, Article 5.5 may be seen to be marking out and elaborating a particular route leading to the same destination set out in Article 2.3.<sup>655</sup>

When dealing with Article 5.5, the Appellate Body in *EC – Hormones* stated the following regarding Article 2.3:

It is well to bear in mind that, after all, the difference in levels of protection that is characterizable as arbitrary or unjustifiable is only an element of (indirect) proof that a Member may actually be applying an SPS measure in a manner that discriminates between Members or constitutes a disguised restriction on international trade, prohibited by the basic obligations set out in Article 2.3 of the *SPS Agreement*.<sup>656</sup>

In *Australia – Salmon*, the issue of the relationship between Articles 2.3 and 5.5 was raised before the Appellate Body by Canada, which argued that the Panel had erred in only applying Article 2.3 through Article 5.5 and not independently. The Appellate Body found that the Panel had not intended to deny that Article 2.3 contains an obligation independent of Article 5.5<sup>657</sup> but had merely refrained from addressing Article 2.3 separately

<sup>653</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 31 October–1 November 2001. Note by the Secretariat*, G/SPS/R/25, circulated on 18 January 2002, para. 36.

<sup>654</sup> Appellate Body Report, *EC – Hormones*, para. 212.

<sup>655</sup> *Ibid.*

<sup>656</sup> Appellate Body Report, *EC – Hormones*, para. 240.

<sup>657</sup> Appellate Body Report, *Australia – Salmon*, para. 248. The Appellate Body here quoted the Panel’s finding that ‘given the more general character of Article 2.3, not all violations of Article 2.3 are covered by Article 5.5.’ Panel Report, *Australia – Salmon*, para. 8.109.

on grounds of judicial economy. Further discussing the relationship between Articles 2.3 and 5.5, the Appellate Body in *Australia – Salmon* held:

We recall that the third - and decisive - element of Article 5.5, discussed above, requires a finding that the SPS measure which embodies arbitrary or unjustifiable distinctions in levels of protection results in “discrimination or a disguised restriction on international trade”. Therefore, a finding of violation of Article 5.5 will necessarily imply a violation of Article 2.3, first sentence, or Article 2.3, second sentence. Discrimination “between Members, including their own territory and that of others Members” within the meaning of Article 2.3, first sentence, can be established by following the complex and indirect route worked out and elaborated by Article 5.5. However, it is clear that this route is not the only route leading to a finding that an SPS measure constitutes arbitrary or unjustifiable discrimination according to Article 2.3, first sentence. Arbitrary or unjustifiable discrimination in the sense of Article 2.3, first sentence, can be found to exist without any examination under Article 5.5.<sup>658</sup>

It is therefore clear that Article 2.3 contains disciplines broader than those embodied in Article 5.5 and thus a violation thereof may be found independently of a violation of Article 5.5. In particular, it is useful to note that the discrimination addressed in Article 5.5 is limited to that embodied in the choice of a level of protection, whereas Article 2.3 applies broadly to SPS measures in general.

### 3.2.3 Basic scientific disciplines

As mentioned before, an essential tool used by the *SPS Agreement* to distinguish between measures that aim at health protection and those that are disguised forms of protectionism is science. The first mention of scientific disciplines in the *SPS Agreement* is found in the second and third prongs of Article 2.2, which require that SPS measures be based on scientific principles and not be maintained without sufficient scientific evidence, except as provided for in Article 5.7.

As illustration of the potentially devastating effects of SPS measures that are unfounded on scientific evidence, is provided by the example of the EC’s measures on Kenyan fish. Until 1996, the EC accounted for 62 percent of Kenya’s fish exports. However, from 1997 Kenya was hard hit by a series of SPS measures adopted by the EC with regard to its fish exports. These measures included new testing requirements and bans as a precautionary response to the outbreak of cholera in Mozambique, Kenya, Uganda and Tanzania,<sup>659</sup> as well as due to the EC’s suspicion that Kenyan fishermen were using pesticide chemicals to catch fish by poisoning them.<sup>660</sup> These EC measures remained in place for extended

<sup>658</sup> Appellate Body Report, *Australia – Salmon*, para. 252. In footnote, the Appellate Body cited its finding in *EC – Hormones*, para. 212, characterising Article 5.5 as ‘marking out and elaborating a *particular* route leading to the same destination set out in Article 2.3’.

<sup>659</sup> The EC made a statement before the SPS Committee regarding its precautionary measures to address the cholera epidemic in Mozambique, Kenya, Uganda and Tanzania. See Committee on Sanitary and Phytosanitary Measures, *Measures in Response to Cholera. Statement by the European Community at the Meeting on 12 and 13 March 1998*, G/SPS/GEN/68, circulated on 18 March 1998.

<sup>660</sup> The COMESA Secretariat reports that the EU ban on fish exports from Kenya in 1998, due to the cholera

periods, despite the absence of detectable chemical residues in the Kenyan fish exports, and the statements by the FAO and WHO that the risk of transmission of cholera from commercially imported fish is negligible.<sup>661</sup> The resulting diversion of fish exports to other markets<sup>662</sup> led to a sharp decrease in export revenue for the fishing industry, as prices offered on these other markets are significantly lower than those on the EU market.<sup>663</sup> While, after four years, Kenya was able to meet the new EC requirements and gain market access for its fish exports, there have been significant socio-economic implications in

---

outbreak, led to a drop in Kenyan Nile perch exports of 66%, corresponding to a 32% drop in value. The 20-month EU ban on fish exports from Kenya, under EU decision 99/253/EC of April 1999, due to fears of fish poisoning in Lake Victoria led to many fish factories closing down and affected an estimated 40 000 artisan fishermen (a similar ban was applied to Uganda and Nigeria, but lifted earlier). A further 68% decline in fish exports resulted. COMESA Secretariat, *Market Access Constraints* (Common Market for Southern Africa, Lusaka), 2003, paras 62-64, available at: [www.comesa.int/trade/multilateral/epa/Market%20Access%20Constraints/en](http://www.comesa.int/trade/multilateral/epa/Market%20Access%20Constraints/en), visited on 10 January 2008; Richard O. Abila, *Food Safety in Food Security and Food Trade. Case Study: Kenyan Fish Exports* (International Food Policy Research Institute, Washington D.C.), September 2003.

<sup>661</sup> The Director-General of the WHO, Dr Hiroshi Nakajima, sent a *Note Verbale* to the WHO member countries in 1998 stressing that although the bacterium that causes cholera is transmissible to humans through food, this usually occurs when individual travellers have transported food, usually seafood, across international borders and that the WHO has not documented an outbreak of cholera resulting from *commercially imported* food. 'Consequently, the placing of embargoes on the importation of food such as seafood, fresh water fish and vegetables is not an appropriate course of action to prevent the international spread of cholera, and can represent an additional burden on the economy of the affected countries.' 'Director-General Says Food Import Bans Are Inappropriate For Fighting Cholera' Press Release WHO/24, World Health Organization, 16 February 1998, available at: <http://www.who.int/inf-pr-1998/en/pr98-24.html>, visited on 9 November 2000. Information to this effect was also provided by the WHO to the SPS Committee. Committee on Sanitary and Phytosanitary Measures, *Trade Restrictions in Response to Cholera. Submission by the World Health Organization*, G/SPS/GEN/53, circulated on 20 February 1998. Similarly, the FAO issued a statement in 1998 noting that it did not consider the ban on fish exports from East African countries the most appropriate response to the cholera outbreak. It noted: 'Epidemiological data suggest that the risk of transmission of cholera from contaminated imported fish is negligible. Only rare and sporadic cases of cholera have occurred in developed countries as a result of eating fish transported across international borders by individuals.' 'FAO: Import Ban On Fish Products From Africa "Not The Most Appropriate Answer"' Press Release 98/21, Food and Agriculture Organization, 25 March 1998, available at: [http://www.fao.org/waicent/ois/press\\_ne/presseng/1998/pren9821.htm](http://www.fao.org/waicent/ois/press_ne/presseng/1998/pren9821.htm), visited on 9 November 2000.

<sup>662</sup> Israel became the main market for Kenyan fish, followed by other markets such as Japan, Singapore and the United Arab Emirates. Richard O. <sup>663</sup> Halima Noor, 'Sanitary and Phytosanitary Measures and Their Impact on Kenya', presented at the *African Workshop on Standards and Trade* (UNCTAD and IDRC, Kampala, Uganda) 13 September 2001, 7, available at: [http://r0.unctad.org/trade\\_env/test1/meetings/standards/kenya3.pdf](http://r0.unctad.org/trade_env/test1/meetings/standards/kenya3.pdf), visited on 5 January 2002. These lower prices were partly due to the fact that there are few alternative markets for fresh fish fillets and processors had to switch to production of frozen fillets, for which market prices are 60% lower. Spencer Henson *et al.*, 'Food Safety Requirements and Food Exports from Developing Countries: The Case of Fish Exports from Kenya to the European Union', *American Journal of Agricultural Economics* 82 (5), 2000, 1159-1169, 1164. In addition, Abila points out that the increased distance of these new markets from Kenya led to reductions in profit margins. Richard O. Abila, *Food Safety in Food Security and Food Trade. Case Study: Kenyan Fish Exports* (International Food Policy Research Institute, Washington D.C.), September 2003. The report of the Blair Commission for Africa notes that the costs of compliance with EU hygiene requirements in the fisheries sector for Kenya were US\$ 0.5 million. Blair Commission for Africa, *Our Common Interest*, March 2005, 279, available at: <http://213.225.140.43/english/report/thereport/cfafullreport.pdf>, visited on 6 June 2005.

Kenya. Fishermen have had to invest in new boats and cleaning and preservation facilities and many have been driven out of business by the high costs involved. Transporters have had to bear the costs of refrigerated trucks. Processors have been forced to restructure their facilities and production processes and several fish processing plants have been closed.<sup>664</sup> The government has had to finance training on the new requirements for fishermen and other fisheries workers, set up laboratories and employ inspectors to monitor compliance.<sup>665</sup> A study on the cost of upgrading a boat single landing site on Lake Victoria estimated this to be US\$1.2 million.<sup>666</sup> In order to reduce costs of providing the necessary facilities, Kenya has decided that only five out of the previous 300 villages may be landing places for fish destined for export markets, meaning that fishermen from elsewhere bear high costs in bringing their fish to the designated villages.<sup>667</sup> In addition, the high costs in meeting EC standards makes the final product too expensive for the domestic market. Instead, these fish must be exported to recover costs.<sup>668</sup> As all resources available to the fisheries sector are absorbed in meeting export standards, little effort goes to setting and enforcing safety standards for the domestic market and local consumers are exposed to potentially unsafe fish.<sup>669</sup> In view of the absence of a scientific basis for the EC measure, one may wonder if these negative consequences could have been avoided by Kenya by reliance on the scientific disciplines of the *SPS Agreement*.<sup>670</sup>

---

<sup>664</sup> Henson *et al* note that this has had significant consequences for persons, mainly women, whose livelihoods depend on processing the skeletons and other waste products produced by processing plants. Spencer Henson *et al.*, 'Food Safety Requirements and Food Exports from Developing Countries: The Case of Fish Exports from Kenya to the European Union', *American Journal of Agricultural Economics* 82 (5), 2000, 1159-1169, 1166.

<sup>666</sup> Spencer Henson *et al.*, 'Food Safety Requirements and Food Exports from Developing Countries: The Case of Fish Exports from Kenya to the European Union', *American Journal of Agricultural Economics* 82 (5), 2000, 1159-1169.

<sup>667</sup> Abila notes that this creates room for middlemen to operate between villages and centralised landing points, running counter to the current efforts to reduce the influence of middlemen on the fishing industry. Richard O. Abila, *Food Safety in Food Security and Food Trade. Case Study: Kenyan Fish Exports* (International Food Policy Research Institute, Washington D.C.), September 2003. Henson *et al* point out that these changes, while helping to secure longer-term access to the EC market, increase fishermen's dependency on industrial fish processors, directly and via traders, and reduce their ability to negotiate the terms on which they trade. Spencer Henson *et al.*, 'Food Safety Requirements and Food Exports from Developing Countries: The Case of Fish Exports from Kenya to the European Union', *American Journal of Agricultural Economics* 82 (5), 2000, 1159-1169, 1166.

<sup>668</sup> As Lake Victoria has a near-monopoly of Nile perch, perch prices can be raised to cover some of the costs of meeting EC standards. Richard O. Abila, *Food Safety in Food Security and Food Trade. Case Study: Kenyan Fish Exports* (International Food Policy Research Institute, Washington D.C.), September 2003.

<sup>669</sup> *Ibid.*

<sup>670</sup> It is interesting to note that Tanzania, one of the Members affected by the EC's measures in response to the cholera outbreak, raised a concern in this regard at the meeting of the SPS Committee in June 1998, stressing that tests had not found the bacteria concerned in fishery products from the four African countries affected. The EC responded that it had revised its measure, effective probably as of 1 July 1998, and that trade would be restored with the African countries concerned under these new requirements, since the EC was now convinced that the necessary guarantees were in place. The matter was reported 'partially resolved' due to the revision of the EC measure. Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 40. Notably, Kenya did not indicate its support for the Tanzanian concern, probably due to the fact that, as noted below, Part IV, Section 2.1, Kenya's resource constraints mean that it very rarely sends a delegate to meetings of the SPS Committee. Under the revised EC requirements, Kenya continued

In an effort to avoid the introduction of SPS measures that are motivated by unfounded fears, or are imposed in response to domestic industry interests, Article 2.2 of the *SPS Agreement* introduces the use of science as the touchstone against which SPS measures will be judged. The importance of the basic scientific disciplines contained in Article 2.2, and further elaborated in Article 5.1, in mediating between the goals of health protection and the liberalisation of trade was made explicit in *EC – Hormones*, where the Appellate Body stated as follows:

The requirements of a risk assessment under Article 5.1, as well as of ‘sufficient scientific evidence’ under Article 2.2, are essential for the maintenance of the delicate and carefully negotiated balance in the *SPS Agreement* between the shared, but sometimes competing, interests of promoting international trade and of protecting the life and health of human beings.<sup>671</sup>

The centrality of science to the operation of the *SPS Agreement* is thus irrefutable – it is the scale on which the competing values of health protection and trade liberalisation are balanced. It is interesting to examine the way in which the *SPS Agreement* uses science to strike this balance, and to determine whether this is appropriate to the needs of Members across different levels of development.

The following analysis of the basic scientific discipline in Article 2.2 of the *SPS Agreement* must be conducted bearing in mind the preceding discussion on the role of science in regulation.<sup>672</sup>

### 3.2.3.1 Meaning of ‘scientific principles’ and ‘sufficient scientific evidence’

At the crux of the scientific requirements of Article 2.2 is the question of the meaning of the terms ‘scientific principles’ and ‘sufficient scientific evidence’, with regard to the required scientific method, quantity of evidence and its quality or scientific validity.<sup>673</sup> The terms themselves are rather imprecise and leave a lot of scope for interpretation, particularly as to what is entailed by ‘scientific’ principles or evidence and what would be regarded as ‘sufficient’. Must a measure be supported by a preponderance of scientific evidence, or is the existence of any scientific support for the measure sufficient? The interpretation given to these scientific requirements is determinative not only for the intensity of the review to be applied by panels in assessing the scientific basis for a challenged SPS measure,<sup>674</sup> but also for the level of scientific capacity demanded of Members by this obligation.

The Panel in *Japan – Apples* was the first to examine the meaning of the words ‘scientific evidence’ in Article 2.2. It held that in order to be ‘scientific’ the evidence must be gathered through scientific methods,<sup>675</sup> and it favoured relying on scientifically produced evi-

---

to suffer a barrier to market access for another three years, until it was able to demonstrate compliance. The question whether the new EC requirements were scientifically justified was never raised.

<sup>671</sup> Appellate Body Report, *EC – Hormones*, para. 177.

<sup>672</sup> See above, Part II, Section 1.5.

<sup>673</sup> Dale E. McNiel, ‘The First Case under the WTO’s Sanitary and Phytosanitary Agreement: The European Union’s Hormone Ban’, *Virginia Journal of International Law* 39, 1998, 89-134, 117.

<sup>674</sup> On the issue of the standard of review to be applied by panels, see below, Part IV, Section 2.2.3.

<sup>675</sup> Panel Report, *Japan – Apples*, para. 8.92.

dence rather than circumstantial evidence.<sup>676</sup> In respect of the term ‘evidence’ the Panel noted that if they had intended that any material could be used, negotiators would have used the term ‘information’ as they did in Article 5.7 of the *SPS Agreement*.<sup>677</sup> It also established that both direct and indirect evidence can be scientific, although the probative value ascribed to each would differ.<sup>678</sup> According to the Panel, ‘evidence’ excludes insufficiently substantiated information and non-demonstrated hypotheses.<sup>679</sup>

The question then arises when scientific evidence will be regarded as ‘sufficient’ for purposes of Article 2.2. This issue arose in *EC – Hormones*, where the US claimed that the EC ban on hormone-treated beef was not based on scientific principles and was maintained without sufficient scientific evidence. The EC argued that many theories of science and ‘scientific method’ exist.<sup>680</sup> According to the EC, SPS measures must be based on scientific principles as opposed to non-scientific ones, such as superstition,<sup>681</sup> requiring only that the ‘minimal attributes of scientific inquiry’ be respected.<sup>682</sup> The Panel in *EC – Hormones* did not address this issue as it found violations of Articles 3 and 5 and thus did not consider it necessary to decide whether Article 2 was violated also.<sup>683</sup> The Appellate Body agreed with this application of judicial economy, but expressed its surprise that the Panel did not follow the more ‘logically attractive’ approach of starting its analysis by focusing on Article 2, which sets out the basic rights and duties, before going on to Article 5, which sets out more specific rules on risk assessment and the determination of an appropriate level of protection.<sup>684</sup>

The use of judicial economy in this case to avoid deciding on the central question of whether there was ‘sufficient scientific evidence’ for the EC measure was sharply criticised.<sup>685</sup> It was argued by some that the Panel had deliberately sidestepped the sensitive

<sup>676</sup> Panel Report, *Japan – Apples*, para. 8.95, where the Panel quoted a statement to this effect by a panel expert. The Panel held that circumstantial evidence is useful if there is little direct evidence. Where there is a substantial body of direct evidence, circumstantial evidence should be considered in the light of the available scientific evidence.

<sup>677</sup> *Ibid.*, para. 8.93.

<sup>678</sup> According to the Panel the only difference between direct and indirect evidence is the degree of relationship between the evidence and the facts to be demonstrated. Therefore both may be considered but will have different probative value. Indirect evidence may be scientific even if it does not directly prove the facts. *Ibid.*, paras 8.91 and 8.98-8.99.

<sup>679</sup> *Ibid.*, para. 8.93.

<sup>684</sup> Appellate Body Report, *EC – Hormones*, para. 250.

<sup>685</sup> Dale McNiel argued that this failure to resolve this crucial issue ‘casts a pall on the ability of the WTO dispute settlement system to decide complex cases involving scientific issues.’ He pointed to the disregard by the EC of the scientific evidence of its own Scientific Working Group as well as that presented at the 1995 Scientific Conference and in various studies reported in reputable journals as showing beyond dispute that the EC ban was not based on scientific principles or sufficient scientific evidence. He claimed that, due to this decision, neither the fact that evidence overwhelmingly supports the safety of a product, nor the total lack of scientific proof of a health risk would guarantee a finding of a lack of ‘sufficient scientific evidence’. Dale E. McNiel, ‘The First Case under the WTO’s Sanitary and Phytosanitary Agreement: The European Union’s Hormone Ban’, *Virginia Journal of International Law* 39, 1998, 89-134, 119-120 and 134. Quick & Blüthner argue that the Panel’s reliance on judicial economy in this instance amounts to a denial of justice, since it does

issue of panel review of national evaluations of the quality and weight of scientific evidence by deciding the case on the more technical question of whether the requirements for a risk assessment under Article 5.1 were met, casting doubts on the ability of panels to decide this type of issue.

In *Japan – Agricultural Products II*, the Panel and the Appellate Body were once again faced with the issue of the meaning of ‘sufficient’ in Article 2.2. In this case they did address the issue, establishing a rather vague test for sufficiency. The Appellate Body stated as follows:

The ordinary meaning of “sufficient” is “of a quantity, extent, or scope adequate to a certain purpose or object”. From this, we can conclude that “sufficiency” is a relational concept. “Sufficiency” requires the existence of a sufficient or adequate relationship between two elements, *in casu*, between the SPS measure and the scientific evidence.

The context of the word “sufficient” or, more generally, the phrase “maintained without sufficient scientific evidence” in Article 2.2, includes Article 5.1 as well as Articles 3.3 and 5.7 of the *SPS Agreement*.<sup>686</sup>

In examining this context, the Appellate Body first agreed with the Panel that its finding in *EC – Hormones* regarding Article 5.1 provides guidance for the interpretation of Article 2.2.<sup>687</sup> In the latter case it had held that the requirement in Article 5.1 that a measure be ‘based on’ a risk assessment, read together with Article 2.2, means that there must be a rational relationship between the measure and the risk assessment. Second, the Appellate Body looked at Article 3.3, which allows Members to introduce or maintain measures resulting in a higher level of protection than those based on the relevant international standard, *inter alia* if there is sufficient scientific justification. The Appellate Body held that there is sufficient scientific justification if there is a rational relationship between the measure and the available scientific information.<sup>688</sup> Third, the Appellate Body turned to Article 5.7, which allows Members to adopt provisional measures in case of insufficient scientific evidence. It held that this is a qualified exemption from Article 2.2 and that a too-broad interpretation of Article 2.2 would render it meaningless.<sup>689</sup>

The Appellate Body then concluded as follows:

[W]e agree with the Panel that the obligation in Article 2.2 that an SPS measure not be maintained without sufficient scientific evidence requires that there be

---

not secure a positive resolution of the dispute. Since Article 2.2 is broader than Article 5.1, it would be possible for the EC to comply with the Panel ruling (as confirmed by the Appellate Body) by conducting a proper risk assessment, yet still be subject to a challenge under Article 2.2, ‘probably necessitating yet another Hormones Case in the future in which the claims which the AB has refrained from dealing with will be put forward by the complainants.’ See Reinhard Quick and Andreas Blüthner, ‘Has the Appellate Body Erred? An Appraisal and Criticism of the Ruling in the WTO *Hormones Case*’, *Journal of International Economic Law* 2 (4), 1999, 603-639, 632-636.

<sup>686</sup> Appellate Body Report, *Japan – Agricultural Products II*, paras 73-74.

<sup>687</sup> *Ibid.*, para. 76.

<sup>688</sup> *Ibid.*, para. 79.

<sup>689</sup> *Ibid.*, para. 80.

a rational or objective relationship between the SPS measure and the scientific evidence. Whether there is a rational relationship between an SPS measure and the scientific evidence is to be determined on a case-by-case basis and will depend upon the particular circumstances of the case, including the characteristics of the measure at issue and the quality and quantity of the scientific evidence.<sup>690</sup>

The Appellate Body then proceeded to agree with the Panel that, in the case at hand, Japan's requirement that different varieties of the eight relevant agricultural products, which are potential hosts of codling moth, be tested before importation to ensure the efficacy of the quarantine treatment (the varietal testing requirement) was maintained without sufficient scientific evidence for four of the eight<sup>691</sup> products at issue.<sup>692</sup>

This 'rational relationship test' does not lay down clear guidelines on what will be regarded as sufficient scientific evidence. Leaving the necessary discretion to panels to make *ad hoc* decisions based on their evaluation of the circumstances of the case, it also gives panels the mandate to evaluate the quality and quantity of the scientific evidence presented. While some assessment of the scientific evidence is clearly entailed by the discipline of Article 2.2, the limits of this assessment are crucial to establish. If panels were to limit their review of the quality and quantity of the scientific evidence to an assessment whether the regulatory choice made by the Member is reasonable (i.e. that its conclusions based on the evidence are plausible) as seems to be implied by the term 'rational relationship', this would seem an appropriate test. If, however, panels see their task under the 'rational relationship' test as including a reassessment of the quality and quantity of the scientific evidence in order to come to their *own* conclusions regarding the risk at issue, a task for which these bodies that are primarily composed of trade experts are not qualified, the test is inappropriate.<sup>693</sup>

The approach taken to this issue by the Panel in *Japan – Apples*, in addressing the meaning of the word 'sufficient' in Article 2.2, does not bode well. Here the Panel had to determine whether Japan's rigorous phytosanitary regime for the importation of apples from the US,<sup>694</sup> aimed at preventing the introduction of fire blight, was maintained with

<sup>690</sup> *Ibid.*, para. 84.

<sup>691</sup> With respect to the other four products at issue, the Panel found that the US had not adduced *any* evidence in support of a finding of inconsistency with Article 2.2 of the *SPS Agreement*. Panel Report, *Japan – Agricultural Products II*, para. 8.45.

<sup>692</sup> The Panel's decision was based on the factual finding of the absence of an actual causal link between varietal differences and test differences regarding the relationship between the fumigant concentration and the time period of fumigation and the level of dose required to kill 50% of codling moths. The experts advising the panel were of the view that the differences in these values could have been caused by a number of factors not related to varietal differences (e.g. leakage in the fumigation chamber, sorption by the packaging material and experimental errors). Panel Report, *Japan – Agricultural Products II*, para. 8.42. The Appellate Body understood this finding to indicate the absence of a rational relationship between the varietal testing requirement and the scientific evidence. Appellate Body Report, *Japan – Agricultural Products II*, para. 83.

<sup>693</sup> The issue of the composition of panels and their use of panel experts is discussed below, Part IV, Section 2.2.5.

<sup>694</sup> Under its *Plant Protection Law and the Enforcement Regulations*, Japan bans the importation of host plants of 15 quarantine pests, including the bacterium fire blight. This import prohibition can be lifted on a case-by-case basis, subject to certain conditions. Japan lifted its prohibition with respect to apples from the US, subject to a phytosanitary regime consisting of 10 cumulative requirements namely: that the apples be produced in designated fire blight-free orchards; that the orchard be free of fire blight-infected plants and other host

sufficient scientific evidence.<sup>695</sup> The Panel followed the interpretation of the Appellate Body in *Japan – Agricultural Products II*, namely that sufficiency is a relational concept and thus that there must be a sufficient or adequate relationship between the SPS measure and the scientific evidence. The Panel took this to mean an objective or rational relationship.<sup>696</sup> Going further than the previous case law, the Panel then stated that although the term ‘sufficient’ is clearly to be considered in relation to the measure itself, ‘scientific evidence relates to a risk and is supposed to confirm the existence of a given risk.’<sup>697</sup> It thus linked the concept of sufficiency in Article 2.2 to the extent to which the scientific evidence indicates the existence of a risk.

After examining the evidence submitted to it, with the assistance of the panel experts, the Panel held that a *negligible*<sup>698</sup> risk of transmission of fire blight through apple fruit was shown and thus that there was no sufficient scientific evidence that apple fruit was likely to serve as a pathway for the entry, establishment or spread of fire blight in Japan.<sup>699</sup> In order to come to this conclusion, the Panel disassembled the sequence of events on the transmission pathway for fire blight, in order to identify the existence and potential of the risk, and then compared the risk so identified with the measure at issue.<sup>700</sup> In so doing, the Panel, in effect, conducted its own risk assessment. As a result of its characterisation of the risk as negligible, the Panel held that Japan’s measure, which consisted of a range of cumulative requirements that had to be met for importation to be allowed, was ‘clearly disproportionate’ to the risk identified.<sup>701</sup> The Panel thus introduced a *strong proportionality test* into the ‘rational relationship’ requirement in Article 2.2.<sup>702</sup>

---

plants of fire blight; that the orchard be surrounded by a 500-meter buffer zone; that the orchard and buffer zone be inspected at least three times per year; that the harvested apples, harvesting containers and interior of the packing facility be disinfected; that apples destined for Japan be kept separate from other apples after harvesting; that US officials certify that the apples are not infested or infected with fire blight and were disinfected; and that Japanese officials confirm the certification and carry out inspections themselves.

<sup>695</sup> Fire blight is a bacterium that causes the infected parts of plants to wither, darken and die. It is believed to be native to the US, and since its discovery in 1793 it has been disseminated to Canada, Mexico, the UK, Egypt, New Zealand, Europe and the Mediterranean. Latin America, Large parts of Africa and Asia, including Japan, appear to be fire blight free. Hosts of fire blight are apples, pears, quince, loquats and several garden plants.

<sup>696</sup> Panel Report, *Japan – Apples*, paras 8.101 – 8.103.

<sup>697</sup> *Ibid.*, para. 8.104.

<sup>698</sup> One of the experts consulted by the Panel, Dr Hayward, indicated that the standard scientific definition of ‘negligible’ was a likelihood of between zero and one in one million.

<sup>699</sup> Panel Report, *Japan – Apples*, paras 8.169 and 8.176.

<sup>700</sup> The Panel based this finding on its conclusions on the basis of the evidence available to it with regard to mature symptomless apples and other apples. With regard to mature, symptomless apples, it found that infection with fire blight had not been established; that populations of endophytic bacteria have not been found and epiphytic bacteria are very rare; and that the risk of completion of the transmission pathway is negligible. With regard to apples other than mature, symptomless fruit, it held that infected apples are capable of harbouring populations of bacteria which could survive through the various stages of commercial handling, storage and transportation; that risks of errors of handling or illegal actions could legitimately be taken into account, although the experts considered these risks small or debatable; but that completion of the last stage of the transmission pathway (the transmission of the bacteria to the host plant) was not shown to be likely. This was because only a reduced number of bacteria would survive commercial storage, handling and transportation and the existence of a vector (such as rain splash or bees), which could transmit the bacteria from the imported apples to the host apple plant in Japan, had not been established. Panel Report, *Japan – Apples*, paras 8.136, 8.139, 8.153, 8.157, 8.161 and 8.168.

<sup>701</sup> Panel Report, *Japan – Apples*, paras 8.181 and 8.198.

<sup>702</sup> The Panel proceeded to examine two elements of Japan’s measure, namely the buffer-zone requirement and the requirement of inspections three times yearly, as instances of elements most obviously maintained

On appeal, the Appellate Body accepted as appropriate the methodology of the Panel of disassembling the sequence of transmission events and comparing the risk to the measure, in its Article 2.2 analysis, but noted that this does not exhaust the range of possible methodologies and that the circumstances of each case will determine the appropriateness of a given methodology.<sup>703</sup> The Appellate Body also did not take issue with the Panel's view that 'clear disproportion' between the risk and the measure implies that a 'rational or objective' relationship does not exist.<sup>704</sup> It rejected Japan's contention that the Panel should have accorded Japan a 'certain degree of discretion' in the way in which it chose, weighed and evaluated the scientific evidence, finding that deference by panels to the findings of national authorities would not be compatible with the standard of review applicable to panels.<sup>705</sup>

The introduction of a strong proportionality test into Article 2.2 gives cause for concern.<sup>706</sup> While it is certainly true that an SPS measure, and all its individual components, must be supported by the scientific evidence, it goes too far to require the rigour of the measure to be proportional to the gravity of the risk. The balancing paradigm of the *SPS Agreement* is premised on respect for the policy choices of a Member in the face of proven risk. In other words, once it has been established that a real risk, as opposed to a hypothetical possibility of risk, exists,<sup>707</sup> it is for the Member to determine how seriously it views this risk, reflected in the level of protection it chooses, and therefore how strict its measures will be to address this risk.<sup>708</sup> It has been affirmed in the case law that even a 'zero risk' level of protection is permissible,<sup>709</sup> despite the fact that this is not realistically achievable and would allow for extremely stringent measures. In addition, in the context of the risk assessment obligation in Article 5.1 of the *SPS Agreement*, it has been established that no threshold level of risk need be shown for a measure to be regarded as based

---

without sufficient scientific evidence either as such or when applied cumulatively with other elements. Panel Report, *Japan – Apples*, paras 8.182-8.197.

<sup>703</sup> Appellate Body Report, *Japan – Apples*, para. 164. Scott notes that this statement seems to indicate a note of caution in the Appellate Body's affirmation of the Panel's approach, although the Appellate Body does not make clear where its concerns lie. Scott speculates that the radical step taken by the Panel in introducing a proportionality test may explain the hesitancy of the Appellate Body. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 90.

<sup>704</sup> Appellate Body Report, *Japan – Apples*, para. 163.

<sup>705</sup> Appellate Body Report, *Japan – Apples*, para. 165. It is well-established case law that the standard of review to be applied by panels is that of an 'objective assessment' of the matter, which implies neither total deference by panels to national authorities' determinations, nor *de novo* review. The issue of the appropriate standard of review is discussed below, Part IV, Section 2.2.3.

<sup>706</sup> On the difference between strong proportionality and weak proportionality, see above, Part III, Section 1.1.1.

<sup>707</sup> Appellate Body Report, *EC – Hormones*, para. 186.

<sup>708</sup> Before the *Japan – Apples* dispute was decided, it was generally accepted that a Member had 'complete freedom to decide on the level of risk it can accept' and that a panel 'cannot therefore, strike down a measure simply because it considers the risk involved to be "minimal".' Joost Pauwelyn, 'Does the WTO Stand for 'Defence to' or 'Interference with' National Health Authorities When Applying the Agreement on Sanitary and Phytosanitary Measures (*SPS Agreement*)?' in *The Role of the Judge in International Trade Regulation: Experience and Lessons for the WTO*, T. Cottier and P.C. Mavroidis (eds.) (University of Michigan Press: Ann Arbor, Michigan), 2003, 175-192, 175. See also Catherine Button, *The Power to Protect. Trade, Health and Uncertainty in the WTO* (Hart Publishing, Oxford and Portland, Oregon), 2004, 47.

<sup>709</sup> Appellate Body Report, *Australia – Salmon*, para. 125.

on, or rationally supported by, a risk assessment.<sup>710</sup> A similar approach could be expected under the more general scientific discipline of Article 2.2.<sup>711</sup>

*In casu*, the Panel had noted that the parties to the dispute agreed on the ecological and economic impact that the introduction of fire blight into Japan could have.<sup>712</sup> It recalled the finding in *EC – Hormones* recognising that responsible governments act with prudence and precaution in case of risks of irreversible damage.<sup>713</sup> The Panel noted the statements of the panel experts, who while viewing Japan's cumulative requirements as excessive were not comfortable with requiring Japan to remove all aspects of its measure. It recognised that although the scientific evidence showed that apples are highly unlikely to be a pathway for fire blight transmission, the evidence did suggest that 'some slight risk' could not totally be excluded.<sup>714</sup> In light of a finding of risk, however small, a Member is free to take measures to reduce or eliminate this risk in accordance with its chosen level of protection. An island Member, such as Japan, is likely to choose for a high level of protection against the introduction of phytosanitary risks due to the vulnerability of its ecosystem. This choice is respected by the disciplines of the *SPS Agreement*. The introduction of a strong proportionality test in Article 2.2 undermines the policy space of a Member in this regard, disturbing the delicate balance between trade liberalisation and health protection in the Agreement.

This policy space is not only important for developed-country Members such as Japan, but also for Members at lower levels of development. For example, like Japan, two of the Members used as illustrative examples in Part II of this book, namely Mauritius and Jamaica, are also island countries with vulnerable ecosystems. In respect of phytosanitary issues deemed particularly important by them, such as the protection against pests and diseases of the sugar crop in Mauritius and the coffee and banana crops in Jamaica, these Members take very strict measures.<sup>715</sup>

It may be argued that introducing a strong proportionality test into Article 2.2 makes it easier for Members at lower levels of development to challenge SPS measures that reflect a high level of protection in the face of a very small risk. An example would be the EC's MRLs for aflatoxins, which are extremely low despite the minimal level of risk arising from the small amount of aflatoxin residues present in the products at issue.<sup>716</sup> However,

<sup>716</sup> Tsunehiro Otsuki *et al.*, *Saving Two in a Billion: A Case Study to Quantify the Trade Effect of European Food Safety Standards on African Exports* (World Bank Development Research Group, Washington D.C.), 2000, available at: <http://www1.worldbank.org/wbiep/trade/Standards/aflatoxins.pdf>, visited on 5 April 2001. This study estimates that the very strict EU harmonised maximum residue level for aflatoxins (which are substances that can produce liver cancer and occur in stored agricultural products such as peanuts) would reduce health risks by only approximately 1.4 deaths per billion per year (the EU's population is only half a billion), while costing African exporters of cereals, dried fruits and nuts to the EU US\$ 670 million.

restricting the regulatory autonomy of a Member in the face of real risk, however small, runs the risk of making the disciplines of the *SPS Agreement* politically unacceptable to Members and of leading to more cases of non-compliance, gradually undermining the value of the Agreement.

### 3.2.3.2 Relevance of the precautionary principle

Inherent in the *SPS Agreement's* reliance on science as the key instrument to distinguish legitimate health protection measures from disguised protectionism is the question of how to deal with situations of scientific uncertainty. As explained in Part II, today the uncritical view of science as an objective benchmark for regulatory justification has made way for the recognition of the limits in science. One of these limits lies in the prevalence of uncertainties in scientific evaluations of risk, particularly in areas as complex as human, animal and plant health. It has led to increasing recognition of the need for precautionary action when the available scientific evidence is unable to provide a definite answer regarding the existence or magnitude of a risk. This is commonly known as the precautionary principle in risk regulation.<sup>717</sup>

It is therefore necessary to examine the extent to which the scientific disciplines in the *SPS Agreement* take account of this current view of the limits of science. In this regard, it is useful to note that Article 2.2 expressly exempts from its requirements situations provided for under Article 5.7, which allows provisional measures in cases of insufficient scientific evidence.<sup>718</sup> However, in view of the pervasiveness of uncertainty in science, it is necessary to examine whether the precautionary principle has relevance beyond the four corner of Article 5.7, as an interpretative tool to be applied to the scientific disciplines of the *SPS Agreement*.

In *Japan – Agricultural Products II* a question arose regarding the applicability of the precautionary principle to the interpretation of Article 2.2.<sup>719</sup> Japan contended that since it had established that certain products were potential hosts of codling moth (a pest of quarantine significance for Japan), it was entitled to adopt a precautionary attitude and require varietal testing. Thus it argued that Article 2.2's requirement of 'sufficient scientific evidence' must be interpreted in the light of the precautionary principle.

This claim was rejected by the Appellate Body,<sup>720</sup> which referred back to its decision on the use of the precautionary principle to soften the application of SPS disciplines in *EC – Hormones*.<sup>721</sup> In the latter case (with reference to the interpretation of Articles 5.1 and 5.2), the Appellate Body felt that it would be 'unnecessary and probably imprudent' for it to decide whether the precautionary principle now forms part of general customary international law (as opposed to customary international environmental law, where it has gained wide acceptance).<sup>722</sup> However, it held that even if this were the case, the specific

<sup>717</sup> The precautionary principle is discussed above, Part II, Section 1.5.

<sup>718</sup> On the relationship between Article 2.2 and Article 5.7, see below, Part III, Section 5.2.5.

<sup>719</sup> For further discussion of the role of the precautionary principle in the *SPS Agreement*, see David A. Wirth, 'Symposium: The Role of Science in the Uruguay Round and NAFTA Trade Disciplines', *Cornell International Law Journal* 27, 1994, 817-859, 838-840.

<sup>720</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 81.

<sup>721</sup> Appellate Body Report, *EC – Hormones*, para. 125.

<sup>722</sup> *Ibid.*, para. 123.

agreement on rules for cases of scientific uncertainty in Article 5.7 of the *SPS Agreement* overrides any such general principle. Thus the precautionary principle cannot be used to justify an otherwise inconsistent measure except to the extent provided for in Article 5.7.<sup>723</sup> The Appellate Body did, however, recognise that:

[A] panel charged with determining, for instance, whether “sufficient scientific evidence” exists to warrant the maintenance by a Member of a particular SPS measure may, of course, and should, bear in mind that responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned.<sup>724</sup>

It is as yet unclear what effect this directive to panels will have in practice on the interpretation of Article 2.2.<sup>725</sup> It would appear that the Appellate Body is making room for a limited application of the precautionary principle to the interpretation of the requirement of ‘sufficient scientific evidence’, for extreme cases of risks to human life. Further, the Appellate Body held that Article 5.7 does not exhaust the relevance of the precautionary principle, which it found to be reflected in the sixth preambular paragraph and Article 3.3 of the *SPS Agreement* as well.<sup>726</sup> These two provisions refer to the right of Members to set their own level of protection, however cautious. These provisions do not reflect the precautionary principle, however, as *before* a Member may apply an SPS measure to achieve its chosen level of protection in respect of a particular risk, there has to be ‘sufficient scientific evidence’ for the measure, and a risk assessment to support it. The precautionary principle is precisely at issue where an insufficiency of scientific evidence hinders the fulfilment of these requirements, yet prompt action is necessary to address suspected risks. Thus the fact that a Member may determine its own level of protection, and apply a measure to achieve this level of protection once the risk has been established does nothing to incorporate the precautionary principle into SPS disciplines.<sup>727</sup>

The Appellate Body’s finding on the precautionary principle in *EC – Hormones* applies not only to the interpretation of Article 5.1, but also to all the science-based rules in the *SPS Agreement*, (as evinced by the reference thereto in *Japan – Agricultural Products II* with respect to Article 2.2). When one bears in mind the pervasive nature of uncertainty

<sup>723</sup> The question whether Article 5.7 SPS deals adequately with the issue of lack of certainty in science is discussed below, Part III, Section 5.2.5.1.

<sup>724</sup> Appellate Body Report, *EC – Hormones*, para. 124.

<sup>725</sup> The Appellate Body in *Japan – Agricultural Products II* did not address the effect of this directive for the interpretation of Article 2.2, probably because what was at stake in that case was a threat to plant health rather than human health whereas the directive is limited to cases of irreversible risks to human health.

<sup>726</sup> Appellate Body Report, *EC – Hormones*, para. 124.

<sup>727</sup> The Appellate Body appears to be confusing the precautionary principle with the protective principle. The latter principle is a forerunner of the precautionary principle, dealing with the duty of governments to provide protection from risks that have been *established scientifically*. Thus the ability of a government to set a high level of protection once a risk has been proved, falls under this principle. The precautionary principle represents a step forward in that it requires government action in the face of suspected risks that *cannot* be scientifically proven in the current state of scientific knowledge. It evolved precisely due to the need to address the regulatory paralysis that results from a lack of scientific certainty. See H. Hohmann, *Precautionary Legal Duties and Principles of Modern International Environmental Law* 1<sup>st</sup> ed. (Graham & Trotman/Martinus Nijhoff, London) 1994, 10.

in scientific analysis and the influence of this factor on most risk assessments and other scientific aspects of the regulatory process, it seems at odds with reality to confine its recognition to a single Article providing for temporary measures.<sup>728</sup> However, under the current case law, the precautionary principle cannot be used as an interpretative principle to be applied to the scientific disciplines of the *SPS Agreement* to soften their application in cases of scientific uncertainty. Instead, all situations of insufficient scientific evidence must be dealt with by means of provisional measures under Article 5.7.

This conclusion is supported by the Appellate Body's finding in *Japan – Agricultural Products II* regarding the relationship between Article 2.2 and Article 5.7, where it stated:

[I]t is clear that Article 5.7 of the *SPS Agreement*, to which Article 2.2 explicitly refers, is part of the context of the latter provision and should be considered in the interpretation of the obligation not to maintain an SPS measure without sufficient scientific evidence. Article 5.7 allows Members to adopt provisional SPS measures '[i]n cases where relevant scientific evidence is insufficient' and certain other requirements are fulfilled.<sup>729</sup> Article 5.7 operates as a *qualified* exemption from the obligation under Article 2.2 not to maintain SPS measures without sufficient scientific evidence. An overly broad and flexible interpretation of that obligation would render Article 5.7 meaningless.<sup>730</sup>

Thus it would appear that the Appellate Body would prefer to limit the scope for deviation from the scientific disciplines of Article 2.2 to the 'qualified exemption' provided for by Article 5.7. Increased flexibility in the interpretation of the provision by means of the use of the precautionary principle is thus rejected by the Appellate Body on the grounds that it would make Article 5.7 'meaningless'. It is consequently necessary to examine the precise nature of the relationship between Article 2.2 and Article 5.7.

### 3.2.3.3 Relationship between Article 2.2 and Article 5.1

The question of the relationship between the second and third prongs of Article 2.2 and the later, more specific, scientific requirement of Article 5.1 of the *SPS Agreement* needs to be addressed. Do the scientific requirements of Article 2.2 impose independent obligations on Members, or are their general disciplines subsumed by the specific rules contained in the later Article?

This question arose in *EC – Hormones*, where the Panel, after finding violations of Articles 3.1, 5.1 and 5.5, applied the principle of judicial economy to refrain from ruling on the Article 2.2 challenge. Appellate Body confirmed the Panel's application of judicial economy. It agreed that Article 5.1 can be seen as 'a specific application of the basic obligations contained in Art. 2.2'<sup>731</sup> and thus once a violation of Article 5.1 is established, it is

<sup>728</sup> Article 5.7 of the *SPS Agreement* is discussed below, Part III, Section 5.2.5. There the question of whether it sufficiently incorporates the precautionary principle is addressed. It should be noted that one of the points raised for negotiation in the failed Seattle Ministerial Conference was the need to strengthen the precautionary principle in the *SPS Agreement*, as Article 5.7 is perceived as insufficient to give it full effect.

<sup>729</sup> The Appellate Body cited the same report. Appellate Body Report, *Japan – Agricultural Products II*, para. 89.

<sup>730</sup> *Ibid.*, para. 80.

<sup>731</sup> Appellate Body Report, *EC – Hormones*, para. 180. Note that in *EC – Approval and Marketing of Biotech*

unnecessary to determine whether Article 2.2 has also been violated. However, as noted above, the Appellate Body expressed its surprise that the Panel had not followed the more ‘logically attractive’ route of starting with an analysis of the basic obligations contained in Article 2.<sup>732</sup> Unfortunately, the Appellate Body did not elaborate further on the relationship between Articles 2 and 5, aside from expressing the view that Articles 2.2 and 2.3 inform Articles 5.1 and 5.5 respectively and these Articles must thus be read together.<sup>733</sup>

In *Australia – Salmon* the Appellate Body had the opportunity to address this relationship again, and clarified that Article 2 is broader than Articles 3 or 5. It thus agreed with the Panel that, while a violation of the specific rules regarding risk assessment contained in Articles 5.1 and 5.2 necessarily implies a violation of the more general requirements of ‘sufficient scientific evidence’ and a basis in ‘scientific principles’ embodied in Article 2.2,<sup>734</sup> due to the more general nature of Article 2.2 not all violations of Article 2.2 are subsumed into Articles 5.1 and 5.2.<sup>735</sup> Thus a panel should start the analysis with the broader general provisions of Article 2 before proceeding to examine the more specific rules contained in Articles 3 and 5.

In *Japan – Agricultural Products II*<sup>736</sup> the Appellate Body rejected as textually unfounded Japan’s proposition that Article 2.2 should only be directly applied in cases where scientific evidence is patently insufficient and that the case at issue should have been dealt with under Article 5.1 instead. It emphasised that the finding in *EC – Hormones* that Article 5.1 is a specific application of the basic obligation contained in Article 2.2, does not justify limiting the scope of Article 2.2 in favour of Article 5.1. It thus appears that the Appellate Body is at pains to make clear that Article 2 sets disciplines which are broader than those contained in more specific Articles and lays down independent obligations against which measures can be directly challenged, without recourse to other Articles. The precise content of these obligations remains to be determined.

### 3.3 Conclusion

The basic rights and obligations set out in Article 2 of the *SPS Agreement* set the tone for the rest of the Agreement. They epitomise the trade/health balance aimed at by the *SPS Agreement* and the manner in which this balance is reflected in the disciplines of the Agreement.

In particular, the express recognition of the *right* of Members to take SPS measures in Article 2.1 is an innovative aspect of the *SPS Agreement*. Unlike the situation under the GATT 1994, Members imposing measures covered by the *SPS Agreement* do not bear the

---

<sup>732</sup> *Ibid.*, para. 250.

<sup>733</sup> *Ibid.*, paras 180, 212 and 250. The Appellate Body held that further analysis of the relationship between these Articles ‘should await another case.’ *Ibid.*, para. 250.

<sup>734</sup> Panel Report *Australia – Salmon*, para. 8.52.

<sup>735</sup> Appellate Body Report, *Australia – Salmon*, para. 137.

<sup>736</sup> Appellate Body Report, *Japan – Agricultural Products II*, para 82.

burden of justifying their measures under an exception to trade liberalisation disciplines. Instead, a complaining Member wishing to challenge an SPS measure must establish a violation of specific disciplines of the *SPS Agreement*.

The limits to the right to take SPS measures, first outlined in Article 2.2 and 2.3, recur in more specific form in the rest of the *SPS Agreement*. These provisions reflect and build upon familiar GATT disciplines, requiring that health measures be limited to what is ‘necessary’ to achieve their aim (first prong of Article 2.2 of the *SPS Agreement*), and prohibiting arbitrary or unjustifiable discrimination and disguised trade restrictions (Article 2.3 of the *SPS Agreement*). In addition, the second and third prongs of Article 2.2 introduce a novel aspect of the *SPS Agreement*, namely the use of scientific disciplines as the scale on which the competing interests of trade and health are balanced.

While recourse to the case law on the relevant provisions of the GATT 1994 from which the trade disciplines of the *SPS Agreement* are derived may be useful in elucidating the latter disciplines, care must be taken not to undermine the object and purpose of the *SPS Agreement* through an indiscriminate transplantation of GATT case law principles to the interpretation of the *SPS Agreement*. The *SPS Agreement* was negotiated to address inadequacies in GATT rules in dealing with the specific situation of SPS measures through establishing a careful balance between trade and health. This balance must be respected in the interpretation of its provisions. There is therefore no room for the importation of a strong proportionality test arising from the ‘necessary’ requirements of Article XX(b) of the GATT 1994 into the ‘necessary’ requirement of Article 2.2 of the *SPS Agreement*.

Similarly, the approach of the Panel in *Japan – Apples* of reading a strong proportionality test into Article 2.2’s requirement of ‘sufficient scientific evidence’ can be criticised. It undermines the policy space left to Members by the *SPS Agreement* once an SPS risk, however small, has been established. The *SPS Agreement* does not allocate the assessment of the gravity of a risk to panels, nor does it provide that the strictness of the measure is to be weighed against the gravity of the risk. For panels to do so seems contrary to the balance that is the object and purpose of the Agreement.

The intrusive approach of the Panel in *Japan – Apples* rests on its understanding that the ‘rational relationship’ requirement to show that an SPS measure is supported by sufficient scientific evidence, is not limited to an assessment of the relationship between the science and the SPS measure, but also entails an assessment of the relationship between the science and the risk which the measure addresses. This approach put the Panel on a slippery slope on which it easily slid to assessing the available scientific evidence to determine the existence of a risk and the potential of the risk materialising, in other words, to conducting its own risk assessment. On the basis of this assessment, the Panel reviewed the stringency of the SPS measure applied to address the risk and found it disproportional. In so doing, the Panel appropriated for itself competences which the *SPS Agreement* leaves to national regulatory authorities. This deprives Members of the room to make their own science policy decisions in their assessment of scientific evidence,<sup>737</sup> and to make policy choices on the seriousness with which they regard the risk and the stringency of the measures they will take to address this risk. In view of the diversity in priorities, economic

---

<sup>737</sup> On the role of subjective science policy decisions in the risk assessment process, in addressing gaps in data, using assumptions, models, rules of thumb and extrapolations, see above, Part II, Section 1.5.

resources and risk-averseness of Members at different levels of development, which are reflected in the policy choices inherent to risk regulation, this result is regrettable.

## CHAPTER 4

### Disciplines promoting harmonisation

International rules laying down trade-related and scientific requirements for national SPS regulatory measures are insufficient to achieve full trade liberalisation. Their disciplining effect has clear limits in the sovereign right of national governments to pursue the legitimate societal aim of the protection of health against SPS risks. While requiring that SPS measures be science-based, non-discriminatory and applied only to the extent necessary to protect health, the *SPS Agreement* leaves much room for Members to make policy choices regarding the level of protection they wish to ensure on their territories. These choices reflect particular conditions in each Member, including consumer preferences, economic considerations and industry interests. The measures Members impose to achieve their chosen level of protection therefore also diverge.

However, as noted above, differences in SPS measures can act as significant trade barriers as exporters are forced to adjust their products or production processes to the requirements of their various export markets, thereby reducing economies of scale.<sup>738</sup> The promotion of harmonisation of SPS regulations at international level has emerged as a response to this problem.

In the preamble of the *SPS Agreement*, one of the aims expressed is the promotion of the use of harmonised SPS measures by Members, based on international standards developed by the relevant international organisations, without requiring Members to change their appropriate level of protection. The *SPS Agreement* therefore attempts to balance the aim of increasing free trade through harmonising SPS measures and thus reducing the trade barriers caused by differing standards, with respect for the right of Members to choose their own level of protection. As a result, harmonisation around international standards is encouraged by means of a presumption of consistency with the GATT 1994 and the *SPS Agreement*, but it is not actually mandated even though global standards would be most trade efficient. This is in line with the fact that the choice of a level of protection is viewed as a sovereign decision and accorded substantial deference in the *SPS Agreement*. Thus a government is not obliged to accept an international standard that leads to a level of health protection lower than that which it has established to be appropriate. This strategy is embodied in Article 3 of the *SPS Agreement*.

In *EC – Hormones*, the Appellate Body elucidated the aim of Article 3 as follows:

In generalized terms, the object and purpose of Article 3 is to promote the harmonization of the SPS measures of Members on as wide a basis as possible, while recognizing and safeguarding, at the same time, the right and duty of Members to protect the life and health of their people. The ultimate goal of the harmonization of SPS measures is to prevent the use of such measures for arbitrary or unjustifiable discrimination between Members or as a disguised restriction on international trade, without preventing Members from adopting or enforcing measures which are both ‘necessary to protect’ human life or health

---

<sup>738</sup> The reasons behind international efforts to harmonise SPS regulations are discussed above Part II, Section 3.1.1.

and ‘based on scientific principles’, and without requiring them to change their appropriate level of protection.<sup>739</sup>

The question arises whether the *SPS Agreement* succeeds in this objective. In particular, bearing in mind the severe imbalance in participation in the standard-setting procedures of the three international bodies referenced in the *SPS Agreement*, discussed in Part II, one may expect that the *SPS Agreement’s* reliance on the resultant standards may have different implications for Members at different levels of development. The provisions of the *SPS Agreement* that promote harmonisation by reference to the work of the international standard-setting bodies active in the SPS area therefore bear closer examination.

#### 4.1 International standards, guidelines or recommendations

As discussed above,<sup>740</sup> the WTO is not a regulatory body with SPS norm-setting capacity. Thus, it does not set the international standards used as benchmarks by the *SPS Agreement* itself, but refers instead in Article 3 to ‘international standards, guidelines or recommendations’.<sup>741</sup>

It is necessary to start by determining what the term ‘standards, guidelines or recommendations’ refers to specifically. Annex A.3 of the *SPS Agreement* defines the term broadly, with reference to the three main international standard-setting bodies active in the area of food safety and plant and animal health, namely the Codex Alimentarius Commission (CAC), the International Office of Epizootics (OIE),<sup>742</sup> and the Secretariat of the International Plant Protection Convention (IPPC).<sup>743</sup> For matters not covered by the CAC, OIE or IPPC, the definition of international standards, guidelines and recommendations refers, in Annex A.3(d) of the *SPS Agreement*, to ‘appropriate standards, guidelines and recommendations promulgated by other relevant organizations open for membership to all Members, as identified by the [SPS] Committee.’

The CAC, OIE and IPPC have been discussed in detail in Part II of this book. A brief look is needed at the residual category of standards relevant for purposes of the harmonisation provisions of the *SPS Agreement*, namely those promulgated by other relevant organisations open for membership to all WTO members, as identified by the SPS Committee.

##### 4.1.1 Appropriate standards of other relevant organisations

To date, the SPS Committee has not made any identification under Annex A.3(d) of the *SPS Agreement*. Neither has the matter come up at all in discussions at SPS Committee meetings. It is nevertheless interesting to consider what could fall under this provision, and to determine the scope of the discretion of the SPS Committee in this regard. While

<sup>739</sup> Appellate Body Report, *EC – Hormones*, para. 177.

<sup>740</sup> See above, Part II, Section 3.2.

<sup>741</sup> The term ‘international standards’ is often used hereinafter as shorthand for ‘international standards, guidelines or recommendations’, unless otherwise indicated.

<sup>742</sup> Note that, as stated above, the name of this organisation has changed since the coming into force of the *SPS Agreement*. It is now known as the ‘World Organisation for Animal Health’. See above, Part II, Section 3.2.2.

<sup>743</sup> See the discussion of these international standard-setting bodies above, Part II, Section 3.2.

some guidance is provided by the terms of Annex A.3(d), considerable ambiguity remains. The criteria that can be found in this provision are discussed briefly below.

First, the provision limits its applicability to matters not covered by the ‘three sisters’. It is not clear whether ‘matters not covered’ should be taken to mean matters outside the respective mandates of the CAC, OIE and IPPC, or also matters within their mandates that have not been addressed yet in their activities. Ideally, the former interpretation would be the most appropriate, since the ‘three sisters’ are generally regarded as the most authoritative standard-setting bodies within their areas of competence.<sup>744</sup> A gap in the coverage of standards within the competence of the referenced international standard-setting bodies is arguably best addressed in that body itself through the initiation of a new standard.<sup>745</sup>

However, this approach does not take into account the reality of the increasing difficulty of setting standards in areas of particular political or economic interest to WTO Members, due to the politicisation of the standard setting processes. Also it disregards the problems of effective participation in the ‘three sisters’ of Members at lower levels of development, discussed above,<sup>746</sup> which hinder such Members’ efforts to exert sufficient influence to obtain standards in their areas of interest. In principle, these problems are better tackled by concerted efforts to reform the standard-setting procedures in the ‘three sisters’ themselves rather than by adding to the plethora of international bodies to which Members must send delegates in order to promote their interests. Nevertheless, in the absence of sufficient progress in this regard, it may be useful to keep the option open of possible reference to another international body that has managed to set appropriate standards in areas of interest to Members at lower levels of development, either due to simpler, less politicised or more technical decision-making procedures or due to greater or more effective participation of the interested Members.<sup>747</sup> Of course, care must be taken not to select bodies whose standard-setting procedures are less transparent and participatory than

<sup>744</sup> This interpretation is followed by Sandrine Maljean-Dubois and Emilie Etchelar, who argue that the Biosafety Protocol is unlikely to become an international organisation that is competent to set standards with regard to trade in GMOs for purposes of the *SPS Agreement* ‘because this already comes within the competence of organisations referred to in the *SPS Agreement*...’. Sandrine Maljean and Dubois & Emilie Etchelar, ‘World Trade and International Normalisation: Codex Alimentarius’, in *WTO Obligations and Opportunities: Challenges of Implementation*, Koen Byttebier and Kim Van Der Borgh (eds.) (Cameron May, London), 2007, 121-153. It is interesting to note that the *Cartagena Protocol* nevertheless exerts an influence on the benchmark standards of relevance under Article 3 of the *SPS Agreement*. As pointed out by Maljean-Dubois and Etchelar, the IPPC Supplement on Phytosanitary Risks for Living Modified Organisms, ISPM 11 (2004) on pest risk analysis for quarantine pests including analysis of environmental risks and living modified organisms, refers repeatedly to the *Cartagena Protocol* as well as to its Biosafety Clearing House. Similarly, the CAC *Ad hoc* Intergovernmental task Force on Food Derived from Biotechnology takes into account the content of the *Cartagena Protocol* and work conducted in its framework. *Ibid.*, 151-152.

<sup>745</sup> A very good example of this is the successful initiation of work on a CAC cinnamon standard by Sri Lanka, discussed below, Part V, Section 2.1.3.

<sup>746</sup> See the discussion above, Part II, Sections 3.2.1.5, 3.2.2.5 and 3.2.3.5.

<sup>747</sup> Steven Bernstein and Erin Hannah argue that pressure could be put on the ‘three sisters’ to adhere to evolving good practice standards for international standard setting, including inclusiveness in participation and responsiveness to consumer food safety concerns, by demanding recognition by the SPS Committee of more responsive bodies if they are perceived as not doing so. However, they note that in view of the importance of science as legitimating SPS measures under the *SPS Agreement*, any alternative standard-setter will have to meet the criterion of science-based standard setting. Steven Bernstein and Erin Hannah, ‘Non-State Global Standard Setting and the WTO: Legitimacy and the Need for Regulatory Space’ *Journal of International Economic Law*, 11(3), 2008, (advance access) 1-34, 21.

those of the ‘three sisters’. Instead, this possibility could better be seen as an incentive to encourage real efforts at adopting the necessary standards in the CAC, OIE and IPPC.

This interpretation of the ‘matters not covered’ criterion also reflects the fact that it would be very difficult to find a standard-setting body in the area of SPS regulation whose activities fall outside the mandates of the ‘three sisters’. The current functional scopes of the CAC, OIE and IPPC are very broad, and seem to cover the entire ambit of matters falling under the scope of application of the *SPS Agreement*.<sup>748</sup> An interpretation of ‘matters not covered’ that is limited to matters falling outside the mandates of the three sisters would render the option in Annex A.3(d) largely irrelevant. The principle of effective treaty interpretation would therefore seem to require ‘matters not covered’ to be interpreted to refer to matters currently not dealt with in standards, guidelines or recommendations of the ‘three sisters’. The danger that the identification of other bodies active within the areas of competence of the ‘three sisters’ could result in conflicting standards is avoided by the fact that, even if an international body is identified whose mandate overlaps with those of one of the ‘three sisters’, the ‘appropriate standards’ relevant for purposes of the *SPS Agreement* would be limited to those dealing with matters not covered by the standards set by the CAC, OIE or IPPC. An example of a matter not covered by existing standards, where the absence of standards has been repeatedly raised as a problem by developing-country exporters, is that of maximum residue levels for pesticides and other contaminants across a range of spices. In the absence of international MRLs, importers opt for a ‘lowest detectable residue’ level, which effectively excludes spices from many developing-country Members. The possibility of referring to the standards set by bodies such as the International Pepper Community, an intergovernmental organisation active in setting standards for microbiological contaminants in pepper and good hygienic practices in pepper production, could alleviate this problem.<sup>749</sup>

Second, it is not clear from Annex A.3(d) whether the SPS Committee is mandated to identify ‘other relevant organizations’ or only their ‘appropriate standards’. At first glance, the qualifying clause could be read to refer either to the organisations themselves or to appropriate standards and other texts promulgated by them. However, the latter interpretation would, in practice, prove unworkable. One must bear in mind the dynamic nature of standard setting. Standards are constantly being elaborated and revised to reflect developments in scientific knowledge, dietary habits, pest control methods etc. Specific standards identified by the SPS Committee would soon become outdated. It makes more sense for the SPS Committee to refer to an organisation and to leave the limitation on the standards of relevance for the *SPS Agreement* to the first criterion discussed above. This would allay fears of duplication of standards in case of overlapping mandates.

---

<sup>748</sup> A possible exception would be if the broad interpretation of the scope of application of the *SPS Agreement* applied by the Panel in *EC – Approval and Marketing of Biotech Products* would be confirmed by the Appellate Body. Such interpretation covers also matters such as environmental damage not affecting humans, plants or animals, and falling outside the mandates of the CAC, OIE and IPPC, for example risks to micro-organisms in soil or water that are specialised in biochemical processes. Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.197-7.211 and 7.292. On this point, see further above, Part III, Section 2.1.1.

<sup>749</sup> The International Pepper Community has set standards for *E. coli*, salmonella, mould and yeast and aerobic plate count in whole and ground pepper, and has developed guidelines for good hygienic practices in pepper production. Its website is available at: <http://www.ipcnet.org/index.php?act=>, visited on 15 June 2008.

Third, it is important to note that the international organisation at issue must be open for membership to all WTO Members. This ensures that all Members have at least the possibility of participation in the elaboration of the standards that will be used as benchmarks by the *SPS Agreement*. Regional organisations that set SPS standards, such as the EC,<sup>750</sup> would clearly be excluded, as would international organisations where the accession process is subject to the consent of existing members, such as the OECD.<sup>751</sup> In addition, organisations whose membership does not consist of states but is limited to industry representatives, for example the International Dairy Federation,<sup>752</sup> or of private economic actors, such as GLOBALGAP,<sup>753</sup> would not be among the organisations which the SPS Committee may identify.<sup>754</sup>

An example of a body that would meet this requirement is the UNECE. The UNECE has a Working Party on Agricultural Quality Standards, which develops both quality and safety

<sup>750</sup> The EC has regulatory competence in the area of SPS protection in terms of Articles 37, 95, 152 and 153 of the *EC Treaty*. An example of the exercise of this competence is Regulation (EC) No 178/2002 of 28 January 2002 which lays down a comprehensive food policy at EC level. While EC food standards are also of relevance to non-Member States of the EU in some cases through agreements such as the customs union agreement with Turkey or the European Economic Area Agreement with Norway, Iceland and Liechtenstein, only EC institutions and Member States are involved in their elaboration. For a thorough discussion of the European food-safety regime, see Alberto Alemanno, *Trade in Food: Regulatory and Judicial Approaches in the EC and WTO* (Cameron May, London), 2007, 33-223.

<sup>751</sup> The OECD is engaged to some extent in setting standards and guidelines for its members in the area of food and agriculture. See for example, OECD, *Guidance on Objective Tests to Determine Quality of Fruits and Vegetables and Dry and Dried Produce*, AGR/CA/FVS(2005)3/REV1, 2006, available at: <http://www.oecd.org/dataoecd/32/47/19515719.pdf>, visited on 5 February 2008; and OECD, 'Scheme' for the Application of International Standards for Fruit and Vegetables, C(92)184/FINAL, 1992. Although participation in this 'scheme' is open to any member of the UN or one of its specialised agencies or any Member of the WTO that wishes to participate therein, this participation refers to the compliance by exporting countries of the standards adopted by the 'scheme' and the recognition of such standards by importing countries. Therefore, it is not participation in setting the standards under the 'scheme' that is open to all WTO Members. See [http://www.oecd.org/document/44/0,3343,en\\_2649\\_201185\\_19507564\\_1\\_1\\_1\\_1,00.html](http://www.oecd.org/document/44/0,3343,en_2649_201185_19507564_1_1_1_1,00.html), visited on 6 February 2008.

<sup>752</sup> The International Dairy Federation (IDF) is a transnational organisation whose members are national committees, made up of the dairy organisations (representing milk production, manufacture, distribution, technology, science, human nutrition, marketing, economics, education and administration) in various countries. It should be noted, however, that although the IDF used to be active in setting standards for dairy products itself, it is now focused on providing input, including in the form of proposals for standards and elaboration of draft standards, to the relevant Codex Committees. See the website of the International Dairy Federation, available at: <http://www.fil-idf.org>, visited on 5 February 2008.

<sup>753</sup> GLOBALGAP is a consortium of retail companies that set private standards in areas such as good agricultural practice and good warehouse practice. It originated in 2007, after the rebranding of EUREP, the European Retailer Produce Working Group, a consortium of European retailers. See the website of GLOBALGAP, available at: [www.globalgap.org](http://www.globalgap.org), visited on 5 February 2008.

<sup>754</sup> Scott notes the difference in this regard between the *SPS Agreement* and the *TBT Agreement*. The latter refers, in Annex 1.4, to international bodies or systems, rather than to international organisations. An international body or system is defined in this provision as a 'body or system whose membership is open to the relevant bodies of at least all Members.' This would include bodies such as the International Organization for Standardisation (ISO). ISO is not an intergovernmental organisation, but rather a network of the national standards institutes of 157 countries. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 245-246. *Contra* see Steven Bernstein and Erin Hannah, 'Non-State Global Standard Setting and the WTO: Legitimacy and the Need for Regulatory Space' *Journal of International Economic Law*, 11(3), 2008, (advance access) 1-34, 20. These authors argue that GLOBALGAP or the International Federation of Organic Agriculture Movements (IFOAM), neither of which are intergovernmental organisations, could be recognised under Annex A.3(d) of the *SPS Agreement*.

standards to facilitate trade in agricultural products.<sup>755</sup> According to the terms of reference of the Working Party, participation in any of its activities is open ‘on an equal footing’ to any member of the UN or of one of its specialised agencies.<sup>756</sup> In fact, in a background note prepared by the GATT Secretariat in the context of the Uruguay Round negotiations on the *SPS Agreement*, regarding the role and work of international organizations relevant in the field of SPS regulation, it expressly identified an UNECE Working Party, alongside the CAC, IPPC and OIE, as a relevant organisation.<sup>757</sup>

Fourth, it is interesting to note that Annex A.3(d) refers to ‘international organizations’. This would seem at first sight to suggest that only standard-setting bodies that fulfil the international law criteria for an international organisation would fall under this provision.<sup>758</sup> However, the term ‘international organizations’ is used elsewhere in the *SPS Agreement* to refer, *inter alia*, to the CAC and the IPPC, neither of which is an international organisation in the legal sense of the term.<sup>759</sup> Therefore, it would seem that intergovernmental standard-setting bodies that are not necessarily international organisations could be identified by the SPS Committee under Annex A.3(d). One could think, for example, of treaty bodies such as the Conference of the Parties to the *Convention on Biological Diversity*, taking decisions under the *Cartagena Protocol on Biosafety* relating to guidelines for the safe handling and transfer of living modified organisms.<sup>760</sup>

The broad interpretation of the criteria for determining the possible international bodies that could be identified as a ‘relevant international organization’ by the SPS Committee under Annex A.3(d) of the *SPS Agreement* is tempered by the reality of the decision making process. Decisions by the SPS Committee under this provision, as all its decisions,

<sup>755</sup> The UNECE standards cover a wide spectrum of agricultural products including fresh fruit and vegetables, dry produce, seed potatoes, meat, cut flowers, eggs and egg products. See for example, UNECE standard DDP-18 *Concerning the Marketing and Commercial Quality Control of Inshell Almonds*, 2007, available at: [http://www.unece.org/trade/agr/standard/dry/dry\\_e/18inalmonds.pdf](http://www.unece.org/trade/agr/standard/dry/dry_e/18inalmonds.pdf), visited on 5 February 2008.

<sup>756</sup> Any country that wishes to participate in the work of the Working Party on Agricultural Quality Standards must notify the Executive Secretary of the UNECE, indicating the national focal point for this work and the institution responsible for quality control and a contact person. The *Terms of Reference* of the Working Party on Agricultural Quality Standards are available at: [http://www.unece.org/trade/agr/info/ToR\\_eng.doc](http://www.unece.org/trade/agr/info/ToR_eng.doc), visited on 5 February 2008.

<sup>757</sup> Negotiating Group on Agriculture, *Sanitary and Phytosanitary Regulations. Role and Status of Work of Selected Organizations. Note by the Secretariat*, circulated on 20 April 1988, 1, available at: [http://www.wto.org/gatt\\_docs/English/SULPDF/92040055.pdf](http://www.wto.org/gatt_docs/English/SULPDF/92040055.pdf), visited on 11 May 2008. The UN ECE Working Party referred to in the Secretariat Note was an earlier body, namely the Working Party on Standardisation of Perishable Produce, established in 1949.

<sup>758</sup> An international organisation is a subject of international law, capable of having rights and obligations. It is established by a treaty or other international law instrument. It must have its own mandate, and possess its own organs, distinct from its members, capable of fulfilling the functions of the organisation. In this regard, see for example, N.M. Blokker, *International Institutional Law*, 4<sup>th</sup> ed. (Martinus Nijhoff, The Hague) 2003, 21-22; Phillippe Sands and Pierre Klein, *Bowett's Law of International Institutions*, 5<sup>th</sup> ed. (Sweet and Maxwell, London) 2001, 16; Jan Klabbbers, *An Introduction to International Institutional Law* (Cambridge University Press, Cambridge) 2002, 7-13; and C.F. Amerasinghe, *Principles of the Institutional Law of International Organizations* 2<sup>nd</sup> ed. (Cambridge University Press, Cambridge) 2005, 10-11.

<sup>759</sup> For example, see Articles 3.4 and 3.5 of the *SPS Agreement*.

<sup>760</sup> However, it is very unlikely that this body would, in practice, be identified by the SPS Committee under Annex A.3(d), due to the controversial nature of the regulation of genetically modified organisms among WTO Members.

must be taken by consensus.<sup>761</sup> This ensures that all Members have an opportunity to prevent the identification of an international standard-setting body as relevant for purposes of the harmonisation provisions of the *SPS Agreement*, if they regard this as contrary to their interests. While this may make it difficult to reach decisions on this matter, particularly with regard to controversial bodies, such as that acting under the *Cartagena Protocol on Biosafety*, it also serves a useful purpose.<sup>762</sup> It acts as a safeguard against an uncontrolled expansion of the number of international bodies whose standards have relevance as benchmarks for purposes of the *SPS Agreement*. Such an expansion, while increasing the number of standards available as a basis for harmonisation, also increases the number of bodies in which WTO Members will have to participate in order to protect their interests. The identification of a ‘relevant international organisation’ under Annex A.3(d) therefore remains a last resort, for cases where Members agree that standards are needed in an area currently not covered by one of the ‘three sisters’. These cases are far more likely to relate to areas not currently prioritised by the CAC, OIE or IPPC than to areas where the absence of standards is due to the controversial nature of the matter at issue.

#### 4.1.2 Nature of the relevant international norms

A second issue that arises with regard to the definition of ‘standards, guidelines and recommendations’ in Annex A.3, relates to whether differences in the substantive or procedural nature of various international norms are taken into account by the *SPS Agreement* in its use of these norms as benchmarks. In particular, this question relates to differences in the substantive types of norms (i.e. standards, guidelines or recommendations) and differences in the procedure that led to the creation of the norm.

No explicit distinction is made in the *SPS Agreement* between ‘standards, guidelines and recommendations’. However, their substantive nature is clearly quite different and they are not intended by the standard-setting bodies themselves to have the same status. As mentioned above,<sup>763</sup> soon after the coming into force of the *SPS Agreement*, a question was sent by the CAC to the SPS Committee regarding whether the obligations in Article 3 of the *SPS Agreement* applied equally and without distinction to standards, guidelines and recommendations set by the CAC.<sup>764</sup> This was important to CAC members in order to know what effect the differences in the types of norms they adopted would have on their obligations under the *SPS Agreement*. The answer received from the SPS Committee was

---

<sup>761</sup> Article 12.1 of the *SPS Agreement*.

<sup>762</sup> Scott argues that the consensus requirement for decision making in the SPS Committee is likely to be an insurmountable obstacle to the identification of other relevant organisations by the SPS Committee. In support of this point she refers to the fact that no agreement could be reached in the SPS Committee even on granting observer status to the *Cartagena Protocol on Biosafety*. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 245. While such pessimism is no doubt warranted with regard to bodies active in controversial areas, as are the bodies under the *Cartagena Protocol on Biosafety* that deals with living modified organisms, other more technical bodies setting standards for particular commodities may not present as many problems.

<sup>763</sup> On this point, see above, Part II, Section 3.2.1.4.

<sup>764</sup> Codex Alimentarius Commission, *Report of the Twenty-Second Session*, ALINORM 97/37 (Joint FAO/WHO Food Standards Programme, Geneva), 23-28 June 1997, para. 172.

that the Agreement makes no distinction between the three types of norms and that they are thus equally applicable under the disciplines set by Article 3 of the *SPS Agreement*.<sup>765</sup>

Although not expressly mentioned in the Annex A.3 definition, the term ‘international standards, guidelines and recommendations’ includes the requirement that the norms set by the relevant international bodies be ‘international’ in nature. This would therefore exclude standards set at regional level, intended to address specifically regional SPS concerns. An example would be the standards set by the regional offices of the International Plant Protection Convention, or those adopted by the Codex Alimentarius Commission on proposal by one of the regional Coordination Committees for purposes of that region only.<sup>766</sup> The omission of the requirement of an international nature would have led to the anomalous situation that Members outside the relevant region for which the standard was set would have to scientifically justify their deviation from a standard or guideline neither intended nor appropriate for their adoption.

There are no explicit qualifications in the definition of ‘standards, guidelines and recommendations’ with regard to the procedure used to set the norm. Instead, the obligation in Article 3.1 refers broadly to ‘international standards, guidelines or recommendations, where they exist’.<sup>767</sup> In particular, there is no requirement as to the degree of support the norm should represent, such as a qualified majority or a consensus in favour. Neither is there any reference to the extent of participation by developing countries in the procedure leading to its adoption. It is only provided that the other relevant international organisations for matters not covered by the ‘three sisters’ should be ‘open for Membership to all Members.’<sup>768</sup> The latter requirement, however, says nothing about the actual participation by all Members in standard setting, or about the effectiveness of the participation that does occur.<sup>769</sup>

This unqualified use of international norms for purposes of the harmonisation disciplines of Article 3 of the *SPS Agreement* was confirmed by the Panel in *EC – Hormones*. In that case the EC argued that as the existing Codex standards were not relevant to the dispute as they had been adopted by a very narrow majority indicating their controversial

<sup>765</sup> In the preparatory phase leading towards the Seattle Ministerial Conference, several developing-country Members proposed that the definition of ‘international standards, guidelines or recommendations’ be amended to distinguish ‘mandatory international standards and voluntary international guidelines/recommendations.’ WTO Secretariat, *Preparations for the 1999 Ministerial Conference. Compilation of Proposals Submitted in Phase 2 of the Preparatory Process. Informal Note by the Secretariat. Revision*, JOB(99)/4797/Rev.3, circulated on 18 November 1999, para. F. While this proposal seems to rest on the mistaken view that standards are mandatory, or are made mandatory by the *SPS Agreement*, it does serve to indicate the stronger legal status of standards relative to that of guidelines and recommendations, and the wish to have this recognised in the way the *SPS Agreement* deals with each.

<sup>766</sup> This was confirmed in the abovementioned response of the SPS Committee to the CAC. Codex Alimentarius Commission, *Report of the Twenty-Second Session* (Joint FAO/WHO Food Standards Programme, Geneva), 23-28 June 1997, para. 168.

<sup>767</sup> Note however, that in contrast to the *TBT Agreement* which refers in Article 2.4 to international standards where they exist or where their completion is imminent, the *SPS Agreement* does not refer to imminent standards.

<sup>768</sup> The CAC, OIE and IPPC are open to membership by all WTO Members according to their constituent documents, as noted above, Part II, Sections 3.2.1.3, 3.2.2.3 and 3.2.3.3. Thus this requirement only needed to be specified for the ‘other relevant international organizations’ mentioned in Annex A.3(d).

<sup>769</sup> See the discussion on the problems of participation in the CAC, OIE and IPPC, above, Part II, Sections 3.2.1.5, 3.2.2.5 and 3.2.3.5.

nature; they embodied levels of protection, not measures, and were thus irrelevant to the obligations in the *SPS Agreement*; and the process leading to their adoption had commenced long before the coming into force of the *SPS Agreement* so that Codex members were unaware of the effect they would have by virtue of the Agreement.<sup>770</sup> In response the Panel noted that:

Article 3.1 unambiguously prescribes that “... Members shall base their sanitary ... measures on international standards ... *where they exist* ...” (emphasis added). Paragraph 3 of Annex A of the *SPS Agreement* states equally clearly that the international standards mentioned in Article 3:1 are “for food safety, the standards ... *established by the Codex Alimentarius Commission* relating to ... *veterinary drug ... residues* ...” (emphasis added). No other conditions are imposed in the *SPS Agreement* on the relevance of international standards for the purposes of Article 3. Therefore, as a panel making a finding on whether or not a Member has an obligation to base its sanitary measure on international standards in accordance with Article 3.1, we only need to determine whether such international standards exist. For these purposes, we need not consider (i) whether the standards reflect *levels* of protection or sanitary *measures* or the *type* of sanitary measure they recommend, or (ii) whether these standards have been adopted by consensus or by a wide or narrow majority, or (iii) whether the period during which they have been discussed or the date of their adoption was before or after the entry into force of the *SPS Agreement*.<sup>771</sup>

The Appellate Body did not address this issue as it was not raised by the EC in appeal. A similar approach was taken by the Panel in *Australia – Salmon* with respect to the applicability of OIE standards. In this case, in the context of the interim review of the Panel Report, Australia stated that the OIE *Aquatic Animal Health Code* does not set adequate international guidelines since it is under substantial revision, is not representative of global conditions, is not grounded on a scientific basis and is the result of non-transparent decision-making.<sup>772</sup> The Panel found that:

... the *SPS Agreement* (paragraph 3(b) of Annex A) explicitly directs us to the OIE and the standards, guidelines and recommendations it develops ... The fact that the OIE Code is subject to revision or the way it has been adopted in our view does not change its validity for our purposes.<sup>773</sup>

This deferential approach to assessing the relevance of the standards set by the three referenced international standard-setting bodies flows from the terms of the *SPS Agreement* itself.<sup>774</sup> The absence of procedural or substantive requirements for establishing the relevance of these international standards is indicative of a choice written into the Agreement to allocate the competence for balancing competing trade and health objectives to the in-

<sup>771</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.72; Panel Report, *EC – Hormones (US)*, para. 8.69.

<sup>772</sup> Panel Report, *Australia – Salmon*, para. 7.10.

<sup>773</sup> *Ibid.*

<sup>774</sup> For a discussion of the standard of review that this implies, see below, Part IV, Section 2.2.3.

ternational bodies identified in the Agreement in the first place.<sup>775</sup> However, it is clear that the question of participation in standard-setting in international organisations needs to be addressed if the resultant standards are to constitute credible benchmarks for national authorities.<sup>776</sup> This issue was raised in the run-up to the Seattle Ministerial Conference, where a group of developing-country Members called for a narrower definition of ‘international standards, guidelines and recommendations’ to be developed to include only those standards that are developed with the participation of countries at different levels of development and from all geographical regions.<sup>777</sup> Further, another group of developing-country Members proposed the inclusion of a requirement that such international standards had to have been adopted by consensus in order to fall within the definition.<sup>778</sup> These proposals evince developing-country concerns with the absence of procedural requirements in the *SPS Agreement* for the standards used as benchmarks by its provisions.

Naturally, although not expressly stated in the reference to international standards, guidelines or recommendations in Article 3 of the *SPS Agreement*, the obligations in this Article are only triggered when the existing international norms are relevant to the risk addressed by the SPS measure.<sup>779</sup> The question arises how closely the international norm must correspond to the issue addressed by the SPS measure in dispute. In *EC – Hormones*, the EC argued that the existing Codex standards were not relevant to the dispute as they did not apply to the *use* of hormone growth promoters, as did the EC measure, but rather set MRLs and ADIs.<sup>780</sup> The Panel noted that Codex standards existed for five of the six hormones at issue,<sup>781</sup> and proceeded to examine ‘the definition and scope of application’ of the Codex standards and to determine whether they applied to the EC measure in dispute.<sup>782</sup> After finding that the ‘type’ of SPS measure embodied in an international standard is irrelevant, the Panel pointed out that the existing Codex standards related to veterinary drug residues, as referred to in Annex A.3(a), they applied exclusively to cattle and bo-

<sup>775</sup> For a discussion of the idea that harmonisation of SPS requirements around international standards aims to promote the efficient supply of global public goods (free trade and health) by using international negotiations to ensure that costs and benefits of all stakeholders are taken into account at the global level, see above Part II, Section 3.1.1.

<sup>776</sup> The problems of participation in international standard-setting procedures are addressed above Part II, Sections 3.2.1.5, 3.2.2.5 and 3.2.3.5.

<sup>777</sup> WTO Secretariat, *Preparations for the 1999 Ministerial Conference. Compilation of Proposals Submitted in Phase 2 of the Preparatory Process. Informal Note by the Secretariat. Revision*, JOB(99)/4797/Rev.3, circulated on 18 November 1999, para. F. This proposal was made by Cuba, the Dominican Republic, Egypt, El Salvador, Honduras, India, Indonesia, Malaysia, Nigeria, Pakistan, Sri Lanka and Uganda.

<sup>778</sup> *Ibid.*, para. H. This proposal was made by Zambia, Jamaica, Kenya, Pakistan, Sri Lanka, Tanzania, Uganda and Zimbabwe.

<sup>779</sup> Article 2.4 of the *TBT Agreement* explicitly qualifies the international standards it refers to as ‘relevant’. This has been interpreted as meaning that the international standard must ‘bear upon, relate to, or be pertinent to’ the technical regulation at issue. Panel Report, *EC – Sardines*, para. 7.68; and Appellate Body Report, *EC – Sardines*, para. 229.

<sup>780</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.69; Panel Report, *EC – Hormones (US)*, para. 8.66.

<sup>781</sup> With respect to the three natural hormones at issue, oestradiol-17 $\beta$ , progesterone and testosterone, the Codex Committee on Residues of Veterinary Drugs in Food found it unnecessary to establish an MRL or ADI as they were considered safe when used in accordance with good veterinary practice. With respect to two of the three synthetic hormones at issue, Zeranol and Trenbolone, the applicable Codex standards were an ADI of 0-0.5 and 0.02  $\mu\text{g}/\text{kg}$  body weight respectively and an MRL of 2 $\mu\text{g}/\text{kg}$  in bovine muscle, 10 2 $\mu\text{g}/\text{kg}$  in bovine liver for both.

<sup>782</sup> Panel Report, *EC – Hormones (Canada)*, para.8.61; Panel Report, *EC – Hormones (US)*, para. 8.58.

vine meat products and they related to five of the six hormones in dispute when used for growth promotion purposes. Similarly, the EC ban applied to bovine meat and meat products in respect of which cattle had been treated with the six hormones for growth promotion purposes. As a result of this correspondence in the product, the risk-causing substance and its technological purpose, the Panel found that international standards existed with respect to the EC measure in dispute in the sense of Article 3.1 and Annex A.3(a).<sup>783</sup>

In *Australia – Salmon*, the question of the existence of relevant international standards was once again at issue since the guideline that had been drafted by the OIE did not cover all 24 of the fish diseases at which the Australian measure was aimed, nor was it specifically aimed at salmon, the product at issue. The Panel found as follows:

Paragraph 3(b) of Annex A to the SPS Agreement indicates that the international standards, guidelines or recommendations referred to in Article 3 *for animal health* (the concern at issue in this dispute) are those developed under the auspices of the International Office of Epizootics ('OIE'). Both parties agree that the International Aquatic Animal Health Code adopted by the OIE in 1995 ('OIE Code') provides international guidelines on a disease-by-disease basis. However, they also agree that as of today no relevant OIE guideline exists which deals with salmon on a product specific basis. Moreover, both parties also agree that OIE guidelines do not exist for all of the 24 diseases of concern to Australia. ... In this respect, we are of the view, however, that the fact that in this case no international guidelines exist for *all* 24 diseases of concern does not mean that an international guideline which applies to only *one* of these diseases cannot be relevant (or, according to the language of Article 3.1, does not 'exist') for the measure at issue.<sup>784</sup>

Thus, a much lower level of correspondence between the international standard and the SPS measure was accepted in this case to establish the relevance of the international standard.

The lack of concern for the procedural aspects of the international standard that Members are encouraged to adopt is worrying in the light of the problems that exist in the standard-setting procedures followed in the relevant international organisations, as discussed above.<sup>785</sup> As a result, many international standards reflect the interests and priorities of developed-country members of the standard-setting bodies, and are of limited relevance to developing-country members. This, coupled with the eagerness of the Panel in *Australia – Salmon* to make the international norms applicable to a case, regardless of whether they really fully cover the situation at hand, gives cause for concern. As aptly stated by Joanne Scott, this means that:

<sup>783</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.73; Panel Report, *EC – Hormones (US)*, para. 8.70.

<sup>784</sup> Panel Report, *Australia – Salmon*, para. 8.46. In this case, however, the Panel noted that as, in the absence of OIE standards for all 24 diseases at issue, it would in any event be obliged to consider whether Australia complied with Articles 2 and 5 of the *SPS Agreement*, it would begin its analysis with the latter Articles before turning to Article 3. As it found violations of Articles 2 and 5, it exercised judicial economy with respect to the claims under Article 3. *Ibid.*, para. 8.184.

<sup>785</sup> See above, Part II, Sections 3.2.1.5, 3.2.2.5 and 3.2.3.5.

The authority of international standards is ‘automatic’. It is not contingent upon the nature of the standard setting process, and that process is not subject to judicial oversight at the WTO. It is not open for Members to seek to justify their departure from international standards on the basis of scientific or due process deficits which characterized their adoption. To the extent that such standards enjoy authority in the WTO, they enjoy authority without judicial contestability.<sup>786</sup>

The unqualified acceptance of all international standards, guidelines and recommendations adopted by the relevant international standard-setting bodies as applicable to the disciplines of Article 3, leads to the question of what exactly is encompassed by these obligations. This will determine the implications of the all-encompassing nature of the reference to international norms for Members at different levels of development.

#### 4.2 Obligations with regard to international standards

The particular obligations with regard to the promotion of harmonisation around the international standards set by the CAC, OIE and IPPC are found in Article 3.1, 3.2 and 3.3 of the *SPS Agreement*. Further, Members are obliged under Article 3.4 to participate in the work of these organisations, to the extent that their resources permit, and to promote development and periodic review of SPS standards. Article 3.5 mandates the SPS Committee to establish a procedure to monitor the process of international harmonisation in co-ordination with the relevant international organisations.<sup>787</sup>

Aside from Article 3, dealing directly with harmonisation and which refers expressly to the CAC, OIE and IPPC, other provisions of the *SPS Agreement* refer to ‘relevant international organizations’. While not directly promoting the harmonisation of SPS measures, as noted by Stewart and Johanson, they do promote increased uniformity by encouraging participation in these organisations and promoting regard for processes and guidelines developed by them or the information gathered by them.<sup>788</sup> For example, Article 5.1 obliges Members to take account of risk assessment processes developed by the ‘relevant

<sup>786</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 275. Here, Scott cites Robert Howse, who refers to the ‘automatic’ legal force of international standards in the WTO, meaning that ‘the Appellate Body does not, apparently, consider it to be of any importance to take into account the intentions or practice of the standard-setting regime in question; it is unconcerned with the intentions of the standard-setting regime or its participants, and uninterested in the practice of that regime. The [Appellate Body] is quite prepared to confer legal force on international standards, without any consideration of the institutional context in which such standards arise.’ Robert Howse, ‘A New Device for Creating International Legal Normativity: The WTO Technical Barriers to Trade Agreement and “International Standards”’ in C. Joerges and E. Petersmann (eds) *Constitutionalism, Multilevel Trade Governance and Social Regulation*, Studies in International Trade Law, 9 (Hart Publishing, Portland) 2006, 383-395.

<sup>787</sup> Article 12.4 of the *SPS Agreement* reiterates this obligation, stating that the SPS Committee must develop a procedure to monitor the process of international harmonization. On the work of the SPS Committee in this regard, see below, Part IV, Section 2.1.3.

<sup>788</sup> Terence P. Stewart and David S. Johanson, ‘The *SPS Agreement* of the World Trade Organization and International Organizations: The Roles of the Codex Alimentarius Commission, the International Plant Protection Convention, and the International Office of Epizootics’, *Syracuse Journal of International Law and Commerce* 26, 1998, 27-53, 31-32.

international organizations'.<sup>789</sup> Article 5.7 allows provisional measures to be adopted in cases of scientific uncertainty on the basis of available scientific information 'including that from relevant international organizations'. Article 6.1 obliges Members, in assessing pest- or disease-free areas, to take into account 'guidelines which may be developed by the relevant international organizations'.<sup>790</sup> In Article 9.1 Members agree to facilitate the provision of technical assistance to developing-country Members either bilaterally or through 'the appropriate international organizations'. Article 10.4 provides that Members should encourage the participation of developing-country Members in 'the relevant international organizations'.<sup>791</sup> Article 11.2 makes it possible for dispute settlement panels to consult 'relevant international organizations' when faced with scientific or technical issues.<sup>792</sup> These provisions are discussed further below, but it is useful to bear in mind here that the impact of the relevant international standard-setting bodies extends beyond the harmonisation disciplines of Article 3.

The specific provisions of Article 3.1 to 3.3 of the *SPS Agreement* and their interpretation by panels and the Appellate Body are now examined in detail. Under the heading *Harmonization*, these provisions state:

1. To harmonize sanitary and phytosanitary measures on as wide a basis as possible, Members shall *base* their sanitary or phytosanitary measures on international standards, guidelines or recommendations, where they exist, except as otherwise provided for in this Agreement, and in particular in paragraph 3.
2. Sanitary or phytosanitary measures which *conform* to international standards, guidelines or recommendations shall be deemed to be necessary to protect human, animal or plant life or health, and presumed to be consistent with the relevant provisions of this Agreement and of GATT 1994.
3. Members may introduce or maintain sanitary or phytosanitary measures which result in a *higher level* of sanitary or phytosanitary protection than would be achieved by measures based on the relevant international standards, guidelines or recommendations, if there is a scientific justification, or as a consequence of the level of sanitary or phytosanitary protection a Member determines to be appropriate in accordance with the relevant provisions of paragraphs 1 through 8 of Article 5. Notwithstanding the above, all measures which result in a level of sanitary or phytosanitary protection different from that which would be achieved by measures based on international standards, guidelines or recommendations shall not be inconsistent with any other provision of this Agreement. (Emphasis added)

In short, Article 3.1 expresses the aim of harmonising SPS measures on as wide a basis as possible, and states the obligation of Members to 'base' their SPS measures on international standards, guidelines or recommendations, where they exist, except as provided for

<sup>789</sup> See further on this point below, Part III, Section 5.1.3.

<sup>790</sup> See further on this point below, Part IV, Section 1.2.7.

<sup>791</sup> See further on this point below, Part V, Section 2.4.

<sup>792</sup> See further on this point below, Part IV below, Section 2.2.5.

in Article 3.3. Art 3.2 creates a presumption of consistency with GATT 1994 and the *SPS Agreement* for measures which ‘conform to’ international standards. Article 3.3 recognises the right of Members to use SPS measures which result in a higher level of protection than would be achieved by measures ‘based on’ the relevant international standards and sets certain requirements for this.

The Appellate Body in *EC – Hormones* identified the various options open for Members under these provisions. It rejected the Panel’s approach of seeing Articles 3.1 and 3.2 as the general rule and Article 3.3 as the exception.<sup>793</sup> Instead it identified three *autonomous* options available to Members under these provisions. It held as follows:

Under Article 3.2 of the *SPS Agreement*, a Member may decide to promulgate an SPS measure that conforms to an international standard. Such a measure would embody the international standard completely and, for practical purposes, converts it into a municipal standard. Such a measure enjoys the benefit of a presumption (albeit a rebuttable one) that it is consistent with the relevant provisions of the *SPS Agreement* and of the GATT 1994.

Under Article 3.1 of the *SPS Agreement*, a Member may choose to establish an SPS measure that is based on the existing relevant international standard, guideline or recommendation. Such a measure may adopt some, not necessarily all, of the elements of the international standard. The Member imposing this measure does not benefit from the presumption of consistency set up in Article 3.2; ...

Under Article 3.3 of the *SPS Agreement*, a Member may decide to set for itself a level of protection different from that implicit in the international standard, and to implement or embody that level of protection in a measure not ‘based on’ the international standard. The Member’s appropriate level of protection may be higher than that implied in the international standard. The right of a Member to determine its own appropriate level of sanitary protection is an important right.<sup>794</sup>

The nature and implications of each of the three autonomous options identified by the Appellate Body bear closer examination.

#### 4.2.1 Measures based on international standards

The first option open to Members, under Article 3.1, is to ‘base’ their SPS measures on international standards, guidelines or recommendations. The question arises whether this requires that Members conform their measures to international standards, as was found by the Panel in *EC – Hormones*.<sup>795</sup> The Panel in this case further held that to be ‘based on’

<sup>793</sup> Appellate Body Report, *EC – Hormones*, para. 168.

<sup>794</sup> Appellate Body Report, *EC – Hormones*, paras 170-172.

<sup>795</sup> The Panel had held that Article 3.1 does not define ‘based on’ but that Article 3.2 equates measures ‘based on’ international standards with those which ‘conform to’ these standards. Panel Report, *EC – Hormones (US)*, para. 8.72 and Panel Report *EC – Hormones (Canada)*, para. 8.75.

an international standard, the measure must achieve the same level of sanitary protection as that standard, a conclusion it viewed as implied by Article 3.3.<sup>796</sup>

The Appellate Body rejected this reasoning, finding that the plain meaning of the terms ‘based on’ and ‘conform to’ differ. A thing based on another “‘stands” or is “‘founded” or “‘built” upon or “‘is supported by” the latter.<sup>797</sup> By contrast, it held that ‘conform to’ requires much more, namely that the SPS measure “‘comply with”, “‘yield or show compliance” with the latter’ or correspond ‘in form or manner’ with, or follow ‘in form or nature’ the international standard.<sup>798</sup> It held further:

A measure that ‘conforms to’ and incorporates a Codex standard is, of course, ‘based on’ that standard. A measure, however, based on the same standard might not conform to that standard, as where only some, not all, of the elements of the standard are incorporated into the measure.<sup>799</sup>

Noting the fact that the two terms are used in different provisions, the Appellate Body found:

The implication arises that the choice and use of different words in different places in the *SPS Agreement* are deliberate, and that the different words are designed to convey different meanings. A treaty interpreter is not entitled to assume that such usage was merely inadvertent on the part of the Members who negotiated and wrote that Agreement. Canada has suggested the use of different terms was ‘accidental’ in this case, but has offered no convincing argument to support its suggestion. We do not believe this suggestion has overturned the inference of deliberate choice.<sup>800</sup>

The Appellate Body also pointed out that the Panel’s interpretation was contrary to the object and purpose of Article 3.1, which is ‘[t]o harmonize [SPS] measures on as wide a basis as possible’.<sup>801</sup> Noting the desire recorded in the preamble to the *SPS Agreement* to further the use of harmonised measures and the tasks assigned to the SPS Committee in this regard under Article 12 of the *SPS Agreement*, the Appellate Body stated:

It is clear to us that harmonization of SPS measures of Members on the basis of international standards is projected in the Agreement, as a *goal*, yet to be realized *in the future*. To read Article 3.1 as requiring Members to harmonize their SPS measures *by conforming those measures with international standards, guidelines and recommendations, in the here and now*, is, in effect, to vest such international standards, guidelines and recommendations (which are by the terms of the Codex *recommendatory* in form and nature) with *obligatory* force and effect. The Panel’s interpretation of Article 3.1 would, in other words, transform those standards, guidelines and recommendations into binding *norms*. But, as

---

<sup>796</sup> Panel Report, *EC – Hormones (US)*, para. 8.73; Panel Report *EC – Hormones (Canada)*, para. 8.76.

<sup>797</sup> Appellate Body Report, *EC – Hormones*, para. 163.

<sup>798</sup> *Ibid.*, para. 163.

<sup>799</sup> *Ibid.*

<sup>800</sup> *Ibid.*, para. 164.

<sup>801</sup> Article 3.1 of the *SPS Agreement*, cited *ibid.*, para. 165.

already noted, the *SPS Agreement* itself sets out no indication of any intent on the part of the Members to do so. We cannot lightly assume that sovereign states intended to impose upon themselves the more onerous, rather than the less burdensome, obligation by mandating *conformity* or *compliance with* such standards, guidelines and recommendations. To sustain such an assumption and to warrant such a far-reaching interpretation, treaty language far more specific and compelling than that found in Article 3 of the *SPS Agreement* would be necessary.<sup>802</sup>

The Appellate Body thus made it clear that the voluntary standards set by the relevant international standard-setting bodies do not become mandatory through the operation of the *SPS Agreement*.<sup>803</sup>

Aside from noting that the requirement for an SPS measure to be ‘based on’ an international standard is not to be equated with a requirement to ‘conform to’ such a standard, the Appellate Body further clarified that a measure ‘based on’ an international standard ‘may adopt some, not necessarily all, of the elements of the international standard.’<sup>804</sup> The closeness of the relationship required between the SPS measure and the international standard in order for it to be ‘based on’ this standard is still not clear.<sup>805</sup> The Appellate Body refrained from deciding on the correctness of the rest of the Panel’s analysis on the meaning of ‘based on’, including the finding that ‘for a sanitary measure to be *based on* an international standard ..., that *measure* needs to reflect the same level of sanitary protection as the *standard*.’<sup>806</sup> Although the question was thus left open by the Appellate Body, it would appear that the Panel was correct in informing the term ‘based on’ in Article 3.1 with reference to the use of the same term in Article 3.3. Thus in order to be regarded as ‘based on’ an international standard, the SPS measure must not only adopt at least some of the elements of the international standard but also result in the same level of protection.<sup>807</sup>

Despite the more lenient interpretation of the requirements of Article 3.1 given by the Appellate Body in *EC – Hormones* than that given by the Panel, the EC ban was obviously not ‘based on’ the existing Codex standards and did not adopt any elements thereof.

<sup>802</sup> *Ibid.*, para. 165.

<sup>803</sup> Before the Panels, the EC had argued that CAC members were used to adopting voluntary standards and were not aware that the standards for hormones in beef would in effect become mandatory through the operation of the *SPS Agreement*. Panel Report *EC – Hormones (US)*, para. 8.68; Panel Report *EC – Hormones (Canada)*, para. 8.71.

<sup>804</sup> Appellate Body Report, *EC – Hormones*, para. 171.

<sup>805</sup> In *EC – Sardines*, with respect to the requirement in Article 2.4 of the *TBT Agreement* that international standards be used ‘as a basis’ for technical regulations, the Appellate Body held that ‘there must be a very strong and close relationship’ between them and ‘at minimum, no such relationship can exist where there is a contradiction’ between the regulation and the standard. Appellate Body Report, *EC – Sardines*, para. 245. It is doubtful whether this interpretation can be applied by analogy to the ‘based on’ requirement in the *SPS Agreement*, however, as unlike the *SPS Agreement*, the *TBT Agreement* does not contain an alternative ‘conform to’ option. Therefore it is to be expected that the relationship required by the *TBT Agreement* between the measure and the international standard in order for the former to be based on the latter is closer than that under the *SPS Agreement*.

<sup>806</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.76; Panel Report, *EC – Hormones (US)*, para. 8.73.

<sup>807</sup> Appellate Body Report, *EC – Hormones*, para. 171.

As stated above, the CAC had set no ADI or MRL<sup>808</sup> for any of the relevant natural hormones, finding this to be unnecessary as it had determined them to be safe when used in accordance with good veterinary practice, and had set certain ADIs and MRLs<sup>809</sup> for the two synthetic hormones, which were obviously exceeded by the EC's ban. The Appellate Body thus continued by analysing the EC's measure under the requirements of Article 3.3 for measures that are not based on international standards.<sup>810</sup>

The question arises what the consequences would be of choosing the option under Article 3.1. The Appellate Body in *EC – Hormones* clarified these consequences as follows:

Under Article 3.1 of the *SPS Agreement*, a Member may choose to establish an SPS measure that is based on the existing relevant international standard, guideline or recommendation. ... The Member imposing this measure does not benefit from the presumption of consistency set up in Article 3.2; but, as earlier observed, the Member is not penalized by exemption of a complaining Member from the normal burden of showing a *prima facie* case of inconsistency with Article 3.1 or any other relevant article of the *SPS Agreement* or of the GATT 1994.<sup>811</sup>

Thus, clearly a Member that merely bases its SPS measures on international standards, without conforming to them, does not enjoy a presumption of compliance of its measures with the *SPS Agreement* and the GATT 1994. Still, it seems logical that there should be an advantage for a Member which chooses this alternative over that provided under Article 3.3. It has been argued that as a measure based on an international standard is automatically based on a risk assessment (that underlying the standard set by the relevant international standard-setting body), the measure should be deemed to comply with Article 5.1-5.3 of the *SPS Agreement*.<sup>812</sup> Thus an evaluation of whether the strict requirements for a risk assessment were met is rendered unnecessary. While not providing a safe haven for SPS measures against challenges under the *SPS Agreement* and the GATT 1994, as is the case for Article 3.2, the option under Article 3.1 arguably saves SPS measures that are based on international standards from the rigorous scientific disciplines of the Agreement. This would be in line with the *SPS Agreement's* strong reliance on the expertise and reputable nature of the 'three sisters'. It would also be consistent with the structure of Article 3, in particular the requirement in Article 3.3 of scientific justification for SPS measures that are *not based on* international standards. SPS measures based on the relevant international standards would then only be vulnerable to challenges under the remaining

---

<sup>808</sup> Codex standards for veterinary drugs are normally stated in terms of ADI and MRL. ADI constitutes an estimate by the JECFA of the amount of a veterinary drug, expressed on the basis of body weight that can be ingested over a lifetime without appreciable health risks. MRL indicates the maximum concentration of residues, resulting from the use of the veterinary drug, which are recommended to be legally permitted or considered acceptable in food.

<sup>809</sup> These Codex standards, based on the 32<sup>nd</sup> Report of the JECFA of 1988, set an ADI of 0-0.2 ug/kg body weight for Trenbolone and 0-0.5 ug/kg body weight for Zeranol. For both synthetic hormones it set an MRL of 2 ug/kg (muscle) and 10 ug/kg (liver).

<sup>810</sup> Appellate Body Report, *EC – Hormones*, paras 176-177.

<sup>811</sup> Appellate Body Report, *EC – Hormones*, para. 171.

<sup>812</sup> David R. Hurst, 'Hormones: European Communities - Measures Affecting Meat and Meat Products', *European Journal of International Law* 9 (1), 1998, 182-183, available at: <http://www.ejil.org/journal/Vol9/No1/sr1g.html>, visited on 12 June 2008.

trade-related disciplines, such as the non-discrimination and necessity requirements of the Agreement, and its procedural rules.<sup>813</sup>

This approach is partly supported by the findings of the Panels in *US – Continued Suspension* and *Canada – Continued Suspension* with regard to the implications of the existence of relevant international standards for the determination of ‘insufficiency’ of scientific evidence.<sup>814</sup> Although this finding was made in relation to Article 5.7 of the *SPS Agreement* it has broader relevance for the relationship between international standards and the scientific disciplines of the *SPS Agreement*.<sup>815</sup> The Panels held that the presumption of consistency with the *SPS Agreement* and the GATT 1994 of measures conforming to international standards, contained in Article 3.2 of the *SPS Agreement*, implies that such standards are based on risk assessments meeting the requirements of the *SPS Agreement*, and therefore also that ‘sufficient scientific evidence’ exists for these standards.<sup>816</sup> The Panels stressed that ‘some meaning’ must be given to the role of international standards under the *SPS Agreement* and in particular the Article 3.2 presumption.<sup>817</sup>

The alternative, providing no advantage to measures based on international standards as compared to measures not so based, would undermine the promotion of harmonisation by the *SPS Agreement* by eliminating the incentive to use such standards as a basis for SPS measures. It would also mean that the scientific basis of international standards would be open to review by panels and the Appellate Body. As discussed below, panels have difficulty in evaluating scientific evidence and appreciating the limits of science in applying the risk assessment disciplines of the *SPS Agreement* to national measures.<sup>818</sup> It can be expected that the same would occur in the evaluation of risk assessments by international expert bodies. Allowing panels to second-guess the work of internationally renowned experts would call into question the authoritative nature of the standards developed by the international standard setting bodies and disturb the relationship between them and the WTO.

More problematically, the latter approach would also have the unfortunate effect of reducing considerably the utility of the first of the ‘autonomous options’ for developing-country

---

<sup>813</sup> *Contra* see Scott, who argues that concerns regarding the scientific basis for decision-making under the CAC and the politicisation of risk regulation in its context may be addressed through review by WTO panels or the Appellate Body of international standards against the *SPS Agreement’s* rules on risk assessment, least trade restrictive measure, equivalence etc. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 258. Scott recognises that measures based on international standards have the benefit of providing a Member with ‘a reservoir of internationally recognised scientific data upon which to draw in mounting their defence.’ But she regards it as ‘not inconceivable’ that a panel could find that an international standard does not have an adequate basis in science, in view of the mode or operation of the international standard-setting bodies and the mixture of politics and science on which their standards rest. *Ibid.*, 261.

<sup>814</sup> The Panels recalled that Codex Alimentarius standards existed for 4 of the 5 hormones at issue under the Article 5.7 analysis. Panel Report, *US – Continued Suspension*, para. 7.643; Panel Report, *Canada – Continued Suspension*, para. 7.621.

<sup>815</sup> These findings are discussed in relation to Article 5.7 of the *SPS Agreement* below, Part III, Section 5.2.5.

<sup>816</sup> Panel Report, *US – Continued Suspension*, para. 7.644; Panel Report, *Canada – Continued Suspension*, para. 7.622.

<sup>817</sup> Panel Report, *US – Continued Suspension*, para. 7.646; Panel Report, *Canada – Continued Suspension*, para. 7.624.

<sup>818</sup> See below, Part IV, Section 2.2.3.

Members. Reliance by these Members on international standards as a basis for their SPS measures is often motivated by the possibility this offers to draw upon the sound scientific basis of these standards, in the face of insufficient scientific capacity at domestic level. At the same time, as the option under Article 3.1 does not require conformity with all aspects of the relevant international standards, it builds in flexibility for developing-country Members to adjust the international standard to their local needs and technical capacities. While these adjustments are still subject to the non-science-related disciplines of the *SPS Agreement*, to ensure, *inter alia*, that the resulting measure is not more trade restrictive than necessary, not a form of arbitrary discrimination and is applied only to the extent necessary, safeguarding its scientific basis from challenge allows international standards to meet an important need of developing-country Members. This need, namely for a reliable scientific basis for their SPS measures, is one of the things the international standard-setting bodies were created to address.

#### 4.2.2 Measures conforming to international standards

The second autonomous option open to a Member where international standards, guidelines or recommendations exist, is to adopt an SPS measure that conforms to the relevant international standard, guideline or recommendation under Article 3.2 of the *SPS Agreement*. It is thus necessary to examine what is required for a measure to ‘conform to’ an international standard. This issue was addressed by the Appellate Body in *EC – Hormones*. As already noted above, the Appellate Body regarded the term ‘conform to’ as requiring ‘correspondence in form or manner’, ‘compliance with’, or ‘acquiescence’ to ‘follow[ing] in form or nature’.<sup>819</sup> It further clarified that ‘[s]uch a measure would embody the international standard completely and, for practical purposes, converts it into a municipal standard.’<sup>820</sup>

The measure must thus completely embody the international standard. This would seem to mean that the measure and the international standard must be identical in both form and level of protection aimed at.

The *SPS Agreement* promotes such measures by deeming them to be necessary to protect human, animal or plant life or health and by granting them a presumption of consistency with the *SPS Agreement* and GATT 1994. The Appellate Body in *EC – Hormones* addressed the implications of the presumption of consistency, stating as follows:

The presumption of consistency with relevant provisions of the *SPS Agreement* that arises under Article 3.2 in respect of measures that conform to international standards may well be an *incentive* for Members so to conform their SPS measures with such standards. It is clear, however, that a decision of a Member not to conform a particular measure with an international standard does not authorize imposition of a special or generalized burden of proof upon that Member, which may, more often than not, amount to a *penalty*.<sup>821</sup>

<sup>819</sup> Appellate Body Report, *EC – Hormones*, para. 163. This definition draws upon *The New Shorter Oxford English Dictionary on Historical Principles*, vol. 1 (Clarendon Press), 187.

<sup>820</sup> *Ibid.*, para. 170.

<sup>821</sup> *Ibid.*, para. 102.

The advantage of choosing the option provided by Article 3.2 therefore lies in the safe harbour it creates for measures conforming to international standards. Such measures are not only free from scientific challenges, but are also regarded as meeting the necessity test and all other relevant requirements of the *SPS Agreement* and the GATT 1994. This wide shelter for measures under this provision is indicative of the high regard reflected in the *SPS Agreement* for the work of the international standard-setting bodies and the strength of its harmonisation objective.

Article 3.2 of the *SPS Agreement* does not specify whether its presumption of conformity is rebuttable or not. This is in marked contrast to the *TBT Agreement* where measures based on international standards are expressly only ‘rebuttably presumed’ to comply with the necessity requirement of that agreement.<sup>822</sup> However, the Appellate Body in *EC – Hormones* held nevertheless that the presumption of conformity in Article 3.2 is rebuttable.<sup>823</sup> It stated:

Such a measure enjoys the benefit of a presumption (albeit a rebuttable one) that it is consistent with the relevant provisions of the *SPS Agreement* and of the GATT 1994.<sup>824</sup>

Remarkably, this finding of rebuttability, despite its importance, is a mere bracketed afterthought, with no indication of its motivation anywhere in the Appellate Body Report. It can be criticised for taking away much of the advantage for measures conforming to international standards. While the burden of proof on the complainant to show a violation of other provisions of the *SPS Agreement* would be higher due to the need to overcome the presumption of conformity, this is a small gain for the Member that has taken the effort to embody completely the international standard in its domestic regulation.<sup>825</sup> This does little to promote harmonisation, contrary to the express objective of the *SPS Agreement* to ‘further to use of harmonized sanitary and phytosanitary measures between Members, on the basis of international standards ...’<sup>826</sup>

---

<sup>822</sup> The relative weakness of the harmonisation provision in Article 2.5 of the *TBT Agreement* as compared to the *SPS Agreement* is evinced not only in the express rebuttability of its presumption, but also in the fact that the presumption only covers conformity with the necessity requirement and not the entirety of the Agreement and the GATT 1994. In addition, the presumption kicks in when the measure is not only based on an international standard, but also aims at one of the enumerated legitimate objectives listed in Article 2.2 of that Agreement.

<sup>823</sup> Appellate Body Report, *EC – Hormones*, para. 170. The implications of this presumption for the burden of proof are discussed further below, Part IV, Section 2.2.2.

<sup>824</sup> Appellate Body Report, *EC – Hormones*, para. 170.

<sup>825</sup> As noted by Scott, this ‘does not seem to be a benefit worth having’ since in the absence of a rule/exception relationship between Article 3.1 and 3.3 ‘...it is never incumbent upon a Member to justify its regulatory choices until such a time as another state has entered a complaint, and established a prima facie case of inconsistency. As such, there is no initial burden resting upon the regulating state, such as is susceptible to being reversed in the event of conformity with international standards.’ Joanne Scott, ‘International Trade and Environmental Governance: Relating Rules (and Standards) in the EU and the WTO’, *European Journal of International Law* 15, 2004, 307-354, 310. On this burden of proof issue, see further below, Part IV, Section 2.2.2.

<sup>826</sup> Sixth preambular paragraph to the *SPS Agreement*.

### 4.2.3 Measures providing a higher level of protection than international standards

The third option open to Members is to promulgate SPS measures providing a higher level of protection than would measures ‘based on’ the relevant standards. This provision recognises the right of Members to choose their own level of protection, an important principle in the *SPS Agreement*. It embodies the clearly expressed proviso in the sixth pre-ambular statement of the *SPS Agreement* indicating the desire to further harmonisation, ‘without requiring Members to change their appropriate level of protection of human, animal or plant life or health’.

In *EC – Hormones*, as stated above, the Panel regarded Article 3.3 as ‘an *exception* to the general obligation contained in Article 3.1.’<sup>827</sup> Therefore, it stated that if a complainant shows that a relevant international standard exists and that the SPS measure in dispute is not based on the international standard, the burden of proof shifts to the respondent Member to show that it has met the requirements of Article 3.3.<sup>828</sup> The Appellate Body in *EC – Hormones* clarified the relationship between Article 3.3 and Article 3.1 and 3.2 as follows:

It appears to us that the Panel has misconceived the relationship between Articles 3.1, 3.2 and 3.3, ... which is qualitatively different from the relationship between, for instance, Articles I or III and Article XX of the GATT 1994. Article 3.1 of the *SPS Agreement* simply excludes from its scope of application the kinds of situations covered by Article 3.3 of that Agreement, that is, where a Member has projected for itself a higher level of sanitary protection than would be achieved by a measure based on an international standard.<sup>829</sup>

Significantly, the Appellate Body held in *EC – Hormones* that the ‘right of a Member to establish its own level of sanitary protection under Article 3.3 of the *SPS Agreement* is an autonomous right and *not* an “exception” from a “general obligation” under Article 3.1’.<sup>830</sup> Therefore, rather than creating an exception to its disciplines, the words in Article 3.1 ‘except as otherwise provided in this Agreement, and in particular in paragraph 3’ have the effect of carving out a particular type of situation from its scope of application, namely where the level of protection chosen by a Member is higher than that which would result from the international standard. This interpretation is in keeping with the balancing approach of the *SPS Agreement*, a key element of which is respect for the right of a Member to choose its appropriate level of protection, in accordance with its policy priorities. It would therefore be inappropriate to punish a Member that chooses a higher level of protection by requiring it to bear the burden of proof to justify its measure.

However, as recognised by the Appellate Body, the right of a Member to define its own level of protection is not an ‘absolute or unqualified right’.<sup>831</sup> Instead, Article 3.3 sets two science-related conditions in the alternative. Either there must be a scientific justification

<sup>827</sup> Panel Report, *EC – Hormones (US)*, para. 8.86; and Panel Report, *EC – Hormones (Canada)*, para. 8.89.

<sup>828</sup> Panel Report, *EC – Hormones (US)*, para. 8.87; and Panel Report, *EC – Hormones (Canada)*, para. 8.90.

<sup>829</sup> Appellate Body Report, *EC – Hormones*, para. 104.

<sup>830</sup> *Ibid.*, para. 172.

<sup>831</sup> *Ibid.*, para. 173.

for the measures, or they must be the result of the higher level of protection chosen by the Member in accordance with Article 5.1-5.8. In both cases the measures must be consistent with all other provisions of the *SPS Agreement*. In footnote, it is clarified that a ‘scientific justification’ exists:

...if, on the basis of an examination and evaluation of available scientific information in conformity with the relevant provisions of this Agreement, a Member determines that the relevant international standards, guidelines or recommendations are not sufficient to achieve its appropriate level of sanitary or phytosanitary protection.<sup>832</sup>

The distinction made in Article 3.3 between these two possible situations creates problems of interpretation. In *EC – Hormones* the EC argued that there was a ‘scientific justification’ for its measure, so it need not be in accordance with Article 5.1-5.8, which requirement is set for the second situation only. It thus claimed that no risk assessment was required as a basis for its ban on hormone-treated beef, despite the fact that it deviated from Codex standards. The Appellate Body held that ‘Article 3.3 is evidently not a model of clarity in drafting and communication’<sup>833</sup> and that the distinction between the two situations identified in Article 3.3, is more apparent than real.<sup>834</sup> In fact both situations require a risk assessment in accordance with Article 5. The Appellate Body in *EC – Hormones* thus stated as follows:

The use of the disjunctive ‘or’ does indicate that two situations are intended to be covered. These are the introduction or maintenance of SPS measures which result in a higher level of protection:

- (a) ‘if there is a scientific justification’; or
- (b) ‘as a consequence of the level of ... protection a Member determines to be appropriate in accordance with the relevant provisions of paragraphs 1 through 8 of Article 5’.

It is true that situation (a) does not speak of Articles 5.1 through 5.8. Nevertheless, two points need to be noted. First, the last sentence of Article 3.3 requires that ‘all measures which result in a [higher] level of ... protection’, that is to say, measures falling within situation (a) as well as those falling within situation (b), be ‘not inconsistent with any other provision of [the SPS] Agreement’. ‘Any other provision of this Agreement’ textually includes Article 5. Secondly, the footnote to Article 3.3, while attached to the end of the first sentence, defines ‘scientific justification’ as an ‘examination and evaluation of available scientific information in conformity with relevant provisions of this Agreement ...’. This examination and evaluation would appear to partake of the nature of the risk

<sup>832</sup> Footnote 2 to Article 3.3 of the *SPS Agreement*.

<sup>833</sup> Appellate Body Report, *EC – Hormones*, para. 175.

<sup>834</sup> *Ibid.*, para. 176. According to the Appellate Body the ‘involved and layered language’ of Article 3.3 left it with no choice but to interpret the distinction between the two situations in this way. *Ibid.*

assessment required in Article 5.1 and defined in paragraph 4 of Annex A of the *SPS Agreement*.<sup>835</sup>

Thus this ruling can be understood as requiring that a Member claiming scientific justification for its deviation from international standards, must base such a claim on a valid risk assessment, in the same way as a Member who justifies its deviation from the international standard on the grounds that it has chosen a different level of protection than that achieved by the international standard.<sup>836</sup>

It is useful to note that the Appellate Body's interpretation is expressly motivated by its consideration of the object and purpose of the *SPS Agreement* as a whole, recognising the delicate balance between trade and health sought by the Agreement.<sup>837</sup> In this light, the Appellate Body indicated its 'belief that compliance with Article 5.1 was intended as a countervailing factor in respect of the right of Members to set their appropriate level of protection.'<sup>838</sup> Thus the requirements of a risk assessment in Article 5.1 and of sufficient scientific evidence in Article 2.2 are regarded by the Appellate Body mediating between the goals of trade liberalisation and the protection of health. The role of science as the scale on which these interests are balanced is striking in this interpretation of this provision.

In *Japan – Agricultural Products II*, the Appellate Body again faced the question of what a Member needs to show when it claims there is 'scientific justification' for a deviating measure. It held as follows:

In our opinion, there is a 'scientific justification' for an SPS measure, within the meaning of Article 3.3, if there is a rational relationship between the SPS measure at issue and the available scientific information.<sup>839</sup>

This finding clarifies the required relationship between the deviating SPS measure and the scientific information (in the form of a risk assessment).<sup>840</sup> It logically follows the interpretation of the requirement of Article 5.1 that an SPS measure be 'based on' a risk assessment. For the measure to be justified by the risk assessment required by Article 3.3, it clearly must be based on, i.e. have a rational relationship with, that risk assessment.

<sup>835</sup> *Ibid.*, para. 175. The Appellate Body thus agreed with the Panel that although the EC had established for itself a level of protection higher than that implied in the relevant Codex standards, it was obliged to comply with the risk assessment requirements of Article 5.1. *Ibid.*, para. 176.

<sup>836</sup> Dale E. McNeil, 'The First Case under the WTO's Sanitary and Phytosanitary Agreement: The European Union's Hormone Ban', *Virginia Journal of International Law* 39, 1998, 89-134, 126.

<sup>837</sup> Appellate Body Report, *EC – Hormones*, para. 177. It is useful to recall, as already noted above, the Appellate Body's statement that '[t]he requirements of a risk assessment under Article 5.1, as well as of "sufficient scientific evidence" under Article 2.2, are essential for the maintenance of the delicate and carefully negotiated balance in the *SPS Agreement* between the shared, but sometimes competing, interests of promoting international trade and protecting the life and health of human beings.' *Ibid.*

<sup>838</sup> *Ibid.*

<sup>839</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 79.

<sup>840</sup> The words 'available scientific information' rather than risk assessment in this finding should not be taken to mean that the Appellate Body here stopped short of actually requiring a risk assessment in the case of reliance on a 'scientific justification'. Instead the term used is simply taken from the footnote definition of 'scientific justification' which has already been interested to amount to a requirement of a risk assessment as set out above.

It has been argued that the reason behind the distinction in Article 3.3 between the two different situations mentioned is to emphasise the difference in the scope of review in each case.<sup>841</sup> The first situation deals with the Member's judgement, on the basis of scientific information, that the international standards are inadequate to meet its level of protection. This could, for example, be the case where, due to local peculiarities (including dietary practices, climatic conditions etc.) or flaws in the international standard, the standard is ineffective in securing the level of health protection it was aimed at.<sup>842</sup> The second situation deals with the choice of a different level of protection by a Member, which is a policy choice. One could thus speak of a scientific justification and a policy justification.<sup>843</sup> In the *SPS Agreement* scientific justifications are more rigorously reviewed than policy ones. While in both cases the risk assessment underlying the measure must meet the strict test of Article 5.1, harmonisation will be more vigorously promoted in the former case than in the latter.

#### 4.2.4 Measures providing a lower level of protection than international standards

Measures that are not based on international standards are of course not limited to those that provide a higher level of protection than these standards; they include also those providing a lower level of protection. However, Article 3 of the *SPS Agreement* does not expressly deal with the latter situation. It obliges a Member to adopt measures which are 'based on' international standards, that is, achieving the same level of protection, except as provided for in Article 3.3. The latter article allows SPS measures resulting in a *higher* level of protection under certain conditions. It would therefore seem, at first sight, that Article 3 requires Members to maintain at least the minimum level of SPS protection that is reflected in relevant international standards, while allowing higher, but not lower, levels of protection.<sup>844</sup>

<sup>841</sup> Vern R. Walker, 'Keeping the WTO from Becoming The "World Trans-Science Organization": Scientific Uncertainty, Science Policy, and Factfinding in the Growth Hormones Dispute', *Cornell International Law Journal* 31, 1998, 251-320, 275-276.

<sup>842</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.84. Here the Panel stated that both Canada and the EC interpreted the first situation as existing where the relevant international standard is outdated, inadequate, faulty or obsolete from a scientific perspective, for example where it in fact does not provide the level of protection it was intended to provide.

<sup>843</sup> Vern R. Walker, 'Keeping the WTO from Becoming The "World Trans-Science Organization": Scientific Uncertainty, Science Policy, and Factfinding in the Growth Hormones Dispute', *Cornell International Law Journal* 31, 1998, 251-320, 276. On the contrary, Wirth argues that the footnote explaining the meaning of 'scientific justification' might be taken to mean that there are scientific constraints on the choice of the appropriate level of protection. David A. Wirth, 'Symposium: The Role of Science in the Uruguay Round and NAFTA Trade Disciplines', *Cornell International Law Journal* 27, 1994, 817-859, 827. However, it seems rather that the scientific analysis mandated by that footnote is directed at the question of whether the international standards are effective in achieving the Member's chosen level of protection, rather than at the choice of appropriate level itself.

<sup>844</sup> Although the possibility for measures aimed at a lower level of protection is not expressly mentioned, it is useful to note that the last sentence of Article 3.3 states: 'Notwithstanding the above, all measures which result in a level of sanitary or phytosanitary protection different from that which would be achieved by measures based on international standards, guidelines or recommendations shall not be inconsistent with any other provision of this Agreement.' The reference to SPS measures resulting in a level of protection *different* from that achieved by international standards is not limited to a higher level of protection but includes measures resulting in a lower level of protection, thereby implicitly recognising this possibility.

It has consequently been asked whether Article 3 of the *SPS Agreement* uses international standards ‘only as a tool to *loosen-up* national regulations that go beyond international standards ... or whether those standards could be invoked to *tighten* national regulations against countries that fall below the minimum of the international standard.’<sup>845</sup> In other words, are the international standards to be seen as only a ceiling beyond which SPS measures will require scientific justification, or are they also a floor below which no measures may sink?

If Article 3 of the *SPS Agreement* were read to require a harmonised minimum level of SPS protection in all Members, based on international standards, serious questions would arise as to the legitimacy of the international standards used for this purpose and of the WTO’s role in requiring compliance therewith. While it may seem laudable to promote minimum levels of health protection, on closer inspection trying to achieve this aim through the WTO, and in particular the *SPS Agreement*, may lead to undesirable results. The mandate of the WTO is limited to disciplines relating to trade barriers and does not extend to the direct promotion of health objectives.<sup>846</sup> It has been correctly pointed out that the WTO should no longer maintain the fiction that trade policy has nothing to do with human rights, but instead accept that it is bound by international law to work within a framework of key human rights principles and duties arising from the legally binding human rights obligations of WTO Members. This entails, as discussed above,<sup>847</sup> that in fulfilling its mandate, the WTO must have full regard for the human rights implications of its work, including with respect to the right to development, the right to health and the right to safe food. This, however, is something different from arguing that the WTO should exceed its mandate and become a global SPS regulator, by requiring a mandatory minimum level of SPS protection based on international standards that were not elaborated with such a role in mind, and whose procedural legitimacy has been called into question.<sup>848</sup> Instead, the WTO’s disciplines, *within* its area of competence, must be

---

<sup>845</sup> Joost Pauwelyn, ‘Non-Traditional Patterns of Global Regulation: Is the WTO ‘Missing the Boat?’?’ presented at the *Conference on Legal Patterns of Transnational Social Regulations and Trade* (European University Institute, Florence) 24–25 September 2004, 14, available at: <http://eprints.law.duke.edu/1311/1/6Sept04.pdf>, visited on 25 May 2008. Pauwelyn argues that if international standards only have a ceiling, not a floor, effect, they do not have a strong harmonising pull as the incentive to harmonise is limited to the safe haven offered by conforming to the standard.

<sup>846</sup> This task is left to other international organisations set up for this purpose, such as the World Health Organisation. However, this single-issue focus of international organisations has been sharply criticised by UN human rights bodies, which call for the full integration of human rights principles and obligations (including the right to health) in future negotiations in the WTO. UN Committee on Economic, Social and Cultural Rights, *Statement to the Third Ministerial Conference of the WTO in Seattle*, issued in November 1999. This issue falls within the very interesting question of new forms of global governance, which, however, is outside the ambit of this book. See further on this issue Malini Mehra, *Human Rights and the WTO: Time to Take on the Challenge*, WTO Watch (Institute for Agriculture and Trade Policy, Minneapolis), 22 August 2000, available at: <http://www.wtowatch.org/news/index.cfm?ID=1012>, visited on 15 January 2001. See also the UNDP’s *Human Rights Development Report*, 2000.

<sup>847</sup> See above, Part I, Section 1.1.

<sup>848</sup> Pauwelyn states that were international standards to be given binding authority as minimum standards, the argument for the Appellate Body ‘to exercise closer scrutiny over the procedural qualities and legitimacy of international standards would gain all the more force.’ Joost Pauwelyn, ‘Non-Traditional Patterns of Global Regulation: Is the WTO ‘Missing the Boat?’?’ presented at the *Conference on Legal Patterns of Transnational Social Regulations and Trade* (European University Institute, Florence) 24–25 September 2004, 15, available at: <http://eprints.law.duke.edu/1311/1/6Sept04.pdf>, visited on 25 May 2008. See also Joanne Scott,

applied in a way that contributes to, rather than undermines, human rights.<sup>849</sup> It is exactly this objective that is reflected in the *SPS Agreement's* cautious approach to the policy space of Members, which takes pains to avoid downward harmonisation of SPS protection, while promoting economic growth through trade.

Further, it seems unlikely that a positive obligation in the *SPS Agreement* to provide a minimum level of SPS protection was intended or would be accepted by WTO Members. Members promote international efforts to improve health protection in international fora other than the WTO. It is hard to imagine one Member challenging another within a trade forum for having a too low level of health protection for its own citizens, a situation which can have no negative trade implications for other Members.<sup>850</sup> In addition, it should be remembered that the Appellate Body in *EC – Hormones* rejected the Panel's interpretation of Article 3.1 in a way that would give international standards binding force, absent an indication of this intention in the text of the Agreement.<sup>851</sup> The same reasoning that applies to giving international standards binding force as maximum standards applies to giving them such force as minimum standards, bearing in mind the level of intrusion into national regulatory policy this would entail. In addition, it should be remembered that the respect shown by the harmonisation provisions in the *SPS Agreement* for the regulatory autonomy of Members by not requiring them to change their appropriate levels of protection is not limited to downward changes.<sup>852</sup> All indications therefore point to the conclusion that Article 3 of the *SPS Agreement* does not have the effect of imposing a minimum level of SPS protection on WTO Members on the basis of international standards.

This conclusion is particularly important for developing-country Members. As less influential participants in the standard-setting process at the relevant international bodies, these Members are often confronted with international standards that are beyond their capacity to adopt, or that are ill-suited to their particular conditions.<sup>853</sup> They are there-

---

'International Trade and Environmental Governance: Relating Rules (and Standards) in the EU and the WTO', *European Journal of International Law* 15, 2004, 307-354, 310 and 330.

<sup>849</sup> This is recognised by the preamble to the *WTO Agreement* in which Members recognise that 'their relations in the field of trade and economic endeavour should be conducted with a view to raising standards of living, ensuring full employment and a large and steadily growing volume of real income and effective demand, and expanding the production of and trade in goods and services, while allowing for the optimal use of the world's resources in accordance with the objective of sustainable development, seeking both to protect and preserve the environment and to enhance the means for doing so in a manner consistent with their respective needs and concerns at different levels of economic development'

<sup>850</sup> Pauwelyn notes that seeing international standards as required minimum standards would have the 'odd result' that the WTO would ask a defendant to restrict trade *more* (i.e. to impose stricter SPS requirements). Joost Pauwelyn, 'Non-Traditional Patterns of Global Regulation: Is the WTO 'Missing the Boat'?' presented at the *Conference on Legal Patterns of Transnational Social Regulations and Trade* (European University Institute, Florence) 24-25 September 2004, 15, available at: <http://eprints.law.duke.edu/1311/1/6Sept04.pdf>, visited on 25 May 2008.

<sup>851</sup> Appellate Body Report, *EC – Hormones*, para. 165.

<sup>852</sup> This point is made in Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 264.

<sup>853</sup> An example of such an international standard is ISPM 15, the IPPC standard for wood packaging materials used in international trade. Several developing-country Members have raised concerns regarding their difficulties in implementing this standard, as noted by Mauritius in 2005. As mentioned in Part II above, the heat treatment requirements for wood packaging material for export in ISPM 15 is difficult for many less developed Members to comply with. Mauritius has sought a 4-year moratorium on the implementation of

fore more likely to deviate downwards from international standards than are developed-country Members, which typically pursue higher levels of protection than those reflected in international standards. By contrast to the leeway granted in Article 3.3 of the *SPS Agreement* for SPS requirements stricter than international standards, interpreting Article 3 as prohibiting SPS requirements that are less demanding than international standards would withhold the very flexibility that developing-country Members need.

### 4.3 Conclusion

Trade would be greatly facilitated by increased harmonisation of SPS measures as this does away with the barriers created by disparate requirements in various importing countries. As a result, Article 3 of the *SPS Agreement* aims to promote the harmonisation of SPS measures. However, the lack of a rule-making body in the WTO to take on the task of providing generally applicable SPS requirements creates an institutional gap.<sup>854</sup> Article 3 attempts to fill this gap by making use of other authoritative providers of uniform standards, namely the international standard-setting bodies referenced in Annex A.3. These international standard-setting bodies use recognised risk assessment procedures conducted by scientific expert bodies and discussed in committees to draw up standards. Their standards aim to reflect a large degree of scientific consensus on risk as well as policy agreement on the best way to address such risks.<sup>855</sup> WTO Members are therefore encouraged to use these standards through the disciplines of Article 3 of the *SPS Agreement*.

Ideally, harmonisation around international standards could go a long way to assisting less-developed Members that face capacity constraints in undertaking their own risk assessments as a basis for regulatory decisions. It thus seems imperative to interpret the autonomous options provided by Articles 3.1-3.3 in a manner that rewards Members choosing to base their measures on international standards or to conform their measures to these standards, in contrast to the current interpretation. By regarding a measure that is 'based on' an international standard as complying with the requirement of a scientific basis (in Articles 2.2 and 5.1), as argued above, a less-developed Member which has limited scientific capacity can be given the possibility of relying on the relevant international standard, and in particular the risk assessment that underlies it, while adjusting the aspects of the international standard that are not well-suited to its particular situation. While its measure could still be challenged under the remaining disciplines of the *SPS Agreement*, such as those relating to necessity, consistency and non-discrimination, it would be safe from scientific challenges. This is a significant advantage for Members

---

ISPM 15 from the IPPC and from those Members who had adopted the standard, and has requested Members to give positive consideration to the use of phosphine fumigation treatment as an equivalent treatment during the interim period. Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Seventh Annual Report Adopted by the Committee on 30 June 2005*, G/SPS/37, circulated on 19 July 2005, para. 8. See above, Part II, Section 2.5.2.3.

<sup>854</sup> This is unlike the situation which exists in the EU, where negative integration (lowering of trade barriers) is accompanied by positive integration (setting of general norms or rules). This is possible due to the norm-setting capacity of the EU institutions, which operate on a supranational level, a characteristic which is absent in the WTO.

<sup>855</sup> On the scientific basis of international standards, see above, Part II, Sections 3.2.1.4, 3.2.2.4 and 3.2.3.4 and Part III, Section 4.2.1.

with weak scientific capacities. Similarly, if the presumption of consistency of measures that ‘conform to’ international standards with the requirements of the GATT 1994 and the *SPS Agreement*, contained in Article 3.2 of the *SPS Agreement*, is interpreted as irrefutable, it would provide a safe harbour for those Members whose weak regulatory capacity prompts them to fully adopt international standards. An equally important advantage of these interpretations is that they create a stronger impetus for harmonisation around international standards, without calling into question the right of Members to deviate from international standards if this is necessitated by their chosen level of protection. This interpretation therefore furthers the objective of Article 3 as outlined in the Preamble to the *SPS Agreement*.

These considerations notwithstanding, it is important to recall the concerns raised with regard to international standard-setting procedures in Part II of this book.<sup>856</sup> The fact that a measure that is in conformity with international standards enjoys a presumption of consistency, even if rebuttable, increases the importance of standard setting on international level.<sup>857</sup> This is relevant as the distribution of power in international standard-setting organisations is different than on national level due to the fact that certain interests, like those of developing countries, are underrepresented while other groups, such as developed countries and their producer associations, have a lot of influence.<sup>858</sup> Once it is recognised that the scientific process, on which the standard-setting activities of international organisations are based, rests on value-ridden assumptions which fill gaps in scientific knowledge, and that these assumptions are dictated by the scientific community to which the participating scientists belong, it is easy to see that the bias in participation will result in risk assessment outcomes that reflect developed-country approaches to risk rather than those of developing countries. Even more so, the risk management decisions taken in the international standard-setting bodies will reflect the preferences of those participants which are most actively involved in the standard-setting process and have the most resources to dedicate to ensure the effectiveness of their participation, namely developed countries and industry groups. As these actors, due to the new importance of the resultant standards, increasingly focus attention and resources on the standard-setting activities of the international standard-setting bodies, this problem is exacerbated. Developing-country Members are at a marked disadvantage in this regard.<sup>859</sup>

---

<sup>856</sup> See above, Part II, Section 3.1.2.

<sup>857</sup> As pointed out by Quick and Blüthner this does not mean that international standards become (either directly or indirectly) binding on WTO Members as a result of SPS disciplines. The standards only give content to the provisions of the *SPS Agreement*. It is the latter provisions which have binding force. However, the effect of the SPS provisions on harmonisation is to encourage the adoption of international harmonised standards and thus they do increase the status and relevance of these standards for WTO Members. Reinhard Quick and Andreas Blüthner, ‘Has the Appellate Body Erred? An Appraisal and Criticism of the Ruling in the WTO *Hormones Case*’, *Journal of International Economic Law* 2 (4), 1999, 603-639, 613.

<sup>858</sup> See further above, Part II, Section 3.1.2. See also Jeffery Atik, ‘Symposium - Institutions for International Economic Integration: Science and International Regulatory Convergence’, *Journal of International Law and Business* 17, 1997, 736-758, 744.

<sup>859</sup> Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume II: Procedures Followed by Selected International Standard-Setting Organisations and Country Reports on TBT and SPS* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2004, 148 and 154.

For example, as reported in an ITC/Commonwealth Secretariat study of 2004, Mauritius has very little capacity to conduct risk analyses with respect to the SPS measures it adopts in the absence of relevant international standards. It lacks the substantial empirical data necessary to undertake such analyses and the requisite professional expertise. For this reason, it is of particular importance to Mauritius that international SPS standards be set in areas of relevance to it and that such standards reflect its capabilities and concerns. As mentioned above,<sup>860</sup> an example of an area where Mauritius faces difficulties in implementing an international standard is that of the IPPC standard for wood packaging material (ISPM 15). Due to its inability to meet the costs of participation, Mauritius does not participate at all in IPPC meetings, but only tries to keep informed of developments at the IPPC through discussions with South Africa's representative to the IPPC. Thus Mauritius was unable to provide an input into the development of this standard.

In addition, in many cases international standards are lacking in areas of importance to developing-country Members. For example, in 2002, Thailand raised a concern before the SPS Committee with regard to Australia's requirements on cooked chicken meat, aimed at the deactivation of infectious bursal disease virus.<sup>861</sup> Thailand submitted a risk assessment to Australia showing that the risk of introducing this virus to backyard flocks through cooked chicken meat was negligible, but reported that Australia's long and complex risk analysis process resulted in no progress being made to resolve this issue by June 2003.<sup>862</sup> In 2002 Thailand had expressed its hope that the OIE, under its new food safety mandate, would undertake work to develop a standard in this area.<sup>863</sup> The OIE took note of Thailand's risk assessment and indicated that it would mandate an EWG to review the OIE standard to address this issue, once data had been received from other Members. However, by June 2003, the OIE had not commenced work on the proposed new standard. It reported that despite its request to members to provide the necessary scientific information, none had been forthcoming.<sup>864</sup>

Some efforts are already underway within the international standard-setting bodies to address the institutional and procedural constraints to developing-country participation, as discussed in Part II of this book. Japan has recently pointed out that systemic improvements have been made at each of these bodies since the previous workshop organised by the WTO Secretariat on this matter in 2001.<sup>865</sup> It proposed that the SPS Committee organise a new workshop on the standard-setting procedures of the CAC, OIE and IPPC in order for WTO Members to familiarise themselves with these procedures. However, it is clear that much remains to be done to redress the imbalance in participation of Members

at different levels of development in the international standard-setting bodies. Without successful efforts in this regard, the harmonisation disciplines of the *SPS Agreement* will have a negative impact on development, contrary to their objective.

## CHAPTER 5

### Disciplines regarding risk analysis

In well-developed national SPS systems, the regulatory process by means of which SPS measures are developed typically involves *risk analysis*. For the purposes of the discussion of the substantive disciplines of the *SPS Agreement*, two elements of risk analysis are relevant, namely risk assessment and risk management. It is useful to recall here the main aspects of these two aspects of risk analysis, which were explained in Part II above.<sup>866</sup> As was noted in that Part, the term ‘*risk assessment*’ refers to the science-based process of identifying the existence of a risk and establishing the likelihood that the risk may actually materialise according to the measures that could be applied to address the risk. ‘*Risk management*’, by contrast, is the policy-based process of determining the level of protection a country wants to ensure in its territory and choosing the measure that will be used to achieve that level of protection. In risk management decision-making, not only are the scientific results of the risk assessment taken into account but also societal values and other policy considerations such as citizens’ tolerance of risk, industry interests, relative costs, etc. The distinction between these two elements of the risk analysis process is not absolute. Non-scientific considerations do play some part in risk assessment, in particular in the science policy decisions that inform this process. However, the distinction is a useful tool in enhancing the understanding of the regulatory process.

In the background note on risk analysis prepared by the WTO Secretariat to assist Members in the negotiations in the SPS Committee on guidelines for the implementation of Article 5.5 of the *SPS Agreement*,<sup>867</sup> it is expressly stated that different Articles of the *SPS Agreement* address various aspects of the risk analysis process. In particular, this note distinguishes between the science-based risk assessment process, addressed in Article 5.1, 5.2 and 5.3 and the risk management process, dealt with in Articles 5.4, 5.5 and 5.6.<sup>868</sup>

It is interesting to note that this Secretariat paper points to the fact that WTO Members find themselves in different situations in terms of their use of formal risk assessment pro-

<sup>866</sup> See for a brief discussion of the risk assessment and risk management aspects of the regulatory process above, Part II, Section 1.5. For a more detailed analysis of this distinction, see Vern R. Walker, ‘Keeping the WTO from Becoming The “World Trans-Science Organization”: Scientific Uncertainty, Science Policy, and Factfinding in the Growth Hormones Dispute’, *Cornell International Law Journal* 31, 1998, 251-320, 256-277.

<sup>867</sup> These guidelines are discussed below, Part III, Section 5.2.3.5. It is important to note that the WTO Secretariat is not competent to develop authoritative interpretations of the WTO agreements. However, the vast experience of the Secretariat staff servicing the SPS Committee with the operation of the *SPS Agreement* has led Members to entrust the Secretariat with the task of drawing up background documents, such as the one referred to here, to assist them in their negotiations. As such, these documents are useful to examine in view of the light they shed on the provisions of the Agreement.

<sup>868</sup> Note that the risk analysis process, as discussed above, also contains a third element, namely risk communication. In the context of the *SPS Agreement* some elements of risk communication are addressed in the transparency requirements, including those of publication and notification of SPS measures, provision of information through Enquiry Points and the explanation of reasons for measures upon request. Committee on Sanitary and Phytosanitary Measures, *Risk Analysis. Note by the Secretariat*, G/SPS/W/80, circulated on 6 March 1997, para. 12. These requirements are addressed in Part IV of this book, dealing with procedural rules in the *SPS Agreement*. See below, Part IV, Section 1.3. However, it is useful to bear in mind here that risk communication is part of the risk analysis process.

cedures and in particular the resources and technical expertise they have in this regard. However, with regard to *risk management*, the Secretariat points out:

[E]ach and every Member nonetheless regularly makes decisions as to whether to permit the imports in question without further restriction, or whether to require some particular treatment to reduce potential risks, or whether to ban altogether the importation of the product concerned. This decision, however unsophisticated methods it may be based on, represents a management of the risks at hand and reflects an inherent decision of what level of risk the Member considers to be acceptable in that particular situation.<sup>869</sup>

The distinction between risk assessment and risk management was recognised by the Panel in *EC – Hormones*.<sup>870</sup> However, it mistakenly used this distinction to exclude from the scope of a risk assessment certain non-scientific reports as well as opinions of the European Parliament and the Economic and Social Committee, which evaluated reports submitted to them, and the question of risks associated with the problem of control of the use of hormones. It viewed these issues as having to do with social-value judgements and thus as not scientifically based. As a result, it saw them as belonging under risk management rather than risk assessment.

The Appellate Body rejected the Panel's distinction, stating that the *SPS Agreement* nowhere refers to the term 'risk management' but only to 'risk assessment'.<sup>871</sup> Thus the Panel's use of the distinction to limit the scope of what falls under risk assessment, was held to have no basis in the text. The Appellate Body stated in this regard:

The Panel observed that an assessment of risk is, at least with respect to risks to human life and health, a 'scientific' examination of data and factual studies; it is not, in the view of the Panel, a 'policy' exercise involving social value judgments made by political bodies.<sup>872</sup> The Panel describes the latter as 'non-scientific' and as pertaining to 'risk management' rather than to 'risk assessment'.<sup>873</sup> We must stress, in this connection, that Article 5 and Annex A of the *SPS Agreement* speak of 'risk assessment' only and that the term 'risk management' is not to be found either in Article 5 or in any other provision of the *SPS Agreement*. Thus, the Panel's distinction, which it apparently employs to achieve or support what appears to be a restrictive notion of risk assessment, has no textual basis. The fundamental rule of treaty interpretation requires a treaty interpreter to read and interpret the words actually used by the agreement under examination, and not words which the interpreter may feel should have been used.<sup>874</sup>

<sup>869</sup> Committee on Sanitary and Phytosanitary Measures, *Risk Analysis. Note by the Secretariat*, G/SPS/W/80, circulated on 6 March 1997, para. 10.

<sup>870</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.98; Panel Report, *EC – Hormones (US)*, para. 8.95.

<sup>871</sup> Appellate Body Report, *EC – Hormones*, para. 181.

<sup>872</sup> In the footnote to this sentence, the Appellate Body cited Panel Report, *EC – Hormones (US)*, para. 8.94; Panel Report, *EC – Hormones (Canada)*, para. 8.97.

<sup>873</sup> In the footnote to this sentence, the Appellate Body cited Panel Report, *EC – Hormones (US)*, para. 8.95; Panel Report, *EC – Hormones (Canada)*, para. 8.98.

<sup>874</sup> Appellate Body Report, *EC – Hormones*, para. 181.

While it is true that the term ‘risk management’ is not explicitly mentioned in the *SPS Agreement*, this Agreement clearly deals in different ways with the Members’ obligation to base their SPS measures on a risk assessment and their right to establish their own appropriate level of protection and choose an SPS measure to achieve this objective. As will be seen below, risk assessment is subject to strict scientific criteria, whereas the choice of an appropriate level of protection is only reviewable on the basis that it ‘take[s] into account’ the aim of reducing negative trade effects<sup>875</sup> and avoids arbitrary or unjustifiable distinctions in different but comparable situations.<sup>876</sup> The SPS measure established by a Member must be the least trade-restrictive measure that *achieves* the appropriate level of protection of the Member. The criteria for validity of the choice of level of protection and of the SPS measure recognise the sovereign right of Members to make their own policy choices in the area of public health, taking into account various non-scientific considerations. The choice is ultimately one based on societal value judgements. The latter area of decision-making is commonly known as risk management.

It would perhaps have made more sense for the Appellate Body to take issue with the Panel’s classification of the risks of control as non-scientific and thus as not forming part of a risk assessment, rather than denying the *de facto* different treatment of risk assessment and risk management in the *SPS Agreement*. The Appellate Body partially recognised this when it overruled the Panel’s decision that risks from failure to observe good veterinary practice and problems relating to detection and control of such failure must be rejected *a priori* because they are unscientific and thus do not fall within Article 5.2. The Appellate Body found that the Panel had misinterpreted the scope of Article 5.2 and that these considerations did, in fact, belong thereunder.<sup>877</sup>

In *US/Canada – Continued Suspension*, the EC relied upon the Appellate Body’s finding in *EC – Hormones*, mentioned above, to argue that ‘a risk assessment within in the meaning of Article 5.1 includes a risk management stage which is the responsibility of the regulator to carry out and not of the scientific bodies’<sup>878</sup> and which involves ‘weighing policy alternatives in light of the results of risk assessment and, if required, selecting and implementing appropriate control options, including regulatory measures.’<sup>879</sup> The Panel disagreed, clarifying that:

Although the Appellate Body disapproved of the original panel’s distinction between “risk assessment” and “risk management” because it had no textual basis in the Agreement, this Panel can find no statement by the Appellate Body confirming that what the European Communities describes as risk management is included within the definition of a risk assessment as set forth in Annex A(4) of the *SPS Agreement*.<sup>880</sup>

---

<sup>875</sup> Article 5.4 of the *SPS Agreement*.

<sup>876</sup> Article 5.5 of the *SPS Agreement*.

<sup>877</sup> Appellate Body Report, *EC – Hormones*, para. 187.

<sup>878</sup> Panel Report, *US – Continued Suspension*, para. 7.495; Panel Report, *Canada – Continued Suspension*, para. 7.467.

<sup>879</sup> Panel Report, *US – Continued Suspension*, para. 7.519; Panel Report, *Canada – Continued Suspension*, para. 7.492.

<sup>880</sup> Panel Report, *US – Continued Suspension*, para. 7.519; Panel Report, *Canada – Continued Suspension*, para. 7.491.

One could therefore argue that the risk assessment/risk management distinction is *implicitly* taken into account in those disciplines of the *SPS Agreement* that relate to the risk analysis process contained in Article 5. Therefore, the following sections of this Chapter discuss these two aspects of risk analysis separately. First the strict scientific disciplines for risk assessments on which SPS measures must be based, contained in Articles 5.1 to 5.3 of the *SPS Agreement* are examined. Second, the rules addressing a Member's choice of an appropriate level of protection contained in Articles 5.4 to 5.5 of the *SPS Agreement* and its choice of a measure to achieve this level of protection in Articles 5.3 and 5.6 of the *SPS Agreement* - both aspects of risk management - are set out.

### 5.1 Risk assessment

The risk assessment obligation of the *SPS Agreement* can be seen as an attempt to ensure rational, science-based decision making in national SPS regulation, and thereby to prevent private-interest capture of the regulatory process.<sup>881</sup> In particular, in situations where harmonisation is not possible due to the lack of a relevant international standard, or is not feasible due to differences in national conditions or policy preferences, science operates to generate rational regulatory choices.<sup>882</sup>

Article 5.1 of the *SPS Agreement* contains the obligation of Members with regard to risk assessment. It provides:

Members shall ensure that their sanitary or phytosanitary measures are based on an assessment, as appropriate to the circumstances, of the risks to human, animal or plant life or health, taking into account risk assessment techniques developed by the relevant international organizations.

In all disputes decided under the *SPS Agreement* thus far, the SPS measures at issue have been found to be in violation of the obligations of Article 5.1,<sup>883</sup> making this scientific

<sup>881</sup> Robert Howse, 'Democracy, Science, and Free Trade: Risk Regulation on Trial at the World Trade Organization', *Michigan Law Review* 98, 2000, 2329-2357. See further the discussion of the role of science in SPS regulation above, Part II, Section 1.5.

<sup>882</sup> As noted by Jacqueline Peel: 'the very fact of having to take a risk assessment into account and respond to its findings could have the salutary effect of forcing national regulators "to articulate objectives, to assess means, and to rationalize results"', a substantial improvement for the regulatory processes of many nations.' Jacqueline Peel, *Risk Regulation under the WTO SPS Agreement: Science as an International Normative Yardstick?*, Jean Monnet Working Paper 02/04 (NYU School of Law, New York), June 2004, 57, available at: [www.jeanmonnetprogram.org/papers/04/040201.pdf](http://www.jeanmonnetprogram.org/papers/04/040201.pdf), visited on 14 September 2004. The citation referred to by Peel comes from Henrik Horn and Joseph H.H. Weiler, 'European Communities - Trade Description of Sardines: Textualism and Its Discontent', *The WTO case law of 2002: The American Law Institute reporter's studies* 1, 2003, 248-275.

<sup>883</sup> In *Japan - Agricultural Products II*, the only SPS dispute in which the Panel found it unnecessary to make a finding under Article 5.1, since it had already found a violation of the scientific discipline of Article 2.2, the Appellate Body completed the legal analysis on this point. The Appellate Body in that case found a violation of Article 5.1 of the *SPS Agreement*. Appellate Body Report, *Japan - Agricultural Products II*, para. 114. In *EC - Approval and Marketing of Biotech Products*, the general *de facto* moratorium on biotech approvals and the product specific measures were not addressed under Article 5.1 of the *SPS Agreement* because they were found not to be 'SPS measures'. The EC Member States' safeguard measures were SPS measures and were therefore analysed under Article 5.1 and found to be in violation thereof.

obligation the discipline on which SPS measures stand or fall. The precise nature of the obligation under Article 5.1, as interpreted in the case law, is therefore crucial to examine.

The Panel in *Japan – Apples* identified two elements to the obligation of Article 5.1 of the *SPS Agreement*. According to the Panel, Article 5.1 requires:

- (1) an assessment of risk; and
- (2) that Members ensure that their SPS measures are ‘based on’ such an assessment.<sup>884</sup>

These elements are now examined in more detail.

### 5.1.1 Definition of a risk assessment

The first element of the disciplines of Article 5.1 of the *SPS Agreement* is the requirement of a risk assessment. It is therefore essential to understand what is meant by a risk assessment for purposes of the *SPS Agreement*. A ‘risk assessment’ is defined in Annex A.4 of the *SPS Agreement* as follows:

The evaluation of the likelihood of entry, establishment or spread of a pest or disease within the territory of an importing Member according to the sanitary or phytosanitary measures which might be applied, and of the associated potential biological and economic consequences; or the evaluation of the potential for adverse effects on human or animal health arising from the presence of additives, contaminants, toxins or disease-causing organisms in food, beverages or feedstuffs.

There are thus *two* types of risk assessment, each with different requirements. The type of risk assessment required in a given case will depend on the objective of the SPS measure at issue. The first type of risk assessment is applicable to SPS measures aimed at risks from pests or diseases; the second to SPS measures aimed at food- or feed-borne risks.

Panels and/or the Appellate Body have examined these definitions in seven disputes.<sup>885</sup> The interpretation of these definitions is important in assessing what is required of Members which impose SPS measures that deviate from international standards. The rigour of these requirements determines the possibilities for Members at lower levels of development, which often face constraints in respect of scientific capacity, to maintain SPS measures that are not based on international standards, or to challenge the measures of their trading partners for a lack of basis on a risk assessment.

<sup>884</sup> Panel Report, *Japan – Apples*, para. 8.233.

<sup>885</sup> Panel Report, *EC – Hormones (US)*, paras 8.98-8.101 and 8.108-8.111; Appellate Body Report, *EC – Hormones (US)*, paras 178-186; Panel Report, *Australia – Salmon*, paras 8.68-8.92; Appellate Report, *Australia – Salmon*, paras 119-135; Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, paras 7.37-7.71; Appellate Body Report, *Japan – Agricultural Products*, para. 113 (the Panel in this cases did not address Article 5.1 but the Appellate Body completed the legal analysis in this regard); Panel Report, *Japan – Apples*, paras 8.245-8.290; Panel Report, *Japan – Apples*, paras 189-216; Panel Report, *Japan – Apples (Article 21.5 – US)*, paras 8.135-8.147; Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.301-7.3034 and 7.3036-7.3055 (in respect of Austria’s measure on T25 maize – an assessment was carried out for all the safeguard measures at issue in this dispute); Panel Report, *US – Continued Suspension*, paras 7.504-7.572; and Panel Report, *Canada – Continued Suspension*, paras 7.476-7.540.

The first type of risk assessment, which must be conducted where the risk at issue is from pests or diseases, contains three requirements. Such a risk assessment must:

- *identify the pests/diseases* whose entry, establishment or spread a Member wants to prevent, as well as the *potential biological and economic consequences* associated with the entry, establishment or spread of such pests/diseases;
- *evaluate the likelihood* of entry, establishment or spread of these pests/diseases and the associated biological and economic consequences; and
- evaluate the likelihood of entry, establishment or spread of these diseases *according to the SPS measures that might be applied*.<sup>886</sup>

The second type of risk assessment, relevant to risk to human or animal health from food or feed, comprises two requirements, namely that the risk assessment must:

- *identify the adverse effects* on human [or animal] health (if any) arising from the additive, contaminant, toxin or disease-causing organism in food/beverages/feedstuffs *at issue*; and
- if such adverse health effects exist, evaluate the *potential or probability of occurrence* of these effects.<sup>887</sup>

These detailed requirements immediately raise the question of how less developed Members with weak scientific capacity are to be able to comply. In this respect it is useful to note that the Appellate Body in *EC – Hormones* clarified that the *SPS Agreement* is not prescriptive as to *who* carries out the risk assessment. It stated as follows:

Article 5.1 does not insist that a Member that adopts a sanitary measure shall have carried out its own risk assessment ... The SPS measure might well find its objective justification in a risk assessment carried out by another Member, or an international organization.<sup>888</sup>

This leaves Members free to base their measures on ‘borrowed’ risk assessments conducted by other Members or international organisations. However, risk assessments relevant to the particular risk at issue, and appropriate to the circumstances of less developed Members do not necessarily exist. In such cases, the Member concerned must conduct its own risk assessment on which to base its measure.

<sup>886</sup> This three-pronged test was set out by the Panel and endorsed by the Appellate Body in *Australia – Salmon*. Appellate Body Report, *Australia – Salmon*, para. 121. The test was confirmed in Appellate Body Report, *Japan – Agricultural Products*, para. 113 and used again in Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.41.

<sup>887</sup> These requirements are generalised on the basis of the findings of the Panel in *EC – Hormones* as modified by the Appellate Body in that case. Panel Report, *EC – Hormones (Canada)*, para. 8.101; Panel Report, *EC – Hormones (US)*, para. 8.98; and Appellate Body Report, *EC – Hormones*, paras 184-186.

<sup>888</sup> Appellate Body Report, *EC – Hormones*, para. 190. The Appellate Body did require that proof that a risk assessment supporting the measure does exist, be produced at dispute-settlement proceedings. This finding was reiterated in Panel Report, *US – Continued Suspension*, para. 7.442; Panel Report, *Canada – Continued Suspension*, para. 7.431.

The case law dealing with the two definitions of a risk assessment is now examined to elucidate the requirements that have to be met before a risk assessment will fulfil the requirements of Annex A.4. First, some elements common to both types of risk assessment are set out. Thereafter, aspects of the additional third requirement for the first type of risk assessment, relevant to risks from pests or diseases, are examined.

### 5.1.1.1 Specificity

One of the issues common to both types of risk assessment is the requirement of specificity in the analysis of risk. The first step in both definitions of a risk assessment is the *identification* of the risk at issue. The second step requires the evaluation of the *identified* risk. The case law has given great importance to the need for specificity in both these steps.<sup>889</sup>

In *EC – Hormones*, as a food-safety risk was at issue, the second type of risk assessment was relevant. Applying the first requirement of a risk assessment to the case before it, the Panel considered that:

in this dispute, a risk assessment carried out in accordance with the *SPS Agreement* should (i) *identify the adverse effects* on human health (if any) arising from the presence of the hormones at issue when used as growth promoters *in meat or meat products*, ...<sup>890</sup>

Examining the scientific reports and attendant evaluations that the EC invoked as its risk assessment, the Panel found that several of them related to ‘the carcinogenic or genotoxic potential of entire *categories* of hormones or hormones at issue *in general*, not when used specifically for growth promotion purposes’.<sup>891</sup> Further the Panel noted that these studies did not specifically evaluate the potential for adverse effects arising from the presence of the hormones at issue *in food* (specifically meat and meat products). As a result, it found that no scientific evidence was available that showed an ‘identifiable risk’.<sup>892</sup> In this regard, the Appellate Body in *EC – Hormones* stated as follows:

... [the studies submitted by the EC] constitute general studies which do indeed show the existence of a general risk of cancer; but they do not focus on and do not address the particular kind of risk here at stake - the carcinogenic or genotoxic potential of the residues of those hormones found in meat derived from cattle to which the hormones had been administered for growth promotion purposes – as is required by paragraph 4 of Annex A of the *SPS Agreement*. Those general studies, are in other words, relevant but do not appear to be sufficiently specific to the case at hand.<sup>893</sup>

<sup>889</sup> Note that the specificity requirement is not always seen as part of the analysis of whether a risk assessment exists, but is sometimes incorporated in the analysis of whether a Member’s measure is ‘based on’ a risk assessment. However, for purposes of clarity, all the case law on specificity is addressed in this section.

<sup>890</sup> Panel Report, *EC – Hormones (Canada)*, para. 9.101; Panel Report, *EC – Hormones (US)*, para. 8.98.

<sup>891</sup> Panel Report, *EC – Hormones (Canada)*, para.8.133; Panel Report, *EC – Hormones (US)*, para. 8.130.

<sup>892</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.137; Panel Report, *EC – Hormones (US)*, para. 8.134.

<sup>893</sup> Appellate Body Report, *EC – Hormones*, para. 200.

Further the Appellate Body in *EC – Hormones* agreed with the Panel that a risk assessment must be comprehensive, i.e. it must cover each of the substances at issue. Thus, the Appellate Body upheld the Panel's finding that 'there was no risk assessment with regard to MGA',<sup>894</sup> one of the six growth hormones at issue, stating that '[i]n other words, there was an almost complete absence of evidence on MGA in the panel proceedings.'<sup>895</sup> On this point, the Panel explained that 'one of the basic principles of a risk assessment appears to be that it needs to be carried out for each individual substance.'<sup>896</sup>

The second type of risk assessment was again at issue in the *US – Continued Suspension* and *Canada – Continued Suspension* disputes. These disputes dealt with the question whether the continued suspension of concessions by the US and Canada against the EC for its non-compliance with the rulings in *EC – Hormones* was illegal due, *inter alia*, to the fact that the new scientific studies of the EC constituted a risk assessment on which its measure was based, thus bringing its measure into compliance with the *SPS Agreement*. The Panel in these cases also imposed strict specificity requirements for the risk assessment at issue, to the extent that it inserted an additional first requirement into the second definition. According to the Panel:

... Annex A(4) requires a Member to (a) identify the additives, contaminants, toxins or disease-causing organisms in food, beverages or feedstuffs at issue (if any); (b) identify any possible adverse effect on human or animal health; and (c) evaluate the potential for that adverse effect to arise from the presence of the identified additives, contaminants, toxins or disease-causing organisms in food, beverages or feedstuffs.<sup>897</sup>

Therefore, not only must the adverse effects (or the risk) be identified but also the specific substances *causing* the adverse effects. The evaluation in the third requirement must therefore address the potential for the specific adverse effects identified to arise from the specific substances identified in the product at issue. Examining the Opinions of the EC's Scientific Committee on Veterinary Measures related to Public Health (SCVPH), the Panel found that they identified the food product and contaminant at issue, namely meat and meat products from cattle treated with oestradiol-17 $\beta$  for growth promotion purposes. Also, the Opinions specified the possible adverse effects on human or animal health, namely neurobiological, developmental, reproductive and immunological effects, as well as immunotoxicity, genotoxicity, and carcinogenicity.<sup>898</sup> However, examining the Opinions and taking into account the views of the panel experts on this point, the Panel found that no analysis was provided of 'the potential for the adverse effects to arise from the consumption of meat and meat products which contain residues of oestradiol-17 $\beta$  as a result of the cattle they are derived from being treated with the hormone for growth promotion purposes.'<sup>899</sup> Therefore, despite the specificity in identifying the relevant risk,

<sup>894</sup> *Ibid.*, para. 201.

<sup>895</sup> *Ibid.*

<sup>897</sup> Panel Report, *US – Continued Suspension*, para. 7.507; Panel Report, *Canada – Continued Suspension*, para. 7.279.

<sup>898</sup> Panel Report, *US – Continued Suspension*, para. 7.508; Panel Report, *Canada – Continued Suspension*, para. 7.480.

<sup>899</sup> Panel Report, *US – Continued Suspension*, para. 7.537; Panel Report, *Canada – Continued Suspension*,

product and contaminant, the evaluation of the potential for the risk to occur was insufficiently specific.

Similar specificity is required under the first definition of a risk assessment, applicable to risks from pests or diseases. The Panel in *Australia – Salmon* examined the Australian risk assessment, contained in its 1996 Final Report, and found that it met the first requirement of the three-pronged test under this definition, identified 24 diseases whose establishment or spread Australia was trying to prevent and their potential biological and economic consequences.<sup>900</sup> Thus it was sufficiently specific in this regard. When dealing with the second element of the three-pronged test, the Panel in *Australia – Salmon* again emphasised the need for specificity, finding:

[G]iven the definition of risk assessment applicable in this case (the ‘evaluation of the likelihood of entry, establishment or spread of a ... *disease*’, in the singular form), a risk assessment for the measure at issue in this dispute at least has to *identify* risk on a disease specific basis, i.e., it has to identify the risk for any given disease of concern separately, not simply address the overall risk related to the combination of all diseases of concern. ... The experts advising the Panel on this issue confirmed this. In the *EC – Hormones* case as well, both the panels and the Appellate Body required some degree of specificity for a risk assessment – or a study or report allegedly part thereof – to be in accordance with the requirements imposed in Article 5.1.<sup>901</sup>

The Appellate Body in *Australia – Salmon* agreed with the Panel in this regard.<sup>902</sup> However, the requirement of specificity does *not* imply that for each product or risk agent at issue, a completely new risk assessment must be carried out. On the relevance of studies on one product category for a risk assessment in respect of another product category, the Panel in *Australia – Salmon* noted:

We do, however, agree with Australia that some of the evidence, assessments and conclusions contained in the 1996 Final Report might be relevant for the risk assessment to be carried out (or relied upon) for the other categories of salmon products and that, therefore, a completely new risk assessment for these other categories of salmon products might not be necessary.<sup>903</sup>

The issue of specificity was again addressed in *Japan – Apples*, where the Panel examined Japan’s risk assessment which evaluated the risk of entry, establishment and spread of fire blight through a collection of possible hosts, including apples. The Panel found that as Japan’s risk assessment did not evaluate the risks in relation to apple fruit separately from those posed by other hosts, whereas scientific evidence showed that the risks vary

---

para. 7.509.

<sup>900</sup> Panel Report, *Australia – Salmon*, para. 8.73.

<sup>901</sup> *Ibid.*, para. 8.74.

<sup>902</sup> Appellate Body Report, *Australia – Salmon*, para. 126. The Appellate Body disagreed with other aspects of the Panel’s analysis however, including its identification of the measure at issue as a heat-treatment requirement for salmon rather than the import prohibition on fresh, chilled or frozen salmon. The Appellate Body overturned the Panel’s findings in this regard and completed the legal analysis by assessing itself whether the requirements for a risk assessment had been met in respect of the import prohibition.

<sup>903</sup> Panel Report, *Australia – Salmon*, para. 8.58. This finding was not addressed on appeal.

significantly depending on the vector (host plant) involved, it did not meet the requirement of specificity.<sup>904</sup> On appeal, Japan argued that the methodology of a risk assessment is not regulated by the *SPS Agreement* and a Member may thus decide for itself whether to analyse the risk on the basis of a particular pest or disease, or on the basis of a particular commodity.<sup>905</sup> The Appellate Body upheld the Panel's finding, holding that it did not limit a Member's choice of risk assessment methodology. Members are free to organise their risk assessments along the lines of pests or diseases, or of the commodity imported, provided that a likelihood of entry, establishment or spread of the disease is attributed to *each agent specifically*.<sup>906</sup> The Appellate Body emphasised that, as held in *EC – Hormones*, the risk to be specified in a risk assessment is the harm concerned *as well as* the precise agent that may cause the harm.<sup>907</sup> It stated, in footnote:

Indeed, we are of the view that, as a general matter, 'risk' cannot usually be understood only in terms of the disease or adverse effects that may result. Rather, an evaluation of risk must connect the possibility of adverse effects with an antecedent or cause. For example, the abstract reference to the 'risk of cancer' has no significance, in and of itself, under the *SPS Agreement*, but when one refers to the 'risk of cancer from smoking cigarettes', the particular risk is given content.<sup>908</sup>

In *US – Continued Suspension*, the requirement of specificity was the key to the Panel's finding that the EC's risk assessment did not meet the requirements of Annex A.4. After referring to the findings on specificity by the Appellate Body in *EC – Hormones* and *Japan – Apples*, the Panel asked the panel experts whether the 'Opinions' of the SCVPH that made up the EC risk assessment 'identified the potential for adverse effects on human health, including the carcinogenic or genotoxic potential, of the residues of oestradiol-17 $\beta$  found in meat derived from cattle to which this hormone had been administered for growth promotion purposes in accordance with good veterinary practice and to what extent the Opinions evaluated the potential occurrence of these adverse effects.'<sup>909</sup> On the basis of the statements of all the experts and an examination of the 'Opinions' the Panel held that the EC:

... has evaluated the potential for the identified adverse effects to be associated with oestrogens in general, but has not provided analysis of the potential for these effects to arise from consumption of meat and meat products which contain residues of oestradiol-17 $\beta$  as a result of the cattle they are derived from being treated with the hormone for growth promotion purposes.<sup>910</sup>

---

<sup>904</sup> Panel Report, *Japan – Apples*, paras 8.268-8.271.

<sup>905</sup> Appellate Body Report, *Japan – Apples*, para. 204.

<sup>906</sup> *Ibid.*

<sup>907</sup> *Ibid.*, para. 202.

<sup>908</sup> *Ibid.*, footnote 372.

<sup>909</sup> Panel Report, *US – Continued Suspension*, para. 7.521; Panel Report, *Canada – Continued Suspension*, para. 7.493.

<sup>910</sup> Panel Report, *US – Continued Suspension*, para. 7.537; Panel Report, *Canada – Continued Suspension*, para. 7.509.

It appears from the above case law that a rather high degree of specificity is required in a risk assessment. It has to identify and address the particular risk arising from the specific risk-causing substance at issue, when present in the relevant product, not just generally establish that the substance is harmful. It must comprehensively cover all pests, diseases or harmful substances at issue and evaluate the risk for *each* type of pest, disease or harmful substance separately. Although a completely new risk assessment is not required for each product category, a risk assessment for one product cannot be regarded as constituting a risk assessment for related product categories.

While this level of rigour required of risk assessments is useful in ensuring a sound basis for regulatory decisions, it demands a high degree of scientific capacity, which many Members simply do not have. In addition, the possibility for these Members to rely on borrowed risks assessments, identified by the Appellate Body in *EC – Hormones*,<sup>911</sup> is severely restricted by the requirement of a high level of specificity in the risk assessment used.<sup>912</sup> The chance that a Member might find a risk assessment conducted by another Member or an international organisation that deals as specifically with the particular risk at issue as is required in the case law is very slim.

#### 5.1.1.2 Quantification and threshold level of risk

A second significant issue of relevance to both types of risk assessment is whether a quantification of the level of risk is required in a risk assessment in terms of Annex A.4 of the *SPS Agreement*. A related question is whether a minimum level of risk must be shown in a risk assessment.

In *EC – Hormones*, addressing the second type of risk assessment, the Panel considered that a risk assessment, if adverse effects have been identified, must ‘*evaluate the potential or probability of occurrence of these effects.*’<sup>913</sup> The Appellate Body regarded the Panel’s use of ‘probability’ as an alternative for ‘potential’ as cause for concern as the word implies a higher degree of potentiality and seems to introduce a quantitative element into a risk assessment.<sup>914</sup> The Appellate Body stated:

The ordinary meaning of ‘potential’ relates to ‘possibility’ and is different from the ordinary meaning of ‘probability’. ‘Probability’ implies a higher degree or a threshold of potentiality or possibility. It thus appears that here the Panel introduces a quantitative dimension to the notion of risk.<sup>915</sup>

The Appellate Body addressed the argument of the EC that the Panel by requiring a ‘scientifically identified risk’ was ‘in effect requiring a Member carrying out a risk assessment to quantify the potential for adverse effects on human health’,<sup>916</sup> and found as follows:

<sup>911</sup> Appellate Body Report, *EC – Hormones*, paras 189-190. This finding is set out above, Part III, Section 5.1.1.

<sup>912</sup> Catherine Button, *The Power to Protect. Trade, Health and Uncertainty in the WTO* (Hart Publishing, Oxford and Portland, Oregon), 2004, 67.

<sup>913</sup> Panel Report, *EC – Hormones (Canada)*, para. 9.101; Panel Report, *EC – Hormones (US)*, para. 8.98.

<sup>914</sup> Appellate Body Report, *EC – Hormones*, paras 184-186.

<sup>915</sup> *Ibid.*, para. 184.

<sup>916</sup> *Ibid.*, para. 185.

It is not clear in what sense the Panel uses the term ‘scientifically identified risk’. ... In one part of its Reports, the Panel opposes a requirement of an ‘identifiable risk’ to the uncertainty that theoretically always remains since science can *never* provide *absolute* certainty that a given substance will not *ever* have adverse health effects.<sup>917</sup> We agree with the Panel that this theoretical uncertainty is not the kind of risk which, under Article 5.1, is to be assessed. In another part of its Reports, however, the Panel appeared to be using the term ‘scientifically identified risk’ to prescribe implicitly that a certain *magnitude* or threshold level of risk be demonstrated in a risk assessment if an SPS measure based thereon is to be regarded as consistent with Article 5.1.<sup>918</sup> To the extent that the Panel purported to require a risk assessment to establish a minimum magnitude of risk, we must note that imposition of such a quantitative requirement finds no basis in the *SPS Agreement*.<sup>919</sup>

Thus it is clear that theoretical uncertainty is not the kind of risk to be assessed under Article 5.1.<sup>920</sup> Such uncertainty always exists since it is not possible for science to ever completely rule out the possibility of risk. If theoretical uncertainty were to be accepted as a ‘risk’ under Article 5.1, much room would be left for regulations that are a knee-jerk response to consumer fears regarding purely hypothetical risks.<sup>921</sup> Instead, Article 5.1 has been interpreted to require proof of an actual risk, not just uncertainty about whether or not a risk exists.<sup>922</sup> However, no threshold requirement that a certain minimum magnitude of risk be shown is contained in the second definition. Further, the Appellate Body stated that the risk assessment may go beyond the controlled conditions in a scientific laboratory, and take account of the actual potential for adverse effects in the ‘real world where people live and work and die.’<sup>923</sup>

The issue then arises whether the first type of risk assessment, which unlike the second type requires an evaluation of the *likelihood* of the occurrence of the risk, necessitates a quantitative evaluation of risk, or a minimum threshold level of risk to be demonstrated. This question was addressed in *Australia – Salmon*. The Panel had examined the Australian risk assessment and found that it evaluated *some* elements of possibility and probability regarding the likelihood of entry or spread of these diseases and thus that the second element of the three-pronged test was met. Further, the Panel held that the

<sup>917</sup> In the footnote to this sentence, the Appellate Body cited Panel Report, *EC – Hormones (US)*, paras. 8.152-8.153; and Panel Report, *EC – Hormones (Canada)*, paras. 8.155-8.156

<sup>918</sup> In the footnote to this sentence, the Appellate Body cited Panel Report, *EC – Hormones (US)*, footnote 331; and Panel Report, *EC – Hormones (Canada)*, footnote 437.

<sup>919</sup> Appellate Body Report, *EC – Hormones*, para. 186.

<sup>920</sup> *Ibid.*

<sup>921</sup> Catherine Button, *The Power to Protect. Trade, Health and Uncertainty in the WTO* (Hart Publishing, Oxford and Portland, Oregon), 2004, 66.

<sup>922</sup> Note, however, that the line between hypothetical risks and real risks is not that easily drawn. Walker argues: ‘On the continuum between a merely speculative risk and a conclusively demonstrated one lies a vast stretch of undemonstrated, unquantified, but scientifically plausible risks. Within that zone, the risk of harm is real so long as safety is unproven.’ Vern R. Walker, ‘Keeping the WTO from Becoming The “World Trans-Science Organization”’: Scientific Uncertainty, Science Policy, and Factfinding in the Growth Hormones Dispute’, *Cornell International Law Journal* 31, 1998, 251-320, 305.

<sup>923</sup> Appellate Body Report, *EC – Hormones*, para. 187.

*SPS Agreement* does not require a quantitative evaluation of risk.<sup>924</sup> The Appellate Body agreed that the evaluation of the likelihood need not be done quantitatively. It stated:

The likelihood may be expressed either quantitatively or qualitatively. Furthermore, we recall, as does the Panel, that we stated in *European Communities – Hormones* that there is no requirement for a risk assessment to establish a certain magnitude or threshold level of degree of risk.<sup>925</sup>

While in *EC – Hormones* the Appellate Body had rejected the use of the term ‘probability’ due to a concern that it might introduce a quantitative element into the second definition, in *Australia – Salmon* it found that likelihood or probability in the first definition could be expressed quantitatively or qualitatively. However, Australia’s evaluation of the probability as ‘low’ or ‘small’ was not deemed sufficient. It is not clear what kind of qualitative determination of probability would satisfy this requirement. Further, the Appellate Body in *Australia – Salmon* confirmed the finding in *EC – Hormones* that a risk assessment need not establish a certain magnitude or threshold level of risk. Thus, even a very small, demonstrated probability of risk is sufficient. Despite the unexpected finding that, contrary to the suggestion of the Appellate Body in *EC – Hormones*, also the first type of risk assessment requires no quantification of risk, the Appellate Body in *Australia – Salmon* did give weight to the different language used in the first and second definitions of risk assessment in Annex A.<sup>926</sup> It noted that while the second definition calls for an evaluation of the ‘potential’ for adverse effects, the first requires the evaluation of the ‘likelihood’ of entry, establishment or spread of pests or diseases. It did ‘not believe that it is correct to diminish the substantial differences between these two types of risk assessments’.<sup>927</sup> Noting that the first definition requires the evaluation of ‘likelihood’ and that in *EC – Hormones* it has referred to the dictionary meaning of ‘probability’ as ‘degrees of likelihood’ and ‘a thing that is judged likely to be true’, for the purpose of distinguishing the terms ‘potential’ and ‘probability’,<sup>928</sup> the Appellate Body considered that ‘likelihood’ has the same meaning as ‘probability’.<sup>929</sup> It stated:

On this basis, as well as on the basis of the definition of ‘risk’ and ‘risk assessment’ developed by the Office international des épizooties (‘OIE’) and the OIE *Guidelines for Risk Assessment*, we maintain that for a risk assessment to fall within the meaning of Article 5.1 and the first definition in paragraph 4 of Annex A, it is not sufficient that a risk assessment conclude that there is a *possibility* of entry, establishment or spread of diseases and associated biological and economic consequences. A proper risk assessment of this type must evaluate the ‘likelihood’, i.e., the ‘probability’, of entry, establishment or spread of diseases

<sup>924</sup> Panel Report, *EC – Hormones*, para. 8.80

<sup>925</sup> Appellate Body Report, *Australia – Salmon*, para. 124. The Appellate Body referred to the Appellate Body Report, *EC – Hormones*, para. 186.

<sup>926</sup> Appellate Body Report, *Australia – Salmon*, para. 123 and note 69.

<sup>927</sup> Appellate Body Report, *Australia – Salmon*, note 169. Here the Appellate Body rejected the EC’s argument that ‘the object, purpose and context of the *SPS Agreement* indicate that no greater level of probability can have been intended for the first type of risk assessment than for the second type, [as b]oth types can apply both to human life or health and to animal or plant life or health’. *Ibid.*

<sup>928</sup> Appellate Body Report, *EC – Hormones*, para. 184.

<sup>929</sup> Appellate Body Report, *Australia – Salmon*, para. 123.

and associated biological and economic consequences as well as the ‘likelihood’, i.e., ‘probability’, of entry, establishment or spread of diseases *according to the SPS measures which might be applied*.

... We do not agree with the Panel that a risk assessment of this type needs only *some* evaluation of the likelihood or probability. The definition of this type of risk assessment in paragraph 4 of Annex A refers to ‘the evaluation of the likelihood’ and not to *some* evaluation of the likelihood.<sup>930</sup>

The Appellate Body distinguished the evaluation of risk, which must show an ascertainable risk, not just a theoretical uncertainty, from the determination of an appropriate level of protection, which may be premised on a zero-risk level.<sup>931</sup> It is thus possible for a Member, once an actual risk, however small, has been proven to have a *certain probability*, to choose a zero-risk level of protection and institute strict SPS measures to achieve this level. This respect for the level of protection chosen by a Member is inherent to the delicate balance struck in the *SPS Agreement*, as discussed above. However, the usefulness of the precise determination of probability required in the case law is thereby called into question, since no matter how small the probability of the risk occurring is proved to be, the state’s chosen level of protection cannot be challenged on grounds of proportionality.<sup>932</sup> The more stringent criterion thus only serves to make it harder to satisfy the risk assessment requirement in cases where risks from pests and diseases are at issue.

In finding that Australia’s risk assessment did not meet the requirement of ‘an evaluation of likelihood’ of the entry, establishment or spread of the fish diseases at issue and their associated potential biological and economic consequences, the Appellate Body relied on the Panel’s findings based on statements of the panel experts.<sup>933</sup> These experts expressed the view that the risk assessment lent more weight to unknown and uncertain elements of the assessment and looked at the possibility of adverse effects occurring rather than assessing the *probability* thereof.<sup>934</sup> According to the Appellate Body, the existence of unknown or uncertain elements does not justify a departure from the requirements for a risk assessment.<sup>935</sup>

The same emphasis on the evaluation of probability was exhibited by the Panel in *Japan – Apples*, where again the first definition of a risk assessment was at issue. Japan had claimed that it had qualitatively evaluated the probability. The Panel, quoting the Appellate Body’s finding in *EC – Hormones*, held that probability requires a higher degree or threshold of potentiality or possibility, although it may be expressed quantitatively or qualitatively.<sup>936</sup>

<sup>930</sup> Appellate Body Report, *Australia – Salmon*, paras. 123-124.

<sup>931</sup> *Ibid.*, para. 125.

<sup>932</sup> The safeguarding of Members’ policy space with regard to their chosen level of protection once a risk (however small) has been proven, achieved by this finding of the Appellate Body, is undermined by the strong proportionality requirement read into Article 2.2 by the Panel in *Japan – Apples*, discussed above, Part III, Section 3.3.3.1. This can be compared to the situation under EC law, where the Article 30 exception for health measures, which requires that the measure be ‘necessary’ to protect human life or health, has been interpreted by the ECJ to include the requirement that the measure be proportional to the aim it seeks to achieve.

<sup>933</sup> Appellate Body Report, *Australia – Salmon*, para. 129.

<sup>934</sup> Panel Report, *Australia – Salmon*, para. 8.83.

<sup>935</sup> Appellate Body Report, *Australia – Salmon*, para. 130. See further below, Part III, Section 5.1.2.

<sup>936</sup> Panel Report, *Japan – Apples*, para. 8.273.

Japan's risk assessment had used a scale of grades, ranging from 'A' (extremely high) to 'D' (extremely low) to rank the risk at issue, and had assessed the overall risk of fire blight as Grade A.<sup>937</sup> However, aside from the fact that the risk assessment's conclusion did not seem to relate to the risk of fire blight transmission from apple fruit specifically,<sup>938</sup> the Panel found that, where apple fruit was addressed, no 'precise evaluation of the "degree of potentiality" or probability' was suggested.<sup>939</sup> Although Japan's risk assessment used the term probability, the Panel held that it did not assess the degree of likelihood of the risk occurring. The risk assessment concluded from the cited studies that:

... the mature apple fruit harvested in fire blight occurring orchards can carry *E. amylovora* and, in addition, the mature fruit not carrying *E. amylovora* can be contaminated by harvesting operation, etc., in the orchard where there are sources. In particular, when scarred fruit is infected with *E. amylovora* and becomes rotten, it can be considered to exude bacterial ooze. Such fruit can be the source of transmission after being imported.<sup>940</sup>

In the Panel's view, the emphasised terms indicate the identification of a *possibility* of entry, establishment and spread of fire blight, but did not evaluate the *likelihood* thereof as required in the first definition of a risk assessment.<sup>941</sup> Consequently, Japan's risk assessment was held not to meet the requirements of Annex A.4 and Article 5.1 of the *SPS Agreement*.<sup>942</sup> This issue was not addressed on appeal.

The importance of the probability assessment element of the first definition of a risk assessment again came to the fore in *EC – Approval and Marketing of Biotech Products*, where the Panel had to address whether each of the nine safeguard measures applied by EC Member States to ban biotech products that had already been approved at EC level, were based on risk assessments. For example, when looking at Austria's safeguard measure on T25 maize, the Panel rejected Austria's contention that a scientific report, known as the Hoppichler study,<sup>943</sup> constituted a risk assessment under Article 5.1.<sup>944</sup> According to the Panel, the Hoppichler study did not identify the relative probability of the risks it identified, but only referred to the possibilities of the risks, or to the inability to determine probabilities.<sup>945</sup> It therefore did not meet the requirements of the first definition of a risk

---

<sup>937</sup> *Ibid.*, para. 8.274.

<sup>938</sup> The specificity issue is addressed above, Part III, Section 5.1.1.1.

<sup>939</sup> Panel Report, *Japan – Apples*, para. 8.274.

<sup>940</sup> This paragraph of the risk assessment was cited by the Panel, which added the emphasis indicated. *Ibid.*, para. 8.275.

<sup>941</sup> *Ibid.*, para. 8.276.

<sup>942</sup> *Ibid.*, para. 8.280.

<sup>943</sup> The study by Hoppichler, entitled 'Concepts of GMO-free Environmentally Sensitive Areas', was commissioned by the Austrian Federal Ministry of Women's Affairs and Consumer Protection.

<sup>944</sup> The first definition of a risk assessment was at issue to the extent that Austria's measure was aimed at addressing concerns regarding the spread of pollen to surrounding cultivated fields, long-term ecological consequences and the development of resistance to toxins in insects. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3039.

<sup>945</sup> *Ibid.*, para. 7.3044.

assessment.<sup>946</sup> Similar findings were made in respect of the studies relied upon as the basis for several of the other safeguard measures at issue in this dispute.<sup>947</sup>

In general, it would appear that by allowing the probability to be established quantitatively or qualitatively, not requiring a minimum level of risk to be shown and finding that the risk to be ascertained is not only that which can be established in science laboratories under controlled conditions but includes that occurring in the ‘real world’, the Appellate Body is trying to make provision for the reality that scientific evaluations of risk cannot provide absolute, concrete answers to all regulatory questions. This pragmatic approach is to be commended. Unrealistic application of the scientific disciplines of the *SPS Agreement* would not promote market access. Instead, by resulting in rulings lacking in legitimacy and political acceptability, it would lead to increased instances of non-compliance with the outcome of dispute settlement and undermine the authority of the regime created by the *SPS Agreement*.

However, the narrow focus on the establishment of a *specific* probability of entry, establishment or spread of a pest or disease in the first definition of a risk assessment, does not seem useful. It makes it harder to meet the already difficult requirements for a risk assessment, while adding little to the outcome in respect of the SPS measure applied.

It seems possible that the different terminology in the two definitions of risk assessment was intended to set less stringent requirements in cases where human health is more likely to be at risk, namely where food safety is at issue, than in cases where the risk applies to pests or diseases, which are more likely to affect plants or animals.<sup>948</sup> While recent scares with human health risks from animal diseases, such as avian flu and bovine spongiform

---

<sup>946</sup> *ibid.*, para. 7.3046. Similar findings regarding the lack of an evaluation of likelihood or probability were made in respect of other safeguard measures to which the first definition of a risk assessment applied. See for example *ibid.*, paras. 7.3078 (with regard to Austria’s measure on Bt-176 maize), 7.3094 and 7.3098 (with regard to Austria’s measure on MON810 maize), paras 7.3145 and 7.3151 (with regard to Germany’s measure on Bt-176 maize), para. 7.3170 (with regard to Greece’s measure on Topas oilseed rape), para. 7.3186 (with regard to Italy’s measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize) and para. 7.3205 (with regard to Luxembourg’s measure on Bt-176 maize).

<sup>947</sup> The lack of an evaluation of likelihood or probability was identified as a defect in the scientific studies relied upon in respect of several other safeguard measures to which the first definition of a risk assessment applied. See for example *ibid.*, paras. 7.3078 (with regard to Austria’s measure on Bt-176 maize), 7.3094 and 7.3098 (with regard to Austria’s measure on MON810 maize), paras 7.3145 and 7.3151 (with regard to Germany’s measure on Bt-176 maize), para. 7.3170 (with regard to Greece’s measure on Topas oilseed rape), para. 7.3186 (with regard to Italy’s measure on T25 maize, MON810 maize, MON809 maize and Bt-11 maize) and para. 7.3205 (with regard to Luxembourg’s measure on Bt-176 maize).

<sup>948</sup> Contrary to the EC’s contention, it is not the case that both definitions apply equally to human life or health and plant and animal life or health. In fact the second definition omits plants. While the second definition refers to animal health as well as human, it seems the human health consideration was paramount in the setting of a more lenient criterion to satisfy the obligation to conduct a risk assessment. The first definition, referring to the entry, establishment or spread of pests or diseases is obviously most likely to affect animals and plants, and a stricter requirement was set. It seems that risks to human health were not envisaged as very likely to fall within the first definition. It has since become apparent that pests or diseases that can be spread by cross-border movement of plants or animals not contained in food or beverages (such as BSE and avian flu) can cause serious health risks to humans. It should be noted that the definition of SPS measures in Annex A expressly includes, in paragraph 1(c), measures to protect *human* health from risks from pests or diseases carried by animals or plants or products thereof. Thus the possibility of risks to humans falling under the first definition of risk assessment must have been foreseen. Therefore the wisdom of interpreting the first definition to lay down a stricter requirement can be questioned.

encephalitis, have amply shown that not only food imports create risks for human health, it is nevertheless that case that food safety is a much more sensitive issue than risks from pests and diseases, and that risks to human health from the latter are rare.

It is now necessary to examine the additional elements contained in the first definition of a risk assessment relevant to risks from pests and diseases, to determine what exactly is required from Members in such cases.

### 5.1.1.3 Identification and evaluation of potential biological and economic consequences

Clearly the severity of the consequences of a particular risk occurring differs from situation to situation. These consequences are both economic (such as losses in production or sales of agricultural products and costs of eradication of a pest or disease) and biological (such as damage to biodiversity). It is useful for regulators to establish the severity of the consequences of the risk at issue, as it provides relevant information to be taken into account when making risk management decisions. Regulators are placed in a position where they can consider the costs and benefits of the regulatory options before making a decision. This improves the quality of national risk regulation.

While the consequences of the occurrence of a risk from toxins or contaminants in food and feed also vary, as can be seen by comparing the usually not serious risk of salmonellosis from improperly cooked eggs and poultry infected with salmonellae,<sup>949</sup> to the serious risk of cancer from dioxin residues in food, as human life or health may be at stake in these cases it is less appropriate to weigh up costs and benefits in such cases.<sup>950</sup> Therefore, unlike the definition of a risk assessment that applies to risks from food and feed, a risk assessment dealing with risks from pests and diseases must identify and evaluate an additional factor, namely the risk of the ‘associated potential biological and economic consequences’.

This requirement was addressed in *Australia – Salmon*, where the first type of risk assessment was relevant as the risk related to fish diseases that could be introduced through the importation of adult, wild, ocean-caught Pacific salmon from Canada. Referring to the definition in Annex A.4, the Panel clarified which risks have to be evaluated in this type of risk assessment as follows:

[W]e consider, first of all, that the risk thus to be assessed includes (1) the risk of ‘entry, establishment or spread’ of a disease and (2) the risk of the ‘associated

<sup>949</sup> While a few strains of salmonella (such as *Typhi*) are serious and cause typhoid fever, the strains of salmonella currently endemic in commercial chicken populations typically produce diarrhoeal disease with much less severe symptoms and outcome. These cases of salmonellosis are usually self-limiting and do not require antibiotics. Salmonella is currently one of the largest contributors to food-borne disease in many developed countries. This information was taken from the website of the Emerging Pathogens Institute of the University of Florence, available at: <http://epi.ufl.edu/food/>, visited on 30 June 2008.

<sup>950</sup> Note that not only human but also animal life and health is at stake in risk assessments falling under the second definition which covers risks from food and *feed*. Nevertheless, it seems that concerns with applying inappropriate requirements to risk assessments involving human health risks predominated in the choice to omit the additional requirements related to the economic and biological consequences of the risk in the second definition. This recognises the fact that any risk to human life or health can legitimately be viewed as very severe in and of itself.

potential biological and economic consequences'. When we refer hereafter to the risk related to a disease, this risk thus includes the risk of entry, establishment or spread of that disease as well as the biological and economic consequences associated therewith.<sup>951</sup>

The Panel found that Australia's risk assessment, contained in the 1996 Final Report, had properly identified not only the diseases at issue, but also the potential biological and economic consequences associated with them.<sup>952</sup> However, instead of determining further whether the probability of the risk and associated consequences was evaluated, as mentioned above, the Panel merely assumed that this was the case.<sup>953</sup> The Appellate Body in this case agreed with the Panel in respect of the elements of a risk assessment under the first definition,<sup>954</sup> of its finding that the risk assessment at issue identified the risk and its associated consequences.<sup>955</sup> However, the Appellate Body was of the view that the Panel should have come to the conclusion that the 1996 Final Report did not evaluate likelihood of the associated potential biological and economic consequences as required in the first definition of a risk assessment, as 'some' evaluation is insufficient.<sup>956</sup>

An example of a case where a risk assessment was found to have complied with this requirement is provided in *Australia – Salmon (Article 21.5 – Canada)*. Here the Panel had to assess whether Australia's revised risk assessment, the 1999 PRA, undertaken in support of its new SPS measure, met this requirement. It noted that, for each of the 15 fish diseases identified in the risk assessment as 'high priority' diseases, the risk assessment also determined the 'expected impact or significance of disease establishment' or conducted what it called the 'consequence assessment'.<sup>957</sup> Using a qualitative scale (catastrophic, high, moderate, low or negligible) it evaluated the severity of the impact of the consequences identified, disease by disease. In each case, it did so with reference to the

---

<sup>951</sup> Panel Report, *Australia – Salmon*, para. 8.72. The Panel later reiterated the two aspects of risk to be analysed under the first definition as follows: 'According to this first definition in paragraph 4, such risk assessment has to take into account risks arising not only from the 'entry, establishment or spread of a pest or disease', but also from the 'associated biological and economic consequences'. Panel Report, *Australia – Salmon*, para. 8.116.

<sup>952</sup> *Ibid.*, para. 8.73. The Panel here referred in footnote to a section of the 1996 Final Report entitled 'Impact of Salmonid Disease Introduction into Australia' but did not explain further how the information contained therein met the requirement at issue.

<sup>953</sup> *Ibid.*, para. 8.83.

<sup>954</sup> Appellate Body Report, *Australia – Salmon*, paras 121-122.

<sup>955</sup> *Ibid.*, para. 127.

<sup>956</sup> *Ibid.*, para. 128. For the same reasons, discussed above, Part III, Section 5.1.1.2, that the Appellate Body regarded the 1996 Final Report as not comprising an evaluation of the risk of entry, establishment or spread of the fish diseases identified, it held that it did not evaluate the associated potential economic or biological consequences. Also in *EC – Approval and Marketing of Biotech Products*, the question of whether the studies relied upon by some EC Member States as the risk assessments on which their safeguard measures were based met the requirement of identification and evaluation of the associated economic and biological consequences was addressed. For example, the 2001 BEC report on which France relied for its safeguard measure on MSI/RFI oilseed rape (EC-161) was held not to provide any analysis of the associated potential biological and economic consequences of herbicide resistance in oilseed rape varieties, and therefore not to meet the requirements of the first definition of a risk assessment. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3120.

<sup>957</sup> Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.54.

risks related to imports of eviscerated salmonids (the product at issue).<sup>958</sup> This was found by the Panel to meet the requirement set by the additional factor in the definition of a risk assessment for risks from pests or diseases in Annex A.4 of the *SPS Agreement*.<sup>959</sup>

The purpose of the additional requirement of the identification and evaluation of the potential economic and biological consequences associated with the risk, in cases where the risks from pests and diseases are at issue, seems to be to ensure that the severity of the risk is considered in the regulatory process.<sup>960</sup> By obliging Members to undertake this evaluation when they assess risks from pests or diseases, it seems that the *SPS Agreement* aims to inject greater rationality into the assessment of these risks. Nevertheless, the *SPS Agreement* stops short of requiring Members to ensure that their SPS measures are proportional to the severity of the risk so identified. A Member remains free to choose its own appropriate level of protection in the face of the identified risk, and to select an SPS measure that will achieve this level of protection. In other words, the additional requirement in the first definition of a risk assessment is purely a procedural one, requiring that the evaluation of consequences be undertaken, rather than a substantive one requiring that the SPS measure based on this assessment be proportional to the consequences of the risk.

#### 5.1.1.4 Evaluation according to the SPS measures that might be applied

The outcome of the risk analysis process, and therefore the aspect of this process of greatest concern to exporting Members, is the choice of an SPS measure to impose in order to address the risk identified in the risk assessment in a manner which achieves the level of protection chosen by the importing Member. In order to ensure that the choice of a particular measure is firmly grounded in the scientific facts, and is necessary to protect health, it is necessary to assess the contribution that different possible SPS measures would make to addressing the risk at issue. For this reason, the first definition of a risk assessment requires, in its third prong, that the risk of entry, establishment or spread of pests or diseases be evaluated ‘according to the sanitary or phytosanitary measures which might be applied.’

In *Australia – Salmon*, the Panel clarified that the term ‘those SPS measures which might be applied’ refers to those SPS measures that reduce the risks of concern. Australia’s 1996 Final Report referred to these measures as the ‘risk reduction factors’, and examined a large number of them for each of the 24 diseases of concern.<sup>961</sup> On appeal, the Appellate Body agreed with the Panel’s clarification in this regard.<sup>962</sup> However, it disagreed with the Panel that ‘some evaluation of the extent to which these factors could reduce risk’

<sup>958</sup> *Ibid.*, para. 7.55.

<sup>959</sup> *Ibid.*, para. 7.58. Note that In *Japan – Apples*, the additional factor of the biological and economic consequences to be evaluated was not addressed before the original or the compliance Panels, most likely because the evaluation of the first factor (the risk of entry, establishment or spread of the disease at issue) was already found insufficient.

<sup>960</sup> For a discussion of the relationship between the requirement to identify and evaluate associated economic and biological consequences in the first definition of a risk assessment in Annex A.4 and the requirement in Article 5.3 of the *SPS Agreement* that assessments of risks to animal or plant life or health take into account certain economic factors, see below, Part III, Section 5.1.4.

<sup>961</sup> Panel Report, *Australia – Salmon*, para. 8.89.

<sup>962</sup> Appellate Body Report, *Australia – Salmon*, para. 132.

was sufficient to justify an assumption that this requirement was met.<sup>963</sup> It therefore found that the 1996 Final Report did not meet the third requirement of the first definition of a risk assessment. In *Australia – Salmon (Article 21.5 – Canada)*, the compliance Panel had to determine whether Australia’s new risk assessment, contained in the 1999 PRA, met this requirement. It found that, contrary to what had been done in the 1996 Final Report, the 1999 PRA identified and discussed, for each disease at issue, a series of ‘risk management measures’ that might be applied and that would reduce the risk associated with the relevant disease.<sup>964</sup> Examples of SPS measures discussed were inspection and grading, export certification, controls on waste disposal and restrictions as to the age of the fish. Each measure was discussed and evaluated in the light of the effect that the measures would have on the ‘key risk factors’ identified in the risk assessment.<sup>965</sup> On the basis of this evaluation, a list of pre-export and post-import requirements were adopted for each specific disease in order to achieve Australia’s appropriate level of protection.<sup>966</sup> The Panel found that it was not precluded from finding that these steps were sufficient to meet the third prong of the first definition of a risk assessment by the fact that some of the measures actually applied by Australia were not among those assessed. It stated:

[T]he fact that the 1999 IRA would not evaluate the likelihood according to *all* sanitary measures which may be applied, including some of those that were actually selected, does not, in our view, preclude that the 1999 IRA taken separately meets the definition of risk assessment. Paragraph 4 of Annex A refers to an evaluation “according to the sanitary ... measures which might be applied” *tout court*. It does not require that *all possible* measures (of which there could be a very great number) be evaluated nor specify precisely which measures need to be evaluated.<sup>967</sup>

The Panel further rejected the contention that, in order for 1999 PRA to meet the requirements of the third prong of the first definition of a risk assessment, the SPS measure finally applied must be shown to be linked to the risk assessment. It stated as follows:

Canada’s claim ... raises the question of whether the definition of risk assessment *as such*, requiring Members to assess risk ‘according to the [sanitary] measures which might be applied’, can be construed so as to include the obligation to make the link between the assessment, the measures *finally selected* and the necessity to use these measures in order to achieve the ALOP. We find it difficult to read such a requirement into paragraph 4 of Annex A.

In our view, the rights and obligations in respect of these linkages are set out *not* in the definition of risk assessment itself – which logically *precedes* the selection of measures – but, *inter alia*, in the obligation to *base* sanitary measures *on* a risk assessment in Article 5.1 and to ensure that sanitary measures are not more trade-restrictive than required to achieve the ALOP in the sense of Article 5.6.

<sup>963</sup> Panel Report, *Australia – Salmon*, paras 8.89-8.91; Appellate Body Report, *Australia – Salmon*, para. 134.

<sup>964</sup> Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.64.

<sup>965</sup> *Ibid.*, para. 7.65.

<sup>966</sup> *Ibid.*

<sup>967</sup> *Ibid.*, para. 7.70.

To examine these questions of relationship between the risk assessment, the measures selected and the ALOP under the definition of risk assessment – as Canada ... seem[s] to do – would, in our view, run the risk of adding to or diminishing the more specific rights and obligations of Members set out in other SPS obligations, contrary to Article 19.2 of the DSU.<sup>968</sup>

Thus, the third element of the three-pronged test, requiring the evaluation of the likelihood of entry, establishment or spread of the relevant diseases *according to the SPS measure which might be applied* does not necessitate a determination of the link between the measure applied and the risk assessment or appropriate level of protection, something best left to the evaluation of whether the measure is ‘based on’ the risk assessment, and whether it is not more trade restrictive than required.<sup>969</sup> Instead, the first definition of a risk assessment only requires that the risk be determined according to the different options available to mitigate the risk.

In *Japan – Apples*, the Panel found that Japan had not evaluated the risk according to the measures that might be applied, as its risk assessment had examined only the SPS measure Japan had actually imposed to address the risk from fire blight. According to the Panel, ‘consideration should be given not just to those specific measures which are currently in application, but at least to a potential range of relevant measures.’<sup>970</sup> On appeal, the Appellate Body found:

We agree with the Panel that this phrase “refers to the measures *which might* be applied, not merely to the measures which *are being* applied.” The phrase “which might be applied” is used in the conditional tense. In this sense, “might” means: “were or would be or have been able to, were or would be or have been allowed to, were or would perhaps”. We understand this phrase to imply that a risk assessment should not be limited to an examination of the measure already in place or favoured by the importing Member. In other words, the evaluation contemplated in paragraph 4 of Annex A to the *SPS Agreement* should not be distorted by preconceived views on the nature and the content of the measure to be taken; nor should it develop into an exercise tailored to and carried out for the purpose of justifying decisions *ex post facto*.<sup>971</sup>

Risk assessments under the first definition must therefore evince an evaluation of a range of possible SPS measures which could be applied to address the risk at issue, and their relative effectiveness, not merely address the measure actually applied. Otherwise they could be regarded as prejudging their own outcome<sup>972</sup> by showing that the measure actually applied is appropriate and effective, without regard for possible alternatives. Instead,

<sup>968</sup> *Ibid.*, paras 7.68-7.69.

<sup>969</sup> The requirement in Article 5.1 of the *SPS Agreement* that an SPS measure be ‘based on’ a risk assessment is discussed below, Part III, Section 5.1.5. The requirement in Article 5.6 of the *SPS Agreement* that an SPS measure not be more trade restrictive than required to achieve the appropriate level of protection of the relevant Member is discussed below, Part III, Section 5.2.4.

<sup>970</sup> Panel Report, *Japan – Apples*, para. 8.285.

<sup>971</sup> Appellate Body Report, *Japan – Apples*, para. 208.

<sup>972</sup> This comment was made by one of the experts advising the Panel in *Japan–Apples*. Panel Report, *Japan – Apples*, para. 6.177.

Members are required to consider alternative regulatory options. Doing so will make it easier for Members to ensure that the SPS measure they choose is necessary, as required by Article 2.2, and is the least-trade-restrictive SPS measure available that achieves their appropriate level of protection, as required by Article 5.6. However, this does not mean that *all* possible alternatives must be considered, something that would place an impossible task on risk assessors.

### 5.1.2 Risk assessment as appropriate to the circumstances

The requirement that SPS measures be based on a risk assessment is qualified by the phrase ‘as appropriate to the circumstances.’ It is therefore necessary to determine what this qualification entails to determine whether circumstances such as scientific uncertainty, or the insufficient economic resources or scientific capabilities of a Member might ease the strict requirements relating to risk assessments. When addressing the applicability of the *SPS Agreement* to those SPS measures adopted before the entry into force of the *WTO Agreement*, the Appellate Body in *EC – Hormones* noted the following:

We are aware that the applicability, as from 1 January 1995, of the requirement that an SPS measure be based on a risk assessment to the many SPS measures already in existence on that date, may impose burdens on Members. It is pertinent here to note that Article 5.1 stipulates that SPS measures must be based on a risk assessment, *as appropriate to the circumstances*, and this makes clear that the Members have a certain degree of flexibility in meeting the requirements of Article 5.1.<sup>973</sup>

However, what exactly this flexibility would entail in practice is not clear, as the Appellate Body did not relax any of the disciplines in its ensuing assessment of whether the EC had met the requirements for a risk assessment in this case.

The meaning of ‘as appropriate to the circumstances’ arose again in *Australia – Salmon* where the Panel had to address Australia’s argument that its risk assessment for one product category was equally valid with respect to other product categories which had the same disease agent in common. Referring back to the relevant finding in *EC – Hormones*, the Panel noted as follows:

As to the product coverage of Article 5.1, the reference contained in Article 5.1 to base sanitary measures on an assessment ‘as appropriate to the circumstances’ cannot, in our view, annul or supersede the substantive obligation resting on Australia to base the sanitary measure in dispute (irrespective of the products that measure may cover) on a risk assessment. We consider that the reference ‘as appropriate to the circumstances’ relates, rather, to the way in which such risk assessment has to be carried out. Only Article 5.7 allows for an exception to the obligation to base sanitary measures on a risk assessment.<sup>974</sup>

<sup>973</sup> Appellate Body Report, *EC – Hormones*, para. 129.

<sup>974</sup> Panel Report, *Australia – Salmon*, para. 8.57.

Turning to an examination of Australia's risk assessment, to determine if it constituted a risk assessment in respect of adult, wild, ocean caught salmon, the Panel further stated:

Following Article 5.1, a risk assessment needs to be 'appropriate to the circumstances'. Answering a Panel question in this respect, Canada is of the view that the circumstances thus referred to are the source of the risk (e.g., an animal pathogen or a chemical contaminant) and the subject of the risk (i.e., whether it is to human, animal or plant life or health). For Australia, the phrase 'as appropriate to the circumstances' confers a right and obligation on WTO Members to assess the risk, on a case by case basis, in terms of product, origin and destination, including, in particular, country specific situations. We agree that both interpretations may be covered by the term 'as appropriate to the circumstances'. In our view, also the OIE risk assessment techniques as well as the scientific opinions we gathered, may shed light on what is a risk assessment 'appropriate to the circumstances'.<sup>975</sup>

The Panel, however, did not proceed to evaluate whether Australia's 1996 Final Report met the requirements of a risk assessment, but merely assumed it did so<sup>976</sup> and went on to determine whether the measure was 'based on' the 1996 Final Report. The Appellate Body in this case did not find it appropriate to base its examination of Article 5.1 on this assumption of the Panel, and thus examined itself the question whether Australia's 1996 Final Report was a risk assessment within the meaning of Article 5.1. In its finding that the second requirement of a risk assessment (the evaluation of the likelihood of the risk) was not met, it stated as follows:

[T]he existence of unknown and uncertain elements does not justify a departure from the requirements of Articles 5.1, 5.2 and 5.3, read together with paragraph 4 of Annex A, for a risk assessment. We recall that Article 5.2 requires that "in the assessment of risk, Members shall take into account available scientific evidence". We further recall that Article 2, entitled "Basic Rights and Obligations", requires in paragraph 2 that "Members shall ensure that any sanitary ... measure ... is based on scientific principles and is not maintained without sufficient scientific evidence, except as provided for in paragraph 7 of Article 5."<sup>977</sup>

Although the Appellate Body was not specifically addressing the question of the meaning of the phrase 'as appropriate to the circumstances', it did not seem to allow the existence of elements of scientific uncertainty to mitigate the requirements for a risk assessment in Article 5.1.

In *Japan – Apples*, the Panel examined what is meant by a risk assessment 'as appropriate to the circumstances'. It held that this factor, together with the consideration of the risk assessment techniques developed by the relevant international organisations,<sup>978</sup> pervades the entire risk assessment as defined in Annex A.4 and is therefore relevant to the evaluation of the risk assessment *as a whole*. It therefore addressed this first, before looking at

<sup>975</sup> *Ibid.*, 8.71.

<sup>976</sup> *Ibid.*, paras 8.83 and 8.92.

<sup>977</sup> Appellate Body Report, *Australia – Salmon*, para. 130.

<sup>978</sup> The latter factor is discussed below, Part III, Section 5.1.3.

other requirements for a risk assessment.<sup>979</sup> The Panel first found, rather obviously, that as Japan's measure was a phytosanitary measure, it must focus on risks related to plant life and health.<sup>980</sup> It then recalled that the term 'as appropriate to the circumstances' has been interpreted, in *Australia – Salmon*, to provide some flexibility for risk assessments, on a case-by-case basis, including consideration of country-specific situations. It therefore found that Japan's fire blight-free status and its climatic conditions, which were favourable to the spread of fire blight, were relevant 'circumstances' to be taken into account in Japan's risk assessment, and noted that they related to some of the factors required to be considered under Article 5.2.<sup>981</sup>

In *Japan – Apples (Article 21.5 – US)*, the compliance Panel went further in its examination of whether Japan's new 2004 PRA was a risk assessment 'as appropriate to the circumstances'. Recalling that Article 5.1 may be viewed as a specific application of Article 2.2,<sup>982</sup> it found that the scientific evidence that is being evaluated must support the conclusions of the risk assessment in order for the risk assessment to be 'appropriate to the circumstances'.<sup>983</sup> In particular, the studies used by Japan had to 'reflect the real production and trade conditions'<sup>984</sup> in order to support the view that apple fruit were likely to complete the transmission pathway and contaminate host plants in Japan under non-laboratory conditions. Stating that it was mindful that it was not supposed to conduct its own risk assessment or to impose any scientific opinion on Japan, the Panel stated that it would only examine the scientific evidence in the light of the relevant WTO provisions.<sup>985</sup> As the Panel experts were of the view that the scientific studies relied upon by Japan in its 2004 PRA did not reflect either natural orchard conditions or commercial practice, the Panel found that these studies did not support the conclusion in the risk assessment that apple fruit were likely complete the transmission pathway. Thus there was no risk assessment 'as appropriate to the circumstances'.<sup>986</sup>

In *EC – Approval and Marketing of Biotech Products*, the Panel addressed the question whether the term 'as appropriate to the circumstances' allows a Member to take into account as a relevant 'circumstance' the level of protection it has chosen and the uncertainties in science. The EC argued that an importing Member may reject an existing risk assessment as not 'appropriate to [its] circumstances' on the grounds that the risk

<sup>979</sup> Panel Report, *Japan – Apples*, para. 8.237.

<sup>980</sup> *Ibid.*, para. 8.238.

<sup>981</sup> *Ibid.*, para. 8.240 and footnote 372. Article 5.2 is discussed below, Part III, Section 5.1.4.

<sup>982</sup> The Panel here recalled the finding on this point in Appellate Body Report, *EC – Hormones*, para. 180.

<sup>983</sup> Panel Report, *Japan – Apples (Article 21.5 – US)*, para. 8.136.

<sup>984</sup> *Ibid.*, para. 8.140.

<sup>985</sup> *Ibid.*, para. 8.137. This finding is discussed further in relation to the standard of review applied by panels when assessing the scientific evidence before them. See below, Part IV, Section 2.2.3.

<sup>986</sup> Panel Report, *Japan – Apples (Article 21.5 – US)*, paras 8.141-8.146. In *US – Continued Suspension and Canada – Continued Suspension*, the Panel relied on this finding to conduct an examination into the question whether the scientific evidence supported the conclusions of the Opinions of the EC Scientific Committee for Veterinary Public Health that excess exposure to oestradiol-17 $\beta$  and its metabolites resulting from the consumption of meat and meat products presents a health risk, especially to pre-pubertal children, and that the hormone is a complete carcinogen. After consulting the Panel experts on this point, the Panel found that the scientific evidence did not support the conclusions reached in the Opinions. Panel Report, *US – Continued Suspension*, paras 7.538 and 7.552-7.572; and Panel Report, *Canada – Continued Suspension*, paras 7.510 and 7.520-7.540.

assessment identified constraints or uncertainties such that the risk assessment would not enable the Member to determine with a sufficient degree of precision whether an SPS measure would achieve its appropriate level of protection.<sup>987</sup> The Panel rejected this argument, finding that the appropriate level of protection of a Member and the uncertainties or constraints identified in a risk assessment do not play a role in determining whether there is a risk assessment as appropriate to the circumstances. Rather, they are factors to be considered by a Member in determining the SPS measure to be applied for achieving its appropriate level of protection.<sup>988</sup>

From the above discussion it appears that the qualifying phrase ‘as appropriate to the circumstances’ has been interpreted by panels and the Appellate Body to indicate that the *manner* of conducting a risk assessment may differ, depending on the source of the risk (e.g. chemical or pathogen), subject of the risk (human, plant or animal), product involved, and country-specific situations regarding the country of origin or destination of the product (including risk-free status and climatic conditions). What the appropriate manner of conducting a risk assessment is in a specific case is determined with reference to the opinions of scientific experts, and risk assessment techniques established by international standard-setting organisations in the area at issue. In addition, this term has been interpreted to include a *substantive* requirement, namely that the scientific evidence that is being evaluated in the risk assessment supports the conclusions of that risk assessment. For example, the risk must be evaluated according to the actual production and trade conditions, rather than laboratory conditions, so that the scientific studies actually support the conclusions come to in the risk assessment.

It seems therefore, that far from providing flexibility to Members at lower levels of development to undertake risk assessments in a manner suitable to their technical and scientific capacities, the criterion of a risk assessment ‘appropriate to the circumstances’ has been used to further tighten the already strict requirements for a risk assessment.<sup>989</sup> This makes it even more difficult for Members that lack the capacity to undertake their own risk assessments to ‘borrow’ risk assessments conducted by other Members or by international organisations. In addition, and rather worryingly, the reading given to this qualifying phrase has opened the door for an intrusive review by panels of the science evaluated in a risk assessment, to determine if the panel, assisted by the panel experts, agrees with the conclusions come to in the risk assessment.<sup>990</sup> This reading is not supported by the text of Article 5.1 of the *SPS Agreement*.

### 5.1.3 Taking into account the risk assessment techniques developed by the relevant international organisations

While the *SPS Agreement* does not mandate a particular methodology for risk assessments, it does promote some convergence in this regard by referring to international

<sup>987</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3244.

<sup>988</sup> *Ibid.*

<sup>989</sup> This is also the case with regard to the temporal dimension of the ‘appropriate to the circumstances’ criterion, identified in Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.3031-7.3032. On this point, see below, Part III, Section 5.1.5.2.

<sup>990</sup> The intrusive nature of the standard of review applied by some panels to the scientific evidence is discussed below, Part IV, Section 2.2.3.

guidelines for risk assessments. Specifically, Article 5.1 of the *SPS Agreement* provides that the risk assessment on which a measure is based must be ‘tak[e] into account risk assessment techniques developed by the relevant international organizations.’

The first question that arises is which are the ‘relevant international organizations’ referred to in this provision. This issue arose before the Panel in the *US/Canada – Continued Suspension* disputes. The Panel noted that the ‘relevant international organizations’ for purposes of Article 5.1 are not specifically identified in the *SPS Agreement*.<sup>991</sup> However, on the basis of references to the ‘three sisters’ in the Preamble and Annex A.3 to the *SPS Agreement* and Articles 3.2 and 3.4 of the *SPS Agreement*, the Panel held that the CAC constitutes a ‘relevant organization’ within the meaning of Article 5.1.<sup>992</sup> In addition, the Panel regarded the risk assessment techniques of JECFA as relevant to an analysis of compliance under Article 5.1 because, even though JECFA is not officially part of the CAC structure, it provides independence scientific expert advice to the CAC and its committees.<sup>993</sup> In particular, the Panel noted that the maximum residue levels adopted by the CAC for five of the hormones at issue in this case were based on JECFA recommendations. It can similarly be deduced that the other two international standard-setting bodies referred to in Annex A.3, namely the OIE and IPPC, are the ‘relevant organizations’ with regard to risk assessment techniques in the area of animal and plant health, respectively.

In *Australia – Salmon*, as noted above, the Panel took account of the risk assessment techniques developed by the OIE as part of its consideration of what is covered by the term ‘as appropriate to the circumstances’.<sup>994</sup> In *Japan – Apples*, however, the Panel examined this issue separately, as one of the two factors which pervade the evaluation of a risk assessment. After noting that Article 5.1 merely requires that these risk assessment techniques be ‘taken into account’, rather than that a risk assessment be ‘based on’ or ‘in conformity with’ them, the Panel found that:

...such techniques should be considered relevant, but that a failure to respect each and every aspect of them would not necessarily, *per se*, signal that the risk assessment on which the measure is based is not in conformity with the requirements of Article 5.1. Nonetheless, reference to these risk assessment techniques can provide very useful guidance as to whether the risk assessment at issue constitutes a proper risk assessment within the meaning of Article 5.1.<sup>995</sup>

<sup>991</sup> Panel Report, *US – Continued Suspension*, para. 7.446; Panel Report, *Canada – Continued Suspension*, para. 7.435.

<sup>992</sup> Panel Report, *US – Continued Suspension*, para. 7.446; Panel Report, *Canada – Continued Suspension*, para. 7.435.

<sup>993</sup> Panel Report, *US – Continued Suspension*, para. 7.447; Panel Report, *Canada – Continued Suspension*, para. 7.436. On the role of JECFA in the CAC standard-setting procedures see above, Part II, Section 3.2.1.4.

<sup>994</sup> Panel Report, *Australia – Salmon*, para. 8.71.

<sup>995</sup> Panel Report, *Japan – Apples*, para. 8.241. In this context, the Panel examined two relevant standards set by the International Plant Protection Convention, ISPM 2 on Guidelines for Pest Risk Analysis, and ISPM 11 on Pest Risk Analysis for Quarantine Pests. The parties agreed that both instruments build upon the same framework, thus the Panel focused on the key issue of whether Japan’s risk assessment sufficiently identified and assessed the possible pathways for the introduction and spread of fire blight through apple fruit and the likelihood for their being realised, as required by both instruments. *Ibid.*, para. 8.244.

It is thus clear that the risk assessment techniques developed by the relevant international organisations, while useful, are not determinative to the evaluation of whether a risk assessment complies with Article 5.1 of the *SPS Agreement*.

This issue arose again before the Panel in the *US/Canada – Continued Suspension* disputes. The panel experts, when questioned on this point, had concluded that the EC's risk assessment, contained in the Opinions of the SCVPH of 1999, 2000 and 2002, was not entirely consistent with the CAC definition of and guidelines for a risk assessment.<sup>996</sup> Recalling the finding in *Japan – Apples* cited above, the Panel in *US – Continued Suspension* stated:

This means that although the risk assessment techniques of Codex and JECFA are relevant and must be considered by the risk assessor, compliance with Codex or JECFA risk assessment techniques is not required by the *SPS Agreement*. What is required is that the risk assessor takes those techniques into account and that it complies with the other requirements of Article 5 and Annex A of the *SPS Agreement* with respect to conducting a risk assessment.<sup>997</sup>

As it was undisputed that the EC was aware of the CAC and JECFA guidelines and had considered them in preparing its risk assessment, the Panel concluded that although it had not strictly followed the risk assessment techniques of the relevant international organisations, it had taken them into account as required by Article 5.1.<sup>998</sup>

The purpose of the obligation to consider the risk assessment techniques developed by the relevant international bodies seems to be to promote regulatory learning and gradual convergence in approaches, by ensuring that Members have regard to the guidelines developed by the international bodies that have particular expertise in regulation for protection against risks from food, pests or diseases. By considering the risk assessment techniques set out in these international guidelines, Members benefit from the regulatory experience of those experts involved in the elaboration of these guidelines. However, bearing in mind that the risk assessment techniques adopted by the CAC, OIE and IPPC are not necessarily feasible for all Members, and respecting the choice of each Member to apply the risk assessment methodology it sees fit, Article 5.1 does not oblige Members to follow international guidelines in this respect.

Regardless of whether a Member finally does or does not follow the risk assessment techniques developed by the relevant international organisations, its risk assessment must still comply with the substantive requirements of Article 5.1 and Annex A.4, discussed above. There is no presumption of conformity for a risk assessment undertaken in conformity

---

<sup>996</sup> Panel Report, *US – Continued Suspension*, para. 7.463; Panel Report, *Canada – Continued Suspension*, para. 7.453. The Panels noted that there was considerable debate among the Panel experts and the parties regarding whether all the steps of a risk assessment as defined by the CAC had been followed by the EC, and whether it was in fact necessary to do so in the case of a substance which has genotoxic potential, such as oestradiol-17 $\beta$ . Panel Report, *US – Continued Suspension*, para. 7.467; Panel Report, *Canada – Continued Suspension*, para. 7.457.

<sup>997</sup> Panel Report, *US – Continued Suspension*, para. 7.468; Panel Report, *Canada – Continued Suspension*, para. 7.458.

<sup>998</sup> Panel Report, *US – Continued Suspension*, para. 7.469; Panel Report, *Canada – Continued Suspension*, para. 7.459.

with international guidelines, with the requirements of the *SPS Agreement*. This is illustrated by the finding of the compliance Panel in *Japan – Apples (Article 21.5 – US)* that the fact that the panel experts stated that Japan’s new 2004 PRA closely followed the procedural steps set out in the relevant IPPC standard, ISPM 11, did not save it from being found in violation of the substantive requirements of Article 5.1.<sup>999</sup>

#### 5.1.4 Relevant factors to be considered in assessing risk

Although the *SPS Agreement* does not specify a methodology to be used in conducting a risk assessment, it does list the scientific and economic factors that Members must take into account, in Articles 5.2 and 5.3.

Firstly, Article 5.2 provides that Members must take certain factual considerations into account when assessing risks. These are: the available scientific evidence; the relevant processes and production methods; the relevant inspection, sampling and testing methods; the prevalence of specific diseases or pests; the existence of pest- or disease-free areas; the relevant ecological and environmental conditions; and quarantine or other treatment.

In *Japan – Apples*, the Panel held that Articles 5.1 and 5.2 ‘directly inform each other, in that paragraph 2 sheds light on the elements that are of relevance in the assessment of risks foreseen in paragraph 1.’<sup>1000</sup> Consequently, ‘Article 5.2 imparts meaning to the general obligation contained in paragraph 1 to base measures on an “assessment ...of risks”.’<sup>1001</sup> According to the Panel, if a risk assessment that does not take into account the factors listed in Article 5.2 could be found to be in conformity with Article 5.1, Article 5.2 would serve no purpose. The Panel in *US – Continued Suspension* agreed with this finding and noted that a panel ‘must construe the covered agreements in a way that gives meaning to each provision’ in accordance with the principle of effective treaty interpretation.<sup>1002</sup> In *EC – Hormones*, the Panel had held that the risks relating to detection and control of failure to observe good veterinary practice should be excluded from risk assessment *a priori* because they are non-scientific and thus do not fall within the scope of Article 5.2’s provision on ‘relevant inspection sampling and testing methods’, but rather are taken into account in risk management. The Appellate Body rejected this finding, holding that the scope of Article 5.2 allowed the taking into account of these risks. The Appellate Body noted:

The listing in Article 5.2 begins with ‘available scientific evidence’; this, however, is only the beginning. We note in this connection that the Panel states

<sup>999</sup> Panel Report, *Japan – Apples (Article 21.5 – US)*, para. 8.147. The Panel therefore found it unnecessary to make a finding on whether the 2004 PRA followed the relevant procedural requirements, once it had concluded that it did not amount to a ‘risk assessment’ for purposes of Article 5.1 of the *SPS Agreement*.

<sup>1000</sup> Panel Report, *Japan – Apples*, para. 8.230.

<sup>1001</sup> *Ibid.*, para. 8.232.

<sup>1002</sup> Panel Report, *US – Continued Suspension*, para. 7.441 and footnote 546. The Panel noted that Articles 31.1 and 26 of the *Vienna Convention on Law of Treaties*, requiring good faith interpretation of treaties and good faith performance of treaty obligations militate against an assumption that ‘a provision of a treaty is written without any meaning at all.’ It also referred to the statement of the Appellate Body in *Japan – Alcoholic Beverages II*, that ‘a fundamental tenet of treaty interpretation flowing from the general rule of interpretation set out in Article 31 [of the Vienna Convention] is the principle of effectiveness (*ut res magis valeat quam pereat*)’. Appellate Body, *Japan – Alcoholic Beverages II*, 12.

that, for purposes of the EC measures in dispute, a risk assessment required by Article 5.1 is ‘a *scientific* process aimed at establishing the *scientific* basis for the sanitary measure a Member intends to take’.<sup>1003</sup> To the extent that the Panel intended to refer to a process characterized by systematic, disciplined and objective enquiry and analysis, that is, a mode of studying and sorting out facts and opinions, the Panel’s statement is unexceptionable. However, to the extent that the Panel purports to exclude from the scope of a risk assessment in the sense of Article 5.1, all matters not susceptible of quantitative analysis by the empirical or experimental laboratory methods commonly associated with the physical sciences, we believe that the Panel is in error.<sup>1004</sup>

As noted by the Appellate Body, not all the factors listed in Article 5.2 are ‘wholly susceptible of investigation according to laboratory methods of, for example, biochemistry or pharmacology.’<sup>1005</sup> In addition, it pointed out that there is nothing in Article 5.2 to indicate that it is intended to contain a closed list of factors. In a memorable and often-quoted statement, the Appellate Body held:

It is essential to bear in mind that the risk that is to be evaluated in a risk assessment under Article 5.1 is not only risk ascertainable in a science laboratory operating under strictly controlled conditions, but also risk in human societies as they actually exist, in other words, the actual potential for adverse effects on human health in the real world where people live and work and die.<sup>1006</sup>

Thus, the Appellate Body is careful to avoid unrealistic limits to the factors that may form part of a risk assessment. It recognises that Article 5.2 does not set out a closed list of factors, thereby making room for Members to incorporate ‘real world’ considerations into their risk assessments. According to the Appellate Body the reference in Article 5.2 to ‘relevant processes and production methods’ and ‘inspection, sampling and testing methods’ read with Article 8 and Annex C:<sup>1007</sup>

... is amply sufficient to authorize the taking into account of risks arising from failure to comply with the requirements of good veterinary practice in the administration of hormones for growth promotion purposes, as well as risks arising from difficulties of control, inspection and enforcement of the requirements of good veterinary practice.<sup>1008</sup>

The Appellate Body qualified its finding, however, by stating that it was not suggesting that risks from potential abuse in the administration of controlled substances or problems of control must be assessed in each and every case. Instead, their relevance must be deter-

---

<sup>1003</sup> Panel Report, *EC – Hormones (US)*, para. 8.107; Panel Report, *EC – Hormones (Canada)*, para. 8.110.

<sup>1004</sup> Appellate Body Report, *EC – Hormones*, para. 187.

<sup>1005</sup> *Ibid.*

<sup>1006</sup> *Ibid.*

<sup>1007</sup> Here the Appellate Body noted that Article 8 of the *SPS Agreement* requires Members to ‘observe the provisions of Annex C in the operation of control, inspection and approval procedures’. In Annex C, a footnote clarifies that ‘control, inspection and approval procedures include, *inter alia*, procedures for sampling, testing and certification’.

<sup>1008</sup> Appellate Body Report, *EC – Hormones*, para. 205.

mined on a case-by-case basis. What the Appellate Body regarded as ‘a fundamental legal error’ was the *a priori* exclusion of such risks from the scope of application of Articles 5.1 and 5.2.<sup>1009</sup>

While Article 5.2 has been held to be an open list, the question arises whether there are any limits to the types of considerations that may be included in a risk assessment. For example, may consumer preferences and industry interests play a role? The Appellate Body’s findings cannot be interpreted that broadly. Implicitly, the Appellate Body restricted the scope of Article 5.2 to factors relevant to the assessment of the health risk at issue. It stated:

[T]he *SPS Agreement* requires assessment of the potential for adverse effects on human health arising from the presence of contaminants and toxins in food. We consider that the object and purpose of the *SPS Agreement* justify the examination and evaluation of all such risks for human health whatever their precise and immediate origin may be.<sup>1010</sup>

Thus the *SPS Agreement* requires an assessment of the potential or likelihood for adverse effects on human, animal or plant life or health from food, pests or diseases, regardless of the origin of these risks. Factors that are relevant to assessing these health risks may be taken into account, even if not expressly listed in Article 5.2. However, factors that are not related to the health risk at issue, but rather to extraneous matters such as consumer preferences or other policy considerations, are not among the factors to be considered in a risk assessment.<sup>1011</sup>

The Appellate Body further rejected the risk assessment/risk management distinction made by the Panel, holding that it has no basis in the text of the *SPS Agreement*. As discussed above,<sup>1012</sup> it is debatable whether the denial of this distinction is correct, provided that certain risk factors are not artificially excluded for the scope of a risk assessment.

An illustration of the impact of consideration of ‘real world’ factors, such as problems of control, in assessing the risk from imported products is provided by the EC’s prohibition on the use of fishmeal in ruminant feed. In 2001, Peru raised a trade concern before the SPS Committee regarding this measure, which had a very serious impact on the Peruvian economy due to the fact that fishmeal was one of Peru’s main export products.<sup>1013</sup> Peru noted that fishmeal poses no risk from BSE for humans or animals. The EC clarified that its ban on fishmeal in ruminant feeds was due to concerns of cross-contamination of fishmeals with other animal meals that do pose BSE risks, during processing to ruminant feed in the EC. The OIE representative at the meeting drew attention to an expert conference on BSE in 2001, where discussions had highlighted the lack of technical means

<sup>1009</sup> *Ibid.*, para. 206.

<sup>1010</sup> *Ibid.*

<sup>1011</sup> This does not mean that such factors have no role to play in the regulatory process. Instead, they play a role in the policy decisions taken at the risk management stage of SPS regulation. See further below, Part III, Section 5.2.3.1.

<sup>1012</sup> See above, in the introductory paragraphs to Part III, Chapter 5.

<sup>1013</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 97.

to verify the absence of banned products in meals at very low levels, and therefore the risk of cross-contamination. The EC confirmed that its measure reflected failures in the implementation of rules on animal feed. In 2004, a new diagnostic test was developed which permitted mammalian meals to be distinguished from fish meals, eliminating the risk of cross-contamination. While the EC recognised that this new test removed the main scientific barrier to lifting the ban on fishmeal in ruminant feeds, it pointed to the reluctance of the EC Commission to reopen the feed dossier given consumer sensitivities in this area.<sup>1014</sup> While, prior to the development of the new diagnostic test, the EC's problems of control of implementation of its rules on the use of animal meals in ruminant feed seem legitimate factors to be taken into account in its risk assessment, and may reasonably support measures to avoid cross-contamination, the same cannot be said after the new test became available. The continuation of the EC's ban after the control problem was resolved was due to unfounded consumer fears. To allow baseless fears to be considered when making decisions on SPS measures would undermine the scientific disciplines of the *SPS Agreement*, and disregard the balance it tries to achieve between legitimate health protection and the liberalisation of agri-food trade.

While Article 5.2 can be regarded as an open list, it does set out a mandatory minimum list of factors that must be considered in a risk assessment, as indicated by the words 'shall take into account'. In *US – Continued Suspension*, the US argued that in drafting its risk assessment the EC had failed to take into account two of the elements listed in Article 5.2, namely the available scientific information and the relevant inspection, sampling, and testing methods.<sup>1015</sup> According to the US, as the conclusions in the EC's risk assessment were not supported by the scientific evidence, the EC must not have considered the scientific evidence when formulating its risk assessment. The Panel disagreed, holding that whether a risk assessment is supported by the scientific evidence considered is irrelevant to the question whether the relevant scientific evidence was *taken into account* when formulating the risk assessment as required by Article 5.2.<sup>1016</sup> It found:

[I]n the context of risk assessment techniques, taking available scientific evidence into account does not require that a Member conform its actions to a particular conclusion in a particular scientific study. The available scientific information may contain a multiplicity of views and data on a particular topic. It is the view of the Panel that the requirement in Article 5.2 is to ensure that a Member, when assessing risk with the aim of formulating an appropriate SPS measure, has as wide a range as possible of scientific information before it to ensure that its measure will be based on sufficient scientific data and supported by scientific principles.<sup>1017</sup>

<sup>1014</sup> *Ibid.*, item 97, para. 234. No solution has been reported to this issue.

<sup>1015</sup> Panel Report, *US – Continued Suspension*, para. 7.470-7.475.

<sup>1016</sup> *Ibid.*, para. 7.481.

<sup>1017</sup> *Ibid.*, para. 7.480. *In casu* the Panel noted that the EC's risk assessment specifically addressed the evidence available with regard to the risks at issue, including the very scientific studies that the US alleged were not taken into account. Therefore it found the EC to have taken the available scientific evidence into account as required by Article 5.2. Similarly, with regard to the question whether the EC took into account the relevant sampling, testing and inspection methods, the Panel pointed to the fact that a significant portion of the 1999 Opinion addressed this issue and that the EC had compiled a Working Document on abusive use and difficulties of control of the administration of growth hormones and had conducted on-site inspections and visits to

Clearly, thus, the obligation to ‘take into account’ the listed factors is quite different from a requirement to ensure that the measure is ‘based on’ the factors considered. By analogy to the finding of the Panel in *Japan – Apples* with regard to the requirement in Article 5.1 to take into account the risk assessment techniques of the relevant international organisations,<sup>1018</sup> or that of the Panel in *EC – Approval and Marketing of Biotech Products* with regard to the requirement to take into account the special needs of developing-country Members in elaborating SPS measures,<sup>1019</sup> it can be argued that Article 5.2 merely requires that the listed factors be considered as relevant in the risk assessment.

In addition to the factors to be considered in all risk assessments, set out in Article 5.2, Article 5.3 sets out an additional list of economic factors to be taken into account in assessing risk to *animal or plant life or health* and in determining which SPS measure should be applied. In particular, Article 5.3 provides:

In assessing the risk to animal or plant life or health and determining the measure to be applied for achieving the appropriate level of sanitary or phytosanitary protection from such risk, Members shall take into account as relevant economic factors: the potential damage in terms of loss of production or sales in the event of the entry, establishment or spread of a pest or disease; the costs of control or eradication in the territory of the importing Member; and the relative cost-effectiveness of alternative approaches to limiting risks.

This list of factors reflects the recognition of the fact that risk assessments are not purely science-based but may involve economic considerations as well. In particular, Members are obliged to consider the factors that relate to the ‘associated potential ... economic consequences’ of the risk, which is an aspect of the risk that must be evaluated under the first definition of a risk assessment, relevant to risks from pests or diseases.<sup>1020</sup> In addition, Members must consider the cost effectiveness of alternative measures, which assessment is relevant to the requirement in Article 5.6 that Members adopt the least trade-restrictive measure reasonably available, taking into account the ‘economic feasibility’ of alternative measures. In the Uruguay Round negotiations on the *SPS Agreement* the need to specify the types of economic considerations relevant to a risk assessment was stressed by some Members, which expressed concern that, in the absence of specification, Members might consider their industry interests as a relevant economic factor in a risk assessment.<sup>1021</sup>

It is significant that human health risks are excluded from this provision, making it clear that Members are entitled to prioritise human health above economic considerations when assessing risks.<sup>1022</sup> However, it is useful to recall that some human health risks fall within

---

US regulatory agencies. Therefore it had taken onto account the relevant sampling, testing and inspection methods, regardless of whether the conclusions it reached on this issue were scientifically supported. Panel Report, *US – Continued Suspension*, para. 7.483.

<sup>1018</sup> This finding is discussed above, Part III, Section 5.1.3.

<sup>1019</sup> This finding is discussed below, Part V, Section 1.1.

<sup>1020</sup> This requirement in the first definition of a risk assessment is discussed above, Part III, Section 5.1.1.3.

<sup>1021</sup> Negotiating Group on Agriculture, Working Group on Sanitary and Phytosanitary Regulations and Barriers, *Summary of Main Points Raised at the Third Meeting of the Working Group on Sanitary and Phytosanitary Regulations and Barriers: Note by the Secretariat*, MTN.GNG/NG5/WGSP/W/6, circulated on 17 October 1989, para. 3.

<sup>1022</sup> The exclusion of human health constitutes a significant amendment to the original text of the Dunkel Draft

the first definition of a risk assessment, relevant to risks from pests or diseases, which requires an evaluation of potential economic consequences of the risk, despite the fact that no examination of the Article 5.3 factors is mandated in such cases. It would seem best to resolve this incongruity, as suggested by Scott, by seeing Article 5.3 as a ‘second order’ obligation, clarifying the requirement to evaluate the potential economic consequences of a risk in the first type of risk assessment.<sup>1023</sup>

The question arises what the benefit is of the requirement that Members, in their risk assessments, ‘take into account’ the factors set out in Articles 5.2 and 5.3 of the *SPS Agreement*, if there is no corresponding obligation to ensure that the final decision on the SPS measure to be adopted reflects these considerations. Are the requirements of Articles 5.2 and 5.3 mere ‘empty proceduralism’?<sup>1024</sup> As noted by Andrew Green and Tracey Epps, procedural rules contain a significant benefit, namely that of increasing information and transparency at the domestic level. By requiring the pertinent factors to be included in the assessment of risk that underlies an SPS measure, Articles 5.2 and 5.3 ensures that regulators have at their disposal a broad range of useful information, thereby improving the possibilities for well-founded and rational decision making. In addition, these requirements place national stakeholders in a position to exert pressure to induce a rational response to the risk at issue, and thereby to counteract protectionist tendencies.

### 5.1.5 Requirement that SPS measures be based on a risk assessment

After examining what is meant by a ‘risk assessment’ for purposes of the *SPS Agreement*, it is necessary to consider the import of the obligation in Article 5.1 of the *SPS Agreement* that SPS measures be ‘based on’ such a risk assessment. As noted above, the choice of an SPS measure is a risk management decision that is taken on the basis, not only of the scientific assessment of the risk at issue, but also of policy considerations, including the available economic resources and societal value judgements. The meaning of the ‘based on’ requirement will therefore determine the room left for policy decisions in the choice of an SPS measure.

The meaning of ‘based on’ was first discussed in *EC – Hormones*.<sup>1025</sup> In this case the Panel had read a procedural requirement into the term, obliging Members to actually take a risk assessment into account when enacting or maintaining SPS measures.<sup>1026</sup> It looked

---

which referred only to ‘assessing the risk’. The final text adds the words ‘to animal or plant life or health’ after this phrase, to indicate that risks to human health are not intended here. See Terence P. Stewart, *The GATT Uruguay Round: A Negotiating History (1986–1994)*, vol. IV: The End Game (Kluwer, The Hague/London/Boston), 1999, 44. See further, above Part III, Section 1.2.2.

<sup>1023</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 104. For a detailed discussion of the problem and suggestions to regard Article 5.3 and the definitions in Annex A.4 as cumulative or alternatively as autonomous, see *ibid.*, 102–104.

<sup>1024</sup> The risk that procedural disciplines on risk assessments may amount to ‘empty proceduralism’, reducing the ability of the WTO to police protectionism, is identified in Andrew Green and Tracey Epps, ‘The WTO, Science, and the Environment: Moving Towards Consistency’, *Journal of International Economic Law* 10 (2), 2007, 285–316, 315.

<sup>1025</sup> Appellate Body Report, *EC – Hormones*, paras 188–209.

<sup>1026</sup> Thus the panel found that the EC could not rely on new scientific evidence regarding the risks posed by hormone treated beef, published in journals in 1995 and 1996, since it could not have been considered by the EC at the time of imposing the import ban. Panel Report, *EC – Hormones (US)*, para. 8.113; Panel Report

to preambles of EC Directives for evidence that this was in fact done.<sup>1027</sup> The Appellate Body in *EC – Hormones* rejected this subjective procedural requirement as having no basis in the text. It found:

The term ‘based on’, when applied as a ‘minimum procedural requirement’ by the Panel, may be seen to refer to a human action, such as particular human individuals ‘taking into account’ a document described as a risk assessment. Thus, ‘take into account’ is apparently used by the Panel to refer to some subjectivity which, at some time, may be present in particular individuals but that, in the end, may be totally rejected by those individuals. We believe that ‘based on’ is appropriately taken to refer to a certain *objective relationship* between two elements, that is to say, to an *objective situation* that persists and is observable between an SPS measure and a risk assessment. Such a reference is certainly embraced in the ordinary meaning of the words ‘based on’ and, when considered in context and in the light of the object and purpose of Article 5.1 of the *SPS Agreement*, may be seen to be more appropriate than ‘taking into account’. We do not share the Panel’s interpretative construction and believe it is unnecessary and an error of law as well.<sup>1028</sup>

The Panel had additionally found that Article 5.1 contained a substantive requirement, namely that the scientific conclusions reached in the risk assessment and those implicit in the SPS measure should *conform*.<sup>1029</sup> The Appellate Body agreed with the relevance of the relationship between the two sets of conclusions, but emphasised that this is only *one* of the relevant factors.<sup>1030</sup> It then held:

We believe that Article 5.1, when contextually read as it should be, in conjunction with and as informed by Article 2.2 of the *SPS Agreement*, requires that the results of the risk assessment must sufficiently warrant – that is to say, reasonably support – the SPS measure at stake. The requirement that an SPS measure be ‘based on’ a risk assessment is a substantive requirement that there be a rational relationship between the measure and the risk assessment.<sup>1031</sup>

The conclusion of the Appellate Body that for an SPS measure to be ‘based on’ a risk assessment there must be an ‘objective relationship’, or in other words a ‘rational relationship’, between the risk assessment and the SPS measure leaves open many questions as to what would be considered to constitute such a relationship.<sup>1032</sup> While the measure needs not ‘conform’ to the conclusions of the risk assessment, the closeness of the relationship

<sup>1027</sup> Panel Report, *EC – Hormones, (Canada)*, paras 8.116-8.119 and Panel Report, *EC – Hormones, (US)*, paras 8.113 and 8.115-8.116.

<sup>1028</sup> Appellate Body Report, *EC – Hormones*, para. 189. The Appellate Body also rejected the use of preambles as evidence as they are not required by the *SPS Agreement* and are not normally used to show that a Member has complied with its international obligations.

<sup>1029</sup> Panel Report, *EC – Hormones, (Canada)*, para 8.120 and Panel Report, *EC – Hormones, (US)*, para. 8.117.

<sup>1030</sup> Appellate Body Report, *EC – Hormones*, para. 193.

<sup>1031</sup> *Ibid.*, para. 193.

<sup>1032</sup> Note that the requirement that a risk assessment be sufficiently specific was seen by the Appellate Body in *EC – Hormones* as part of the ‘based on’ enquiry. Appellate Body Report, *EC – Hormones*, paras 198-199.

required is not clearly specified. This has implications for the extent to which a panel may reassess the scientific evidence that forms part of a Member's risk assessment.<sup>1033</sup>

The requirement that an SPS measure be 'based on' a risk assessment was again at issue in *Australia – Salmon*, but due to several errors made by the Panel, little assistance can be garnered from the findings this dispute. The Panel in this case, after having assumed that Australia's 1996 Final Report was a risk assessment meeting the requirements of Annex A.4, incorrectly identified the measure at issue as a heat-treatment requirement.<sup>1034</sup> It then found that as the 1996 Final Report made no substantive assessment of the risk or of the risk reduction related to heat-treatment requirements, the heat-treatment requirement was not based on a risk assessment.<sup>1035</sup> This finding was overturned by the Appellate Body, which held that the 1996 Final Report was not a proper risk assessment, and therefore that Australia's measure, which was in fact its import prohibition on fresh, chilled or frozen salmon, could not be seen as 'based on' a risk assessment.<sup>1036</sup> Similarly, in *Japan – Agricultural Products II*, *Japan – Apples*, and *Japan – Apples (Article 21.5 – Canada)* the fact that the scientific studies at issue were held not to be proper risk assessments within the meaning of Annex A.4 meant that the SPS measures at issue were held not to be 'based on' a risk assessment, without necessitating analysis of the meaning of 'based on'.<sup>1037</sup>

The compliance Panel in *Australia – Salmon (Article 21.5 – Canada)* had to address the question whether Australia's revised SPS measure, namely its requirement that salmonids not be released from quarantine unless they were 'consumer-ready',<sup>1038</sup> was based on its new risk assessment, the 1999 IRA. The 'consumer-ready' requirement aimed to avoid the risk that during commercial processing of imported salmonids in Australia, waste disposal of infected salmon parts could introduce diseases into Australia. However, the Panel noted that none of the panel experts could find a justification in the 1999 IRA for the 'consumer-ready' requirement. The disease agents responsible for the diseases of concern were identified as found in the viscera, head, gills, brain, skin, mucus, blood and

---

<sup>1033</sup> This issue is addressed in the discussion of the standard of review to be applied by panels below, Part IV, Section 2.2.3.

<sup>1034</sup> According to the Panel, '[f]rom a trade perspective ... the measure at issue in effect constitutes an import prohibition on, *inter alia*, fresh, chilled and frozen salmon.' However, approaching the measure from a sanitary perspective, the Panel found that the measure 'in effect imposes heat-treatment as a sanitary solution to the risk posed by the importation of salmon.' The Panel saw these two perspectives as 'two sides of a single coin' and regarded the sanitary perspective as necessary for an analysis under the *SPS Agreement*. Panel Report, *Australia – Salmon*, para. 8.95. The Appellate Body disagreed with this view of the measure at issue, holding that: 'it is not a consequence of the requirement that *smoked* salmon be heat-treated that imports of *fresh, chilled or frozen* salmon are prohibited.' Appellate Body Report, *Australia – Salmon*, para. 104.

<sup>1035</sup> Panel Report, *Australia – Salmon*, paras 8.98-8.100.

<sup>1036</sup> Appellate Body Report, *Australia – Salmon*, para. 136.

<sup>1037</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 114; Panel Report, *Japan – Apples*, para. 8.291; Appellate Body Report, *Japan – Apples*, para. 216; Panel Report, *Japan – Apples (Article 21.5 – US)*, para. 8.156.

<sup>1038</sup> A consumer-ready product was defined in Australia's measure as: 'a product that is ready for the householder to cook/consume' and this was further specified as including cutlets weighing less than 450g; skinless fillets of any weight; skin-on fillets weighing less than 450g; eviscerated, headless, pan-size fish weighing less than 450g; and any product that is processed further than the stage described above. Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.78.

kidney remnants.<sup>1039</sup> The 1999 PRA stated that evisceration, removal of head and gills and thorough washing of the external and internal surfaces of the fish to remove skin, mucus and visceral remnants would ‘significantly reduce risk’ but went on to propose, in addition, either the requirement that only approved premises (subject to waste disposal controls) be permitted to commercially process imported salmonids in Australia, or that only ‘consumer ready’ products be released from quarantine.<sup>1040</sup> The Panel was of the view that as the parts of the salmon that contained disease agents were effectively excluded from importation by the evisceration, beheading, gilling and washing requirements, and no specific explanation for the additional requirements was given in the 1999 PRA, no ‘rational relationship’ existed between the ‘consumer-ready’ requirement imposed by Australia and the 1999 PRA.<sup>1041</sup> As the 1999 PRA specifically recommended the ‘consumer-ready’ requirement, it is arguable that the SPS measure imposed by Australia was in fact firmly based on the risk assessment. What the Panel takes issue with is the risk assessment itself, and specifically its failure to explain why additional requirements are necessary despite the ability of the other requirements to ‘significantly reduce risk’.<sup>1042</sup> Considering Australia’s high appropriate level of protection, it seems likely that the conservative measures chosen aim to reduce risks to a very low level.<sup>1043</sup>

In *EC – Approval and Marketing of Biotech Products*, the Panel had to address the question whether the safeguard measures imposed by six EC Member States banning biotech products that had been approved at EC level, were ‘based on’ risk assessments. The complainants argued that, although the Member States concerned had offered reasons for their measures, pointing to shortcomings in the risk assessments conducted as part of the EC approval process or expressing general concerns with regard to risks to human health or the environment arising from the relevant biotech products, they had not put forward risk assessments meeting the requirements of Annex A.4. Instead, the only risk assessments available were those conducted by the EC scientific committees and lead competent Authorities,<sup>1044</sup> which were favourable to the biotech products at issue. Consequently, the safeguard measures could not be said to be ‘based on’ these risk assessments.<sup>1045</sup> To the contrary, the EC argued, *inter alia*, that the risk assessments carried out at the time of approval of the biotech products ‘could serve, at least temporarily, as a basis both for the original Community consent, and for the Member States provisional [safeguard] measures.’<sup>1046</sup> This argument was based on the EC’s view that as the requirement for a measure to be ‘based on’ a risk assessment does not mean that the measure must ‘conform

---

<sup>1039</sup> *Ibid.*, para. 7.80.

<sup>1040</sup> *Ibid.*, para. 7.81.

<sup>1041</sup> *Ibid.*, para. 7.88.

<sup>1042</sup> Note, however, that in its analysis of whether the requirements for a risk assessment had been met, the Panel expressly rejected Canada’s argument that the failure to assess the risk according to the SPS measure actually imposed meant that the third element of the first definition of a risk assessment had not been complied with. See above, Part III, Section 5.1.1.4. It is not clear why the Panel preferred to address this issue under the ‘based on’ requirement.

<sup>1043</sup> Australia had determined its level of protection to be ‘a high or very conservative level of protection aimed at reducing risks to very low levels’ Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.129

<sup>1044</sup> The lead Competent Authorities were the authorities of the Member State to which the application for approval of the relevant biotech product was originally submitted.

<sup>1045</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.3012-7.3013.

<sup>1046</sup> *Ibid.*, para. 7.3015.

to' that risk assessment, the same risk assessment can 'sufficiently warrant' or 'reasonably support' more than one possible SPS measure.

It was common ground between the parties that the assessments conducted by the EC scientific committees and the lead Competent Authorities were risk assessments within the meaning of Annex A.4 and Article 5.1.<sup>1047</sup> The question was thus whether the safeguard measures were 'based on' these assessments.<sup>1048</sup> The Panel agreed with the EC that the words 'based on' in Article 5.1 do not mean the same as 'conform to'.<sup>1049</sup> It accepted that a particular risk assessment can form the basis for different types of measures, in cases where a risk is determined to exist.<sup>1050</sup> It also acknowledged that the determination of whether a measure is 'based on' a risk assessment may be influenced by the fact that a Member has chosen to follow a precautionary approach in the face of uncertainties or constraints identified in the risk assessment.<sup>1051</sup> However, the Panel noted that this does not mean that 'Members are free to adopt any kind of SPS measure provided there exists a risk assessment for the product subject to the SPS measure.'<sup>1052</sup> It recalled that the term 'based on' has been interpreted by the Appellate Body to mean 'sufficiently warranted by', 'reasonably supported by' or 'rationally related to'. The Panel held therefore that the 'based on' requirement in Article 5.1 'is plainly a substantive requirement and not simply a formal requirement to accompany an SPS measure by a risk assessment.'<sup>1053</sup> However, the Member States' safeguard measures at issue simply disregarded favourable risk assessments.<sup>1054</sup> They did not identify uncertainties or constraints and explain how these justified the safeguard measures.<sup>1055</sup> According to the Panel, if it were to allow this, it would turn the conduct of risk assessments into 'a mere formality.'<sup>1056</sup>

### 5.1.5.1 Problem of differing scientific opinions

Article 5.1, together with Article 2.2, set science as the touchstone against which SPS measures are judged for validity. However, once one recognises the fallacy inherent in a notion of universal science, it becomes necessary to ask: *whose* science must measures be tested against? The same factual situation can lead to different scientific conclusions. These different scientific conclusions may be arrived at due to different choices between various scientifically plausible alternatives. This is particularly true when the

---

<sup>1047</sup> *Ibid.*, para. 7.3027. The Panel agreed with the parties on this point.

<sup>1048</sup> This question was addressed with regard to each of the safeguard measures at issue. However, as the same arguments were presented by the EC in this regard, the Panel addressed the arguments in respect of the first safeguard measure it addressed, Austria's ban on T25 maize, and referred back to these findings, *mutatis mutandis*, in its analysis of the other safeguard measures.

<sup>1049</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3067.

<sup>1050</sup> *Ibid.*, para. 7.3064.

<sup>1051</sup> *Ibid.*, para. 7.3065. In these cases, the Panel held that the Member might decide to apply an SPS measure even if another Member might not do so on the basis of the same risk assessment; or might decide to apply a stricter SPS measure than that applied by another Member to address the same risk.

<sup>1052</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3067.

<sup>1053</sup> *Ibid.*, para. 7.3067.

<sup>1054</sup> At issue here was the safeguard measure imposed by Austria with respect to T25 maize, which was adopted in disregard of the risk assessment conducted by the EC Scientific Committee on Plants and that conducted by the lead Competent Authority.

<sup>1055</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3066.

<sup>1056</sup> *Ibid.*, para. 7.3067.

science-policy decisions inherent in the assumptions, rules-of-thumb and models used to fill gaps in data differ. The science policy choices made in conducting national risk assessments reflect subjective values as risk assessors reflect on how the scientific information before them must be understood.<sup>1057</sup> Therefore the risk orientation prevalent in a Member will influence the outcome of a risk assessment, leading to the possibility that different conclusions may be drawn from the same scientific data. This situation is sometimes referred to as the problem of ‘duelling science.’<sup>1058</sup>

The question therefore arises whether, in judging the validity of an SPS measure against the scientific criteria of Articles 2.2 and 5.1, a panel should defer to the choice of scientific view made by the regulatory authorities of the Member imposing the measure, or whether it should substitute its own judgement for that of the Member.<sup>1059</sup>

An illustration of this situation is provided by the statement of one of the panel experts in *US – Continued Suspension*.<sup>1060</sup> The panel experts had been asked to evaluate the EC’s risk assessment, including its assertion that as the hormone oestradiol-17β has genotoxic potential, the fact that the doses used in growth promotion are low is irrelevant because there is no threshold for genotoxic substances. In response, one of the panel experts explained:

The EC’s statement that a threshold cannot be identified reflects their view of genotoxic mechanisms, just as the contrary statement that there is a threshold and that this threshold is above the levels found in meat residues reflects how Canada and the US view genotoxic mechanisms. Neither statement has been demonstrated by the scientific evidence, rather, they are different assumptions that each party uses in their interpretation of the available evidence.<sup>1061</sup>

In such cases, it would seem inappropriate for a panel to set itself up as the arbiter of the scientific merit of the opposing views. The subjective assumptions that are an inherent part of a risk assessment should be seen as within the competence of the regulating Member, and not subject to judicial review. There is no legitimate basis for replacing the science policy choices of a Member with those of a panel. Nevertheless, assessing the Opinions in accordance with the views of the other three panel experts that ‘there is no appreciable risk of cancer from the residues of oestradiol-17β in meat and meat products from cattle treated with the hormone for growth-promotion purposes’,<sup>1062</sup> the Panel came to the conclusion that the science did not support the conclusions in the Opinions of the SCVPH.<sup>1063</sup>

<sup>1057</sup> Andrew Green and Tracey Epps, ‘The WTO, Science, and the Environment: Moving Towards Consistency’, *Journal of International Economic Law* 10 (2), 2007, 285-316, 304.

<sup>1058</sup> For a more detailed discussion of the problem of ‘duelling science’ see above, Part II, Section 1.5.

<sup>1059</sup> A discussion on the standard of review to be applied by panels in assessing scientific evidence is found below, Part IV, Section 2.2.3.

<sup>1060</sup> Although this statement was used by the Panel in its analysis under Article 5.1, rather than Article 2.2, of the *SPS Agreement*, the same considerations with regard to science-policy choices apply in both cases.

<sup>1061</sup> Panel Report, *US – Continued Suspension*, Annex D, para. 186; Panel Report, *Canada – Continued Suspension*, Annex D, para. 186. This Annex contains the replies by the scientific experts to Panel questions.

<sup>1062</sup> Panel Report, *US – Continued Suspension*, para. 7.569.

<sup>1063</sup> *Ibid.*, para. 7.572.

Differences in scientific opinions exist not only in the varying views on the risk at issue between the parties to the dispute, but may also be found between the scientific experts conducting a particular risk assessment. In *EC – Hormones*, the Appellate Body addressed the possibility of conflicting scientific opinions in a risk assessment, and the recognised that Members may legitimately choose to rely on minority views. The Appellate Body held:

We do not believe that a risk assessment has to come to a monolithic conclusion that coincides with the scientific conclusion or view implicit in the SPS measure. The risk assessment could set out both the prevailing view representing the ‘mainstream’ of scientific opinion, as well as the opinions of scientists taking a divergent view. Article 5.1 does not require that the risk assessment must necessarily embody only the view of a majority of the relevant scientific community. ... In most cases, responsible and representative governments tend to base their legislative and administrative measures on ‘mainstream’ scientific opinion. In other cases, equally responsible and representative governments may act in good faith on the basis of what, at a given time, may be a divergent opinion coming from qualified and respected sources. By itself, this does not necessarily signal the absence of a reasonable relationship between the SPS measure and the risk assessment, especially where the risk involved is life-threatening in character and is perceived to constitute a clear and imminent threat to public health and safety. Determination of the presence or absence of that relationship can only be done on a case-to-case basis, after account is taken of all considerations rationally bearing upon the issue of potential adverse health effects.<sup>1064</sup>

In *EC – Hormones*, a single scientist, Dr. Lucier, was of the opinion that using oestrogen for growth promotion could raise the risk of breast cancer by up to one in one million. His opinion was deemed, by the Panel and Appellate Body, to be of insufficient weight to overturn the contrary results of the other studies referred to by the EC (which confirmed the safety of the hormones at issue), as it was not based on studies, carried out by him or under his supervision, specifically focused on hormone residues in meat from cattle on which such hormones were used for growth promotion purposes.<sup>1065</sup> It was rejected for these reasons, rather than because it was a minority opinion. This does not necessarily imply, however, that if his opinion had been sufficiently specific, it would necessarily have been regarded as a rational basis for the EC’s measure despite the contrary majority opinion. While the Appellate Body’s finding does not make clear within which limits minority opinions may be relied upon, aside from specifying that they must come from ‘qualified and respected sources’, some further guidelines can be gleaned from later cases.

The compliance Panel in *Japan – Apples (Article 21.5 – Canada)* considered whether new scientific studies, presented by Japan in support of its revised measure against the risk of fire blight, could be considered a ‘minority opinion’ on which Japan was entitled to rely.<sup>1066</sup> Japan argued that the new studies used in its 2004 PRA dealt with all the issues

---

<sup>1064</sup> Appellate Body Report, *EC – Hormones*, para. 194.

<sup>1065</sup> *Ibid.*, para. 198.

<sup>1066</sup> Panel Report, *Japan – Apples (Article 21.5 – Canada)*, para. 8.146.

raised by the experts before the original Panel.<sup>1067</sup> Although the panel experts before the compliance Panel confirmed that these new studies were scientific in nature and closely followed the procedural steps set out by the IPPC in ISPM 11, they did not agree with the conclusions in these studies. In particular, they regarded the studies as reflecting ‘laboratory conditions’ as opposed to ‘real world conditions’, namely orchard conditions and commercial practice.<sup>1068</sup> As a result, the Panel considered that the new studies did not objectively support what Japan wanted to demonstrate, namely that mature apples could be latently infected and that the transmission pathway for fire blight was ‘likely to be completed in real conditions.’<sup>1069</sup> As a result, these studies could not ‘be assimilated to a minority opinion’ in the Panel’s view.<sup>1070</sup>

In *EC – Approval and Marketing of Biotech Products*, the question arose whether an SPS measure could be said to be based on a ‘divergent opinion’ in a risk assessment if that risk assessment set out a single opinion with which the Member concerned disagreed. The Panel clarified that, to the extent that Members disagree with some or all of the conclusions contained in such a risk assessment:

it would in [the Panel’s] view be necessary for Members to explain, by reference to the existing assessment, how and why they assess the risks differently, and provide their revised or supplemental assessment of the risks.<sup>1071</sup>

It is clear, therefore, that the flexibility for divergent opinions read by the Appellate Body into the obligation to base an SPS measure on a risk assessment does *not* make room for Members to merely disregard those risk assessments they disagree with and consider their own opinion a ‘divergent opinion’. Instead, they may offer an alternative risk assessment that diverges from the one they disagree with, and supports their view.

While concerns have been raised that the Appellate Body’s approach has left intact the issue of duelling science and has opened the door for the use of ‘hired scientists’ in future dispute settlement cases,<sup>1072</sup> this seems unlikely. It should be recognised that the Appellate Body’s approach is the only realistic one that could be taken in the light of the lack of consensus that often exists within the scientific community with respect to risks. Respect for Members’ right to choose their appropriate levels of protection implicitly includes allowing them to make policy decisions regarding the choice among conflicting scientific views. The careful examination of what has been proffered as a ‘minority opinion’ in subsequent cases indicates that the scope for misuse is recognised by panels and guarded against. A proper, alternative risk assessment is required, and is subject to the same rigorous review as is usually applied by panels to risk assessments.

Certainly the vigilant approach of panels in this regard is to be applauded. A divergent opinion must meet the normal requirements of a risk assessment to be considered as such. Nevertheless, as is the case with all reviews of scientific evidence by panels, not only in

<sup>1072</sup> Dale E. McNiel, ‘The First Case under the WTO’s Sanitary and Phytosanitary Agreement: The European Union’s Hormone Ban’, *Virginia Journal of International Law* 39, 1998, 89-134, 134.

the case of divergent opinions, it is argued in this book that care must be taken by panels not to undertake a new risk assessment. It is recommended that a panel should limit its enquiry, also in cases where scientific dissent regarding the issue at hand is present as evinced by the presence of a good faith difference of opinion among scientists, to the plausibility of the view relied upon by the Member imposing the measure. If there is reputable scientific support for the Member's measure, it should be held to be based on a risk assessment, even if the panel might have chosen the opposing scientific view or finds it more convincing.<sup>1073</sup>

In practice, as seen in the previous discussion, the positions taken by panels and the Appellate Body to scientific evidence do not indicate deference to national scientific assessments. While the Appellate Body has shown greater deference to national choices than panels, recognising the right of regulatory health authorities to rely on minority opinions and to act with caution in life-threatening situations, it reserves for panels the ability to rule on the quality and weight of the scientific evidence. As will be seen below,<sup>1074</sup> this has opened the door for a very intrusive standard of review applied by panels in their assessment of the scientific evidence, undermining the trade/health balance sought by the *SPS Agreement*.

#### 5.1.5.2 Problem of evolving science

Science is inherently in a state of flux. Scientific conclusions with regard to the existence and extent of SPS risks are continuously being updated in the light of scientific developments. The situation could therefore arise that an SPS measure is based on a risk assessment that is subsequently invalidated by new scientific findings. Similarly, an SPS measure not based on a risk assessment at the time of its adoption could be supported by new risk assessments undertaken later.

It is thus important, first, to determine *when* the risk assessment needs to have been made in order for a measure to be 'based' thereon. Obviously there are a multitude of SPS measures which were in existence long before the coming into force of the *SPS Agreement*.<sup>1075</sup> It is likely that many of these were not based on a risk assessment, particularly in Members whose resources are too scarce to permit them routinely to undertake thorough risk assessments before enacting SPS measures. With respect to the risk assessment requirement for SPS measures enacted *before* the entry into force of the *SPS Agreement*, the Panel in *EC – Hormones* noted:

[Article 5.1] does not prevent that with respect to a sanitary measure enacted *before* the entry into force of the *SPS Agreement*, the risk assessment is carried out or invoked *after* the entry into force of that Agreement (and thus *after* the enactment of the sanitary measure in question). However, the fact that a sanitary measure may be enacted *before* the entry into force of the *SPS Agreement* does

<sup>1073</sup> See in this regard Vern R. Walker, 'Keeping the WTO from Becoming The "World Trans-Science Organization": Scientific Uncertainty, Science Policy, and Factfinding in the Growth Hormones Dispute', *Cornell International Law Journal* 31, 1998, 251-320, 280.

<sup>1074</sup> See Part IV below, where the intrusive nature of the standard of review currently applied is examined.

<sup>1075</sup> The temporal scope of application of the *SPS Agreement* is discussed above, Part III, Section 2.3.

not mean that, once the *SPS Agreement* entered into force, there is no obligation for the Member in question to base that measure on a risk assessment.<sup>1076</sup>

The Appellate Body in that case confirmed this finding,<sup>1077</sup> but recognised the burden that this could impose on Members due to the many SPS measures that were already in existence at the time of entry into force of the *SPS Agreement*. As stated above, it regarded the stipulation in Article 5.1 that SPS measures must be based on a risk assessment, *as appropriate to the circumstances* as giving Members ‘a certain degree of flexibility in meeting the requirements of Article 5.1.’<sup>1078</sup> The form this flexibility would take was not specified, however.

A related issue which arises is whether new scientific evidence that comes to light after the adoption of the SPS measure at issue can be taken into account as constituting the risk assessment on which the measure is based. The Appellate Body in *EC – Hormones* addressed this situation, in an aside. It rejected the Panel’s ‘minimum procedural requirement’ read into the question of whether a measure is ‘based on’ a risk assessment, which obliged a Member imposing an SPS measure to submit evidence that it actually took into account a risk assessment *when it enacted or maintained* its SPS measure.<sup>1079</sup> The Appellate Body stated that this procedural requirement ‘could well lead to the elimination or disregard of available scientific evidence that rationally supports the SPS measure being examined.’<sup>1080</sup> According to the Appellate Body, this risk of exclusion of available scientific evidence could be particularly important for the bulk of SPS measures which were put in place before the entry into force of the *SPS Agreement* and that have been ‘simply maintained thereafter’.<sup>1081</sup>

The question of whether an SPS measure could be regarded as ‘based on’ a risk assessment finalised *after* its entry into force was at issue before the compliance Panel in *Australia – Salmon (Article 21.5 – Canada)*. Canada had claimed that the new Australian measure could not be said to be based on a risk assessment, because the publication of the new measure on 19 July 1999, *preceded* the publication in its final form, on 12 November 1999, of Australia’s new risk assessment, the 1999 IRA. The compliance Panel referred back to the finding in the original dispute that it is the scientific and technical content of the studies submitted to the Panel that is relevant, not their administrative status (i.e. as official government reports or not).<sup>1082</sup> The compliance Panel applied this same approach to the 1999 PRA. It noted that although the 1999 PRA was only edited and published in book form on 12 November 1999, it was announced in July 1999, i.e. before the new measures were adopted. All the substantive elements of the risk assessment were already contained in the draft IRA of July 1999 and the amendments in the final report

---

<sup>1076</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.102; Panel Report, *EC – Hormones (US)*, para. 8.99.

<sup>1077</sup> The Panel in *Australia – Salmon* also followed this approach, stating that Article 5.1 places no qualification on the application in time of the substantive obligation on Members to base their sanitary measures on a risk assessment. Panel Report, *Australia – Salmon*, para. 8.56.

<sup>1078</sup> Appellate Body Report, *EC – Hormones*, para. 129.

<sup>1079</sup> Panel Report, *EC – Hormones (US)*, para. 8.113; Panel Report, *EC – Hormones (Canada)*, para. 8.116.

<sup>1080</sup> Appellate Body Report, *EC – Hormones*, para. 190.

<sup>1081</sup> *Ibid.*

<sup>1082</sup> Panel Report, *Australia – Salmon*, para. 8.136.

did not ‘alter the substance or the conclusions of the report as announced on 19 July.’<sup>1083</sup> Therefore the later publication of the final version of the 1999 IRA did not preclude Australia’s measures from being ‘based on’ this IRA.<sup>1084</sup> A similar situation arose before the compliance Panel in *Japan – Apples (Article 21.5 – US)*, where Japan’s 2004 PRA was adopted in September 2004, postdating the adoption of its SPS measure on 30 June 2004. As the Panel found no substantive difference the draft version of the PRA completed in mid-June of that year, i.e. before the adoption of the SPS measure at issue, and the final version adopted in September 2004, it held that the later adoption did not preclude Japan’s measure from being ‘based on’ the 2004 PRA.<sup>1085</sup>

It is thus clear that although the fact that an SPS measure predates the entry into force of the *SPS Agreement* will not excuse the Member imposing the measure from the obligation of (later) basing the measure on a risk assessment, the final adoption of this risk assessment does not have to precede the enactment of the SPS measure. However, it does appear that a compliance panel will examine whether a risk assessment existed at the time the new SPS measure was adopted in compliance with a DSB ruling, although the final version of the risk assessment need not have been published before the enactment of the measure.

Developments in the scientific evidence regarding a particular risk can operate not only to provide more support for the SPS measure imposed, but also to invalidate the risk assessment on which a measure is based. The question therefore arises whether the scientific disciplines of the *SPS Agreement* include the obligation to continuously review the scientific basis for SPS measures in the light of advances in scientific evidence.<sup>1086</sup> In *Japan – Apples*, Japan argued that the conformity of its risk assessment, the 1999 PRA, with Article 5.1 should be assessed only in the light of the information available at the time when the PRA was conducted.<sup>1087</sup> The Panel disagreed, holding that the PRA was already four years old at the time it was reviewed by the Panel. According to the Panel:

[S]ome assessment of the subsequent evolution of the scientific evidence is not only acceptable, it is also necessary, if only to monitor the development of any new evidence which might require a revision of the risk assessment.<sup>1088</sup>

The Panel emphasised the need to bear in mind the purpose of a risk assessment, namely to serve as a basis for regulatory actions. It noted that an evolution in the scientific evidence might be an indication that a review of the risk assessment, or a new risk assess-

---

<sup>1083</sup> *Ibid.*, para. 7.77.

<sup>1084</sup> *Ibid.*

<sup>1085</sup> Panel Report, *Japan – Apples (Article 21.5 – US)*, para. 8.155.

<sup>1086</sup> It is interesting to note that the *TBT Agreement*, unlike the *SPS Agreement*, explicitly requires regard to changed circumstances with respect to the maintenance of measures. Specifically, Article 2.3 of the *TBT Agreement* states: ‘Technical regulations shall not be maintained if the circumstances or objectives giving rise to their adoption no longer exist or if the changed circumstances or objectives can be addressed in a less trade-restrictive manner.’ Such an *express* reference to changed circumstances is absent from the obligation in Article 2.2 of the *SPS Agreement* not to maintain SPS measures without sufficient scientific evidence.

<sup>1087</sup> Panel Report, *Japan – Apples*, para. 7.11. This argument was made during the interim review stage of the panel proceedings.

<sup>1088</sup> *Ibid.*, para. 7.12.

ment, is needed.<sup>1089</sup> The Panel also pointed to the legal inconsistency that would arise if the obligation in Article 2.2 to ensure that an SPS measure not be maintained without sufficient scientific evidence would be taken to require a measure to be based on sufficient scientific evidence at the time of the Panel's assessment, yet it would be accepted that risk assessments need not be reviewed in the face of new evidence.<sup>1090</sup> The Panel was therefore willing to consider evidence subsequent to Japan's 1999 PRA in assessing whether Japan had complied with Article 5.1 of the *SPS Agreement*.<sup>1091</sup> On appeal against the Panel's finding that its 1999 PRA was inconsistent with Article 5.1, Japan argued that its 1999 PRA should have been reviewed only against the information available at the time it was conducted.<sup>1092</sup> However, Japan did not bring evidence to persuade the Appellate Body that the Panel had, in fact, relied on scientific evidence not available to Japan at the time it conducted its risk assessment when analysing the conformity of the 1999 PRA with Article 5.1.<sup>1093</sup> The Appellate Body therefore found it unnecessary to express its views on the question whether the conformity of a risk assessment with Article 5.1 should be evaluated solely against the scientific evidence available at the time the risk assessment was conducted, or could take into account later scientific developments.<sup>1094</sup> Whether such an evaluation of a risk assessment in light of the subsequent evolution in science is permissible therefore awaits clarification by the Appellate Body.

The Panel in *EC – Approval and Marketing of Biotech Products*,<sup>1095</sup> confused the issue by conflating the question whether risk assessments postdating the adoption of the SPS measure could be relied upon as the scientific basis for the measure with the related question of whether an evolution in science subsequent to a risk assessment can be used to challenge the validity of the risk assessment. When examining whether the various safeguard measures of the EC Member States were based on a risk assessment, the Panel

<sup>1089</sup> *Ibid.*

<sup>1090</sup> *Ibid.* Japan had indicated, in response to the questions of the Panel, that it did support this interpretation with regard to Article 2.2 of the *SPS Agreement*.

<sup>1091</sup> *Ibid.*, para. 8.248.

<sup>1092</sup> Appellate Body Report, *Japan – Apples*, para. 210.

<sup>1093</sup> *Ibid.*, paras 213-214.

<sup>1094</sup> *Ibid.*, para. 215.

<sup>1095</sup> It is interesting to note that the Panel in *EC – Approval and Marketing of Biotech Products* also addressed the question of the effect of an evolution in science on the obligation under Article 5.1 in a letter it sent to the parties clarifying the implications of some of its findings. This letter, unprecedented in WTO proceedings, was sent by the Panel due to the fact that the interim Panel report had been leaked to the public, which had led to some of the panel findings 'inadvertently or on purpose' being misconstrued. In this letter, the Panel stated, *inter alia*, that its findings under Article 5.1 of the *SPS Agreement* 'preserve the freedom of Members to take prompt protective action in the event that new or additional scientific evidence becomes available which affects their risk assessments.' According to the Panel, if new scientific evidence 'provides grounds for considering that the use or consumption of a product might constitute a risk to human health and/or the environment, a Member might need expeditiously to re-assess the risks to human health and/or the environment. Initially at least, an expedited re-assessment of relevant risks might be "appropriate to the circumstances" and might provide a basis for a different SPS measure or for an SPS measure where none has been applied before.' The Panel stressed, however, that such an expedited re-assessment might later become no longer 'appropriate to the circumstances' in the case that 'further and more thorough and elaborate analysis of the new or additional scientific evidence, as such and together with other available evidence, was possible and indicated, and such analysis would have shown that the conclusions of the initial, expedited re-assessment of relevant risks is no longer valid.' Panel Reports, *EC – Approval and Marketing of Biotech Products*, Annex K, para. (c). The Panel reports expressly state that this letter of the Panel 'is not part of the Panel's findings and is not intended to modify them in any way.' *Ibid.*, footnote 170.

was faced with the question ‘whether the maintenance of the relevant safeguard measures may be justified both by reference to risk assessments which were carried out before these measures were adopted and by reference to risk assessments which were carried out after these measures were adopted.’<sup>1096</sup> It noted that the issue is not specifically addressed in Article 5.1, but found that it is clear that SPS measures must be based on a risk assessment ‘throughout the period of time for which these measures are maintained.’<sup>1097</sup> According to the Panel, therefore, the appropriate moment at which to assess whether the SPS measure at issue was based on a risk assessment is the date of the establishment of the panel.<sup>1098</sup> It further stated:

Also relevant to our inquiry is the requirement that a risk assessment be “appropriate to the circumstances”. The phrase “as appropriate to the circumstances” is unqualified as far as its temporal scope is concerned. Notably, Article 5.1 does not say “as appropriate to the circumstances existing at the time of adoption of such measures”, or “as appropriate to the circumstances existing at the time of the assessment”. We think it may be inferred from the absence of any temporal limitation that at any given time, SPS measures must be based on an assessment of risks which is appropriate to the circumstances existing at that time. Indeed, this is consistent with the fact that relevant circumstances may change over time. A change in relevant circumstances may have an impact on a completed risk assessment and the validity of its conclusions. If and when a change in relevant circumstances affects the continued relevance and validity of a completed risk assessment, that assessment would, in our view, no longer constitute an assessment “appropriate to the circumstances”.<sup>1099</sup>

As pointed out by Joanne Scott, there is an obvious flaw in this reasoning.<sup>1100</sup> While the question set out by the Panel is whether SPS measures can be *justified* by reference to later risk assessments, the answer it gives allows a measure to be *challenged* on the basis of a later risk assessment that affects the continued validity of the assessment on which it was originally based. While both of these issues relate to the recognition of the evolving nature of science, they have quite different implications.

To allow a Member to rely on later risk assessments, in existence at the time that its SPS measure is challenged before a panel, provides much needed flexibility, particularly in the light of the manifold of SPS measures in existence before the obligation to base them on a risk assessment came into effect. On the contrary, to permit challenges to an SPS measure that was properly based on a risk assessment at the time of its adoption, but whose reliance on this risk assessment has been called into question by later scientific developments, imposes an onerous obligation on Members to continuously review all

<sup>1096</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3029.

<sup>1097</sup> *Ibid.*, para. 7.3030.

<sup>1098</sup> *Ibid.*, para. 7.3034. Consequently the Panel was willing to take into account evidence postdating the imposition of the safeguard measures relied upon by the EC, to the extent that it had been published prior to the establishment of the Panel.

<sup>1099</sup> *Ibid.*, para. 7.3031.

<sup>1100</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 125.

their SPS measures in the light of new scientific developments.<sup>1101</sup> While such a dynamic interpretation of the scientific obligations of the *SPS Agreement* may induce high-quality risk regulation that is up-to-date with the latest scientific advances at any given point in time, this does not correspond to the reality of the regulatory process. While high-income Members that have significant scientific capacity and financial resources typically do engage in periodic review of their existing SPS measures in response to changes in circumstances, including new scientific understandings, this review is not permanently ongoing for all measures in place. For most other Members, the capacity needed not only to have a sound risk assessment in place for every SPS measure, but also to review this assessment regularly, is a distant hope.

## 5.2 Risk management

Risk management, as explained above, entails policy decision-making regarding the level of protection that a country wants to secure in its territory *and* the measure it will use to achieve this level of protection. The WTO Secretariat has explained risk management as follows:

Risk management involves a number of steps. These include, *inter alia*, decisions regarding the acceptable level of risk; identification of possible options to reduce or eliminate the identified risk; evaluation and selection among these options; implementation of the selected measures, as appropriate; and monitoring and control of the effectiveness of the selected measure.<sup>1102</sup>

These choices are based on both scientific evidence and other considerations such as technical and economic feasibility, societal value judgments and the effect on the regulated industry. The *SPS Agreement* gives national regulators substantial latitude in making risk management decisions, but there are certain non-scientific disciplines in place to ensure that the adverse trade effects of these decisions are limited as much as possible.<sup>1103</sup>

---

<sup>1101</sup> Joanne Scott argues that while the obligation of Article 5.1 should be interpreted as static, the obligation of Article 2.2 should be regarded as dynamic, requiring Members ‘to track new scientific developments, and to revise their measures in so far as these developments threaten to undermine the scientific premises upon which existing measures rest.’ *Ibid.*, 126. In other words, she argues that the fact that an SPS measure was based on a risk assessment at the time of its adoption should protect it from challenges under Article 5.1, but not those under Article 2.2. While this would make sense conceptually, due to the fact that Article 2.2 refers to the obligation not to ‘maintain’ an SPS measure without sufficient scientific evidence, indicating a continuous obligation, in practice it still leads to a heavy compliance burden on Members in respect of monitoring scientific developments and reviewing their measures accordingly.

<sup>1102</sup> Committee on Sanitary and Phytosanitary Measures, *Risk Analysis. Note by the Secretariat*, G/SPS/W/80, circulated on 6 March 1997, para. 8.

<sup>1103</sup> It should not be forgotten, however, that the scientific disciplines in Articles 2.2 and 5.1 of the *SPS Agreement* entail a particular relationship between the scientific evidence and the SPS measure applied. In other words, they necessarily have implications for the choice of SPS measure, a risk management decision. While the link required between the measure and the science has been clarified to be that of a ‘rational relationship’, as discussed above, the strictness with which this criterion has been applied limits the possibilities for consideration of non-science factors in the choice of an SPS measure.

### 5.2.1 Concept of an appropriate level of protection

A Member's 'appropriate level of protection' is defined in Annex A.5 of the *SPS Agreement* as '[t]he level of protection *deemed appropriate by the Member* establishing a sanitary or phytosanitary measure to protect human, animal or plant life or health within its territory.'<sup>1104</sup> Thus, the *SPS Agreement* recognises Members' right to choose their own appropriate level of protection, or in other words to freely decide what standard of sanitary and phytosanitary protection they will aim at with their SPS measures.

The determination of an appropriate level of protection (risk management) must be clearly distinguished from the evaluation of risk (risk assessment), which is subject to scientific disciplines. This was not done by the Panel in *Australia – Salmon* which held:

We consider that a risk assessment, on which to base an import prohibition in accordance with Article 5.1, cannot be premised on the concept of 'zero risk'. Otherwise, all import prohibitions would be based on a risk assessment since there is a risk (i.e., a *possibility* of an adverse event occurring), however remote, associated with most (if not all) imports.<sup>1105</sup>

The Appellate Body in that case, on the contrary, noted as follows:

[I]t is important to distinguish -- perhaps more carefully than the Panel did -- between the evaluation of 'risk' in a risk assessment and the determination of the appropriate level of protection. As stated in our Report in *European Communities – Hormones*, the 'risk' evaluated in a risk assessment must be an ascertainable risk; theoretical uncertainty is 'not the kind of risk which, under Article 5.1, is to be assessed.' This does not mean, however, that a Member cannot determine its own appropriate level of protection to be 'zero risk'.<sup>1106</sup>

Clearly, once it is established that there is scientific evidence of risk, Members are free to choose their own appropriate level of protection against this risk. The choice of a particular level of protection is what is typically called a risk management decision. Such decisions are taken by national administrations on grounds of societal value judgements on issues such as what level of risk is considered acceptable in society and what is technically and economically feasible, not purely on the basis of scientific analysis of risk. In other words, once it has scientifically been established that an SPS risk exists and what the magnitude of that risk is, by means of a risk assessment, other policy issues come into play in the actual crafting of the regulation. The decision on an appropriate level of

<sup>1104</sup> Emphasis added. A Note to this definition adds that '[m]any Members otherwise refer to this concept as the "acceptable level of risk".' As mentioned above, during the negotiations leading to the drafting of the *SPS Agreement*, there was some disagreement on the best use of terminology on this point. While some Members preferred 'acceptable level of risk', others were of the view that this term creates the impression that risk is acceptable. In addition there was much confusion between the concept of the determination of an 'acceptable level of risk' and a risk assessment, with some Members using the terms interchangeably. In the end, the term 'acceptable level of protection' was chosen for use in the *SPS Agreement* with the clarification in the Note to the definition of this term with regard to the difference in usage in some Members. See above, Part III, Section 1.2.2.

<sup>1105</sup> Panel Report, *Australia – Salmon*, para. 8.81.

<sup>1106</sup> Appellate Body Report, *Australia – Salmon*, para. 125.

protection is at core a political one, reflecting societal value choices. The *SPS Agreement* recognises this, by placing no requirement of establishing a scientific basis on the choice of the appropriate level of protection. Neither does it place any restrictions on the types of factors that Members may consider when deciding on their choice of level of protection. Thus divergent national health measures result even where the scientific basis for the measures is same everywhere.<sup>1107</sup>

In some cases, the choice by a Member of a very high level of protection leads to serious adverse economic consequences for its trading partners. This is particularly the case for exporting Members at lower levels of development, which may depend on the affected export product for their foreign revenue. An example of this is provided by the UK's ban on kava-kava from Fiji in 2005.<sup>1108</sup> The UK's measure was taken in response to a request by the UK Commission on the Safety of Medicines, on the grounds that it had sufficient evidence to show that kava-kava was associated with rare cases of liver toxicity. Fiji pointed out that kava-kava is one of its few tradable crops of economic significance. It pointed to scientific findings that showed that, should toxicity exist, it would occur in an extremely low number of patients.<sup>1109</sup> The EC pointed out that the ban on kava-kava was in response to reports of rare but serious risks to public health.<sup>1110</sup> In such cases, under the regime of the *SPS Agreement*, if the risk is scientifically established, a Member is free to choose the level of protection that it deems appropriate, even if this level is very conservative.

However, the choice of an appropriate level of protection is not entirely undisciplined. The rules applicable to the choice of an appropriate level of protection are set out in Articles 5.4 and 5.5 of the *SPS Agreement*.

### 5.2.2 The objective of minimising negative trade effects

The first provision in the *SPS Agreement* addressing a Member's choice of an appropriate level of protection is contained in Article 5.4, which provides:

Members should, when determining the appropriate level of sanitary or phytosanitary protection, take into account the objective of minimizing negative trade effects.

The use of the word 'should' rather than 'shall' indicates that this is not a mandatory provision but rather a recommendation. In addition, Members are only encouraged to 'take into account' minimising adverse trade effects as an *objective*. They are thus not obliged

---

<sup>1107</sup> Jeffery Atik, 'Symposium - Institutions for International Economic Integration: Science and International Regulatory Convergence', *Journal of International Law and Business* 17, 1997, 736-758, 737.

<sup>1108</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 220. Kava-kava (*Piper methysticum*) is made from the root of the kava plant, dried and milled to powder form. It is traditionally used to make a drink with tranquilizing properties. It is now marketed in the developed countries as a herbal medicine against stress and insomnia.

<sup>1109</sup> According to Fiji, out of the 450 million kava-kava pills exported all over the world between 1990 and 2000, only three cases of liver problems had been reported.

<sup>1110</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 29-30 June 2005. Note by the Secretariat. Revision*, G/SPS/R/37/Rev.1, circulated on 18 August 2005, paras 72-73.

to lower their level of protection, even where this would be the most trade efficient option. The Panel in *EC – Hormones* noted the following in respect of Article 5.4:

Guided by the wording of Article 5.4, in particular the words ‘should’ (not ‘shall’) and ‘objective’, we consider that this provision of the *SPS Agreement* does not impose an obligation. However, this objective of minimizing negative trade effects has nonetheless to be taken into account in the interpretation of other provisions of the *SPS Agreement*.<sup>1111</sup>

The ‘other provisions’ where this hortatory provision may be of relevance, seem limited to Article 5.5, discussed below, which is the only other discipline on Members’ appropriate level of protection. Still, the effect it may have on the interpretation of this provision is not yet clear.

### **5.2.3 Avoidance of arbitrary or unjustifiable distinctions in appropriate levels of protection**

The second discipline contained in the *SPS Agreement* that applies to a Member’s choice of an appropriate level of protection is found in Article 5.5. Unlike Article 5.4, Article 5.5 of the *SPS Agreement* contains binding obligations on Members. Article 5.5 can be seen as an elaboration of the basic non-discrimination obligation contained in Article 2.3 of the *SPS Agreement* and must be read together with this provision.<sup>1112</sup> It builds upon the general non-discrimination obligation of Article 2.3 and applies it specifically to the case of the choice by a Member of its appropriate level of protection. Article 5.5 provides:

With the objective of achieving consistency in the application of the concept of appropriate level of sanitary or phytosanitary protection against risks to human life or health, or to animal and plant life or health, each Member shall avoid arbitrary or unjustifiable distinctions in the levels it considers to be appropriate in different situations, if such distinctions result in discrimination or a disguised restriction on international trade. Members shall cooperate in the Committee, in accordance with paragraphs 1, 2 and 3 of Article 12, to develop guidelines to further the practical implementation of this provision. In developing the guidelines, the Committee shall take into account all relevant factors, including the exceptional character of human health risks to which people voluntarily expose themselves.

It is necessary to determine what precisely the discipline embodied in Article 5.5 entails. Article 5.5 comprises two distinct elements, namely:

- the *goal* (for the future) of achieving consistency in the application of the ‘concept’ of appropriate level of sanitary or phytosanitary protection;<sup>1113</sup> and

---

<sup>1111</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.169; Panel Report, *EC – Hormones (US)*, para. 8.166.

<sup>1112</sup> The relationship between Article 5.6 and Article 2.3 is discussed above, Part III, Section 3.2.2.

<sup>1113</sup> As set out below, in *EC – Hormones* the Appellate Body agreed with the Panel that no legal obligation of consistency in levels of protection exists, but that consistency in levels of protection is only a goal for the future. Appellate Body Report, *EC – Hormones* para. 213.

- the *legal obligation* to avoid arbitrary or unjustifiable distinctions in the levels of protection deemed appropriate in different situations, *if* these distinctions lead to discrimination or disguised restrictions on trade.

Members are further obliged to co-operate in the SPS Committee to develop guidelines for the practical implementation of this provision.<sup>1114</sup> These aspects of Article 5.5 are now discussed in turn.

### 5.2.3.1 Goal of consistency in appropriate levels of protection

With regard to the first element of Article 5.5, the following clarification was given by the Appellate Body in *EC – Hormones*:

The objective of Article 5.5 is formulated as the ‘achieving [of] consistency in the application of the concept of appropriate level of sanitary or phytosanitary protection’. Clearly, the desired consistency is defined as a goal to be achieved in the future. To assist in the realization of that objective, the Committee on Sanitary and Phytosanitary Measures is to develop *guidelines for the practical implementation of Article 5.5*, bearing in mind, among other things, that ordinarily, people do not voluntarily expose themselves to health risks. Thus, we agree with the Panel’s view that the statement of that goal [consistency] does not establish a *legal obligation* of consistency of appropriate levels of protection.<sup>1115</sup>

The Appellate Body further recognised that Members establish their levels of protection *ad hoc* as risks arise, thus absolute consistency in levels of protection is not realistic, and also not the goal set forth in Article 5.5.<sup>1116</sup> Only arbitrary or unjustifiable inconsistencies are to be avoided.

This finding reflects sensitivity by the Appellate Body to the realities of risk regulation and the role of risk management decisions therein. As stated above, the choice of an appropriate level of protection, as an element of the risk management aspect of the regulatory process, is based not only on the outcome of a risk assessment but also on policy considerations. These policy considerations are manifold and involve delicate balancing between the various societal interests involved. Therefore, a level of protection chosen in a particular situation is not simply a function of the identified risk. If this were so, it would make sense to require absolute consistency in levels of protection chosen in the face of similar risks. However, in reality, other considerations, including consumer preferences, economic resources, policy priorities and industry interests play a legitimate role in the choice of a particular level of protection in a specific situation.

A consideration that plays an important role in distinctions in levels of protection applied in the face of comparable risks in Members at lower levels of development is that of the SPS requirements applicable on their export markets. In many cases, the high level of

<sup>1114</sup> These guidelines have been adopted, and are contained in Committee on Sanitary and Phytosanitary Measures, *Guidelines to Further the Practical Implementation of Article 5.5*, G/SPS/15, circulated on 18 July 2000. They are discussed further below, Part III, Section 5.2.3.5.

<sup>1115</sup> Appellate Body Report, *EC – Hormones*, para. 213.

<sup>1116</sup> *Ibid.*

SPS protection aimed at with regard to a particular product, in contrast to much lower levels of protection against similar health risks in other products, is motivated by the exigencies of the export market. These atypically high levels of protection affect not only the domestic industry producing the export products, something which is irrelevant for purposes of the *SPS Agreement*, but also have implications for the SPS requirements set for imported inputs used in the production process. An example of this situation is provided by Mauritius's requirements in the processed food and fishery products sector. As discussed in Part II above, the export diversification strategy of Mauritius is focused on the potential to become an agri-food processing hub in the region,<sup>1117</sup> by importing fish and agricultural products from neighbouring countries and processing them for export.<sup>1118</sup> In order to succeed in this strategy, it needs to apply strict SPS requirements to the imported inputs so that its processed exports achieve the high levels of protection it sets in order to meet the demanding standards of its trading partners.<sup>1119</sup> Similarly high levels of protection are not aimed at with regard to other food imports not intended for use in the export processing industry. This inconsistency in levels of protection is not motivated by differences in risk, but rather by the intended use of the imported product and in particular by the export interests of the processing industry.

While it is clear that there is no immediate obligation of consistency in appropriate levels of protection, Members are obliged to ensure that the distinctions in the levels of protection they choose meet the requirements of the second element of Article 5.5.

The Appellate Body in *EC – Hormones* set out the three requirements for a violation the second element of Article 5.5 of the *SPS Agreement* to be shown. These are that:

- the Member has set different appropriate levels of protection ‘in different situations’;
- the levels of protection exhibit ‘arbitrary or unjustifiable’ differences in their treatment of different situations; and
- the measure embodying those arbitrary or unjustifiable differences results in ‘discrimination or a disguised restriction’ on trade.<sup>1120</sup>

These elements were found by the Appellate Body to be cumulative, thus proof of the arbitrary or unjustifiable character of differences in levels of protection considered ap-

<sup>1117</sup> Ministry of Agro-Industry and Fisheries of the Republic of Mauritius, *Strategic Options in Crop Diversification and Livestock Sector 2007–2015 (Consultative Draft)* (Republic of Mauritius, Port Louis), August 2007, 123, available at: <http://www.areu.mu/files/pub/areunssp.pdf>, visited on 10 January 2008.

<sup>1118</sup> As previously discussed, the limited suitable land and labour for agricultural production restrict the capacity of Mauritius to produce sufficient agricultural products itself in order to make processing for export economically feasible. Similarly, the small continental shelf of Mauritius limits its local fish production. However, Mauritius has a significant advantage over its neighbouring countries in the area of know-how and technology for processing food and agricultural products. It therefore has the strategy of importing fish and agricultural products from its neighbours and processing them for export. Export diversification is crucial to decreasing Mauritius's dependence on sugar for its export earnings. See further above, Part II, Section 2.5.1.4.

<sup>1119</sup> For example, as mentioned in Part II above, the main export market of Mauritius for processed fishery products is the EC, which has very strict sanitary requirements in this sector.

<sup>1120</sup> Appellate Body Report, *EC – Hormones*, para. 214. These elements were reiterated in Panel Report, *Australia – Salmon*, para. 8.108; and Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.111.

propriate in different situations is not sufficient, though it might serve as a warning signal that the measure might be discriminatory or a disguised restriction on trade.<sup>1121</sup>

### 5.2.3.2 Different appropriate levels of protection in comparable situations

The enquiry under the first element for proving a violation of Article 5.5 clearly requires a ‘comparison of *several* levels of sanitary protection deemed appropriate by a Member’.<sup>1122</sup> As is the case with Article 2.3,<sup>1123</sup> the different treatment (in case in the form of differences in appropriate level of protection) at issue does not relate to ‘like products’ but instead to different ‘situations’. This gives Article 5.6 a very broad reach, far beyond that of the GATT non-discrimination rules.<sup>1124</sup>

However, it is obvious that not all health risks can or should be treated the same. Thus, the Appellate Body in *EC – Hormones* found that to compare the different levels of protection deemed appropriate by a Member, the situations dealt with must be comparable, that is, have some common element or elements ‘sufficient to render them comparable.’<sup>1125</sup> On this issue, the Appellate Body stated as follows:

If the situations proposed to be examined are *totally* different from one another, they would not be rationally comparable and the differences in levels of protection cannot be examined for arbitrariness.<sup>1126</sup>

The Panel regarded the situations at issue as comparable because they entailed the same substance (hormones) or the same adverse health effect (carcinogenicity). The Appellate Body did not take issue with the Panel’s finding that different levels of protection had been established in these different (i.e. comparable) situations.<sup>1127</sup>

Again in *Australia – Salmon* the question of the comparability of ‘different situations’ arose. In this case, the two situations assessed for comparability by the Panel were, on the one hand, the import prohibition on Canadian adult, wild, ocean-caught salmon for human consumption and, on the other hand, the admission of imports of: uncooked Pacific herring, cod, haddock, Japanese eel and plaice for human consumption; uncooked Pacific herring, Atlantic and Pacific cod, haddock, European and Japanese eel and Dover sole for human consumption; whole, frozen herring used as bait; and live ornamental fin-fish.<sup>1128</sup> According to the Panel, these situations would present sufficient common elements to render them comparable if they involved either a risk of entry, establishment

<sup>1121</sup> Appellate Body Report, *EC – Hormones*, para. 215.

<sup>1122</sup> *Ibid.*, para. 217.

<sup>1123</sup> The broad reach of Article 2.3 is discussed above, Part III, Section 3.2.2.

<sup>1124</sup> Charnovitz notes that Article 5.5 exceeds in its reach both the US Commerce Clause and the EC internal market jurisprudence, neither of which prohibit facially neutral regulations from being more stringent than other regulations applied in comparable situations. Steve Charnovitz, ‘The Supervision of Health and Biosafety Regulation by World Trade Rules’, *Tulane Environmental Law Journal* 13, 2000, 271-302, 291. By way of example, Charnovitz refers to *Maine v. Taylor*, 477 U.S. 131, 150 (1986), where the US Supreme Court considered and rejected the argument that Maine’s law violated the Commerce Clause because it allowed the importation of salmonids but not baitfish. *Ibid.*, paras 140-152.

<sup>1125</sup> Appellate Body Report, *EC – Hormones*, para. 217.

<sup>1126</sup> *Ibid.*

<sup>1127</sup> *Ibid.*, para. 218.

<sup>1128</sup> Panel Report, *Australia – Salmon*, para. 8.113.

or spread of the same or a similar disease, *or* similar associated biological and economic consequences.<sup>1129</sup> It found this to be the case in all four comparisons in the two situations.<sup>1130</sup> Australia appealed this finding, arguing that since the risk to be assessed under Annex A.4 is that of the entry, establishment or spread of the relevant diseases *and* the associated biological and economic consequences, comparability should be assessed on the basis of both these elements.<sup>1131</sup> The Appellate Body disagreed, stating:

Situations which involve a risk of entry, establishment or spread of the same or a similar disease have some common elements sufficient to render them comparable under Article 5.5. Likewise, situations with a risk of the same or similar associated potential biological and economic consequences also have some common elements sufficient to render them comparable under Article 5.5. We, therefore, consider that for “different” situations to be comparable under Article 5.5, there is no need for both the disease *and* the biological and economic consequences to be the same or similar.<sup>1132</sup>

In addition, the Appellate Body stated that for situations to be comparable under Article 5.5, it was sufficient for them to have in common a risk of entry, establishment or spread of *one* disease of concern. It was unnecessary that the risk of entry, establishment or spread of *all* diseases of concern be common to both situations.<sup>1133</sup> In the case at hand, the situations were deemed comparable as there was a risk of entry, establishment or spread of the same or similar diseases and the risk of associated potential biological and economic consequences was the same or similar, regardless of whether the disease entered Australia via salmon or via other fish.<sup>1134</sup> However, one could imagine that in other ‘different situations’ that may arise, the disease of concern may be common to both, yet for reasons related to varying agricultural practices or the different end use of the products at issue, the associated biological and economic consequences may differ. Here the Mauritian example mentioned above comes to mind, where despite similar food-safety risks in imported products intended for domestic consumption and those intended for processing for export, the economic consequences of the risk vary greatly due to the end use of the imported products. The broad reach of Article 5.5, as interpreted in the case law, would mean that also these types of situations are caught by the consistency disciplines of this Article.

In response to Australia’s argument that a ‘situation’ cannot be compared under Article 5.5 if no risk assessment has been made in respect of it, the Panel in *Australia – Salmon* noted:

... we consider that even though Australia has not yet conducted import risk analyses for the other products compared under Article 5.5, Australia does, nevertheless, have a level of protection it considers to be appropriate for these other products. Australia currently has a sanitary regime, imposing specific

<sup>1129</sup> *Ibid.*, para. 8.117.

<sup>1130</sup> *Ibid.*, para. 8.121 and Annex 121.

<sup>1131</sup> Appellate Body Report, *Australia – Salmon*, para. 145.

<sup>1132</sup> *Ibid.*, para. 146.

<sup>1133</sup> *Ibid.*, para. 152.

<sup>1134</sup> *Ibid.*, para. 147. Here the Appellate Body referred to the Panel’s findings on this point. Panel Report, *Australia – Salmon*, para. 8.121.

sanitary measures or refraining from such regulation, for these other products. This sanitary regime (whether or not specific measures are enacted) reflects a level of protection. To have a specific level of protection, there is no need to first complete a risk assessment ...

Article 5.5 directs us to compare for different situations the related levels of protection as they are currently considered to be appropriate by Australia and this whether or not the sanitary measures enacted to achieve that level are based on a risk assessment. Of course, such comparison would be easier and more accurate if for both situations an appropriate risk assessment were available. However, according to Article 5.5 and our mandate set out in Article 11 of the DSU (to make an ‘objective assessment of the matter before [us], including an objective assessment of the facts of the case’), we are called upon in this case to make this comparison and to do so on the basis of the evidence before us.<sup>1135</sup>

Therefore, the consistency of a Member’s chosen levels of protection will be evaluated even where the risks entailed by the other different situation used in the comparison have not yet been assessed. Otherwise Members could evade the discipline of Article 5.5 by omitting to conduct a risk assessment in other situations involving similar risks. The comparability of the situations could be established in such cases with reference to the fact that the risk causing agent (pest, disease or contaminant/toxin in food) is the same or similar, even though the nature and extent of the risk in the other situations used in the comparison are not yet known and may differ. The fact that the risk of entry, establishment or spread of the pest or disease at issue (e.g. avian influenza) may be affected by differences in, for example, the characteristics of the products concerned (e.g. live canaries as compared to frozen chicken fillets) is not relevant for the determination of comparability under the first element of Article 5.5, but will be considered under the second element, discussed below.

To establish if the first element has been met, it is further necessary to determine whether the Member has imposed *different* levels of protection in different (but comparable) situations. In *EC – Hormones* the Panel examined the levels of protection adopted by the EC in five comparable situations, namely the levels of protection in respect of (1) natural hormones administered for growth promotion;<sup>1136</sup> (2) natural hormones occurring endogenously;<sup>1137</sup> (3) natural hormones administered for therapeutic or zootechnical purposes;<sup>1138</sup> (4) synthetic hormones (trenbolone and zeranol) administered for growth promotion;<sup>1139</sup> and (5) carbadox and olaquinox, two anti-microbial agents used for

<sup>1135</sup> Panel Report, *Australia – Salmon*, paras 8.126-8.127.

<sup>1136</sup> The level of protection adopted by the EC for natural hormones used for growth promotion purposes was found to be a ‘no residue’ level of protection.

<sup>1137</sup> The level of protection adopted by the EC for natural hormones occurring endogenously was found to be an ‘unlimited residue’ level of protection. Panel Report, *EC – Hormones (US)*, para. 8.191; Panel Report, *EC – Hormones (Canada)*, para. 8.194.

<sup>1138</sup> The level of protection adopted by the EC for natural hormones administered for therapeutic or zootechnical purposes was found to be an ‘unlimited residue’ level of protection. Panel Report, *EC – Hormones (US)*, para. 8.191; Panel Report, *EC – Hormones (Canada)*, para. 8.194.

<sup>1139</sup> The level of protection adopted by the EC for synthetic hormones used for growth promotion purposes was found to be a ‘no residue’ level of protection. Panel Report, *EC – Hormones (US)*, para. 8.212; Panel Report, *EC – Hormones (Canada)*, para. 8.215.

growth promotion in swine.<sup>1140</sup> The Panel found that different levels of protection were in place in the situations of endogenously-occurring natural hormones and administered anti-microbial agents, on the one hand, and of natural or synthetic hormones administered for growth-promotion purposes on the other. In the former cases an ‘unlimited-residue level’ was permitted (complete tolerance) whereas in the latter a ‘no-residue level’ (a ban) was applied.

In *Australia – Salmon*, the Panel also had to determine whether Australia made a distinction in the levels of protection it deemed appropriate in the situations that had been identified as ‘comparable’. It was of the view that it had to examine and compare the SPS measures applied by Australia in the comparable situations.<sup>1141</sup> The Panel stated:

[W]e will for present purposes assume that if there is a difference in the sanitary measures imposed for the different situations we compare under Article 5.5, this difference does reflect a distinction in *levels of protection* achieved in – and considered to be appropriate by – Australia.<sup>1142</sup>

However (when dealing with the determination of the appropriate level of protection under Article 5.6) the Appellate Body in *Australia – Salmon* noted that nothing in the *SPS Agreement* or the DSU permits a panel or the Appellate Body to imply the Member’s appropriate level of protection from the SPS measure it applies to attain that level of protection.<sup>1143</sup> Only if a Member neglects to specify its appropriate level of protection, or does so with insufficient clarity, is it permissible to deduce its level of protection from the SPS measures actually in place. This finding applies equally to the determination of the level of protection under Article 5.5. With regard to diseases from salmon, Australia had explicitly adopted a ‘high or “very conservative” level of protection’. With regard to diseases from herring or ornamental finfish no express determination had been made, but from the measures in place the Appellate Body deduced that its level of protection was ‘definitely lower’.<sup>1144</sup> As a result, different levels of protection were found to exist in comparable situations.

In *Australia – Salmon (Article 21.5 – Canada)*, the compliance Panel had to address whether Australia’s revised measures complied with the consistency requirements of Article 5.5. Australia had not only made its quarantine measures for salmon imports more lenient but had also tightened its controls on other fish imports.<sup>1145</sup> Canada claimed that

<sup>1140</sup> The level of protection adopted by the EC for the two anti-microbial agents used for growth promotion purposes in swine was found to be an ‘unlimited residue’ level of protection. Panel Report, *EC – Hormones (US)*, para. 8.226; Panel Report, *EC – Hormones (Canada)*, para. 8.229.

<sup>1141</sup> Panel Report, *Australia – Salmon*, para. 8.123. In examining the level of protection on the basis of the measure actually applied, the Panel in *Australia – Salmon* agreed with Australia that imposing the same SPS measure for different situations does not necessarily result in the same level of protection. Different SPS measures might sometimes ensure the same level of protection in comparable situations. The Panel stated that ‘one given situation might only represent a small risk for which a lenient sanitary measure will achieve a high level of protection, whereas another situation might pose very high risks requiring a very strict and different sanitary measure in order to meet that same high level of protection.’ *Ibid.*

<sup>1142</sup> Panel Report, *Australia – Salmon*, para. 8.124. This finding was not appealed.

<sup>1143</sup> Appellate Body Report, *Australia – Salmon*, paras 199 and 200. This issue is dealt with further below, Part III, Section 5.2.4.3.

<sup>1144</sup> *Ibid.*, para. 158.

<sup>1145</sup> Following the DSB recommendations and rulings in the original dispute, Australia had conducted risk

Article 5.5 was violated by the distinctions in the levels of protection applied by Australia in respect of two situations, namely imports of fresh, chilled or frozen salmon from Canada, on the one hand, and imports of non-salmonids and live, ornamental fish and the internal movement of dead Australian fish, on the other hand. According to Canada, the different measures applied by Australia to these different categories of fish indicated different levels of protection.<sup>1146</sup> Australia did not contest the comparability of the two situations referred to by Canada. However, in respect of the appropriate levels of protection applied in these situations, Australia argued that it applied, in *all* cases, a ‘high or very conservative level of protection, aimed at reducing risk to very low levels, while not based on a zero risk approach’.<sup>1147</sup>

The compliance Panel referred to the reasons given by the Panel and the Appellate Body in the original dispute as support for its finding that the different fish categories referred to by Canada could be compared as ‘different situations’ under Article 5.5. It referred to the uncontested fact that these situations involved a risk of entry, establishment or spread of the same or a similar disease or a risk of the same or a similar associated biological or economic consequence.<sup>1148</sup> This despite the fact that the Panel recognised that Canada compared salmonids to ‘entire categories of fish ... that include[d] not only a wide variety of different fish but also of different diseases.’<sup>1149</sup> Also, as noted by the Panel, the diseases associated with the internal movement of dead Australian fish ‘are *per force* already present (i.e. endemic) in Australia’ whereas some of the diseases of concern in respect of imports of salmonids ‘are, in contrast, *not* present in (i.e. exotic to) Australia’.<sup>1150</sup> These considerations did not result in a finding by the Panel that the situations at issue were not comparable, but were taken into account instead under the second element of Article 5.5.

In determining whether there were ‘distinctions’ in the levels of protection applied in the situations found to be comparable, the Panel took account of the generality of Canada’s arguments and evidence (with the exception of its arguments on the situation of pilchards), together with the fact of increased convergence in levels of protection applied to different fish categories following Australia’s revision of its measures.<sup>1151</sup> The Panel noted that two of the three panel experts expressed the view that Australia’s different treatment of salmonids was scientifically justified and achieved the same or a similar level of protection as its treatment of non-salmonids and live ornamental finfish.<sup>1152</sup> The Panel found that Canada had not met its burden of proof with regard to the distinctions in appropriate level

---

assessments also for non-salmonids and live ornamental fish, and on this basis had strengthened its import controls on these products. The question whether the risk assessments on these other categories of products were consistent with the *SPS Agreement* was not before the compliance Panel. Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.91 and footnote 203.

<sup>1146</sup> *Ibid.*, para. 4.171.

<sup>1147</sup> *Ibid.*, para. 4.191.

<sup>1148</sup> *Ibid.*, para. 7.89.

<sup>1149</sup> *Ibid.*, para. 7.90.

<sup>1150</sup> *Ibid.*, para. 7.93.

<sup>1151</sup> *Ibid.*, para. 7.91.

<sup>1152</sup> *Ibid.*, para. 7.92. Note that it is not different treatment (i.e. different SPS measures) that is being compared under Article 5.5, but differences in levels of protection. Therefore, if different treatment can be scientifically shown to achieve the same level of protection, the first element for a finding of violation of Article 5.5 is not met.

of protection, except for in the case of imports of pilchards.<sup>1153</sup> In the latter case, Canada had substantiated its claim that import restrictions on salmonids were stricter than those applied to pilchards for use as bait or fish feed.<sup>1154</sup>

The very broad reach of the concept of ‘different’ but comparable situations, as interpreted in the case law under Article 5.5, could lead to an unreasonable obligation to apply consistent levels of protection in situations where differences in the characteristics or use of the products at issue, in the economic or biological consequences of the risk, in societal preferences or in policy priorities for allocation of scarce regulatory resources have led the Member to choose different levels of protection. This possibility is addressed by the two remaining elements of Article 5.5, which set realistic requirements that must be met before the different levels of protection applied in the broadly comparable situations will be found to violate Article 5.5 of the *SPS Agreement*.

### 5.2.3.3 Arbitrary or unjustifiable distinctions in appropriate levels of protection

The second element for a finding of violation of Article 5.5 is the existence of ‘arbitrary or unjustifiable distinctions’ in the appropriate levels of protection compared. To determine whether this element is present, panels and the Appellate Body examine whether reasons exist to justify the differences in levels of protection. The kinds of considerations that may justify different levels of protection are not delimited in Article 5.5. In the case law so far, the Appellate Body has examined:

- whether different levels of risk are at issue in the different situations compared;<sup>1155</sup>
- whether the difficulty of controlling the risk differs in each case;<sup>1156</sup> or
- whether the degree of government intervention necessary to achieve the same level of protection differs in each situation.<sup>1157</sup>

In particular, the Appellate Body in *EC – Hormones* disagreed with the Panels’ finding that both the added hormones and naturally-occurring hormones pose the same risks and practical difficulties of control,<sup>1158</sup> and thus that the difference in the level of protection must therefore be arbitrary. The Appellate Body stated as follows:

[W]e consider there is a fundamental distinction between added hormones (natural or synthetic) and naturally-occurring hormones in meat and other foods. In respect of the latter, the European Communities simply takes no regulatory action; to require it to prohibit totally the production and consumption of such foods or to limit the residues of naturally-occurring hormones in food, entails

<sup>1153</sup> *Ibid.*, para. 7.94. Note that, as was the case in the original dispute, the compliance Panel addressed the question of whether there were distinctions in the appropriate levels of protection not under the first element of Article 5.5, but under the second, together with its examination of whether the distinctions were arbitrary or unjustifiable. Thus some of its reasoning regarding the two elements is somewhat conflated.

<sup>1154</sup> *Ibid.*, para. 7.97.

<sup>1155</sup> Appellate Body Report, *Australia – Salmon*, para. 158.

<sup>1156</sup> Appellate Body Report, *EC – Hormones*, paras 221-225.

<sup>1157</sup> *Ibid.*, para. 221.

<sup>1158</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.190; Panel Report, *EC – Hormones (US)*, para. 8.187.

such a comprehensive and massive governmental intervention in nature and in the ordinary lives of people as to reduce the comparison itself to an absurdity.<sup>1159</sup>

When comparing the levels of protection for hormones used for growth-promotion purposes and hormones used for therapeutic and zootechnical purposes – a comparison not further pursued by the panels – the Appellate Body, referring to the differences in frequency and scale of the two treatments and the strict mode of administration of the latter treatment, found that the distinction in levels of protection ‘is not, in itself, ‘arbitrary or unjustifiable’.<sup>1160</sup>

According to the Panel in *Australia – Salmon*, differences in the levels of risk are to be taken into account in the second element of Article 5.5 in order to establish whether the different level of protection is arbitrary or unjustifiable. Applying this element to the case before it, the Panel found that the different levels of protection applied by Australia against risks from imports of salmon and from imports of non-salmonids were ‘arbitrary or unjustifiable’. It based its finding on the fact that since the level of protection applied in the case of salmon was higher, one could expect that a higher risk was present for salmon than for other fish. However, the evidence pointed to the opposite conclusion, namely that there was ‘a higher risk of disease introduction associated with imports of bait fish and live ornamental fish than the risk posed by imports of salmon products for human consumption.’<sup>1161</sup> The Panel therefore held that the differences in levels of protection applied by Australia were arbitrary and unjustifiable, a finding upheld by the Appellate Body.<sup>1162</sup> This is the only case thus far where a finding was made of a violation of Article 5.5.

In *Australia – Salmon (Article 21.5 – Canada)*, the compliance Panel addressed the only situation in which Canada had brought sufficient evidence to show a distinction in the level of protection as compared to that applied to imports of salmonids, namely that of imports of pilchards for use as bait or feed. It also focused on differences in risk to determine whether the distinction in levels of protection was justified under the second element of Article 5.5. It found that whereas 15 ‘high priority’ diseases had been identified in the 1999 IRA for salmonids, only two diseases had been shown by Canada to be associated with pilchards.<sup>1163</sup> One of these pilchard diseases (herpes virus) was already endemic to Australia and was not associated with salmonids. The other disease (viral haemorrhagic septicaemia virus) was associated with both pilchards and salmonids, but there was no evidence of transmission between pilchards and salmonids. The consequence of the establishment of this disease was determined in the 1999 IRA to be ‘low’ due to its limited

<sup>1159</sup> Appellate Body Report, *EC – Hormones*, para. 121.

<sup>1160</sup> *Ibid.*, paras. 222-225.

<sup>1161</sup> Panel Report *Australia – Salmon*, para. 8.137. The Panel started its examination with these two categories of non-salmonids (whole, frozen herring used as bait and live ornamental finfish) because it had more evidence on these categories than on the others. Since it found arbitrary and unjustifiable distinctions in the levels of protection applied in respect of these two categories of non-salmonids as compared to the level of protection applied in respect of adult, wild, ocean-caught, Pacific salmon, the Panel found it unnecessary to examine the justifiability of the distinctions in levels of protection in respect of the remaining two categories of non-salmonids. *Ibid.*, para. 8.143.

<sup>1162</sup> Appellate Body Report, *Australia – Salmon*, para. 158.

<sup>1163</sup> Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.97.

impact on salmonids and other finfish in Australia. Two of the three panel experts were of the view that the different treatment accorded to pilchards was scientifically justified.<sup>1164</sup> The more lenient import conditions for pilchards were therefore found not to be ‘arbitrary or unjustifiable’ under the second element of Article 5.5.<sup>1165</sup>

It is interesting to note that not only differences in the level of risk or difficulties of controlling the risk may explain differences in the level of protection chosen by a Member in comparable situations. In some cases, differences in the appropriate level of protection are based on subjective consumer preferences. This is particularly the case with regard to the risks to which people voluntarily expose themselves, due to particular cultural practices. Examples include the consumption of traditional foods such as raw fish in Japan, smoked fish in Norway, raw milk cheeses in several European countries including France and Switzerland; as well as the consumption of alcoholic beverages. Article 5.5 recognises that these situations may, exceptionally, justify a lower level of protection by expressly mandating the SPS Committee to take this into account when developing guidelines on the implementation of Article 5.5.<sup>1166</sup> This exception is significant in that it reflects a policy-based consideration that leads to regulatory divergence. Such divergence is grounded in, often irrational, societal preferences rather than objective differences in risk.

#### 5.2.3.4 Discrimination or disguised restriction on trade

The third requirement for a violation of Article 5.5 is that the measure embodying the arbitrary or unjustifiable distinctions in appropriate levels of protection results in ‘discrimination or a disguised restriction on trade’. According to the Appellate Body in *EC – Hormones*, this is the most important of the three elements.<sup>1167</sup>

While this term is to some extent similar to that found in the *chapeau* of Article XX of the GATT 1994, there are also important differences in the two provisions which militate against analogous interpretation, as noted by the Appellate Body in *EC – Hormones*.<sup>1168</sup> Similarly, the Appellate Body disagreed with the Panel that the findings in *Japan – Alcoholic Beverages II* regarding the impact of large differentials in tax treatment for a finding of a violation of the non-discrimination obligation of Article III:2 of the

<sup>1164</sup> *Ibid.*, para. 7.96.

<sup>1165</sup> *Ibid.*, para. 7.101. It seems that here, again, the Panel is comparing the *measures* applied in the face of different levels of risk, rather than comparing the *appropriate levels of protection* applied in different situations. Different measures can achieve the *same* level of protection (here the high or very conservative level of protection chosen by Australia) if the risk at issue differs. In such cases the first element of Article 5.5 appears not to have been met and it is unnecessary to examine the second element.

<sup>1166</sup> These guidelines are discussed below, Part III, Section 5.2.3.5.

<sup>1167</sup> Appellate Body Report, *EC – Hormones*, para. 240.

<sup>1168</sup> *Ibid.*, para. 239. In *US – Gasoline*, the Appellate Body had found that that ‘arbitrary discrimination’, ‘unjustifiable discrimination’ and ‘disguised restriction on international trade’ in the *chapeau* of Article XX of the GATT 1994 impart meaning to each other and that the fundamental theme is the purpose and object of avoiding abuse or illegitimate use of the exceptions in Article XX. Thus the same considerations used to determine if a measure amounts to arbitrary or unjustifiable discrimination can be used to decide if the measure is a disguised restriction on international trade. Appellate Body Report, *US – Gasoline*, 22. The Appellate Body in *EC – Hormones* found that the structural differences between the *chapeau* of Article XX of GATT 1994 and Article 5.5 of the *SPS Agreement* are too great for this analogous interpretation to be made. In its arguments, the EC pointed out that the three elements of the *chapeau* of Article XX of GATT 1994 are in the alternative, whereas those in Article 5.5 of the *SPS Agreement* are cumulative.

GATT 1994 can be used as precedents for the interpretation of Article 5.5 of the *SPS Agreement*.<sup>1169</sup> It thus reversed the Panels' finding, on the basis of the difference in levels of protection in certain comparable situations, that the EC measure in question constituted discrimination or a disguised restriction on international trade, finding that:

... the degree of difference, or the extent of the discrepancy, in the levels of protection, is only one kind of factor which, along with others, may cumulatively lead to the conclusion that discrimination or a disguised restriction on international trade in fact results from the application of a measure or measures embodying one or more of those different levels of protection. Thus, we do not think that the difference between a 'no residues' level and 'unlimited residues' level is, together with a finding of an arbitrary or unjustifiable difference, sufficient to demonstrate that the third, and most important, requirement of Article 5.5 has been met ... Evidently, the answer to the question whether arbitrary or unjustifiable differences or distinctions in levels of protection established by a Member do in fact result in discrimination or a disguised restriction on international trade must be sought in the circumstances of each individual case.<sup>1170</sup>

In *Australia – Salmon*, the Panel identified what it called three 'warning signals' i.e., elements which are 'not conclusive in [their] own right',<sup>1171</sup> and three 'other factors more substantial in nature'<sup>1172</sup> taken cumulatively, to support its finding that the third element of Article 5.5 was met.<sup>1173</sup> The relevance of these warning signals and other factors will depend on the circumstances of each case.<sup>1174</sup> The 'warning signals' are:

- the arbitrary character of the differences in the levels of protection (i.e., that the second element of Article 5.5 is met);<sup>1175</sup>
- the existence of rather substantial differences in the levels of protection,<sup>1176</sup> and

---

<sup>1169</sup> In *Japan – Alcoholic Beverages II*, it was held that a large difference in the taxation applied to imports and that applied to domestic products could be sufficient to prove that it was applied so as to afford protection to domestic products, contrary to Article III of GATT 1994. Appellate Body Report, *Japan – Alcoholic Beverages II*, 30. The Appellate Body in *EC – Hormones*, distinguished the reasoning in *Japan – Alcoholic Beverages II* regarding tax differentials from the different question in this case regarding different levels of health protection. As tax is always expressed quantitatively and affects the competitiveness of imports, a tax differential necessarily protects domestic products. There is no such link between differences in levels of health protection and the issue of discrimination or a disguised restriction on international trade. The extent of the difference is only one factor among others to be taken into account in determining whether there is discrimination or a disguised restriction on trade. Appellate Body Report, *EC – Hormones*, paras 239-251. Regard must be had to the circumstances of each case.

<sup>1170</sup> Appellate Body Report, *EC – Hormones*, para. 240.

<sup>1171</sup> Panel Report, *Australia – Salmon*, para. 8.151.

<sup>1172</sup> *Ibid.*, para. 8.152.

<sup>1173</sup> *Ibid.*, para. 8.159.

<sup>1174</sup> Panel Report, *Australia – Salmon* paras 8.149-8.151, as approved by the Appellate Body. Appellate Body Report, *Australia – Salmon* paras 162, 164 and 166. The first two warning signals had also been relied upon in Appellate Body Report *EC – Hormones* paras 215 and 240.

<sup>1175</sup> Panel Report, *Australia – Salmon*, para. 8.149.

<sup>1176</sup> *Ibid.*, para. 8.150.

- the absence of scientific justification (based on earlier findings of a violation of Articles 2.2 and 5.1) which indicates that the measure is a disguised restriction on trade.<sup>1177</sup>

The Appellate Body in this case addressed Australia's contention, on appeal, that the Panel had erroneously regarded proof of arbitrary and unjustifiable distinctions in the levels of protection, i.e. the second element of Article 5.5, as evidence that the third element, that of discrimination or a disguised restriction on trade, was met. It clarified that the fact that the second element is established can be *one* indication (or a 'warning signal') that the third element is also met, although the former cannot be regarded as conclusive proof of the latter.<sup>1178</sup> This is so even if the distinction in levels of protection is great. Instead, each element must be determined separately and its existence must be determined on a case by case basis, taking into account all relevant circumstances.

The Appellate Body further agreed with the Panel that the rather substantial difference in levels of protection between an import prohibition on ocean-caught Pacific salmon, as opposed to tolerance for imports of herring used as bait and of live ornamental fish, be treated as a separate (second) warning signal.<sup>1179</sup> It held that the degree of difference in level of protection justified this factor being treated as a separate warning signal, as distinct from the first.

The Appellate Body also agreed with the Panel in respect of the third warning signal, stating:

We note that a finding that an SPS measure is not based on an assessment of the risks to human, animal or plant life or health - either because there was no risk assessment at all or because there is an insufficient risk assessment - is a strong indication that this measure is not really concerned with the protection of human, animal or plant life or health but is instead a trade-restrictive measure taken in the guise of an SPS measure, i.e., a 'disguised restriction on international trade.'<sup>1180</sup>

The Appellate Body thus agreed with the Panel's conclusion that Article 5.5, and for that reason also Article 2.3, was violated,<sup>1181</sup> although it reversed the Panel's finding in respect of one of the additional factors.<sup>1182</sup> In *Australia – Salmon (Article 21.5 – Canada)*,

<sup>1177</sup> *Ibid.*, para. 8.151.

<sup>1178</sup> Appellate Body Report, *Australia – Salmon*, para. 162. The Appellate Body found that the Panel had considered the arbitrary or unjustifiable character of differences in levels of protection as a 'warning signal' for, and not as 'evidence' of, a disguised restriction on international trade.

<sup>1179</sup> *Ibid.*, para. 164.

<sup>1180</sup> *Ibid.*, para. 166.

<sup>1181</sup> Panel Report *Australia – Salmon*, para. 8.160; Appellate Body Report *Australia – Salmon*, para. 177.

<sup>1182</sup> Appellate Body Report *Australia – Salmon*, paras 167-169. The 'additional factor' at issue was the fact that two substantially different SPS measures (import prohibitions as opposed to tolerance) were applied, leading to discrimination between salmon on one hand and herring used as bait and ornamental finfish on the other. Thus the Panel viewed 'disguised restriction on international trade' under Article 5.5 as including restrictions amounting to arbitrary or unjustifiable discrimination *between products*. Australia contended that the Panel's concept of discrimination under Article 5.5 was wrong, as discrimination here refers to discrimination *between countries*. The Appellate Body agreed with Australia that this 'additional factor' should be excluded from consideration, as all 'arbitrary and unjustifiable distinctions' in levels of protection will logically lead to discrimination between products, whether they are the same or different. Thus this factor is no different

the compliance Panel applied the same ‘warning signals’ and ‘additional factors’ to the case before it and found that none but one of these were present in respect of Australia’s revised quarantine regime for fish imports.<sup>1183</sup> The remaining ‘warning signal’ namely the fact that Australia’s consumer-ready requirements had been found not to be based on a risk assessment in violation of Articles 5.1 and 2.2, was considered insufficient in and of itself to lead to a conclusion that the third element of Article 5.5 was met.<sup>1184</sup>

It is important to establish whether the fact that considerations unrelated to the risk at issue were taken into account by a Member in determining its appropriate level of protection will lead to a finding of discrimination or a disguised trade restriction. In *EC – Hormones*, in support of its finding that the difference in the level of protection for hormones and that for antimicrobial agents, carbadox and olaquinox, was discriminatory or a disguised restriction on trade, the Panel pointed, among other factors, to the fact that the preambles of the relevant EC directives, the reports of the European Parliament and the opinions of the Social and Economic Committee of the EC indicated that the measure was aimed at harmonisation of laws within the EC, the removal of distortions of competition and barriers to intra-Community trade, the increase of beef consumption and the reduction of internal surpluses. The Appellate Body rejected this conclusion, stating that it did not attach the same importance as the Panel to the multiple objectives of the measure. It pointed to the demonstrated ‘depth and extent of the anxieties experienced’ within the EC concerning ‘the results of the general scientific studies (showing the carcinogenicity of hormones), the dangers of abuse (highlighted by scandals relating to black-marketing and smuggling of prohibited veterinary drugs in the European Communities) ... and the intense concern of consumers within the European Communities over the quality and drug free character of the meat available in its internal market.’<sup>1185</sup> It stated that the harmonisation of regulations was a result of the EC’s mandate to establish a Common Market and that the reduction of beef surpluses not only benefited the EC but also other non-hormone beef producers. It thus concluded that it did not share the Panel’s inference that the import ban was aimed at restricting beef imports from Canada and the US rather than protecting the EC’s population from the risk of cancer.<sup>1186</sup> The Panel’s finding that there was a violation of Article 5.5 was thus reversed.<sup>1187</sup> The Appellate Body’s decision makes it clear that the mere incorporation of various non-scientific considerations in the decision to impose a certain appropriate level of protection is not sufficient to invalidate the chosen level of protection by rendering it a ‘disguised restriction on trade’. This decision implies a positive recognition by the Appellate Body of the important role of societal value judgements in the making of risk management decisions.

---

from the first ‘warning signal’ and should not be taken into account as a separate factor.

<sup>1183</sup> The Panel had not found an ‘arbitrary or unjustifiable distinction’ in the levels of protection applied by Australia in comparable situations (first warning signal), nor had it found that the distinctions in level of protection were ‘rather substantial (second warning signal). The additional factors considered by the original Panel, relating to the differences in the conclusions of the draft and final risk assessments and the absence of controls on movement of dead Australian fish, has lost their relevance in the compliance dispute. Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.104.

<sup>1184</sup> *Ibid.*, para. 7.105.

<sup>1185</sup> Appellate Body Report, *EC – Hormones*, para. 245.

<sup>1186</sup> *Ibid.*

<sup>1187</sup> *Ibid.*, para. 246.

The difficulty in evaluating the justifiability of distinctions lies in the problem of explaining why a society accepts some risks but not others or values some goals more than others.<sup>1188</sup> This fact was explicitly recognised by the drafters of the *SPS Agreement* in their direction to the SPS Committee to take into account ‘the exceptional character of human health risks to which people voluntarily expose themselves’ in the SPS Committee’s formulation of guidelines for the implementation of this Article.

### 5.2.3.5 Guidelines to further the implementation of Article 5.5 of the SPS Agreement

As noted above, Article 5.5 obliges Members to cooperate in the SPS Committee to develop guidelines to further its practical implementation. In doing so, as noted above, the SPS Committee is required to take account of all relevant factors, ‘including the exceptional character of risks to which people voluntarily expose themselves.’

Negotiations took place in the SPS Committee in fulfilment of this mandate.<sup>1189</sup> Steve Suppan reports that when negotiating these guidelines, the US tried to reflect therein the *EC–Hormones* Panel ruling in its favour with regard to Article 5.5, whereas the EC tried to reflect the Appellate Body’s ruling overturning that of the Panel on this point. Suppan further reports that the US was in favour of making the guidelines binding, but was prevented from doing so by the EC and other Members.<sup>1190</sup>

The outcome of the compromise reached is reflected in the *Guidelines to Further the Practical Implementation of Article 5.5* (the *Guidelines on Article 5.5*), provisionally adopted in June 2000 after five years of deliberations.<sup>1191</sup> Members having objections to the final adoption were asked to make these known by 14 July 2000. Since no objections were raised by that date, the guidelines were regarded as finally adopted on that date. The *Guidelines on Article 5.5* are expressly stated to be intended to assist Members in the practical implementation of Article 5.5, and *not* to add to or detract from the rights and

---

<sup>1188</sup> Vern Walker has therefore suggested that national choice of levels of protection should be respected except in ‘the most blatant or unexplainable cases.’ Vern R. Walker, ‘Keeping the WTO from Becoming The “World Trans-Science Organization”’: Scientific Uncertainty, Science Policy, and Factfinding in the Growth Hormones Dispute’, *Cornell International Law Journal* 31, 1998, 251-320, 270.

<sup>1189</sup> The Chairman of the SPS Committee initiated informal discussions on the best way to proceed to elaborate these guidelines in December 1995 by circulating a questionnaire of pertinent questions to all Members. Committee on Sanitary and Phytosanitary Measures, *Consistency: Questions for Consideration: Note by the Chairman*, G/SPS/W/45, circulated on 6 December 1995. After identifying common elements in the responses, the Chairman put the issue on the agenda of the meeting of 29-30 May 1996 for general discussion. Committee on Sanitary and Phytosanitary Measures, *Consistency: Elaboration of Guidelines: Note by the Chairman*, G/SPS/W/59, circulated on 6 May 1996. The report of the Chairman on the comments received evinced a strong focus on procedural aspects, and on the link between risk management decisions and the risk assessments on which they are based. Some Members stressed the importance of applying consistent risk assessment methodologies, and referred to the factors required to be considered in risk assessments, under Articles 5.2 and 5.3, as the ‘relevant factors’ to be addressed in the SPS Committee in establishing these guidelines.

<sup>1190</sup> Here Suppan refers to: ‘WTO Works out New SPS Guidelines without Legal Status’, *Inside US Trade*, 14 April 2000. {, 2005 #4077}

<sup>1191</sup> Committee on Sanitary and Phytosanitary Measures, *Guidelines to Further the Practical Implementation of Article 5.5*, G/SPS/15, circulated on 18 July 2000.

obligations of Members under the *SPS Agreement* or to provide any legal interpretation or modification to the Agreement.<sup>1192</sup>

The *Guidelines on Article 5.5* focus on recommending procedural tools that should be used to promote consistency in decisions on the appropriate level of protection. Much of the case law on Article 5.5 is reflected in the *Guidelines on Article 5.5*. In particular, several of the rulings of the Appellate Body on Article 5.5 in *Australia – Salmon* can be found incorporated in its provisions, including the finding of an implicit obligation on a Member to clearly state its appropriate level of protection, and the ruling on the three ‘warning signals’ relevant to the determination of discrimination or a disguised restriction on trade.<sup>1193</sup>

In brief, the *Guidelines on Article 5.5* are divided into two parts, the first addresses the concept of the *appropriate level of protection*, and the second relates to the practical implementation of this concept through the adoption of *SPS measures*. In the first part, after stating that Members should indicate their appropriate level of protection clearly and in so doing should consider the three prongs of Article 5.5,<sup>1194</sup> the *Guidelines on Article 5.5* recommend that Members take certain procedural steps to promote consistency. These are first the establishment of clear and effective communication and information flows between the authorities responsible for determining the appropriate level of protection, so that they can be aware of each others’ decisions in comparable cases.<sup>1195</sup> Second, Members should compare any proposed decision on a level of protection to levels it has previously considered appropriate in previous comparable situations, including those taken in an *ad hoc* fashion, to ensure that differences between them are justifiable and do not lead to discrimination or a disguised trade restriction.<sup>1196</sup> Third, Members should review their previous decisions on appropriate levels of protection in the light of the ‘objectives and requirements’ of Article 5.5, at suitable intervals.<sup>1197</sup> Fourth, it is stated that in determining a new or modified level of protection Members may find it useful to

<sup>1192</sup> *Ibid.*, 1.

<sup>1193</sup> *Ibid.*, paras A.2 and B. The *Guidelines on Article 5.5* further specify, also in line with the *Australia–Salmon* ruling, that if a Member is not able to indicate precisely its appropriate level of protection, this may be determined from the level of protection reflected in the SPS measure in place.

<sup>1194</sup> In this respect, the findings in the case law on each of the three prongs are set out, to explain what is required of a Member. Specifically it is stated that the comparison of levels of protection in different situations requires sufficient common elements to render the situations comparable (such as, in the case of risks from pests and diseases, either the risk of the entry establishment or spread of the same or a similar disease or potential biological or economic consequences and in the case of risks from food/feed, the same type of adverse health effect or the same pathogen or substance). Further, the fact that the question whether differences are arbitrary or unjustifiable is decided on a case by case basis and the fact that establishing different levels of protection in the face of similar risks may raise the question as to whether these differences are arbitrary or unjustifiable. Finally, with regard to the third prong the three ‘warning signals’ are set out, noting that their cumulative occurrence could indicate discrimination or a disguised restriction on trade. *Ibid.*, para. A.2.

<sup>1195</sup> *Ibid.*, para. A.3.

<sup>1196</sup> *Ibid.*, para. A.4. Here the *Guidelines on Article 5.5* that in the case that there are unjustifiable differences, either the proposed level of protection in the current situation, or the previous level of protection in the comparable situation may need to be modified. It is recommended that Members categorise the risks they examine into groups of similar risks, and that they express possible damage in common terms, whether quantitative or qualitative, although the former is preferable where feasible to facilitate comparisons.

<sup>1197</sup> *Ibid.*, para. A.5. Here it is clarified that unless changes are made to all comparable decisions on level of protection at the same time, temporary unjustifiable differences will be difficult to avoid.

examine relevant international standards or decisions taken by other Members facing similar risks and situations, while recognising that no obligation to harmonise levels of protection exists.<sup>1198</sup> Fifth, expert advice is recommended when Members determine new or modified levels of protection.<sup>1199</sup>

With regard to the mandate to consider the exceptional character of risks to which people voluntarily expose themselves, the *Guidelines on Article 5.5* note the fact that a significant difference in levels of protection may be justified, in exceptional circumstances, by such voluntarily accepted risks. Examples are the consumption of alcoholic beverages or traditional foods such as smoked fish or raw milk cheeses. The *Guidelines on Article 5.5* state that a Member should clearly identify those situations which it considers justify its acceptance of a lower level of protection of human health in this context.<sup>1200</sup>

Part B of the *Guidelines on Article 5.5* turns to address the selection and implementation of SPS measures, due to the fact that in practice Members are not always able to precisely indicate their appropriate level of protection, in which case it will be deduced from the SPS measure in place. The same procedural recommendations that were set out in Part A are laid down in Part B, *mutatis mutandis*.<sup>1201</sup> The only additional recommendation is that a Member establish common procedures for its authorities for carrying out risk assessments and for the choice of an SPS measure to achieve the appropriate level of protection.<sup>1202</sup>

While useful in setting out the practical steps that Members can take in their regulatory processes in order to promote consistency in appropriate levels of protection, the *Guidelines on Article 5.5* seem premised on the existence of a sophisticated and well-functioning regulatory system. As argued by Steve Suppan, these guidelines ‘have a degree of complexity that favours only those Members with massive SPS bureaucracies capable of setting norms for protecting human, plant and animal health without being accused of trade protectionism.’<sup>1203</sup>

#### 5.2.4 Least-trade-restrictive measure

As noted above, the risk management phase of the regulatory process involves not only the choice of an appropriate level of protection, but also the choice of an SPS measure to achieve this level of protection. The SPS measure applied by a Member may be seen as the ‘link’ between the scientifically-established risk and the policy-based choice of a level of protection. While an SPS measure is applied to achieve the appropriate level of

<sup>1198</sup> *Ibid.*, para. A.6.

<sup>1199</sup> *Ibid.*, para. A.7.

<sup>1200</sup> *Ibid.*, para. A.8.

<sup>1201</sup> *Ibid.*, paras B.1 and B.3-B.7.

<sup>1202</sup> *Ibid.*, para. B.2.

<sup>1203</sup> Steve Suppan, ‘The WTO Agreement on the Application of Sanitary and Phytosanitary Measures (SPS)’, in *Decision Making in the Global Market: Trade, Standards and the Consumer* (Consumers International, London), 2005, 133-148, 142, available at: [http://consint.live.poptech.coop/Shared\\_ASP\\_Files/UploadedFiles/1E6FE541-9535-4E43-A86E-D7F66DE4728A\\_GlobalGovernancefinalpdf.pdf](http://consint.live.poptech.coop/Shared_ASP_Files/UploadedFiles/1E6FE541-9535-4E43-A86E-D7F66DE4728A_GlobalGovernancefinalpdf.pdf), visited on 9 April 2008. {, 2005 #4077} {, 2005 #4077}

protection chosen by a Member, it must be firmly based, or have a ‘rational relationship’ with, a risk assessment, as explained above.<sup>1204</sup>

Within the limits set by the need for a scientific basis, a variety of SPS measures may be imposed by Members, reflecting their technological and financial capacities and policy priorities. While as seen above, Members have very broad leeway in their choice of level of protection, subject only to a prohibition on arbitrary or unjustifiable distinctions leading to discrimination or disguised trade restrictions, the choice of measure is disciplined to minimise its adverse trade effects.

The provision in Article 5.3 of the *SPS Agreement*, discussed above,<sup>1205</sup> obliging Members to take account of certain economic factors in assessing risks from pests or diseases, also applies to the choice of an SPS measure to address these risks. As noted previously, the obligation in this Article is limited to the requirement that Members ‘take account’ of, or consider, the listed factors. This is thus an obligation of conduct, rather than of result. It operates to ensure that regulators have useful economic information before them when making a decision regarding what SPS measure to apply, thereby promoting rationality and cost/benefit analysis in regulatory choices regarding SPS measures to address risks from pests and diseases.

One of the factors listed in Article 5.3 is the ‘relative cost-effectiveness of alternative approaches to limiting risks’. The consideration of this factor is of relevance to the more rigorous discipline on the choice of an SPS measure set out in Article 5.6. Article 5.6 provides:

Without prejudice to paragraph 2 of Article 3, when establishing or maintaining sanitary or phytosanitary measures to achieve the appropriate level of sanitary or phytosanitary protection, Members shall ensure that such measures are not more trade-restrictive than required to achieve their appropriate level of sanitary or phytosanitary protection, taking into account technical and economic feasibility.

The explicit reference to Article 3.2 in this provision highlights the fact that measures which ‘conform to’ international standards and are thus deemed ‘necessary’ and in conformity with the *SPS Agreement* and the GATT 1994, under Article 3.2, are also presumed to comply with the least-trade-restrictive requirement of Article 5.6. Legally speaking this reference is redundant, since the presumption of conformity in Article 3.2 extends to the whole of the *SPS Agreement* (and the GATT), and thus by necessity also Article 5.6. However, its express inclusion may serve to indicate the negotiators’ view that international standards are inherently considered to be the least-trade-restrictive means to achieve a Member’s appropriate level of protection.

It has been held that Article 5.6 can be seen as a specific elaboration of the ‘necessary’ requirement in the first prong of Article 2.2.<sup>1206</sup> However, as noted above, while Article 2.2 refers to the extent of application of the SPS measure at issue, Article 5.6 refers to

---

<sup>1204</sup> The requirement that an SPS measure must be ‘based on’ a risk assessment amounts to a discipline on the choice of SPS measure, in that a ‘rational relationship’ must exist between the risk assessment and the measure chosen to address the risk. The nature of this relationship is discussed above, Part III, Section 5.1.5.

<sup>1205</sup> See above, Part III, Section 5.1.4.

<sup>1206</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1430.

its establishment or maintenance.<sup>1207</sup> Still, the two provisions are clearly closely related and impart meaning to each other. As a result, Article 5.6 should be read in the light of Article 2.2.<sup>1208</sup>

In a footnote to Article 5.6, what is meant by ‘a measure not more trade-restrictive than required’ is defined as follows:

For purposes of paragraph 6 of Article 5, a measure is not more trade-restrictive than required unless there is another measure, reasonably available taking into account technical and economic feasibility, that achieves the appropriate level of sanitary or phytosanitary protection and is significantly less restrictive to trade.<sup>1209</sup>

As is clear from the discussion of the GATT case law of relevance to health measures in Chapter 1 above,<sup>1210</sup> this discipline closely reflects the interpretation of the ‘necessary’ requirement of Article XX(b) of the GATT 1994. However, the express reference to alternative measures that achieve the appropriate level of protection of the Member concerned indicates the absence of room for strong proportionality testing in respect of the choice of an SPS measure.<sup>1211</sup>

In *Australia – Salmon*, the Panel set out the three elements of this definition, which it held to be cumulative, namely that a measure is more trade restrictive than required only if there is another SPS measure which:

- is reasonably available taking into account technical and economic feasibility;
- is significantly less trade restrictive than the contested measure; and
- achieves the Member’s appropriate level of sanitary protection.<sup>1212</sup>

The Appellate Body in *Australia – Salmon* agreed with this three-pronged test and confirmed that the three elements are cumulative ‘in the sense that, to establish inconsistency with Article 5.6, all of them have to be met.’<sup>1213</sup> It further stated:

Thus, if there is no alternative measure available, taking into account technical and economic feasibility, *or* if the alternative measure does not achieve the Member’s appropriate level of sanitary or phytosanitary protection, *or* if it is not

<sup>1207</sup> On the relationship between Article 2.2 and Article 5.6 see further above, Part III, Section 3.2.1.

<sup>1208</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.71; and Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1430. This relationship has not yet been confirmed by the Appellate Body.

<sup>1209</sup> Footnote 3 to Article 5.5 of the *SPS Agreement*.

<sup>1210</sup> See above, Part III, Section 1.1.1.

<sup>1211</sup> Above it is argued that the ‘weighing and balancing’ test of the ‘necessity’ requirement of Article XX of the GATT 1994 allows for strong proportionality testing. See above, Part III, Section 1.1.1. See also Marceau and Trachtman, who point out that the necessity test in Article XX GATT requires an actual balancing of the *degree* to which the measure in dispute contributes to the aim pursued whereas the ‘least-trade restrictive’ requirement of Article 5.6 of the *SPS Agreement* does not. Gabrielle Marceau and Joel P. Trachtman, ‘GATT, TBT and SPS: A Map of WTO Law of Domestic Regulation of Goods’, in *The WTO Dispute Settlement System 1995–2003*, F. Ortino and Ernst-Ulrich Petersmann (eds.) (Kluwer Law International, Deventer), 2004, 275-340, 296.

<sup>1212</sup> Panel Report, *Australia – Salmon*, para. 8.167.

<sup>1213</sup> Appellate Body Report, *Australia – Salmon*, para. 194.

significantly less trade-restrictive, the measure in dispute would be consistent with Article 5.6.<sup>1214</sup>

It is now useful to examine, in turn, each of the three cumulative requirements for a violation of Article 5.6 of the *SPS Agreement*.

#### 5.2.4.1 Reasonably available taking into account technical and economic feasibility

The first element of the three-pronged test of Article 5.6, requires that the alternative measure be ‘reasonably available, taking into account technical and economic feasibility’ of the *SPS Agreement*.

It should be recalled that the consideration of technical and economic feasibility represents a departure from the previous approach of GATT panels under Article XX(b) of the GATT 1947, which did not take account of economic feasibility when deciding if a measure was more trade restrictive than required. In the *Thailand – Cigarettes*,<sup>1215</sup> case, the GATT Panel interpreted the requirement of Article XX(b) that the measure be ‘necessary’ to protect health to mean that it should be the least GATT-inconsistent measure which Thailand could reasonably be expected to employ to achieve its health policy objectives.<sup>1216</sup> However, in comparing Thailand’s ban on cigarette imports to alternative regulatory measures,<sup>1217</sup> the GATT Panel did not look at the economic impact that the proposed regulatory regimes would have on Thailand. It thus found that alternative GATT-consistent measures were available to Thailand to achieve its health objectives.<sup>1218</sup> A change in this approach took place after the establishment of the WTO. The Appellate Body has evinced a willingness to consider the technical and economic feasibility of alternative measures as relevant to the ‘necessary’ test of Article XX of the GATT 1994.<sup>1219</sup>

<sup>1214</sup> *Ibid.* This finding was reiterated in Appellate Body Report, *Japan – Agricultural Products II*, para. 95.

<sup>1215</sup> GATT Panel Report, *Thailand – Cigarettes*, para. 74.

<sup>1216</sup> *Ibid.*, para. 75.

<sup>1217</sup> The measure in dispute was Thailand’s licensing requirement for cigarette manufacturers and importers. In practice only the licences for the national monopoly were approved. The alternative measures examined by the Panel were labelling and ingredient-disclosure regulations, advertising bans and the maintenance of a government monopoly on the non-discriminatory importation and national sale of cigarettes. GATT Panel Report, *Thailand – Cigarettes*, paras. 77-79.

<sup>1218</sup> GATT Panel Report, *Thailand – Cigarettes*, para. 80.

<sup>1219</sup> In *US – Gambling*, with respect to the ‘necessary’ requirement in Article XIV(c) of the GATS, the Appellate Body held that: ‘[a]n alternative measure may be found not to be ‘reasonably available’ ... where it is merely theoretical in nature, for instance, where the responding Member is not capable of taking it, or where the measure imposes an undue burden on that Member, such as prohibitive costs or substantial technical difficulties.’ Appellate Body Report, *US – Gambling*, para. 308. This finding was recalled by the Appellate Body in *Brazil – Retreaded Tyres*, which held that in the assessment of whether alternative measures or practices are ‘reasonably available’ alternatives to a measure, ‘the capacity of a country to implement remedial measures that would be particularly costly, or would require advanced technologies’ may be relevant. Appellate Body Report, *Brazil – Retreaded Tyres*, para. 171. *In casu* the Appellate Body found that the alternative measures proposed by the EC were costly and required advanced technologies and know-how not readily available on a large scale. For this reason, among others, they could not be regarded as ‘reasonably available’ alternatives to the import ban. *Ibid.*, para. 175.

A clear recognition of the fact that a less trade-restrictive measure could have high regulatory or compliance costs or could be impractical to implement is expressly incorporated in Article 5.6 of the *SPS Agreement*.<sup>1220</sup> The determination of whether an alternative measure is technically and economically feasible is of crucial importance to developing-country Members. In many cases, these Members are constrained in their choice of measure by financial and technical limitations. As a result, there may be more sophisticated measures available that achieve the appropriate level of protection of such a Member while being less restrictive of trade. Nevertheless, these alternative measures are not necessarily feasible for the regulating Member. Article 5.6 expressly takes this into account. It seems logical that the question of economic and technical feasibility will be determined on the basis of the characteristics of the importing Member, rather than by looking in the abstract at the alternative measures themselves. This should result in greater flexibility in the application of this discipline to developing-country Members.

In all disputes heard under the *SPS Agreement* thus far, the respondents were high-income country Members. There has thus not been occasion for a panel to examine the effect of constraints in technical capacity or economic resources on the choice of SPS measure by a less developed Member, and to take this into account in determining the availability of less trade-restrictive alternatives. In the cases where Article 5.6 has been at issue, the panels readily found that the respondent Member had the technical and economic capacity to apply the alternative measures proposed, particularly because these were often less complicated and demanding than the measure actually in place.

In *Australia – Salmon*, the Panel examined the four regulatory options that were identified in Australia's risk assessment, the 1996 Final Report, and stated as follows in this regard:

[A]ll four alternative options ... were presented in the 1996 Final Report itself as options which merit consideration and this in contrast to two other options - removal of all quarantine restrictions and banning the importation of all salmon products - which were thought of as options which could not 'reasonably be considered as appropriate, having regard to associated quarantine risks' and were therefore 'not discussed further'. In our view, this implies that the 1996 Final Report put forward the four alternatives we examine as technically and economically feasible policy options. Nothing in the 1996 Final Report - nor any other evidence before us - implies that any of these four alternatives would be technically or economically unfeasible.<sup>1221</sup>

The compliance Panel in *Australia – Salmon (Article 21.5 – Canada)*, when examining one of the four alternatives proposed by Canada for the Australian 'consumer-ready' requirements for imported salmonids, challenged under Article 5.6, stated that:

---

<sup>1220</sup> Gavin Goh and Andreas R. Ziegler, 'A Real World Where People Live and Work and Die: Australian SPS Measures after the WTO Appellate Body's Decision in the Hormones Case', *Journal of World Trade* 35 (5), 1998, 271-290, 280.

<sup>1221</sup> Panel Report, *Australia – Salmon*, para. 8.171. The Appellate Body noted the panel's 'factual finding' in this respect and considered, therefore, that the first element was met. Appellate Body Report, *Australia – Salmon*, para. 195.

[S]ince one can assume that current Australian requirements are ‘reasonably available taking into account technical and economic feasibility’, also a regime without the consumer-ready requirements ... would be so. Given that inspection and control to release from quarantine only product that meets the consumer-ready requirements would no longer be necessary, a regime without the consumer ready requirements would be even more reasonably available in the sense of Article 5.6.<sup>1222</sup>

The Panel was also of the view that another alternative measure requiring different, less onerous, consumer ready-requirements (individual and commercial packaging before release) would be reasonably available as shown by the fact that New Zealand imposed similar requirements.<sup>1223</sup> While not expressly stated, it seems that the comparison with New Zealand rests on the similarities in income level and technical capacity of this country with Australia. A third alternative, based on end-use conditions, gave rise to difficulties of control. However, as these difficulties were also present with regard to the existing Australian measure, the alternative was found to be technically feasible.<sup>1224</sup>

In *Japan – Agricultural Products II*, the Panel examined whether testing of agricultural products on a product-by-product basis to determine the efficacy of the quarantine treatment (fumigation) against codling moth was a technically and economically feasible alternative to the measure at issue, namely testing the efficacy for each individual variety of the product. Japan did not contest that this was the case, and the Panel agreed since testing by product is easier to implement than all the various tests and procedural steps required for approval of additional varieties of the agricultural products at issue.<sup>1225</sup> This issue was not appealed.

The compliance Panel in *Japan – Apples (Article 21.5 – US)* had to assess whether the measure proposed by the US as an alternative for Japan’s revised quarantine requirements for the importation of apples from the US was technically and economically feasible for Japan. The US had suggested that Japan should require ‘that only mature, symptomless apples be exported to Japan.’<sup>1226</sup> The Panel rejected Japan’s argument that this could not be seen as an alternative measure since it was a statement of commercial practices rather than an administrative requirement, and it required action by both private operators and public authorities. According to the Panel, this could be seen as a reasonably available alternative provided that sufficient guarantees were in place ‘to provide adequate assurances that such practices, whether public or private, will be adhered to.’<sup>1227</sup> It noted, however, that in considering alternative measures it should determine whether the measure ‘would constitute an option reasonably available taking into account technical and economic feasibility *in the real world*.’<sup>1228</sup> The risk of incorrect enforcement is, according to the Panel, part of the technical feasibility of the measure.<sup>1229</sup> In view of the fact that

<sup>1222</sup> Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, paras 7.146.

<sup>1223</sup> *Ibid.*, para. 7.147.

<sup>1224</sup> *Ibid.*, para. 7.148.

<sup>1225</sup> Panel Report, *Japan – Agricultural Products II*, para 8.78.

<sup>1226</sup> Panel Report, *Japan – Apples (Article 21.5 – US)*, para. 8.169.

<sup>1227</sup> *Ibid.*, para. 8.170.

<sup>1228</sup> *Ibid.*, para. 8.171. Emphasis added.

<sup>1229</sup> *Ibid.*

the US had indicated that specifications for mature, symptomless apples were laid down in its *Apple Export Act*, and that it had sufficient quality controls in place to reasonably ensure that the exported product was mature, symptomless apples, the Panel regarded the alternative measure suggested by the US as ‘reasonably available, taking into account technical and economic feasibility’.<sup>1230</sup>

The fact that an alternative measure is technically and economically feasible does not necessarily mean that it must be adopted by the regulating Member. The second and third requirements of Article 5.6 specify additional limits to this obligation.

#### 5.2.4.2 Significantly less trade restrictive

With regard to the second requirement, it is notable that the alternative measure must be *significantly* less trade-restrictive before a Member’s measure will be deemed ‘more trade-restrictive than required.’ Thus a small difference in the trade impacts of the two measures is not sufficient to oblige a Member to adopt the alternative measure.

While Article 5.6 does not define what is meant by ‘significantly less restrictive to trade’, it is useful to note that a similar term is used in the transparency obligation in Annex B.5 of the *SPS Agreement*. Members are obliged to notify their proposed SPS measures if they are not substantially the same as an international standard and ‘may have a significant effect on trade of other Members’. In the absence of a definition of this term, the SPS Committee has provided guidance in the recommended notification procedures it has adopted for purposes of the *SPS Agreement*. This guidance states:

To assess whether the sanitary or phytosanitary regulation may have a significant effect on trade, the Member concerned should consider relevant available information such as: the value or other importance of imports to the importing and/or exporting Members concerned, whether from other Members individually or collectively; the potential development of such imports; and difficulties for producers in other Members, particularly in developing country Members, to comply with the proposed sanitary or phytosanitary regulations. The concept of a significant effect on trade of other Members should include both import-enhancing and import-reducing effects on the trade of other Members, as long as such effects are significant.<sup>1231</sup>

Particularly helpful in this guidance is its emphasis of the relative nature of the enquiry, taking into account the significance of trade in the product at issue to the Members involved, and the compliance constraints faced by developing countries. This clarifies that the significance of the trade effects of a measure cannot be determined in the abstract, but is a factor of the particular situation of the affected Member. While this guidance seems use-

<sup>1230</sup> *Ibid.*, para. 8.181. The Panel noted that it could not be excluded that the US inspection system might sometimes fail to guarantee that all exported apples were mature and symptomless, but Japan had not brought evidence to show that this had occurred with regard to apples in the past.

<sup>1231</sup> The latest version of these guidelines are contained in Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision, G/SPS/7/Rev.3*, circulated on 20 June 2008, para. 10. They are discussed below, Part IV, Section 1.3.7.

ful in general terms in elucidating the third requirement of Article 5.6, four qualifications must be borne in mind. First, the SPS Committee is not empowered to adopt authoritative interpretations of the *SPS Agreement*, but only to further its implementation.<sup>1232</sup> Thus, these guidelines are not the final word on the meaning of the term, even in the context of Annex B.5. Second, the different object and purpose of the two provisions must be taken into account. While Annex B.5 aims to promote transparency by requiring the notification of measures deviating (upwards or downwards) from international standards if this deviation may have significant trade effects, Article 5.6 aims to limit the trade-restrictive effect of SPS measures imposed by Members by requiring, under the abovementioned conditions, that if a significantly less trade-restrictive alternative measure is reasonably available, it be imposed. Consequently, in the former case both the import-enhancing and import-reducing effects of the deviating measure are relevant, while in the latter only the import-enhancing effects of the alternative measure are pertinent. Third, the notification provision in Annex B.5 refers to an SPS measures that ‘may’ have a significant effect on trade, whereas Article 5.6 refers to an alternative SPS measure that ‘is’ significantly less trade-restrictive. Thus, the reference in the notification guidelines to ‘potential’ trade effects would not apply in the context of Article 5.6.<sup>1233</sup> Only measures that actually are significantly less trade restrictive must be considered as possible alternatives. Fourth, while Annex B.5 examines the trade effects of the measure *per se* to determine if they are ‘significant’, Article 5.6 involves a *comparison* of the trade effects of the original measure and the alternative measure, to determine if the latter is significantly less than the former. Thus, the relative nature of the criterion in Article 5.6 is determinative.

Panels have typically not had much difficulty in finding that the alternative measures proposed by the complaining Member meet the criterion of being ‘significantly less restrictive to trade’. This is a factual examination, depending on the circumstances of each case. An overview of panel findings in this regard gives an idea of the considerations that play a role in this determination.

The requirement that the alternative measures must be ‘significantly less restrictive to trade’ was examined by the Panel in *Australia – Salmon*.<sup>1234</sup> It recalled that Australia’s measure *prohibited* the importation of fresh, chilled or frozen salmon, whereas all four of the alternative options proposed would *allow* the salmon products to be imported, albeit under specific conditions (e.g. as retail-ready fillets, eviscerated, headless, gilled etc.).<sup>1235</sup> Consequently, the alternative measures were found to be significantly less trade restrictive.

The compliance Panel in *Australia – Salmon (Article 21.5 – US)* noted that all the alternative measures proposed by the US ‘would result in significantly more salmon product being allowed for direct release from quarantine’ (including skin-on salmon weighing more than 450g, individually or commercially packaged) and that there was demand in

<sup>1232</sup> Article 12.1 of the *SPS Agreement*. Authoritative interpretations are within the exclusive authority of the WTO Ministerial Conference or General Council under Article IX of the *WTO Agreement*.

<sup>1233</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 162.

<sup>1234</sup> Panel Report, *Australia – Salmon*, para. 8.256.

<sup>1235</sup> *Ibid.*, para. 8.182.

Australia for such product.<sup>1236</sup> Thus, the second requirement of Article 5.6 was held to be met by the proposed alternative measures.

In *Japan – Agricultural Products II*, Japan did not contest that the alternative measure proposed by the US, namely testing by product, was significantly less restrictive to trade than testing each variety of the product. The Panel agreed, since market access would then be granted automatically to all additional varieties of a product.<sup>1237</sup> As discussed above, however, as there was insufficient evidence before the Panel to show that testing by product achieved Japan's appropriate level of protection, the three cumulative requirements of Article 5.6 had not been met. The panel experts proposed another alternative measure, namely the determination of the sorption level of additional varieties of a product. Japan also did not contest that this alternative measure was significantly less restrictive to trade. The Panel agreed, since if the sorption level was not higher than that of already approved varieties, no further testing would be required meaning that market access would be obtained significantly more easily than under the existing regime. If the sorption level was higher, further testing could be required, but market access would not be more difficult to obtain than under the existing regime.<sup>1238</sup> Consequently, the Panel found that this alternative measure met all the requirements of Article 5.6. However, on appeal the Appellate Body overturned the Panel's finding in this regard, since the US had not claimed that the determination of sorption levels was an alternative measure meeting the requirements of Article 5.6, and had thus not made a *prima facie* case.<sup>1239</sup>

The compliance Panel in *Japan – Apples (Article 21.5 – US)* readily found that the alternative measure proposed by the US, namely the requirement that only mature, symptomless apple fruit be exported to Japan, would be significantly less trade-restrictive than the combination of quarantine requirements imposed by Japan against fire blight. The Panel noted that the alternative requirement proposed by the US came down to requiring it to do 'what it claims to be already doing under its national legislation'.<sup>1240</sup> This was found to 'certainly' be significantly less trade-restrictive than Japan's quarantine measures.

Although no express clarification of the meaning of the term 'significantly less restrictive to trade' has been given in the case law, it appears from the findings in the Panel reports discussed above that the main consideration is whether market access would be significantly improved if an alternative measure would be imposed. This criterion has not proved problematic.

#### 5.2.4.3 Achieves the Member's appropriate level of protection

The third element of the three-pronged test under Article 5.6 as clarified by its footnote, requires that the alternative measure 'achieves the appropriate level of sanitary or phytosanitary protection' of the regulating Member. As emphasised by the Panel in *Japan*

<sup>1236</sup> Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, paras 7.150-7.153.

<sup>1237</sup> Panel Report *Japan – Agricultural Products II*, para. 8.79.

<sup>1238</sup> Panel Report *Japan – Agricultural Products II*, paras 8.95-8.96.

<sup>1239</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 126. For a discussion on the burden of proof, the role of the panel experts, and the limits to the investigative authority of a panel, see below, Part IV, Sections 2.2.2, 2.2.3 and 2.2.5.

<sup>1240</sup> Panel Report, *Japan – Apples (Article 21.5 – US)*, para. 8.187.

– *Agricultural Products II* in addressing the US’s claim of violation of Article 5.6, the definition of the ‘appropriate level of protection’ in Annex A.5 to the *SPS Agreement* makes clear that it is up to the Member imposing the measure, in that case Japan, to determine the level of protection it deems appropriate.<sup>1241</sup> Therefore, in order to determine whether the third requirement for a violation of Article 5.6 is met, it is necessary to establish what the appropriate level of protection of the relevant Member is.

The Panel in *Australia – Salmon* had found that the level of protection deemed appropriate by a Member could be implied from the level reflected in the SPS measure it adopts.<sup>1242</sup> Thus it must be determined whether the alternative measures meet the level of protection achieved by the measure actually imposed. The Appellate Body disagreed, holding as follows:

We do not believe that Article 11 of the DSU, or any other provision of the DSU or of the *SPS Agreement*, entitles the Panel or the Appellate Body, for the purpose of applying Article 5.6 in the present case, to substitute its own reasoning about the implied level of protection for that expressed consistently by Australia. The determination of the appropriate level of protection, a notion defined in paragraph 5 of Annex A, as ‘the level of protection deemed appropriate by the Member establishing a sanitary ... measure’, is a *prerogative* of the Member concerned and not of a panel or of the Appellate Body.<sup>1243</sup>

The Appellate Body distinguished the appropriate level of protection, which is an *objective*, and the measure used to achieve that level, which is an *instrument* to attain this objective. It held that the provisions of the *SPS Agreement* indicate that ‘the determination by a Member of the “appropriate level of protection” logically precedes the establishment or decision on maintenance of an “SPS measure”.’<sup>1244</sup> The Appellate Body then noted that the correlation between the appropriate level of protection and the relevant SPS measure is most clearly illustrated by Article 5.6 and held:

The words of Article 5.6, in particular the terms ‘*when establishing or maintaining* sanitary ... protection’, demonstrate that the determination of the level of protection is an element in the decision-making process which logically *precedes* and is *separate* from the establishment or maintenance of the SPS measure. ... To imply the appropriate level of protection from the existing SPS measure would be to assume that the measure always achieves the appropriate level of protection determined by the Member. That clearly cannot be the case.<sup>1245</sup>

Thus, according to the Appellate Body, the appropriate level of protection determines what SPS measure will be used, not *vice versa*.<sup>1246</sup> Applying this finding to the case at hand, the Appellate Body noted that although the level of protection reflected in Australia’s SPS measure (the import prohibition) was ‘undisputedly a “zero-risk level” of protection’,

<sup>1241</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.81.

<sup>1242</sup> Panel Report, *Australia – Salmon*, para. 8.173.

<sup>1243</sup> Appellate Body Report, *Australia – Salmon*, para. 199.

<sup>1244</sup> *Ibid.*, paras 200 and 201.

<sup>1245</sup> *Ibid.*, para. 203.

<sup>1246</sup> *Ibid.*

Australia had determined explicitly that its appropriate level of protection was ‘a high or “very conservative” level of sanitary protection aimed at reducing risk to “very low levels”, “while not based on a zero-risk approach”.’<sup>1247</sup> As a result, it found:

[T]he *appropriate* level of protection as determined by Australia is definitely *not* at least as high as the level of protection *reflected* in the SPS measure at issue.<sup>1248</sup>

However, as there is no explicit obligation on Members in the *SPS Agreement* to determine their level of protection, a problem may arise where an importing Member has not done so, or has done so ‘with such vagueness or equivocation’<sup>1249</sup> that it becomes impossible to apply the relevant provisions of the *SPS Agreement* that refer to the level of protection, such as Article 5.6. The Appellate Body recognised this problem, stating that ‘[i]t would obviously be wrong to interpret the *SPS Agreement* in a way that would render nugatory entire articles or paragraphs of articles of this Agreement and allow Members to escape from their obligations under this Agreement.’<sup>1250</sup> It held that an obligation on Members to determine their appropriate level of protection is implicit in Annex B.3, and Articles 4.1, 5.4 and 5.6, which refer to the appropriate level of protection of a Member.<sup>1251</sup> It found:

[I]n cases where a Member does not determine its appropriate level of protection, or does so with insufficient precision, the appropriate level of protection may be established by panels on the basis of the level of protection reflected in the SPS measure actually applied. Otherwise, a Member’s failure to comply with the implicit obligation to determine its appropriate level of protection – with sufficient precision – would allow it to escape from its obligations under this Agreement and, in particular, its obligations under Articles 5.5 and 5.6.<sup>1252</sup>

Thus, if a Member does not determine its appropriate level of protection, or does so with insufficient clarity, panels may deduce the appropriate level from the level reflected in the measure actually applied.

This finding is important in that it prevents the discipline in Article 5.6 from limiting the ability of governments to adopt measures that achieve the level of protection they have chosen. It recognises that the choice of level of protection is the sole prerogative of national decision-makers. Thus alternative measures must always be judged against the Members own chosen level of protection and not simply compared to the measure currently in place. Only in cases where a government does not adequately determine its level of protection, may a panel infer it from the measure applied in order to prevent the avoidance of disciplines under the *SPS Agreement*.

Panels experience difficulties in applying the discipline of Article 5.6 in cases where the appropriate level of protection has been vaguely or qualitatively expressed. In *Australia – Salmon (Article 21.5 – Canada)*, the Panel expressed ‘parenthetically’ its view that

<sup>1247</sup> *Ibid.*, para. 197. In footnote here the Appellate Body referred to Panel Report, *Australia – Salmon*, para. 8.107.

<sup>1248</sup> *Ibid.*

<sup>1249</sup> *Ibid.*

<sup>1250</sup> *Ibid.*, para. 206.

<sup>1251</sup> *Ibid.*

<sup>1252</sup> *Ibid.*

a more explicit, and in particular a quantitative, expression of a Member's appropriate level of protection 'would greatly facilitate the consideration of compliance with not only Article 5.6 but with other provisions of the *SPS Agreement* as well.'<sup>1253</sup> Nevertheless, no such requirement is laid down in the *SPS Agreement*, nor can it be inferred from its provisions. Consequently, panels dealing with qualitative expressions of levels of protection must face the struggle to ascertain whether alternative measures meet these levels of protection, as did the compliance Panel in *Australia – Salmon (Article 21.5 – Canada)*. In that case the Panel took a cautious approach, limited to examining various options without deciding that one of them would necessarily achieve Australia's level of protection. The Panel simply noted after its examination of the alternatives proposed that it was convinced that there were other options available, be it the options it had discussed taken separately or in combination, that would meet Australia's appropriate level of protection. It then stated: 'We leave it up to Australia, preferably in close cooperation with Canada and other trading partners, to select and identify the details of such other measures.'<sup>1254</sup>

In *Japan – Agricultural Products II*, the level of protection deemed appropriate by Japan was clear, expressed quantitatively and undisputed.<sup>1255</sup> The US argued that an alternative less trade-restrictive measure was available that could achieve this level of protection, namely testing by product instead of testing by variety of each product. According to the US, varietal differences did not affect the efficacy of quarantine treatment for codling moth, and thus varietal testing provided no additional protection.<sup>1256</sup> Japan countered that data suggests varietal differences in the efficacy of fumigation, so that testing by product would not achieve its level of protection.<sup>1257</sup> The Panel considered that on the evidence before it, it was impossible 'to state with an appropriate degree of certainty that one and the same treatment would be effective for all varieties of a product.'<sup>1258</sup> It was thus not convinced that testing by product would achieve Japan's level of protection.<sup>1259</sup> The Appellate Body upheld this finding on appeal.<sup>1260</sup> Since it is for the complainant to prove that all three cumulative requirements of Article 5.6 are met, no violation will be found if the complainant is unable to establish that the proposed alternative actually meets the level of protection deemed appropriate by the Member imposing the measure.

---

<sup>1253</sup> Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.129.

<sup>1254</sup> *Ibid.*, para. 7.144.

<sup>1255</sup> In this case both parties agreed that the level of mortality that Japan was seeking with respect to codling moth could be regarded as Japan's appropriate level of protection. Both parties also agreed that this level was 'complete mortality in large scale tests on a minimum of 30,000 codling moths, with respect to all varieties of that product.' Panel Report, *Japan – Agricultural Products II*, paras 8.81 and 8.82.

<sup>1256</sup> *Ibid.*, para. 8.65.

<sup>1257</sup> *Ibid.*, para. 8.68.

<sup>1258</sup> *Ibid.*, para. 8.83.

<sup>1259</sup> *Ibid.*, para. 8.84. The Panel found that another alternative measure suggested by the panel experts, namely the determination of differences in sorption levels of different varieties of products, would achieve Japan's level of protection. *Ibid.*, para. 8.101. However, as the US had not claimed that the determination of differences in sorption levels was an alternative measure meeting the requirements of Article 5.6, the Appellate Body overturned the Panel's findings in respect of this alternative. Appellate Body Report, *Japan – Agricultural Products II*, para. 126.

<sup>1260</sup> Appellate Body Report, *Japan – Agricultural Products II*, paras 97-100. The Appellate Body rejected the US's argument on this point, noting that in essence it challenged the Panel's consideration and weighing of the evidence before it, something which is outside the scope of appellate review.

In *Japan – Apples (Article 21.5 – US)*, Japan identified its level of protection as ‘equivalent to one that would result from an import ban on commercial apples.’ The compliance Panel recalled ‘that it is for Japan to determine its [appropriate level of protection], and that [the Panel] should not question it.’<sup>1261</sup> However, since the Panel had already found that there was no evidence that mature, symptomless apple fruit could complete the transmission pathway for fire blight, it considered that Japan’s level of protection would ‘theoretically’ be met by the alternative measure proposed by the US, namely the requirement that apples be mature and symptomless.<sup>1262</sup> It is not clear why the Panel changed the ‘real world’ approach it used in identifying technically and economically feasible measures for a ‘theoretical’ approach in establishing whether the appropriate level of protection has been met. Such an approach goes against the respectful approach of the *SPS Agreement* towards Members’ appropriate levels of protection and their right to ensure that these levels are met by imported products. It certainly seems ill-advised and it to be hoped that the Appellate Body will correct this in future cases.

An example of a situation involving developing-country Members where the question arose whether a reasonably available less trade-restrictive measure would achieve the level of protection of the importing Member, is provided by the trade concern raised by Argentina against China’s measures against fruit flies.<sup>1263</sup> Argentina’s exports of apples, pears and citrus fruits to China were impeded by China’s limitation of imports to those originating from countries that are free of fruit flies, in order to retain China’s status as a country free of Medfly and South American fruit fly. Argentina argued that it was using cold treatment to eliminate fruit flies from export products, and requested China to respond to a list of questions regarding its risk assessment. However, China indicated that it required Argentina to provide data on the efficacy of cold treatment in order to demonstrate that it could provide the same level of protection as importation from pest-free areas. If this were so, China was prepared to consider it as an alternative treatment against fruit flies.<sup>1264</sup>

### 5.2.5 Rules on provisional measures

Risk management decisions with regard to the imposition of SPS measures are sometimes taken in situations of scientific uncertainty. In cases where the uncertainty takes the form of insufficiency of scientific evidence, such that the performance of a risk assessment is not possible, Members may be prompted by considerations of precaution to adopt SPS measures despite the absence of a risk assessment basis.

Article 5.7 of the *SPS Agreement* provides for such cases of insufficient scientific evidence. It states:

---

<sup>1261</sup> Panel Report, *Japan – Apples (Article 21.5 – US)*, para. 8.193.

<sup>1262</sup> *Ibid.*

<sup>1263</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Resolved Issues*, G/SPS/GEN/204/Rev.8/Add.3, circulated on 27 March 2008, item 115.

<sup>1264</sup> It is not entirely clear from the discussion of this trade concern whether Argentina was requesting that China apply the less trade-restrictive measure of requiring cold treatment for imports of products from Members not free of fruit flies, or whether it was requesting the recognition of the equivalence of cold treatment as a measure. In March 2006, the issue was reported resolved, but no indication was given of what the resolution entailed.

In cases where relevant scientific evidence is insufficient, a Member may provisionally adopt sanitary or phytosanitary measures on the basis of available pertinent information, including that from the relevant international organizations as well as from sanitary or phytosanitary measures applied by other Members. In such circumstances, Members shall seek to obtain the additional information necessary for a more objective assessment of risk and review the sanitary or phytosanitary measure accordingly within a reasonable period of time.

The relationship between Article 5.7 and the scientific disciplines contained in Articles 2.2 and 5.1 of the *SPS Agreement* is useful to examine. As mentioned above, Article 2.2 of the *SPS Agreement* expressly refers to Article 5.7 and its disciplines apply ‘except as provided for in paragraph 7 of Article 5.’ The Appellate Body in *Japan – Agricultural Products II* regarded Article 5.7 as a ‘qualified exemption’ from Article 2.2, rather than as an exception to this provision.<sup>1265</sup> Unlike Article 2.2, Article 5.1 does not expressly refer to Article 5.7. However, the Appellate Body in *Japan – Apples* noted the contextual link between the obligation in Article 5.1 to base an SPS measure on a risk assessment and the first element of Article 5.7, relating to the insufficiency of the scientific evidence. It noted that the scientific evidence will be insufficient for purposes of Article 5.7 if it *does not allow* the performance of an adequate risk assessment.<sup>1266</sup>

The relationship between Article 5.7 and the scientific obligations of Articles 2.2 and 5.1 was fleshed out further by the Panel in *EC – Approval and Marketing of Biotech Products*. In this dispute, the EC argued that its Member States’ safeguard measures banning biotech products that had already been approved at EC level, fell to be assessed under Article 5.7 rather than Articles 2.2 and 5.1 of the *SPS Agreement*. The Panel, relying on the test used by the Appellate Body in *EC – Tariff Preferences* to distinguish between exceptions and exemptions,<sup>1267</sup> agreed with the EC that Article 5.7 is an autonomous right, and not merely an exception from the general scientific obligation under Article 2.2 and the obligation to base a measure on a risk assessment in Article 5.1.<sup>1268</sup> Although Article 5.1 does not expressly refer to Article 5.7, the Panel recalled the Appellate Body’s finding in *Japan – Apples* that scientific evidence is ‘insufficient’ for purposes of Article 5.7 when it is impossible for a Member to conduct a risk assessment on the basis of this evidence. The Panel found it ‘unreasonable to assume that Members would accept, even in principle, an obligation with which they cannot comply.’<sup>1269</sup> Thus, a measure complying with all four

<sup>1265</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 80.

<sup>1266</sup> Appellate Body Report, *Japan – Apples*, para. 179.

<sup>1267</sup> Appellate Body Report, *EC – Tariff Preferences*, para. 88. Under this test, a provision is an autonomous right, rather than an exception from another provision, where ‘one provision permits, in certain circumstances, behaviour that would otherwise be inconsistent with an obligation in another provision, [where] one of the two provisions refers to the other provision, [and] where one of the provisions suggests that the obligation is not applicable to the said measure.’ This test was cited in Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2985.

<sup>1268</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.2969, 7.2976 and 7.2997. This finding is contrary to the finding of the Panel in *Japan–Apples*, which held that the burden of proof under Article 5.7 is on the respondent. The Appellate Body in *Japan – Apples* noted that this finding was not appealed, which the Panel in *EC–Approval and Marketing of Biotech Products* took as expressing the Appellate Body’s reservation with regard to this allocation of the burden of proof. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2979.

<sup>1269</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2995.

requirements of Article 5.7 is *excluded* from the scope of application of both the scientific obligations of the *SPS Agreement*, contained in Articles 2.2 and 5.1.<sup>1270</sup>

This, as recognised by the Panel, has implications for the burden of proof.<sup>1271</sup> The party claiming a violation of Articles 2.2 or 5.1 bears the burden of proving that the challenged measure is inconsistent with at least one of the four requirements set out in Article 5.7. Only then will the measure fall within the scope of application of Articles 2.2 or 5.1.<sup>1272</sup>

It is surprising to note that the safe haven from the scientific disciplines of Articles 2.2 and 5.1 of the *SPS Agreement* has been held to apply only to SPS measures that meet *all four* requirements of Article 5.7. Japan's argument in *Japan – Agricultural Products II*, that an SPS measure that is adopted in conformity with the requirements of the first sentence of Article 5.7 (i.e. in a situation of 'insufficient' scientific evidence and on the basis of available pertinent information), is automatically freed from the requirements of Article 2.2 and can only be tested against the obligations of Article 5.7, was rejected by the Appellate Body. It disagreed with Japan that the words 'except as provided for in Article 5.7' in Article 2.2 refer only to the first sentence of Article 5.7, holding that the text of Article 2.2 does not support this proposition as it refers to Article 5.7 as a whole.<sup>1273</sup> Similarly, the Panel in *EC – Approval and Marketing of Biotech Products* held that if a challenged SPS measure is not consistent with one of the requirements of Article 5.7, the situation is not 'as provided for in Article 5.7' and thus Article 2.2 applies.<sup>1274</sup> A similar finding was made by this Panel in respect of Article 5.1, due to its view of Article 5.7 as a 'qualified exemption' from Article 5.1.<sup>1275</sup> Thus, according to the case law, all four conditions of Article 5.7 must be met in order to avoid the scientific disciplines of Articles 2.2 and 5.1 of the *SPS Agreement*.

It can be questioned whether this line of case law is correct. A preferable approach, as argued by Andrew Lang, would be to regard the right to take provisional measures as existing in *all* cases where the scientific evidence is insufficient for the conduct of a risk assessment. In such cases, as explained below, it is *impossible* for Members to comply with the scientific disciplines of Articles 2.2 and 5.1. The remaining three obligations of Article 5.7 should not be seen as *conditions* for the existence of the right to take provisional measures, but rather as *substantive requirements* triggered by the exercise of this

---

<sup>1270</sup> Despite this finding, the Panel started its analysis with examining whether Article 5.1 was violated, rather than first determining whether the requirements of Article 5.7 were met (in which case Article 5.1 would not be applicable). The Panel explained its choice to follow the same order of analysis than had been applied in previous case law by stating that it considered the 'critical legal issue' in dispute to be whether the EC Member States' safeguard measures met the requirements of Article 5.1. Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.3006-7.3007.

<sup>1271</sup> On burden of proof issues, see below, Part IV, Section 2.2.2.

<sup>1272</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.2976 and 7.2996. It is useful to bear in mind that the fact that a particular SPS measure is found to be maintained 'without sufficient scientific evidence' for purposes of Article 2.2 of the *SPS Agreement* does not necessarily mean that the first requirement, which triggers the application of the Article 5.7 exemption, namely that 'relevant scientific evidence is insufficient', will be met. Panel Report, *Japan – Apples*, para. 8.215. This is discussed below, Part III, Section 5.2.5.2.

<sup>1273</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 90.

<sup>1274</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2975.

<sup>1275</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2998.

right.<sup>1276</sup> If these requirements are not met, the measure is in violation of Article 5.7 of the *SPS Agreement*. To instead ‘send the panel back’ to Articles 2.2 and 5.1 in such cases makes no sense, once it is recognised that Article 5.7 applies only in cases where the insufficiency of the scientific evidence is such as to hinder compliance with Articles 2.2 and 5.1.<sup>1277</sup> In addition, as stated by Lang, ‘at the level of principle: there is something objectionable in principle about a situation in which the right to take protective measures can become legally unavailable, even where a clearly legitimate reason exists for such measures.’<sup>1278</sup>

### 5.2.5.1 Relationship with the precautionary principle

Much of the academic discussion surrounding Article 5.7 of the *SPS Agreement* relates to the question of the scope it provides for regulating Members to act in accordance with the precautionary principle.<sup>1279</sup> Although the content and legal status of the precautionary principle are disputed,<sup>1280</sup> there is increasing recognition of the legitimacy of precautionary approaches to risk regulation in the face of uncertainties in science.<sup>1281</sup> These precautionary approaches may be reflected in conservative assumptions, safety factors, models, extrapolations and rules of thumb used to fill gaps in scientific knowledge when conducting a risk assessment. They may also be reflected in risk management choices, such as the decision to rely on more risk-averse minority opinions as a basis for an SPS measure in cases where divergent scientific opinions arise from assessments of the scientific data. Precaution may also lead regulators to impose SPS measures in cases where the scientific evidence is insufficient to conduct a risk assessment at all.

<sup>1276</sup> Andrew T.F. Lang, *Provisional Measures under Article 5.7 of the WTO’s Agreement on Sanitary and Phytosanitary Measures: Some Criticisms of the Jurisprudence So Far*, LSE Legal Studies Working Paper No. 11/2008 (London School of Economics, London), 30 June 2008, 8, available at: <http://ssrn.com/abstract=1153660>, visited on 18 August 2008.

<sup>1277</sup> The criterion of ‘insufficient’ scientific evidence to trigger the application of Article 5.7 is discussed below, Part III, Section 5.2.5.2.

<sup>1278</sup> Andrew T.F. Lang, *Provisional Measures under Article 5.7 of the WTO’s Agreement on Sanitary and Phytosanitary Measures: Some Criticisms of the Jurisprudence So Far*, LSE Legal Studies Working Paper No. 11/2008 (London School of Economics, London), 30 June 2008, 9, available at: <http://ssrn.com/abstract=1153660>, visited on 18 August 2008.

<sup>1279</sup> See for example Joanne Scott and Ellen Vos, ‘The Juridification of Uncertainty: Observations on the Ambivalence of the Precautionary Principle within the EU and the WTO’, in *Good Governance in Europe’s Integrated Market*, Christian Joerges and Renaud Dehousse (eds.) (Oxford University Press, New York), 2002, 253-286.

<sup>1280</sup> On the debate concerning the status and meaning of the ‘precautionary principle’ see above, Part II, Section 1.5.

<sup>1281</sup> It is interesting to note that in the discussion at the SPS Committee following the notification by the EC of its *Communication on the Precautionary Principle*, Members (including the US, Canada, Mexico, Brazil, Bolivia, Chile and Argentina) did not disagree with the right of Members to act with precaution in regulating against SPS risks. Instead, the point of contention was whether reference to the ‘precautionary principle’ was appropriate in view of the fact that Article 5.7 of the *SPS Agreement* already makes provision for action in the face of insufficient scientific evidence. Concerns were expressed that, if the precautionary principle were seen to override the express disciplines of the *SPS Agreement*, precaution would make room for disguised protectionist measures. Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 15–16 March 2000: Note by the Secretariat*, G/SPS/R/18, circulated on 18 April 2000, paras 3-12. The notification of the EC’s *Communication on the Precautionary Principle* was circulated in Committee on Sanitary and Phytosanitary Measures, *Communication by the European Communities on the Precautionary Principle*, G/SPS/GEN/168, circulated on 14 March 2000.

Developing-country Members have expressed concerns regarding reliance on the precautionary principle in SPS regulation to evade the scientific obligations of the *SPS Agreement*. In discussions in the SPS Committee on this issue, the delegate from Argentina stated that:

[n]o one would disagree about the need to act with precaution. However, it was problematic to introduce this so-called principle that could override SPS obligations; for the sake of precaution, consolidated trade concessions could be removed, impaired or nullified without compensation. He emphasized that this was of much concern to developing countries whose already serious problems in complying with SPS measures in export markets would be made worse by the “blank cheque” of precaution.<sup>1282</sup>

The question arises whether the *SPS Agreement* makes provision for precaution in regulatory action, and if so, what the limits of this possibility are. This has, in turn, led to an examination of the requirements of Article 5.7 and the question whether this Article is the sole embodiment of the scope for precautionary approaches to risk regulation left in the *SPS Agreement*.

In *EC – Hormones*, the EC had tried to rely on the precautionary principle outside the framework of Article 5.7, as a general customary rule of international law or at least a general principle of law, applying to both risk assessment and risk management.<sup>1283</sup> This was because the EC refused to classify its measure as ‘provisional’ and therefore could not base its arguments on Article 5.7, despite its contention that scientific uncertainty persisted regarding the risks involved in hormone treated meat. After expressing its doubts as to whether the precautionary principle has developed into a principle of general or customary international law, outside the field of international environmental law, the Appellate Body found it unnecessary to decide this issue.<sup>1284</sup> It stated as follows:

<sup>1282</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 15–16 March 2000: Note by the Secretariat*, G/SPS/R/18, circulated on 18 April 2000, para. 10.

<sup>1283</sup> It is interesting to note that the EC Commission’s *Communication on the Precautionary Principle* (COM/2000/001, Brussels, 2 February 2000) adopted partly as a reaction to the Appellate Body decision in *EC – Hormones*, reflects a departure from the view that the precautionary principle applies to both phases of risk analysis. It states that the appropriate role for the precautionary principle is in risk management decisions, where scientific uncertainty precludes a full risk assessment. It distinguishes this situation from the prudential approach which scientists take in their assessment of data, in order to deal with the scientific uncertainties inherent in risk assessment. It identifies (at 15) certain prudential techniques adopted by risk assessors to deal with uncertainties, for example the use of animal models to establish potential effects in humans, adopting a safety factor when evaluating an acceptable daily intake to take account of inter- and intra-species variability, not adopting an acceptable daily intake for recognised carcinogens, etc. It seems that the Commission’s change in approach is a reaction to the Appellate Body’s refusal in *EC – Hormones* to see the precautionary principle as allowing deviation from the explicit provisions of Article 5.1 on risk assessment, except as provided for in Article 5.7. It thus cannot influence the application of the risk assessment disciplines. The Commission thus now prefers to view the principle as a risk management tool.

<sup>1284</sup> Appellate Body Report, *EC – Hormones*, para. 123. The Appellate Body refers to various authors both supporting and denying the claim that the precautionary principle is a principle of customary international law. While the widespread use of this principle in international environmental treaties seems to indicate its emergence as a new norm of customary international environmental law, it is less clear that it has attained this status outside the environmental area. However, emerging practice in the area of health does reflect growing recognition of this principle (see the EC Commission’s *Communication on the Precautionary Principle*, COM/2000/001, as well as the work of the Codex Alimentarius Commission to establish guidelines for the

The status of the precautionary principle in international law continues to be the subject of debate among academics, law practitioners, regulators and judges. The precautionary principle is regarded by some as having crystallized into a general principle of customary international *environmental* law. Whether it has been widely accepted by Members as a principle of *general* or *customary international law* appears less than clear. We consider, however, that it is unnecessary, and probably imprudent, for the Appellate Body in this appeal to take a position on this important, but abstract, question. We note that the Panel itself did not make any definitive finding with regard to the status of the precautionary principle in international law and that the precautionary principle, at least outside the field of international environmental law, still awaits authoritative formulation.<sup>1285</sup>

The Appellate Body then held that the precautionary principle (presumably whatever its legal status in international law) could not override the explicit requirements of Articles 5.1 and 5.2, in cases of scientific uncertainty.<sup>1286</sup> On the relationship between the precautionary principle and the *SPS Agreement*, the Appellate Body noted the following four elements:

First, the principle has not been written into the *SPS Agreement* as a ground for justifying SPS measures that are otherwise inconsistent with the obligations of Members set out in particular provisions of that Agreement. Secondly, the precautionary principle indeed finds reflection in Article 5.7 of the *SPS Agreement*. We agree, at the same time, with the European Communities, that there is no need to assume that Article 5.7 exhausts the relevance of a precautionary principle. It is reflected also in the sixth paragraph of the preamble and in Article 3.3. These explicitly recognize the right of Members to establish their own appropriate level of sanitary protection, which level may be higher (i.e., more cautious) than that implied in existing international standards, guidelines and recommendations. Thirdly, a panel charged with determining, for instance, whether ‘sufficient scientific evidence’ exists to warrant the maintenance by a Member of a particular SPS measure may, of course, and should, bear in mind that responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned. Lastly, however, the precautionary principle does not, by itself, and without a clear textual directive to that effect, relieve a panel from the duty of applying the normal (i.e. customary international law) principles of treaty interpretation in reading the provisions of the *SPS Agreement*.<sup>1287</sup>

---

implementation of this principle). The Appellate Body also mentions the ICJ decision in *Case Concerning the Gabcikovo–Nagaymaros Project (Hungary/Slovakia)* ICJ Judgement 25 September 1997, available at: [http://www.icj-cij.org/icjwww/idocket/his/ihsjudgement/his\\_judgement\\_970925.html](http://www.icj-cij.org/icjwww/idocket/his/ihsjudgement/his_judgement_970925.html), visited on 25 June 2007. In this case the ICJ recognised that new norms and standards have developed in the field of international environmental law, but did not specifically mention the precautionary principle as being one of those new norms. Appellate Body Report, *EC – Hormones*, footnotes 92-93.

<sup>1285</sup> Appellate Body Report, *EC – Hormones*, para. 123.

<sup>1286</sup> Appellate Body Report, *EC – Hormones*, para. 125., where it held, ‘We accordingly agree with the finding of the Panel that the precautionary principle does not override the provisions of Article 5.1 and 5.2 of the *SPS Agreement*.’

<sup>1287</sup> *Ibid.*, para. 124.

Thus, the Appellate Body in *EC – Hormones* saw Article 5.7 as incorporating and giving meaning to the precautionary principle for purposes of the *SPS Agreement*. Although, according to the Appellate Body, Article 5.7 does not necessarily exhaust the relevance of this principle, the other two provisions it referred to as reflections of the precautionary principle do not, in fact, embody the precautionary principle but rather the preventive principle.<sup>1288</sup>

The approach of the Appellate Body in *EC – Hormones* was followed by the Panel in *EC – Approval and Marketing of Biotech Products*. In response to the European Communities' argument that the precautionary principle has 'by now' become a fully-fledged principle of international law, the Panel noted:

It appears to us from the Parties' arguments and other available materials that the legal debate over whether the precautionary principle constitutes a recognized principle of general or customary international law is still ongoing. Notably, there has, to date, been no authoritative decision by an international court or tribunal which recognizes the precautionary principle as a principle of general or customary international law.<sup>1289</sup>

While agreeing that the precautionary principle has explicitly or implicitly been incorporated into many international conventions and declarations and has been applied by states at the domestic level, the Panel noted that this is mostly in the field of environmental law. It pointed out that questions remain as to the 'precise definition and content of the precautionary principle'.<sup>1290</sup> Moreover, while many authors have expressed the view that the precautionary principle exists as a general principle in international law, at the same time others have expressed scepticism and consider that the precautionary principle has not yet attained this status.<sup>1291</sup> Therefore the Panel held:

Since the legal status of the precautionary principle remains unsettled, like the Appellate Body before us, we consider that prudence suggests that we not attempt to resolve this complex issue, particularly if it is not necessary to do so.<sup>1292</sup>

However, the matter does not end here. If the precautionary principle can be said to have developed into a principle of customary international law, it has the effect of guiding the interpretation of Articles of the *SPS Agreement*, where there is room for more than one interpretation.<sup>1293</sup> It is a customary international law principle of interpretation that, as parties to a treaty are presumed not to have intended to violate norms of customary international law, treaty provisions are interpreted as far as possible in conformity with these norms.<sup>1294</sup> Thus the Appellate Body's statement that '...the precautionary principle

---

<sup>1288</sup> On the difference between the precautionary principle and the preventive principle, see above, Part II, Section 1.5.

<sup>1289</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.88.

<sup>1290</sup> *Ibid.*

<sup>1291</sup> *Ibid.*

<sup>1292</sup> *Ibid.*, para. 7.89.

<sup>1293</sup> On the role of other international law in the interpretation of WTO agreements, see below, Part IV, Section 2.2.4.

<sup>1294</sup> On this point, see Joost Pauwelyn, *Conflict of Norms in Public International Law: The Example of the World Trade Organization: Internal Hierarchy and How WTO Law Relates to Other Rules of International Law*,

does not, by itself, and without a clear textual directive to that effect, relieve a panel from the duty of applying the normal (i.e. customary international law) principles of treaty interpretation<sup>1295</sup> reveals a misunderstanding of the role of customary international law principles. In fact, it is precisely these ‘normal principles of treaty interpretation’<sup>1296</sup> that require the precautionary principle to be used to guide the interpretation of vague or ambiguous provisions of the *SPS Agreement*, if it can be shown that this principle is now a customary international law norm. Thus the Appellate Body was wrong to state that it was ‘unnecessary’ for it to take a position on this question,<sup>1297</sup> the answer to which is crucial to the determination of the role of the precautionary principle in informing the disciplines of the *SPS Agreement*. The precautionary principle could be important in giving meaning to vague terms in the *SPS Agreement*, such as the ‘sufficient scientific evidence’ requirement in Article 2.2<sup>1298</sup> or the requirement that SPS measures be ‘based on’ a risk assessment, ‘as appropriate to the circumstances’ in Article 5.1.

It is useful to recall, however, that despite the Appellate Body’s reluctance to consider the precautionary principle as an interpretative tool in guiding the application of the scientific disciplines of the *SPS Agreement*, it has implicitly done so in some of its findings on these disciplines. The realistic and pragmatic approach followed by the Appellate Body in interpreting Articles 5.1 and 2.2 of the *SPS Agreement*, discussed above, have made room for precautionary approaches to risk regulation. Examples of this are the Appellate Body’s finding that reliance on minority opinions in risk assessments is permissible,<sup>1299</sup> its rejection of a requirement of a minimum threshold of risk<sup>1300</sup> and its refusal to limit a risk assessment to ‘laboratory science’, recognising the need to consider real world conditions, including problems of control, in assessing risk.<sup>1301</sup> It seems, therefore, that the use

---

Doctoral Thesis, Faculté de Droit (Université de Neuchâtel, Neuchâtel), 2001, 155.. In footnote, Pauwelyn cites Akehurst, stating: ‘just as there is a presumption against the establishment of new customary rules which conflict with pre-existing customary rules, so there is a presumption against the replacement of customary rules by treaties and vice versa.’ Michael Akehurst, ‘The Hierarchy of the Sources of International Law’, 75 *British Yearbook of International Law*, 1974, 273-285, 275. He also cites Panel Report, *Indonesia – Autos*, para. 14.28, finding: ‘in public international law there is a presumption against conflict’. *Ibid.*, footnote 709.

<sup>1295</sup> Appellate Body Report, *EC – Hormones*, para. 124.

<sup>1296</sup> The normal principles of treaty interpretation that are part of customary international law must be used in the interpretation of the provisions of the WTO agreements, according to Article 3.2 of the DSU. These principles are codified in Articles 31 and 32 of the *Vienna Convention on the Law of Treaties*. Article 31.3(c) requires regard to ‘any relevant rules of international law applicable in the relations between the parties’ together with the context when interpreting a treaty provision.

<sup>1297</sup> Appellate Body Report, *EC – Hormones*, para. 123.

<sup>1298</sup> It seems that the Appellate Body itself recognised this possibility, in an *obiter* statement that ‘a panel charged with determining, for instance, whether ‘sufficient scientific evidence’ exists to warrant the maintenance by a Member of a particular SPS measure may, of course, and should, bear in mind that responsible, representative governments commonly act from perspectives of prudence and precaution where risks of irreversible, e.g. life-terminating, damage to human health are concerned.’ Appellate Body Report, *EC – Hormones*, para. 124. Although the interpretation of Article 2.2 was not at issue in this case, the Appellate Body seems to have recognised the possibility of interpreting this Article in the light of a rather restrictive formulation of the precautionary principle.

<sup>1299</sup> See above, Part III, Section 5.1.5.1.

<sup>1300</sup> See above, Part III, Section 5.1.1.2.

<sup>1301</sup> See above, Part III, Section 5.1.1.2.

of precautionary approaches in the risk assessment process is not excluded by the rules of the *SPS Agreement*, as interpreted by the Appellate Body.<sup>1302</sup>

An interesting development in this regard can be found in the *obiter* statement of the Panel in *EC – Approval and Marketing of Biotech Products*. In response to the claims by the US, Canada and Argentina that the safeguard measures applied by the EC Member States, at issue in this dispute, were in violation of Article 5.1, the EC argued that these measures were based on the precautionary principle.<sup>1303</sup> While refraining from referring here to the question whether the ‘precautionary principle’ has achieved any particular status in international law, the Panel agreed that the fact that a Member chooses to follow ‘a precautionary approach’ could have a bearing on the assessment by a panel of whether the SPS measure at issue was ‘based on’ a risk assessment under Article 5.1.<sup>1304</sup> More specifically, the Panel considered that if there are factors, such as the limited body of scientific evidence available, that affect scientists’ confidence in the risk assessment they have conducted, a Member may in principle take this into account in determining the SPS measure to be applied to achieve its appropriate level of protection. Therefore, when faced with a risk assessment that ‘identifies uncertainties or constraints’ a Member following a precautionary approach may apply a stricter measure than another Member to address the same risk, or may decide to apply an SPS measure where another Member might decide not to do so.<sup>1305</sup> However, the SPS measure at issue must still be ‘based on’ (i.e. reasonably supported by) a risk assessment.<sup>1306</sup> In this case, the EC had not identified uncertainties or constraints in the risk assessments at issue, nor had it explained how the safeguard measures were reasonably supported by the relevant risk assessments, which were favourable to the biotech products.<sup>1307</sup> Therefore the argument regarding the ‘precautionary approach’ of the relevant Member States did not persuade the Panel that this approach had been applied consistently with Article 5.1.

Although not addressing the precautionary principle as such, this finding seems to indicate a welcome openness of the Panel to interpret the obligation to base an SPS measure on a risk assessment in a manner that respects the right of Members to choose a precautionary approach in their risk management decisions. Notably, this does not mean that the existing scientific obligations of the *SPS Agreement* are overridden. Instead, in the application of these disciplines, a panel would be guided by the recognition of precaution as a legitimate risk management option, and would therefore not expect as close a correlation between the SPS measure applied and the relevant risk assessment in order for the former to be ‘reasonably supported’ by the latter as has been the case to date. This is precisely the effect that the use of the precautionary principle as an interpretative tool in disputes under the *SPS Agreement* could have, were it to be found to have emerged as a

---

<sup>1302</sup> This flexibility may, however, be undermined by the current practice of panels to review the science evaluated in a risk assessment to determine if they agree with the conclusions arrived at. This allows panels to replace the science policy choices of a regulating Member, including those reflecting conservative or precautionary approaches, with their own. This problem relates to the standard of review applied by panels in their assessment of the scientific evidence, and is discussed below, Part IV, Section 2.2.3.

<sup>1303</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3065.

<sup>1304</sup> *Ibid.*

<sup>1305</sup> *Ibid.*

<sup>1306</sup> *Ibid.*

<sup>1307</sup> *Ibid.*, para. 7.3066.

principle of customary international law. The advantage of basing such an interpretation on a principle of international law is that a normative basis is provided for the flexibility inherent in this approach, thereby enhancing its legitimacy.<sup>1308</sup>

However, as the case law now stands, the Appellate Body's decision in *EC – Hormones* in effect limits the applicability of the precautionary principle to risk management decisions under the *SPS Agreement* to the situation covered by Article 5.7 of the *SPS Agreement*.<sup>1309</sup> It is therefore necessary to examine the provisions of Article 5.7 to determine to what extent they give expression to this principle and deal with the exigencies it was developed to address.

The requirements of Article 5.7 were first set out in *Japan – Agricultural Products II*. The Appellate Body noted that Article 5.7 lays down four requirements for provisional measures. Two of these requirements relate to the conditions for adoption of provisional measures, and two to the conditions for their maintenance. Under the first sentence, the provisional measure may be *adopted* if it is: (1) imposed in respect of a situation where 'relevant scientific information is insufficient' and (2) adopted 'on the basis of available pertinent information.' Under the second sentence, the measure may not be *maintained* unless the Member (1) seeks to 'obtain the additional information necessary for a more objective assessment of risk' and (2) reviews the measure accordingly 'within a reasonable period of time'.<sup>1310</sup> These requirements have been held to be cumulative.<sup>1311</sup> Thus, as discussed above, as the case law now stands, all four requirements of Article 5.7 must be met in order for an SPS measure to be exempt from the scientific disciplines of the *SPS Agreement*.

### 5.2.5.2 Insufficient scientific evidence

Clearly, the first requirement for the adoption of a provisional measure, namely that 'relevant scientific evidence is insufficient', is what triggers the application of Article 5.7. It is thus crucial to determine in what circumstances this criterion will be met.

In *Japan – Agricultural Products II*, Japan argued that the meaning of sufficiency in this Article must be the same as that of the same term in Article 2.2.<sup>1312</sup> This would mean that there is insufficient scientific evidence, and thus Article 5.7 applies, in cases where there is no 'rational relationship' between the available evidence and the SPS measure. The US, on the other hand, averred that the reference to sufficiency in Article 5.7 relates to the sufficiency of the available evidence to enable the conduct of a risk assessment. Thus, at the time of adoption of the provisional measure, the information necessary for an objective risk assessment must be lacking. This is quite different from the case where there is sufficient evidence to conduct a proper risk assessment, but the results of the risk

<sup>1308</sup> For a discussion of the importance of international law norms in providing a normative framework for the interpretation of the *SPS Agreement*, thereby providing a firm foundation for the way in which its trade/health balance is given effect in dispute settlement, see below, Part IV, Section 2.2.4.

<sup>1309</sup> And possibly, to a limited extent, to the interpretation of Article 2.2 of the *SPS Agreement*. See above, Part III, Section 3.2.3.2.

<sup>1310</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 89. These four requirements were reiterated in Appellate Body Report, *Japan – Apples*, para. 176.

<sup>1311</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 89.

<sup>1312</sup> *Ibid.*, para. 12.

assessment do not reasonably support the measure adopted, as is the case when Article 2.2 is violated. To allow recourse to Article 5.7 in these cases would, according to the US, make the obligation contained in Article 5.1 meaningless.<sup>1313</sup> In this case the Panel found it unnecessary to decide on this issue for reasons of judicial economy, with which the Appellate Body agreed.<sup>1314</sup> Nevertheless, it seems that the interpretation given by the US to the requirement in Article 5.7 is logical to the extent that it limits the use of Article 5.7 to cases of where the scientific evidence available does not permit a risk assessment to be conducted, in accordance with its purpose, rather than allowing it to provide a loophole for adopting measures unsupported by the evidence embodied in a risk assessment.

In *Japan – Apples*, the Panel addressed the relationship between the ‘sufficiency’ concepts of Articles 2.2 and 5.7 in its examination of the first criterion of Article 5.7. The Panel had found that Japan’s quarantine requirements for the importation of apples from the US were maintained without sufficient scientific evidence for purposes of Article 2.2, since the scientific evidence showed that the risk of transmission of fire blight by the importation of apples was negligible.<sup>1315</sup> The Panel then proceeded to examine Japan’s claim, in the alternative, that its measure was justified under Article 5.7. It started by determining whether the first requirement of Article 5.7 was met. In this context, it stated:

We first note that the existence of a situation where “relevant scientific evidence is insufficient” cannot be merely presumed on the basis of the fact that the measure at issue has been found to be maintained “without sufficient scientific evidence” pursuant to Article 2.2. The fact that a particular measure, in this instance the set of requirements applied by Japan to the importation of US apple fruit, is found to be maintained without sufficient scientific evidence may not necessarily dispose of the separate question, under Article 5.7, of whether the situation is one where “relevant scientific evidence” is insufficient.<sup>1316</sup>

The Panel noted that the ‘relevant scientific evidence’ for purposes of Article 5.7 included ‘not only evidence supporting Japan’s position, but also evidence supporting other views.’<sup>1317</sup> This differs from the situation under Article 2.2, where it must be examined whether there is ‘sufficient scientific evidence’ supporting the views of the Member imposing the measure, in order for there to be a rational relationship between the evidence and the measure imposed. In the case before it, the Panel found that a wealth of scientific evidence was available and had been submitted not only by the parties to the dispute but also by the experts consulted by the Panel.<sup>1318</sup> It found:

<sup>1313</sup> *Ibid.*, para. 27.

<sup>1314</sup> *Ibid.*, para. 91. While it is clear that, since the requirements of the second sentence of Article 5.7 were not met, Japan could not rely on Article 5.7 to justify its measure and it was unnecessary to go on to investigate whether Japan complied with other two requirements of Article 5.7, it would seem more logical to have started the analysis by determining whether Article 5.7 is applicable to the case at all. For this purpose, it would have been useful to examine the first requirement, which triggers the application of this article when ‘scientific evidence is insufficient.’ The EC expressed the view in its third party submission in *Japan–Agricultural Products II*, that both the requirements of the first sentence are the triggers for the operation of Article 5.7 and should therefore be examined first. Appellate Body Report, *Japan – Agricultural Products II*, para. 64.

<sup>1315</sup> This finding is discussed above, Part III, Section 3.2.3.1.

<sup>1316</sup> Panel Report, *Japan – Apples*, para. 8.215.

<sup>1317</sup> *Ibid.*, para. 8.216.

<sup>1318</sup> It is interesting to note that the Panel in this case found that the insufficiency of the scientific evidence is

The current “situation”, where scientific studies as well as practical experience have accumulated for the past 200 years, is clearly not the type of situation Article 5.7 was intended to address. Article 5.7 was obviously designed to be invoked in situations where *little, or no, reliable evidence* was available on the subject matter at issue. With regard to fire blight, not only a large quantity but a high quality of scientific evidence has been produced over the years that describes the risk of transmission of fire blight through apple fruit as negligible.<sup>1319</sup> Moreover, this is evidence in which the experts have expressed strong and increasing confidence. We therefore are of the view that the first condition of the first sentence of Article 5.7 is not met.<sup>1320</sup>

The Appellate Body in *Japan – Apples* endorsed the Panel’s approach. It further found that for purposes of Article 5.7, relevant scientific evidence will be insufficient ‘if the body of available scientific evidence does not allow, in quantitative or qualitative terms, the performance of an adequate assessment of risks as required under Article 5.1 and as defined in Annex A to the *SPS Agreement*.’<sup>1321</sup> It noted that it is not ‘scientific uncertainty’ that triggers the application of Article 5.7, but rather the ‘insufficiency of scientific evidence’, emphasizing that ‘[t]he two concepts are not interchangeable.’<sup>1322</sup> This finding demarcates the limits of the situations covered by Article 5.7 to a specific category of cases within the broader concept of ‘scientific uncertainty’, namely those cases where a risk assessment as required by Article 5.1 and Annex A.4 is rendered impossible by the insufficiency of the available scientific evidence.<sup>1323</sup>

In *EC – Approval and Marketing of Biotech Products*, the EC argued that the safeguard measures taken by some of its Member States against imports of biotech products could be justified under Article 5.7, as they were provisional measures. The Panel disagreed, finding that the trigger for applicability of Article 5.7 is the insufficiency of the scientific evidence, not the provisional nature of the measure at issue.<sup>1324</sup> It noted that whether the scientific evidence is insufficient for the performance of a risk assessment must be determined on a case-by-case basis.<sup>1325</sup> In addition, the Panel disagreed with the EC that

---

meant to refer to the evidence in general on the SPS question at issue and not to a specific aspect of the SPS problem. It thus rejected Japan’s argument that evidence was insufficient on certain aspects of the dissemination of the bacteria. However, it later stated that even if Japan’s argument was accepted, there was a large volume of relevant scientific evidence even on the specific questions raised by Japan and thus the first requirement of Article 5.7 was still not met. *Ibid.*, paras 8.217-218.218 and 218.220.

<sup>1319</sup> Annex 3, Dr Hale and Dr Smith, paras. 342 and 343 (footnote in the original).

<sup>1320</sup> Panel Report, *Japan – Apples*, para. 8.219. Emphasis added.

<sup>1321</sup> Appellate Body Report, *Japan – Apples*, para. 179.

<sup>1322</sup> *Ibid.*, para. 184.

<sup>1323</sup> As noted above, other aspects of scientific uncertainty that lead to precautionary approaches, including those of conflicting scientific evidence and of gaps in scientific data, have been dealt with by the pragmatic interpretation of the requirements of for a risk assessment. See above, Part III, Sections 5.1.5.1 and 5.1.5.2. See further Doaa Abdel Motaal, ‘Is the World Trade Organization Anti-Precaution?’ *Journal of World Trade* 39 (3), 2005, 483-501, 496.

<sup>1324</sup> The Panel noted that the provisional adoption of an SPS measure is not a precondition for the application of Article 5.7. Instead, the provisional adoption of an SPS measure is permitted by the first sentence of Article 5.7 (if certain conditions are met). Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2939.

<sup>1325</sup> *Ibid.*, para. 7.1350. This finding was reiterated in Panel Report, *US – Continued Suspension*, paras 7.625-7.626; Panel Report, *Canada – Continued Suspension*, paras 7.603-7.604.

the insufficiency of the scientific evidence must be assessed in relation to the appropriate level of protection of the importing Member.<sup>1326</sup> It held:

The protection goals of a legislator may have a bearing on the question of which risks a Member decides to assess with a view to taking regulatory action, if necessary. And a legislator's protection goals are certainly relevant to the determination of the measure ... to be taken for achieving a Member's level of protection against risk. Yet there is no apparent link between a legislator's protection goals and the task of assessing the existence and magnitude of potential risks.<sup>1327</sup>

In the cases at hand, the Panel found that the scientific evidence was not 'insufficient', as enough evidence was available to permit a risk assessment as required under Article 5.1. This was evinced by the fact that the relevant EC scientific committees had conducted risk assessments prior to approving the biotech products at issue, and had reviewed these risk assessments after the adoption of safeguard measures by the Member States concerned. Both the initial assessments and the review assessments were found by the Panel to constitute 'risk assessments' within the meaning of Article 5.1 and Annex A.4 of the *SPS Agreement*.<sup>1328</sup> Thus, according to the Panel, this was not the kind of situation in which Members are allowed to adopt provisional measures.

Interestingly, in an unprecedented move following public criticism on its leaked interim report, the Panel issued a letter to the Parties clarifying some of its findings on the issue of insufficient scientific evidence under Article 5.7.<sup>1329</sup> It made clear that insufficiency can be quantitative or qualitative. It also emphasised that in applying the concept of insufficiency it had born in mind the Appellate Body's statement in *EC – Hormones* that the risk to be assessed is real world risk, rather than only risk ascertainable in a laboratory under controlled conditions. Further, it noted that its findings preserve the freedom of Members to take prompt protective action in case new scientific evidence becomes available that affects the relevant risk assessments. It pointed out that the possibility remains open that scientific evidence which is sufficient for a risk assessment at one time may later be considered insufficient. This would be the case if new scientific evidence negates the validity of the existing risk assessment but is itself insufficient to permit the performance of a new risk assessment.

---

<sup>1326</sup> The Panel found that 'insufficient' in Article 5.7 relates to the sufficiency of the scientific evidence to permit the performance of a risk assessment as defined in Annex A(4). Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3239. In addition, the Panel held that the insufficiency of the scientific evidence must be assessed at the time when the provisional measure was adopted. *Ibid.*, para. 7.3253.

<sup>1327</sup> *Ibid.*, para. 7.3238. This finding was cited and followed in Panel Report, *US – Continued Suspension*, para. 7.609; Panel Report, *Canada – Continued Suspension*, para. 7.587.

<sup>1328</sup> Panel Report, *EC – Approval and Marketing of Biotech Products*, para. 7.3260 (in respect of Austria's ban on T25 maize). Similar findings were made for the other safeguard measures challenged in this dispute.

<sup>1329</sup> This letter is appended to the Panel Reports in *EC – Approval and Marketing of Biotech Products* as Annex K. It appears that the Panel was concerned that its findings (in the leaked interim Panel Reports) had been misconstrued, leading to public concern regarding the scope for government action in areas where science is in a state of flux.

This is precisely the type of situation that, according to the EC, was present in *US – Continued Suspension* and *Canada – Continued Suspension*.<sup>1330</sup> In this case the EC had replaced its ban on the import of beef from cattle treated with six growth hormones (which had previously been found to be in violation of the *SPS Agreement* in *EC – Hormones*) with a provisional ban on beef treated with five of the hormones at issue and a final ban on beef treated with the sixth hormone. The EC argued that its provisional ban was justified under Article 5.7 as ‘Article 5.7 of the *SPS Agreement* is applicable not only when no risk assessment can be made at all, but also when the latest scientific evidence from any credible and objective source raises doubts or puts into question the previously held scientific opinion about the safety or dangerous nature of the substance in question.’<sup>1331</sup> All parties to the dispute agreed that scientific evidence which was previously deemed sufficient could subsequently become insufficient and that there could be situations where new studies could affect the conclusions of existing risk assessments.<sup>1332</sup> According to the EC, the body of evidence had developed since the *EC – Hormones* case, and although a complete and definitive risk assessment was still not possible, the evidence ‘support[ed] the conclusion that precautionary measures [were] required in order to achieve its chosen level of protection.’<sup>1333</sup> It regarded its high level of protection as relevant to the determination whether the relevant scientific evidence is insufficient, because a Member applying a high level of protection may require more information than that provided and may therefore disagree with an international standard based on such evidence.<sup>1334</sup>

The Panels agreed with the parties that:

...there could be situations where existing scientific evidence can be put in question by new studies and information. There could even be situations where evidence which supported a risk assessment is unsettled by new studies which do not constitute sufficient relevant scientific evidence as such to support a risk

---

<sup>1330</sup> Note, as stated above, that the Panels’ conclusions on all aspects of the analysis under the *SPS Agreement* (including that under Article 5.7) were made in the context of their evaluation of whether the EC had removed the measure found to be WTO inconsistent in the *EC – Hormones* dispute, and therefore whether the US and Canada violated Article 22.8 of the DSU by maintaining their suspensions of concessions in that case. Consequently, the Panel made no findings with regard to the *SPS Agreement* in its final conclusions.

<sup>1331</sup> Panel Report, *US – Continued Suspension*, para. 7.615; Panel Report, *Canada – Continued Suspension*, para. 7.595. Further, the EC argued that: ‘due to the dynamic nature of scientific knowledge, a risk assessment that may at one point in time have been based on sufficient scientific evidence may need to be reviewed when new scientific evidence becomes available. In addition, new international risk assessment standards may become available that have to be taken into account in new risk assessments.’ Panel Report, *US – Continued Suspension*, para. 7.616; Panel Report, *Canada – Continued Suspension*, para. 7.596.

<sup>1332</sup> Panel Report, *US – Continued Suspension*, para. 7.597; Panel Report, *Canada – Continued Suspension*, para. 7.619.

<sup>1333</sup> Panel Report, *US – Continued Suspension*, para. 7.588; Panel Report, *Canada – Continued Suspension*, para. 7.557. In particular, the EC argued that although the evidence pointed to a number of risks, it was full of gaps and important contradictions had developed which rendered the JECFA conclusions of 1988, 1999 and 2000 no longer valid. Panel Report, *US – Continued Suspension*, para. 7.589; Panel Report, *Canada – Continued Suspension*, para. 7.558.

<sup>1334</sup> Panel Report, *US – Continued Suspension*, para. 7.604; Panel Report, *Canada – Continued Suspension*, para. 7.579. The EC formulated its level of protection as follows: ‘no (avoidable) risk, that is a level of protection that does not allow any unnecessary addition from exposure to genotoxic chemical substances that are intended to be added deliberately to food.’ Panel Report, *US – Continued Suspension*, para. 7.607; Panel Report, *Canada – Continued Suspension*, para. 585.

assessment but are sufficient to make the existing, previously relevant scientific evidence insufficient.<sup>1335</sup>

According to the Panels, this conclusion is supported by the fact that Article 2.2 of the *SPS Agreement* provides that sanitary measures must not be ‘*maintained* without sufficient scientific evidence except as provided for in paragraph 7 of Article 5’<sup>1336</sup> which ‘suggests the possibility of an evolution from a situation of sufficient evidence to perform a risk assessment to one where, in substance, a risk assessment can no longer be performed.’<sup>1337</sup> However, in line with the findings of the Panel in *EC – Approval and Marketing of Biotech Products*, the Panels disagreed with the EC’s contention that its level of protection is a relevant consideration in this regard. According to the Panels, a Member’s level of protection is relevant in the choice of an SPS measure to address the risk, but ‘should not influence the performance of the risk assessment as such.’<sup>1338</sup>

In determining whether the relevant scientific evidence was indeed insufficient for purposes of Article 5.7, the Panels also refused to consider problems in obtaining the necessary evidence on misuse of hormones, despite the fact that the Appellate Body in *EC – Hormones* had recognised that this factor could be part of a risk assessment under Article 5.1. The Panels stated:

We recall that Article 5.7 is applicable when relevant scientific evidence is not sufficient to undertake a risk assessment in conformity with Article 5.1. Whether instances of misuse or abuse in the administration of hormones exist or not is not as such a scientific issue likely to make a risk assessment within the meaning of Article 5.1 and Annex A(4) of the *SPS Agreement* impossible. In our opinion, the scientific issue is related to the effect of the ingestion of high doses of hormones residues, not to potential or actual misuse or abuse in the administration of hormones. Therefore, we will not address the issue of non compliance with good veterinary practices in our analysis under Article 5.7 of the *SPS Agreement*.<sup>1339</sup>

The Panels then focused their analysis of the first requirement of Article 5.7 by examining when ‘relevant scientific evidence’ can become ‘insufficient’. Recalling the finding of the Appellate Body in *Japan – Apples* cited above,<sup>1340</sup> the Panels noted that while it is always possible to complete formally the four successive steps of a risk assessment,<sup>1341</sup> this ‘does

<sup>1335</sup> Panel Report, *US – Continued Suspension*, para. 7.598; Panel Report, *Canada – Continued Suspension*, para. 7.620.

<sup>1336</sup> Emphasis added by the Panels.

<sup>1337</sup> Panel Report, *US – Continued Suspension*, para. 7.621; Panel Report, *Canada – Continued Suspension*, para. 7.599.

<sup>1338</sup> Panel Report, *US – Continued Suspension*, para. 7.609; Panel Report, *Canada – Continued Suspension*, para. 7.587.

<sup>1339</sup> Panel Report, *US – Continued Suspension*, para. 7.603; Panel Report, *Canada – Continued Suspension*, para. 7.578.

<sup>1340</sup> Appellate Body Report, *Japan – Apples*, para. 179.

<sup>1341</sup> The four steps referred to here are those contained in the definition of a risk assessment in the CAC *Procedural Manual*, namely hazard identification, hazard characterisation, exposure assessment, and risk characterisation. As noted by the EC, while the CAC risk assessment guidelines are clearly relevant, the risk assessment criteria developed by WTO panels and the Appellate Body with regard to the definition of a risk assessment in the *SPS Agreement* would seem more relevant to this analysis. Panel Report, *US – Continued*

not mean that such a process is equated with a risk assessment within the meaning of Article 5.1 and Annex A(4) of the *SPS Agreement*.<sup>1342</sup> According to the Panels:

Article 5.7 will apply in situations where, in substance, the relevant scientific evidence does not allow the completion of an objective evaluation of the potential for adverse effects on human or animal health arising from the presence of additives, contaminants, toxins or disease-causing organisms in food, beverages or feedstuffs.<sup>1343</sup>

Pointing out that insufficiency should not be confused with uncertainty, as held by the Appellate Body in *Japan – Apples*,<sup>1344</sup> the Panels in *US – Continued Suspension* and *Canada – Continued Suspension* held that ‘the fact that a number of aspects of a given scientific issue remain uncertain may not prevent the performance of a risk assessment.’<sup>1345</sup> In particular, the Panels excluded from the determination of ‘insufficiency’ under Article 5.7 ‘theoretical uncertainty’<sup>1346</sup>, uncertainty arising from divergent views on a scientific issue,<sup>1347</sup> and uncertainties that may be present in the conclusions of a risk assessment despite the fact that there was sufficient evidence to perform the risk assessment.<sup>1348</sup> Such uncertainty, according to the Panels, does not mean that ‘previously sufficient evidence has become insufficient nor should it *ipso facto* justify the applicability of Article 5.7 of the *SPS Agreement*.’<sup>1349</sup>

The Panels then turned to examine the implications of the existence of relevant international standards for the determination of ‘insufficiency’ of the scientific evidence.<sup>1350</sup> The presumption of consistency with the *SPS Agreement* and the GATT 1994 of measures

*Suspension*, paras 7.448 and 7.445; Panel Report, *Canada – Continued Suspension*, paras 7.437 and 7.434.

<sup>1342</sup> Panel Report, *US – Continued Suspension*, para. 7.628; Panel Report, *Canada – Continued Suspension*, para. 7.606. The Panels called the latter type of risk assessment a risk assessment ‘in substance’ to distinguish it from merely formally carrying out the four steps of a risk assessment.

<sup>1343</sup> Panel Report, *US – Continued Suspension*, para. 7.628; Panel Report, *Canada – Continued Suspension*, para. 7.606.

<sup>1344</sup> Appellate Body Report, *Japan – Apples*, para. 184.

<sup>1345</sup> Panel Report, *US – Continued Suspension*, para. 7.637; Panel Report, *Canada – Continued Suspension*, para. 7.615.

<sup>1346</sup> This term refers to the uncertainty that always remains because science can never provide absolute certainty about the safety of a particular substance. The Panels here referred to the Appellate Body’s finding in *EC – Hormones* that theoretical uncertainty is not the kind of risk to be assessed under Article 5.1 of the *SPS Agreement*. Appellate Body Report, *EC – Hormones*, para. 186.

<sup>1347</sup> While noting the Appellate Body’s finding in *EC – Hormones* that divergent views could be a form of scientific uncertainty, the Panels stated that uncertainty arising from divergent views can be factored into the conclusions of a risk assessment. In support of this view the Panels cited the Appellate Body’s finding in *Australia – Salmon* that the existence of unknown or uncertain elements does not justify a departure from the requirements for a risk assessment. Appellate Body Report, *Australia – Salmon*, para. 130.

<sup>1348</sup> In this regard, the Panels relied upon the finding of the Panel in *EC – Approval and Marketing of Biotech Products*, which noted that the uncertainties present in a risk assessment may be legitimately taken into account by a Member when determining its SPS measure. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1525. Panel Report, *US – Continued Suspension*, paras 7.631-7.634; Panel Report, *Canada – Continued Suspension*, paras 7.609 – 7.612.

<sup>1349</sup> Panel Report, *US – Continued Suspension*, para. 7.628; Panel Report, *Canada – Continued Suspension*, para. 7.606.

<sup>1350</sup> The Panels recalled that Codex Alimentarius standards existed for 4 of the 5 hormones at issue under the Article 5.7 analysis. Panel Report, *US – Continued Suspension*, para. 7.643; Panel Report, *Canada – Continued Suspension*, para. 7.621.

conforming to international standards, contained in Article 3.2 of the *SPS Agreement*, was held to imply that such standards are based on risk assessments meeting the requirements of the *SPS Agreement*, and therefore the existence of sufficient scientific evidence.<sup>1351</sup> Acknowledging that ‘science continually evolves’<sup>1352</sup> so that new scientific evidence could call into question existing evidence, the Panels nevertheless held that ‘some meaning’ must be given to the role of international standards under the *SPS Agreement* and in particular the Article 3.2 presumption.<sup>1353</sup> In order to properly take into account the existence of international standards in the case before them, the Panels decided to assess whether scientific evidence has become insufficient by determining ‘whether the European Communities has produced any evidence of some sufficient change in the scientific knowledge so that what was once sufficient to perform an adequate risk assessment has now become insufficient (i.e., “deficient in force, quality or amount”).’<sup>1354</sup> Consequently, the Panels concluded:

[I]f relevant evidence already exists, not any degree of insufficiency will satisfy the criterion under Article 5.7 that “relevant scientific evidence is insufficient”. Having regard to our reasoning above, particularly with respect to scientific uncertainty and the existence of international standards, we consider that, depending on the existing relevant evidence, there must be a *critical mass* of new evidence and/or information that calls into question the fundamental precepts of previous knowledge and evidence so as to make relevant, previously sufficient, evidence now insufficient. In the present case where risk assessments have been performed and a large body of quality evidence has been accumulated, this would be possible only if it put into question existing relevant evidence *to the point that* this evidence is no longer sufficient to support the conclusions of existing risks assessments.<sup>1355</sup>

Examining the alleged insufficiencies identified by the EC,<sup>1356</sup> and consulting the Panel experts in this regard, the Panels found that the EC had not shown that there was a ‘criti-

<sup>1351</sup> Panel Report, *US – Continued Suspension*, para. 7.644; Panel Report, *Canada – Continued Suspension*, para. 7.622.

<sup>1352</sup> Panel Report, *US – Continued Suspension*, para. 7.645; Panel Report, *Canada – Continued Suspension*, para. 7.623.

<sup>1353</sup> Panel Report, *US – Continued Suspension*, para. 7.646; Panel Report, *Canada – Continued Suspension*, para. 7.624.

<sup>1354</sup> Panel Report, *US – Continued Suspension*, para. 7.647; Panel Report, *Canada – Continued Suspension*, para. 7.625. Here the Panels referred to the definition of insufficient in *The New Shorter Oxford English Dictionary* (1993), 1384.

<sup>1355</sup> Panel Report, *US – Continued Suspension*, para. 7.648; Panel Report, *Canada – Continued Suspension*, para. 7.626. In footnote, the Panels referred to the European Communities’ argument that due to the long latency period of cancer and the numerous confounding factors it was unable to demonstrate the existence of a clear harm. However, the Panels noted that their test did not require the EC to show the existence of a clear harm in order for Article 5.7 to apply to its measure. Instead, the Panels stated; ‘Under the “critical mass” test, the new scientific information and evidence must be such that they are at the origin of a change in the understanding of a scientific issue.’ Panel Report, *US – Continued Suspension*, footnote 782 to para. 7.648; Panel Report, *Canada – Continued Suspension*, footnote 730 to para. 7.626.

<sup>1356</sup> In particular the EC considered that the scientific evidence relied upon by JECFA and the CAC was insufficient with respect to the issues of: carcinogenicity; the daily hormone-production rate, particularly in pre-pubertal children; dose response and the lack of a safe threshold; bioavailability; and misuse or abuse of the growth hormones. Panel Report, *US – Continued Suspension*, para. 7.654; Panel Report, *Canada*

cal mass of new evidence' that could make the previously sufficient scientific evidence become 'insufficient' for purposes of Article 5.7 of the *SPS Agreement*.<sup>1357</sup>

The Panels' requirement of a 'critical mass' of new evidence before evidence previously considered sufficient for risk assessment may become 'insufficient, sets a rather high threshold. This will ensure that once a relevant risk assessment has been performed, including one underlying an international standard, Article 5.7 will not create a broad loophole, allowing a Member to disregard the outcome the risk assessment if it disagrees with the conclusions contained therein. In order to call into question the continued validity of a risk assessment, a Member must show that new scientific evidence exists that leads to a change in the understanding of the scientific issue.<sup>1358</sup> If this is not the case, the SPS measure at issue does not fall within the scope of application of Article 5.7.<sup>1359</sup>

### 5.2.5.3 Available pertinent information

The second criterion for the adoption of provisional measures, contained in the first sentence of Article 5.7, requires that the provisional measure be adopted 'on the basis of available pertinent information.' This requirement operates to induce a certain level of rationality in situations in which, by their very nature, an objective risk assessment is not possible. To avoid the arbitrary imposition of provisional measures in response to unfounded consumer fears or purely hypothetical risks, Article 5.7 requires that provisional measures be taken on the basis of 'available pertinent information'. While this logically requires something less than a risk assessment within the meaning of Article 5.1 and Annex A.4, what precisely would be considered 'pertinent information' is not defined. The only guidance given in Article 5.7 is that available pertinent information includes 'that from the relevant international organizations as well as from sanitary or phytosanitary measures applied by other Members.' It seems possible that where a risk assessment has been conducted by another Member or relevant organisation, but the regulating Member cannot rely on it as a 'risk assessment' for purposes of Article 5.1 due to the fact that it is insufficiently specific to the precise risk addressed in its regulation, or it is not 'appropriate to the circumstances' of the regulating Member, this risk assessment may still be relied upon as 'available pertinent information' for purposes of Article 5.7.

This possibility is illustrated by Argentina's BSE risk categorisation scheme.<sup>1360</sup> In 2002, Canada, supported by the US, raised a trade concern before the SPS Committee regarding this categorisation, according to which Canada had been given a level 2 rating.<sup>1361</sup> According to Canada, Argentina had copied the EC's risk categorisation scheme for BSE,

---

– *Continued Suspension*, para. 7.631.

<sup>1357</sup> Panel Report, *US – Continued Suspension*, para. 7.835; Panel Report, *Canada – Continued Suspension*, para. 7.821.

<sup>1358</sup> Panel Report, *US – Continued Suspension*, footnote 782 to para. 7.648; Panel Report, *Canada – Continued Suspension*, footnote 730 to para. 7.626

<sup>1359</sup> This does not mean that the measure is necessarily in violation of the *SPS Agreement*. It only means that the scientific obligations of the Agreement apply. The regulating Member is still free to rely on divergent scientific opinions embodied in a risk assessment meeting the requirements of the *SPS Agreement*.

<sup>1360</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Resolved Issues*, G/SPS/GEN/204/Rev.8/Add.3, circulated on 27 March 2008, item 125.

<sup>1361</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 25–26 June 2002. Note by the Secretariat*, G/SPS/R/27, circulated on 2 August 2002, paras 60–63.

and had not followed an international standard or conducted its own risk assessment. Argentina argued that its measures were based on the available information. It seems therefore that Argentina made use of the EC's assessment of BSE risks from various countries, and its consequent categorisation of these countries, as pertinent information on which to base its measures. Argentina pointed out that it had had to take urgent action to update its BSE measures and that any delay would have posed unacceptable risks to Argentina's own BSE status. It indicated its willingness to review its BSE categorisation on the basis of risk assessments.<sup>1362</sup>

In *Japan – Agricultural Products II*,<sup>1363</sup> *Japan – Apples*,<sup>1364</sup> and *EC – Approval and Marketing of Biotech Products*,<sup>1365</sup> judicial economy precluded the application of this requirement to the disputes at issue. However, in the latter case the Panel did analyse the meaning of the second requirement as part of its examination of the relationship between Articles 5.1 and 5.7 of the *SPS Agreement*.<sup>1366</sup> The Panel in *EC – Approval and Marketing of Biotech Products* noted that the reference in the third requirement of Article 5.7 to a *more objective* assessment of risk suggests that provisionally adopted SPS measures must also be based on a risk assessment, namely on a risk assessment that takes into account 'available pertinent information'. Thus, according to the Panel, such a risk assessment:

... would necessarily be different in nature from the kind of risk assessment envisaged in Annex A(4). In other words, any risk assessment which might be required by the first sentence of Article 5.7 would not need to meet the definition of a risk assessment contained in Annex A(4).<sup>1367</sup>

The Panel further supported its conclusion by pointing out that if the right conferred by Article 5.7 arises only when scientific evidence is insufficient for an adequate risk assessment under Article 5.1, as defined in Annex A.4, by definition the risk assessment required under the second requirement of Article 5.7 'could not meet the standard set out in Annex A(4).'<sup>1368</sup>

The word 'pertinent' indicates that the information must have a bearing upon or be relevant to the suspected risk. It would appear to indicate that the risk must be at least theoretically plausible on the basis of what evidence exists. The term 'pertinent' can be

<sup>1362</sup> This matter was reported resolved when, on the basis of scientific evidence submitted by Canada and the US to Argentina, Argentina undertook to conduct its own BSE risk assessments and to re-categorise the US and Canada on this basis. Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 2–3 April 2003. Note by the Secretariat*, G/SPS/R/29, circulated on 17 June 2003, paras 78–80.

<sup>1363</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.59. This exercise of judicial economy was supported by the Appellate Body, which held: 'We, therefore, conclude that the Panel did not err in its application of Article 5.7 by first examining whether the varietal testing requirement meets the requirements of the second sentence of Article 5.7. Having established that the requirements of the second sentence of Article 5.7 are not met, there was no need for the Panel to examine the requirements of the first sentence.' Appellate Body Report, *Japan – Agricultural Products II*, para. 91.

<sup>1364</sup> Panel Report, *Japan – Apples*, para. 8.222.

<sup>1365</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.

<sup>1366</sup> In particular, in applying the test set out in *EC – Tariff Preferences* to determine if these articles are in a relationship of exclusion or of exception to each other, the Panel had to examine whether Article 5.7 permits what Article 5.1 does not allow. For this reason, it examined *inter alia* the second requirement of Article 5.7.

<sup>1367</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2992.

<sup>1368</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2992.

further elucidated by reference to the developing concept of the precautionary principle in international law. In earlier treaties embodying the precautionary principle, the available evidence had to relate to threats of serious or irreversible harm before recourse to the precautionary principle was justified.<sup>1369</sup> However, more recently there has been a tendency to lower this evidentiary threshold or leave it out altogether.<sup>1370</sup> It would appear that the average evidentiary threshold now required is a non-negligible threat of harm, but beyond that the formulation of the principle in the relevant treaty depends on the relevant circumstances of its negotiation.<sup>1371</sup> As Article 5.7 in the *SPS Agreement* incorporates the precautionary principle with respect to health, rather than environmental protection, it seems clear, in the absence of an explicit provision requiring a stricter standard in Article 5.7, that no more than a non-negligible threat should be required to be indicated by the available information.<sup>1372</sup>

The question of when a provisional measure may be considered to be ‘based on’ the available pertinent information has not been clarified at all in the case law. In the light of the Appellate Body’s interpretation of ‘based on’ in Article 5.1, it could be suggested that under Article 5.7, the SPS measure adopted must be ‘reasonably supported’ by whatever information exists. In other words, a reasonable concern that harm could result must be able to be derived from the available information.<sup>1373</sup> Where contradictory information is present, it would appear that the measure need not reflect the preponderance of information, but could be based on a minority view that a potential of harm exists, provided this information comes from qualified and respected sources.<sup>1374</sup>

<sup>1369</sup> The Appellate Body seems to support this high evidentiary threshold for the use of the precautionary principle outside the framework of Article 5.7, to interpret the requirement of ‘sufficient scientific evidence’ in Article 2.2. Appellate Body Report, *EC – Hormones*, para. 124, quoted above, Part III, Section 3.2.3.2.

<sup>1370</sup> For example, while the *Bergen Ministerial Declaration on Sustainable Development in the ECE Region* (Bergen, May 1990) required the threat of ‘serious or irreversible’ damage for the application of the precautionary principle (in art. 7), the *Convention on the Ban of Import into Africa and the Control of Transboundary Movement and Management of Hazardous Wastes within Africa* (Bamako, 29 January 1991) incorporates the precautionary principle (in art. 4(3)(f)) without requiring the threat of serious or irreparable harm. Similarly, the *Cartagena Protocol on Biosafety* (UNP/157, adopted 29 January 2000, entry into force 11 September 2003) refers only to ‘potential adverse effect.’ Both the latter conventions specifically relate to threats to humans as well as the environment, which could explain the lower threshold. See further Sands, P. *Principles of International Environmental Law I – Frameworks, Standards and Implementation* 1<sup>st</sup> ed. (Manchester University Press, Manchester) 1995, 210–211.

<sup>1371</sup> James Cameron and Juli Abouchar, ‘The Status of the Precautionary Principle in International Law’, in *The Precautionary Principle and International Law: The Challenge of Implementation*, David Freestone and Ellen Hey (eds.) (Kluwer Law International), 1996, 29–52, 44.

<sup>1372</sup> It is *Communication on the Precautionary Principle*, the EC Commission suggests that recourse to the precautionary principle should be allowed when it can be concluded from an evaluation of existing information that the desired level of protection could potentially be jeopardised by inaction. European Commission, *Communication from the Commission on the Precautionary Principle*, COM/2000/0001 (European Community, Brussels), 2 February 2000, 17.

<sup>1373</sup> This requirement is embodied in most treaties that incorporate the precautionary principle. See James Cameron and Juli Abouchar, ‘The Precautionary Principle: A Fundamental Principle of Law and Policy for the Protection of the Global Environment’, *Boston College International and Comparative Law Review* 14 (1), 1991, 1–27. for a brief discussion of the treaties that incorporate the precautionary principle.

<sup>1374</sup> The EC Commission supports this view (COM(2000)1, at 17), referring to the following statement by the Appellate Body in *EC – Hormones* at para. 194, ‘In some cases, the very existence of divergent views presented by qualified scientists who have investigated the particular issue at hand may indicate a state of scientific uncertainty.’

#### 5.2.5.4 Information necessary for a more objective assessment of risk

Article 5.7, in its second sentence, lays down two requirements for the *maintenance* of provisional measures. The first of these prohibits the maintenance of a provisional measure unless a Member ‘seeks to obtain the information necessary for a more objective assessment of the risk.’ This seems to imply that there must be an original evaluation of the risk before the provisional measure is imposed, although this need not be altogether objective.<sup>1375</sup>

In *Japan – Agricultural Products II*, Japan argued that the requirement to seek additional information was met by gathering information through the experience of the successful importation of varieties of agricultural products, by requiring exporting countries to submit data when applying for the approval of additional varieties. It claimed that Members are obliged to seek information but no actual results are required.<sup>1376</sup> The US submitted that the information sought by Japan was not relevant to the question whether different varieties of agricultural products have different sorption levels. It thus did not enable Japan to review its measure and therefore did not meet the third requirement.<sup>1377</sup> The Appellate Body noted in this regard that no explicit prerequisites are set out Article 5.7 or in any other provision of the *SPS Agreement* with respect to the ‘additional information’ to be collected or a specific collection procedure. Neither does Article 5.7 specify ‘what actual results must be achieved’.<sup>1378</sup> However, the Appellate Body noted that:

Article 5.7 states that the additional information is to be sought in order to allow the Member to conduct ‘a more objective assessment of risk’. Therefore, the information sought must be germane to conducting such a risk assessment, i.e., the evaluation of the likelihood of entry, establishment or spread of, *in casu*, a pest, according to the SPS measures which might be applied.<sup>1379</sup>

As in this case the Panel had found that the information collected by Japan did not ‘examine the appropriateness’ of its SPS measure at issue and did not address the core issue of whether varietal differences caused divergence in quarantine efficacy, the Appellate Body endorsed the Panel’s conclusion that Japan had not sought ‘to obtain the additional information necessary for a more objective assessment of risk’ as required by Article 5.7.<sup>1380</sup>

In *EC – Approval and Marketing of Biotech Products*, the Panel also examined the third requirement of Article 5.7 of the *SPS Agreement*. It regarded the term ‘a more objective assessment of risk’ as referring to a risk assessment within the meaning of Annex A.4, ‘or at least which is closer to satisfying the definition in Annex A(4) than consideration of

<sup>1375</sup> European Commission, *Communication from the Commission on the Precautionary Principle*, COM/2000/0001 (European Community, Brussels), 2 February 2000, 12. The EC Commission recommends that the evaluation of existing evidence constitute as complete a scientific evaluation as possible, encompassing both an inventory of existing evidence and an identification of the possible gaps in knowledge as well as the degree of scientific uncertainty at each stage (at 16).

<sup>1376</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 13.

<sup>1377</sup> *Ibid.*, para. 26.

<sup>1378</sup> *Ibid.*, para. 92.

<sup>1379</sup> *Ibid.*

<sup>1380</sup> *Ibid.* The Panel pointed out that the information provided by exporting countries was based on studies designed and carried out to *comply* with Japan’s varietal testing requirement. Thus they did not examine the appropriateness of the requirement itself. Panel Report, *Japan – Agricultural Products II*, para. 8.56.

“available pertinent information”.<sup>1381</sup> After noting the Appellate Body’s finding in *Japan – Apples* that ‘relevant scientific evidence’ will be ‘insufficient’ within the meaning of Article 5.7 if the body of available scientific evidence does not allow the performance of a proper risk assessment as required under Article 5.1 and defined in Annex A.4,<sup>1382</sup> the Panel pointed out that:

... if a Member may provisionally adopt an SPS measure on the basis of available pertinent information in situations where the scientific evidence is insufficient for an adequate risk assessment, as required by Article 5.1 and as defined in Annex A(4), it makes sense to require, as the second sentence of Article 5.7 does, that that Member seek to obtain “the additional information necessary” for such a risk assessment. Once a Member has obtained the additional information necessary for a risk assessment which meets the definition of Annex A(4), it will be in a position to comply with its obligation in Article 5.1 to base its SPS measure on a risk assessment which satisfies the definition of Annex A(4).<sup>1383</sup>

The duty to collect additional information is therefore clearly linked to the provisional nature of the measure, pending a final decision on the basis of a proper risk assessment. The obligation to seek the necessary information guards against the indefinite imposition of provisional measures that might result where no efforts are made to generate the data needed to assess the risk.

### 5.2.5.5 Review within a reasonable period of time

Finally, the second requirement for the *maintenance* of provisional measures, set out in the second sentence of Article 5.7 of the *SPS Agreement*, obliges Members to review the provisional SPS measure within a reasonable period of time. This is a reflection of the time-limited nature of such measures under the *SPS Agreement*. Cooney and Lang note that the requirement in Article 5.7 of review in the light of additional information is well suited to the idea of ‘adaptive governance’ in the face of pervasive uncertainty. They state:

[A] ‘learning’ response to uncertainty does not end with the adoption of precautionary approaches, not does it elevate precaution to an over-riding principle on all occasions. ... it is necessarily accompanied by proactive measures to increase our knowledge base through policy experimentation. Furthermore, in learning approaches, policies primarily based on precaution are subject to ongoing review and revision as circumstances change and our state of knowledge advances.<sup>1384</sup>

In line with this approach, Article 5.7 can be seen as creating only a limited exemption from the normal SPS disciplines, pending review of the measure in the light of new evidence. However, as scientific uncertainty may sometimes persist for extended periods of time, artificially linking the requirement of review to a fixed time limit was avoided in

<sup>1381</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2988.

<sup>1382</sup> Appellate Body Report, *Japan – Apples*, para. 179.

<sup>1383</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2990.

<sup>1384</sup> Rosie Cooney and Andrew T.F. Lang, ‘Taking Uncertainty Seriously: Adaptive Governance and International Trade’, *European Journal of International Law* 18 (3), 2007, 523-551, 542.

the *SPS Agreement*. Instead, Article 5.7 refers to a ‘reasonable period of time’. Thus, the possibility for a Member to maintain a measure as long as necessary for a scientific assessment to establish the presence or absence of a risk, is not compromised.

The Appellate Body in *Japan – Agricultural Products II* had to decide on what constitutes a ‘reasonable period of time’ within which to review the measure. The Panel noted that Japan had first applied its varietal testing requirement in 1969, and that since the entry into force of the *SPS Agreement* in 1995, Japan had been ‘under an explicit obligation to collect additional information to enable it to more objectively review the appropriateness of the varietal testing requirement.’<sup>1385</sup> However, the Panel found no evidence that Japan had done so within a reasonable period of time.<sup>1386</sup> On appeal, regarding this element of Article 5.7, the Appellate Body held:

In our view, what constitutes a ‘reasonable period of time’ has to be established on a case-by-case basis and depends on the specific circumstances of each case, including the difficulty of obtaining the additional information necessary for the review *and* the characteristics of the provisional SPS measure.<sup>1387</sup>

As in the case at hand, the Panel had found that it would be ‘relatively easy’ to collecting the necessary additional information to review the measure, the Appellate Body held that despite the fact that the obligation to review the varietal testing requirement had only existed since 1 January 1995, Japan had not reviewed its varietal testing requirement ‘within a reasonable period of time’.<sup>1388</sup> In *Australia – Salmon*, although Article 5.7 had not been invoked, the Panel made an *obiter* statement regarding the temporal dimension of Article 5.7, stating that it did not consider that Article 5.7 applied to the measure in dispute ‘given the fact that it was imposed more than 20 years ago and can thus hardly be seen as a measure ‘provisionally’ adopted.’<sup>1389</sup> However, it should be recalled that there is no time limit expressed in Article 5.7 on the existence of a ‘provisional measure’. While it seems logical that an indirect limit is inherent in the requirement of review within a ‘reasonable period’ the length of this period is subject to the particular circumstances of the case and cannot be determined in the abstract. Thus it is not the length of time for which a measure has been in existence *per se* that is crucial to its ‘provisional’ nature but rather the review thereof, within a reasonable period, which indicates that the measure is not final.

It is interesting to note in this regard that, in its *Communication on the Precautionary Principle*,<sup>1390</sup> the European Commission interpreted the requirement of review ‘within a reasonable period of time’ to include the time needed for completion of the necessary scientific work as well as the time needed for performance of a risk assessment based on the conclusions drawn there from. Thus the provisional nature of measures under Article 5.7

<sup>1386</sup> *Ibid.*

<sup>1387</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 93.

<sup>1388</sup> *Ibid.*

<sup>1389</sup> Panel Report, *Australia – Salmon*, para. 8.57.

<sup>1390</sup> European Commission, *Communication from the Commission on the Precautionary Principle*, COM/2000/0001 (European Community, Brussels), 2 February 2000. See also Committee on Sanitary and Phytosanitary Measures, *Communication by the European Communities on the Precautionary Principle*, G/SPS/GEN/168, circulated on 14 March 2000.

was argued to be dependent on the development of scientific knowledge, rather than on a specific time limit.<sup>1391</sup> This interpretation is partially supported by the Appellate Body's finding that one of the factors to be considered in the determination of what constitutes a reasonable period of time in a given case is the difficulty of obtaining the additional information necessary for the review. Clearly the state of scientific knowledge has a direct impact on the difficulty of obtaining the required information and would thus affect the determination whether a 'reasonable period' has elapsed. This is significant in that it relativises the temporary nature of measures allowed under Article 5.7 and makes provision for circumstances where scientific uncertainty persists for extended periods or where the risks involved are expected to materialise only in the long term. On the other hand, it is important to note that the difficulty of obtaining information is not the sole criterion. The specific circumstances of the case will be evaluated, including factors such as the characteristics of the SPS measure at stake, amongst others, in order to establish whether this criterion has been met. Nonetheless, it seems important to make sure that the determination of what constitutes a 'reasonable period' in each case be made with particular regard to the reality that the state of scientific knowledge has a decisive influence on whether a 'more objective assessment of risk' can be conducted. Therefore, artificially linking the requirement of review within a 'reasonable period of time' to specific deadlines should be avoided. In this way, Members need not fear that reliance on Article 5.7 to justify their measures will compromise their ability to maintain the measure as long as is necessary for scientific evidence to come up with clear answers.<sup>1392</sup>

When the four requirements of Article 5.7 are met, Members may take provisional measures. If these requirements are interpreted in a flexible way to allow recourse to precautionary measures when the available science does not yet permit a risk assessment within the meaning of Article 5.1 and Annex A.4 of the *SPS Agreement*, but a plausible case can be made for the existence of a risk on the basis of existing information, Article 5.7 would seem to provide an adequate vehicle for the incorporation of the precautionary principle into the SPS disciplines relating to risk management. By laying down specific requirements for the exercise of the right to take provisional measures, Article 5.7 operates to avoid abuse of this right. It ensures that a framework is in place within which risk management decisions taken in the face of insufficient scientific evidence can be disciplined, to promote rationality.

This does not imply that scientific uncertainty exists only in limited cases of insufficient evidence, which can be dealt with by means of temporary solutions until certainty is achieved. The true state of affairs is that uncertainty is a more common situation than

---

<sup>1391</sup> European Commission, *Communication from the Commission on the Precautionary Principle*, COM/2000/0001 (European Community, Brussels), 2 February 2000, 21.

<sup>1392</sup> The fact that the EC supports this interpretation of a 'reasonable period of time' could explain why it has changed its approach from the one it followed in *EC – Hormones*, where it did not rely on Article 5.7 as it refused to classify its ban on hormone treated meat as a 'provisional measure' under Article 5.7, fearing that the temporary nature of such a measure would undermine its hormones regime. Now, in statements claiming that it is now in compliance with the ruling in *EC – Hormones*, the EC avers that its continued ban on meat treated with the relevant hormones (except 17- $\beta$  oestradiol, for which it has adopted a permanent ban based on conclusions from new studies) is a provisional measure in terms of Article 5.7, pending the results of studies to determine the effects of the relevant hormones on human health. *Bridges Weekly Trade News Digest*, 30 May 2000.

certainty in scientific affairs. It is often incorporated into assumptions or rules of thumb used in risk assessments where gaps in evidence exist. In this way, the biases underlying these assumptions remain hidden. It is argued that it would be better to deal openly with the uncertainties inherent in scientific analysis. By recognising the pervasive nature of uncertainty and the gaps in information inherent in scientific analysis and by allowing Members to explicitly take account of these problems through conservative or prudent approaches to risk regulation, using the flexibilities in the *SPS Agreement* to do so, panels and the Appellate Body could contribute to greater transparency in SPS regulation. The Appellate Body has already taken some steps along this path.

### 5.3 Conclusion

The examination in Chapter 4 of the harmonisation disciplines in Article 3 of the *SPS Agreement* was instructive in elucidating the role of science in policing the delicate balance between trade liberalisation and health protection. Where no international standards exist or where Members wish to deviate from these standards in the exercise of their sovereign right to choose their appropriate level of protection, 'scientific justification will operate to generate norms and rules.'<sup>1393</sup>

Scientific justification can be seen as counterbalancing the regulatory autonomy of Members, reflected in the policy space reserved to them in the *SPS Agreement*, by imposing rigorous disciplines. The reason for the choice of science as the tool to bring about this balance is the fact that it was seen to be a universal body of knowledge, based on physical experience, neutral and thus valid for all. Therefore, requiring that national regulations which differ from harmonised standards follow the dictates of science as embodied in risk assessment is intended to result in generally acceptable limits and in greater uniformity of health measures by promoting gradual regulatory convergence across national borders.

However, there is currently broad recognition among scientists and regulators of the limits of science. Science is neither universal nor absolute. Risk assessments are characterised by uncertainties and gaps in knowledge, which are dealt with by means of assumptions, models and rules of thumb which reflect the scientific culture and policy preferences that form the context for the risk assessment. As a result, conflicting scientific opinions may exist with regard to the same factual situation. The Appellate Body has interpreted the scientific obligations of the *SPS Agreement* to reflect this reality, in order to prevent these obligations from becoming rigid, unworkable restrictions on the regulatory autonomy of Members. In particular, it has allowed Members to consider 'real world' factors that contribute to risk (such as problems of control) in their risk assessments. It has avoided requiring a quantification of risk or a demonstration of a minimum threshold of risk in risk assessments. It has also allowed Members to rely on minority scientific opinions from qualified and respected sources. The Appellate Body has thus been careful to ensure that the use of science as a tool to balance trade and health in the *SPS Agreement* does not result in a skewed result through the unrealistic application of this tool.

---

<sup>1393</sup> Jeffery Atik, 'Symposium - Institutions for International Economic Integration: Science and International Regulatory Convergence', *Journal of International Law and Business* 17, 1997, 736-758, 739.

While this approach has been criticised as opening the door for the inclusion of non-scientific factors within risk assessment and thus making room for regulations based on irrational consumer fears,<sup>1394</sup> it seems unlikely that the strict definitions of risk assessment, which have been interpreted by the Appellate Body to require proof of actual, not theoretical, risk, would allow for this. Instead, it seems that the Appellate Body's findings are an attempt to take into account factors that are not capable of strict quantifiable analysis, but nonetheless present a real risk for health. This should be seen as a positive development, although it stops short of explicitly recognising the role of science policy in risk assessment, as distinct from risk management decisions.

The fact that a more nuanced understanding of science and the subjective choices inherent in the assessment of risks is emerging does not mean that the reliance on science as a discipline for SPS regulation is completely misplaced. The scientific disciplines of the *SPS Agreement* have the definite benefit of encouraging rationality in risk regulation and thereby improving the quality of national decision making in this regard. Further, by ensuring that Members, at least in respect of risks from pests and diseases, evaluate the gravity of the potential consequences of the risk occurring, and that they take economic considerations into account, these disciplines increase the range of information available to regulators when making their risk management decisions. They also facilitate the monitoring of regulatory choices by national stakeholders.

However, these disciplines also entail significant costs. The rigorous requirements for a risk assessment necessitate a high level of scientific and technical capacity, something which is lacking in many Members at lower levels of development. Even developed-country Members have never successfully defended their SPS measures under the disciplines of Article 5.1 and Annex A.4 in the disputes under the *SPS Agreement* to date. It seems very unlikely that less developed Members will succeed in this regard.<sup>1395</sup> The possibility for these Members to make use of 'borrowed' risk assessments to fill the gap left by their own lack of scientific capacity has been significantly narrowed by the requirement of a great degree of specificity read into the two definitions of 'risk assessment' in Annex A.4, and by the criterion of a risk assessment 'as appropriate to the circumstances'.

The strict scientific rules of the *SPS Agreement* could be expected to be advantageous to developing-country Members that export agri-food products, since they provide disciplines that can be used to challenge the SPS requirements of their trading partners. However, in order to do so, the complaining Member needs to have sufficient scientific capacity to identify the flaws in the scientific basis for the regulating Member's measure, and to pursue discussions on this basis. This capacity is frequently lacking in Members at lower levels of development.

---

<sup>1394</sup> Warren H. Maruyama, 'A New Pillar of the WTO: Sound Science', *The International Lawyer* 32 (3), 1998, 651-677, 672.

<sup>1395</sup> Note that, as discussed in Part IV below, the fact that developing-country Members have never yet been challenged in dispute settlement proceedings for non-compliance with the *SPS Agreement* does not mean that their inability to comply is not a problem. Many disputes regarding SPS issues are resolved through bilateral or multilateral discussions 'in the shadow of the law'. An examination of the compilation of the specific trade concerns raised by Members before the SPS Committee reveals that developing-country Members are increasingly called upon to defend the scientific basis of their SPS measures. See further below, Part IV, Section 2.2.7.

The intrusive review by panels of the scientific evidence evaluated in a risk assessment undermines the scope for national choices in science policy decisions. Despite their assertions to the contrary, panels appear more than eager to conduct their own assessment of the scientific evidence contained in a risk assessment, relying on the opinions of the panel experts, and to replace the assessments of national authorities with their own views. As is discussed in Part IV below, this does not seem an appropriate role for panels. Contrary to what might be expected, an intrusive review by panels of the regulatory determinations of Members in a manner that undermines the room for legitimate policy choices does not lead to increased opportunities for market access. By skewing the balance of the *SPS Agreement* and thereby resulting in politically unacceptable outcomes of dispute settlement, such review increases the possibilities of non-compliance with the recommendations and rulings resulting from the panel and/or Appellate Body reports. This undermines the legal certainty and predictability of the regime put in place by the *SPS Agreement*.

While scientific obligations are used to discipline the risk assessment stage of the regulatory process in order to promote trade liberalisation, at the other side of the balance aimed at by the *SPS Agreement* is the right of Members to embody their own policy choices in their risk management decisions. Risk management decisions include the choice by a Member of the level of protection against SPS risk it wishes to secure on its territory, and its choice of an SPS measure to achieve this level of protection. These choices are based on both scientific evidence and other considerations such as technical and economic feasibility, societal value judgments and the effect on the regulated industry. The *SPS Agreement* gives national regulators substantial latitude in making risk management decisions, but there are certain non-scientific disciplines in place to ensure that the adverse trade effects of these decisions are limited as much as possible.

In particular, Member are free to choose the level of protection they deem appropriate in their national SPS regulation, provided that they do not make arbitrary or unjustifiable distinctions in comparable situations leading to discrimination or disguised trade restrictions. The latter discipline is contained in Article 5.5 of the *SPS Agreement*. The case law has given a very broad interpretation to the types of situations that will be considered comparable for purposes of Article 5.5. To avoid the result that an unrealistic constraint would thereby be placed on Members' ability to respond in a dynamic manner to differences in the nature and extent of the risks that arise, the two additional elements of Article 5.5 have been interpreted in a flexible manner. Differences in risks and in the difficulties of controlling risks are taken into account as justificatory factors, so that the resulting differences in the appropriate level of protection do not meet the criterion of 'arbitrary or unjustifiable' distinctions. In addition, the Appellate Body has made clear that the mere incorporation of non-scientific considerations, such as consumer concerns, in the decision to impose a certain appropriate level of protection is not sufficient to invalidate the chosen level of protection by rendering it a 'disguised restriction on trade'. This decision makes room for the important role of societal value judgements in risk management decisions.

In order to facilitate the implementation of Article 5.5, the SPS Committee is mandated to develop practical guidelines. These have been adopted and are known as the *Guidelines on Article 5.5*. These guidelines elaborate the practical steps that Members can take in their regulatory processes in order to promote consistency in appropriate levels of protection. However, complexity of the guidelines has been criticised as premised on the

existence of a sophisticated and well-functioning regulatory system. This does little to address the difficulties that less-developed Members face in trying to achieve compliance with Article 5.5.

The risk management phase of the regulatory process involves not only the choice of an appropriate level of protection, but also the choice of an SPS measure to achieve this level of protection. The SPS measure chosen by a Member must have a 'rational relationship' with, a risk assessment, as explained above. In addition, Article 5.6 requires that Members ensure that their SPS measures are not more trade restrictive than required to achieve their appropriate level of protection. This discipline closely reflects the interpretation of the 'necessary' requirement of Article XX(b) of the GATT 1994. However, the express reference to alternative measures that *achieve* the appropriate level of protection of the Member concerned indicates the absence of room for strong proportionality testing in respect of the choice of an SPS measure. In addition, Article 5.6 recognises the fact that a less trade-restrictive measure could have high regulatory or compliance costs or could be impractical to implement. Therefore it includes a determination of whether the alternative measure proposed is technically and economically feasible for the regulating Member. This may be expected to provide significant flexibility for developing-country Members which may be constrained in their choice of SPS measure by their financial and technical limitations.

An additional manifestation of the respect in the *SPS Agreement* for the risk management decisions of Members is to be found in Article 5.7, which allows for provisional measures in the case of insufficient scientific evidence. This provision reflects recognition of the fact that Members have the right to act with precaution where there is insufficient scientific evidence to conduct a risk assessment. To prohibit Members from regulating in such cases would be to ignore the reality of gaps in scientific knowledge, to the detriment of SPS protection. The *SPS Agreement* therefore makes room for provisional measures in such cases, by exempting measures that fall under the terms of Article 5.7 from the scientific disciplines of Articles 2.2 and 5.1. This right is subject to specific conditions to prevent the creation of a broad loophole through which protectionist measures could slip. In the first place, its application is triggered only by cases in which the scientific evidence available does not allow, in quantitative or qualitative terms, the performance of a risk assessment as required under Article 5.1 and Annex A.4 of the *SPS Agreement*. Situations of theoretical uncertainty, conflicting scientific opinions and disagreement by a Member with the conclusions of a risk assessment are not covered by Article 5.7. Second, some level of rationality is induced, despite the fact that a proper risk assessment is not possible, by the fact that the provisional measure must be based on the available pertinent information. In addition, measures taken under Article 5.7 may only be maintained if the regulating Member makes efforts to obtain the additional information needed for a risk assessment and reviews the measure accordingly in a reasonable period of time. These requirements are in line with the approach of 'adaptive governance' in situations of pervasive uncertainty, in that they promote regulatory learning and ongoing review.

While the exemption provided by Article 5.7 has been interpreted to apply only where all four of its requirements are met, it is argued here that the right to take provisional measures should be available whenever the trigger for the applicability of Article 5.7 exists, namely insufficient scientific evidence. The remaining requirements of Article 5.7

should rather be seen as requirements for the exercise of this right, than as conditions for its existence.

### Conclusion to Part III

The analysis in Part III of this book attempts to evaluate the balance struck by the relevant substantive provisions of the *SPS Agreement* between the competing interests of trade liberalisation in the food and agricultural sector and the protection of health, with specific regard to its development implications. To this end, the appropriateness for Members at different levels of development of the substantive disciplines used in the *SPS Agreement* to give effect to this balance is examined. In making this examination it is useful to recall the vast differences in trade and health priorities and regulatory capacity illustrated in Part II of this book. As became apparent through the examination of four Members at different income levels in Part II, some Members at high income levels attach great importance and devote enormous resources to SPS regulation. For Members at lower levels of development the available resources are restricted and may be directed to addressing more pressing development priorities. It is in this light that the development implications of the substantive disciplines of the *SPS Agreement* must be seen.

The criteria used for the evaluation of the relevant substantive disciplines of the *SPS Agreement* are those set out in the Introduction to this book, namely whether they effectively increase market access opportunities for WTO Members at lower levels of development; and whether they leave these Members sufficient policy space for SPS regulation. Both these criteria are important, as they reflect the values on either side of the scale that the *SPS Agreement* can be seen to represent. These values are economic growth through increased export opportunities, on the one hand, and the protection of health against SPS risks, on the other. Viewed in the light of the normative framework provided by the concept of the 'right to development', set out in Part I above, the importance of *both* sides of the balance for developing-country Members, as for all Members, is evident. The development dimension of the *SPS Agreement* lies in its potential to promote agri-food trade without endangering the protection of health in less developed Members.

The tools used in the *SPS Agreement* to achieve its balancing objective are best understood in the historical context leading up to the drafting of the Agreement. The inability of the existing rules of the GATT 1947 and the *Standards Code* to effectively address trade/health conflicts was made evident by the long-running dispute between the EC and the US concerning the EC ban on hormone-treated beef. An awareness of the need to improve these rules in order to avoid undermining the progress made in liberalising the agricultural sector formed the impetus for the negotiations in the Uruguay Round on SPS issues. However, this objective was counterbalanced by the broad recognition of the need to ensure appropriate respect for the ability of Members to meet their legitimate SPS regulatory objectives, to avoid politically unacceptable outcomes. While initially the intention was to amend the existing rules, in the course of the negotiations the recognition of the special character of SPS measures and the sensitivity of the competing interests they entail led to the realisation that a separate agreement was necessary to address this conflict. This agreement came to be called the *SPS Agreement*.

It is apparent from the overview of the negotiating history set out in Chapter 1 that the regulatory model embodied in the substantive disciplines of the *SPS Agreement* is that to be found in the proposals of the most active participants in the negotiations. The Agreement

closely reflects best regulatory practices in developed-country Members. While the ideal of improving the practice of SPS regulation among Members through such best-practice disciplines is, in itself, laudatory, there is a danger of ‘putting in place an unrealistic and unachievable model of regulatory practice.’<sup>1396</sup> The examination of the relevant substantive rules of the *SPS Agreement*, as interpreted in the case law, carried out in Chapters 2 to 5 of this Part aimed to establish whether they embody such an ‘unachievable model’, or whether they offer workable tools for Members at lower levels of development to effect the trade/health balance.

This examination commenced in Chapter 2 by addressing the scope of application of the new regulatory disciplines contained in the *SPS Agreement*. Article 1.1 of the *SPS Agreement*, read together with Annex A.1, gives a clear indication of the type of situations which the new disciplines were intended to address, namely those involving a conflict between the liberalisation of agricultural trade and the protection of human, animal or plant life or health. Consequently, these provisions demarcating the coverage of the *SPS Agreement* address those health risks that may arise from trade in primary and processed agricultural products, such as food safety risks and risks from pests or diseases of plants or animals. To achieve this coverage, the relevant provisions speak to the *purpose* of the measure, to establish whether it is an ‘SPS measure’ falling within the ambit of the *SPS Agreement*. The variety of forms that such a measure might take is then broadly defined by means of an illustrative list of measures.

As discussed in Chapter 1, the interpretation of Annex A.1 by the Panel in *EC – Approval and Marketing of Biotech Products* has given the *SPS Agreement* unexpectedly broad coverage. This coverage now includes environmental protection measures that do not address plant or animal health. It is important to avoid being drawn into making the simplistic assumption that developing-country Members necessarily benefit from the resulting application of the strict scientific disciplines of the *SPS Agreement* to a wide range of measures. Such an easy generalisation ignores the diversity of positions and interests among developing-country Members, which are both exporters and importers of agri-food products. As such, these Members have the same interest as all other Members in ensuring that the particular disciplines of the *SPS Agreement* are applied to the specific situations they were crafted to address. The expansion of the application of these disciplines to areas they are ill-suited to is in no-one’s interest. Instead, it should be recalled that the *SPS Agreement* is only one part of an ‘inseparable package’ of rights and obligations of WTO Members. Measures not covered by the *SPS Agreement* are not undisciplined. Rather, they are disciplined by the rules of other WTO agreements that address them more appropriately.

An issue of particular concern to many developing-country Members with regard to the applicability of the *SPS Agreement* is whether private sector SPS standards are covered by its rules. The rapidly increasing trend in recent years towards SPS norm creation and implementation at subnational and transnational levels by private sector actors has brought this issue to the fore. SPS standards are increasingly set and applied by private sector bodies, such as the large retail conglomerates that dominate large sectors of the market

---

<sup>1396</sup> Catherine Button, *The Power to Protect. Trade, Health and Uncertainty in the WTO* (Hart Publishing, Oxford and Portland, Oregon), 2004, 93.

for agri-food products. The distinction between binding SPS regulations and private SPS standards has therefore lost much of its meaning for exporters, for whom market access depends on compliance with private sector standards as much as, or sometimes even more than, with SPS regulations. The question thus arises whether the obligation on Members, in Article 13 of the *SPS Agreement*, to take such reasonable measures as may be available to them to ensure compliance by non-governmental and regional bodies should be interpreted to require them to use legislative means to impose the obligations of the *SPS Agreement* on private sector bodies that set, apply or check conformity with SPS standards. It is argued here that this would not be appropriate. The substantive disciplines of the *SPS Agreement* were drafted with national SPS regulators in mind, whose task it is to weigh up competing interests and whose tendency towards protectionism is appropriately constrained by internationally agreed trade disciplines. The aim of the *SPS Agreement* is to achieve a balance between the sovereign right of Members to protect health in their territories and the need to prevent protectionism under the guise of SPS regulation. The application of its disciplines to private sector bodies would not seem to further this objective. Private economic operators that set, apply or assess conformity with SPS standards have very different objectives from those of public regulators, including profit maximisation through responsiveness to consumer demands. Many of the regulatory disciplines of the *SPS Agreement* are clearly not appropriate for such private operators.

However, the fact that current regulatory disciplines of the *SPS Agreement* are not suitable for direct application to private sector standards, does not mean that the reality of the fact that such standards are a significant obstacle to agri-food trade, particularly from developing-country exporters, can be disregarded. The development impact of private sector standards merits serious attention. The question is how best this matter can be addressed. It is argued here that what is ideally needed is a Code of Good Practice, along the lines of that contained in the *TBT Agreement*, setting out procedural disciplines to address the main problems caused by private sector standards. These disciplines should promote transparency of private sector standards, the institution of consultation mechanisms to ensure participation in standard-setting by the relevant stakeholders, the recognition of equivalent standards, and the reduction of the burden caused by costly and complex conformity assessment procedures. However, this Code of Good Practice should stop short of requiring private sector bodies to base their measures on international standards, conduct risk assessments for their measures, or undertake any other activities inherent to the national regulatory process but inappropriate to the activities of private bodies. Members could then undertake to take reasonable measures available to ensure compliance with the SPS Code of Good Practice.

It seems unlikely, at present, that consensus will be reached on such a Code of Good Practice. It also appears that Members do not regard the Code of Good Practice of the *TBT Agreement* as relevant to private sector SPS standards. In addition, even if a Code of Good Practice were in place to discipline the procedural aspects of private sector standards, the burden of compliance with these standards remains high. Consequently, it is necessary to ensure the provision of effective and disinterested capacity building to enable developing-country exporters to comply with private sector standards. In the meantime, a pragmatic approach to this problem could be the continued use of the multilateral forum provided by the SPS Committee to raise concrete examples of the challenges created by

private sector standards, in an effort to stimulate private sector bodies to be responsive to developing-country Members' needs in the elaboration and implementation of their standards, and to spur donors to provide technical assistance.

Within the limits of its scope of application, certain substantive disciplines of the *SPS Agreement*, as interpreted by panels and the Appellate Body, determine the scope for regulatory action by Members against SPS risks. The basic rights and obligations set out in Article 2 of the *SPS Agreement* epitomise the trade/health balance aimed at by the Agreement and the manner in which this balance is struck in the Agreement. The express recognition in Article 2.1 of the *right* of Members to take SPS measures is key in this respect. It has the result that, unlike the situation under the GATT 1994, Members imposing measures covered by the *SPS Agreement* do not bear the burden of justifying their measures under an exception to trade liberalisation disciplines. Instead, a Member wishing to challenge an SPS measure must establish a violation of specific disciplines of the *SPS Agreement*. The limits to the right to take SPS measures, first outlined in Articles 2.2 and 2.3, recur in more specific form in the rest of the *SPS Agreement*. These provisions reflect and build upon familiar GATT disciplines, requiring that health measures be limited to what is 'necessary' to achieve their aim, and prohibiting arbitrary or unjustifiable discrimination and disguised trade restrictions. Further, Article 2.2 introduces an innovative aspect of the *SPS Agreement*, namely the use of science as the scale on which the competing interests of trade and health are balanced.

This careful balance must be respected in the interpretation of the provisions of the *SPS Agreement*. There is therefore no room for the importation of a strong proportionality test arising from the 'necessary' requirements of Article XX(b) of the GATT 1994 into the 'necessary' requirement of Article 2.2 of the *SPS Agreement*. Neither is the strong proportionality test read into the 'sufficient scientific evidence' requirement of Article 2.2 by the Panel in *Japan – Apples* to be condoned. Requiring an SPS measure to be proportional to the seriousness or magnitude of the risk at issue is contrary to the balance that is the object and purpose of the Agreement. It deprives Members of the room to make their own policy decisions in their responses to risk. In view of the diversity in priorities, economic resources and risk-averseness of Members at different levels of development, reflected in the policy choices inherent to risk regulation, this result is to be avoided.

Harmonisation of SPS measures is promoted by Article 3 of the *SPS Agreement* in order to reduce the barriers to trade created by disparate requirements in various importing Members. In the absence of a rule-making body in the WTO entrusted with the task of providing generally applicable SPS requirements, Article 3 makes use of other international bodies as authoritative providers of uniform standards, namely the international standard-setting bodies referenced in Annex A.3. These international standard-setting bodies use recognised risk assessment procedures conducted by scientific expert bodies and discussed in committees to draw up standards. Their standards aim to reflect a large degree of scientific consensus on risk as well as policy agreement on the best way to address such risks. WTO Members are therefore encouraged to use these standards through the disciplines of Article 3 of the *SPS Agreement*.

Harmonisation of SPS measures around international standards has the potential to assist less-developed Members that lack the scientific capacity to undertake their own risk

assessments as a basis for regulatory decisions. It thus seems imperative to interpret the autonomous options provided by Articles 3.1-3.3 in a manner that provides real benefits to Members that choose to base their SPS measures on international standards or to conform their measures to these standards, in contrast to the current interpretation. If an SPS measure that is 'based on' an international standard would be regarded as complying with the requirement of a scientific basis (in Articles 2.2 and 5.1), less-developed Members with limited scientific capacity could rely on the relevant international standard, and in particular the risk assessment that underlies it, while adjusting the aspects of the international standard that are not well-suited to their particular situations. While such a measure could still be challenged under the remaining disciplines of the *SPS Agreement*, such as those relating to necessity, consistency and non-discrimination, it would be safe from scientific challenges – a significant advantage for Members with weak scientific capacities. Similarly, if the presumption that SPS measures that 'conform to' international standards are consistent with the GATT 1994 and the *SPS Agreement*, contained in Article 3.2 of the *SPS Agreement*, would be interpreted as irrebuttable, it would provide a safe harbour for those Members whose weak regulatory capacity prompts them to fully adopt international standards. Such interpretations create a stronger impetus for harmonisation around international standards, without calling into question the right of Members to deviate from international standards if this is necessitated by their chosen level of protection. This interpretation therefore furthers the objective of Article 3 as outlined in the Preamble to the *SPS Agreement*.

However, any discussion of the potential benefits of the harmonisation provisions of the *SPS Agreement* for less-developed Members must be seen against the factual background of the problems of participation of these Members in the international standard-setting process, as set out in Part II. The preferences of the most active participants in the standard-setting process are reflected in both the science policy choices underlying the risk assessments on which international standards are based and risk management decisions taken in the international standard-setting bodies. The most influential participants are those with the most resources to dedicate to ensure the effectiveness of their participation, namely developed countries and industry groups. Efforts are already underway within the international standard-setting bodies to address the institutional and procedural constraints to developing-country participation, as discussed in Parts II and V of this book. However, it is clear that much remains to be done to redress the imbalance in participation of Members at different levels of development in the international standard-setting bodies. Without successful efforts in this regard, the harmonisation disciplines of the *SPS Agreement* will have a negative impact on development, contrary to their objective.

Harmonisation is not always possible, nor is it always desirable. Diverging SPS measures may be a reflection of the diversity in both capacity and policy priorities that exists in different Members and can be seen as a natural outcome of the exercise of sovereign regulatory authority by their governments. In the absence of harmonisation, the *SPS Agreement* relies on scientific justification to discipline regulatory decisions. These scientific disciplines counterbalance the regulatory autonomy of Members, reflected in the policy space reserved to them in the *SPS Agreement*. Science is regarded as a value-neutral benchmark, universally accepted and thus valid for all. As a result, the *SPS Agreement* requires that

SPS measures that deviate from harmonised standards are rationally supported by science as embodied in a risk assessment.

A more nuanced understanding of science and the subjective choices inherent in the assessment of risks has emerged, undermining the possibilities for reliance on science as an objective yardstick against which to judge SPS regulation. However, this does not mean that the use of science in the disciplines on SPS measures is completely misplaced. The scientific disciplines of the *SPS Agreement* have the definite benefit of encouraging rationality in risk regulation and thereby improving the quality of SPS decision making. The Appellate Body has taken steps to prevent the scientific obligations of the *SPS Agreement* from becoming unrealistic, rigid and unworkable restrictions on the regulatory autonomy of Members. In this way, it has been careful to ensure that the use of science as a tool to balance trade and health in the *SPS Agreement* does not result in a skewed result through the unrealistic application of this tool.

This realistic approach has unfortunately not been taken by panels in their application of the scientific obligations of the *SPS Agreement* to the factual situations before them. Instead, panels have seen it as their task to engage in a detailed assessment of the scientific evidence underlying a Member's measure, and to come to an independent conclusion regarding the existence and extent of the risk at issue. The invasive application of the scientific rules of the *SPS Agreement* by panels might be expected to be advantageous to developing-country Members that export agri-food products, since they provide greater opportunities to challenge the SPS requirements of their trading partners. However, in order to do so, the complaining Member needs to have sufficient scientific capacity to identify the flaws in the scientific basis for the regulating Member's measure, and to pursue challenges on this basis. This capacity is frequently lacking in Members at lower levels of development. In addition, even where the necessary capacity to bring scientific challenges is present, the intrusive approach of panels does not, in fact, lead to increased opportunities for market access. By undermining the scope for national choices in science policy decisions, and thereby skewing the delicate balance of the *SPS Agreement*, these panel decisions result in politically unacceptable outcomes of dispute settlement. This increases the chances of non-compliance by a regulating Member with the recommendations and rulings of the DSB, thereby undermining the effectiveness of the *SPS Agreement*.

The scientific disciplines of the *SPS Agreement* also entail significant compliance costs for Members at lower levels of development. The rigorous requirements for a risk assessment necessitate a high level of scientific and technical capacity, something which is lacking in many Members at lower levels of development. The possibility for these Members to make use of 'borrowed' risk assessments to fill the gap left by their own lack of scientific capacity has been significantly narrowed by the requirement of a great degree of specificity read into the two definitions of 'risk assessment' in Annex A.4, and by the criterion of a risk assessment 'as appropriate to the circumstances'. Consequently, SPS regulations of less-developed Members are often vulnerable to challenges under the scientific obligations of the *SPS Agreement*.

In contrast to its strict scientific disciplines with regard to risk assessment, the *SPS Agreement* provides considerable elbow room for Members to give effect to their policy

choices in their risk management decisions. This policy space left to Members is indicative of the balancing approach of the *SPS Agreement*. It acknowledges that Members have the right to choose the levels of protection against SPS risks that they deem appropriate. Such decisions are taken by national regulators on grounds of societal value judgements on issues such as what level of risk is considered acceptable in society, not purely on the basis of scientific analysis of risk. The *SPS Agreement* recognises this, by placing no requirement of establishing a scientific basis on the choice of the appropriate level of protection. Neither does it place any restrictions on the types of factors that Members may consider when deciding on their choice of level of protection. Thus particularised national health measures result even where the scientific basis for the measures is same everywhere

The only real discipline on the choice of a level of protection is the prohibition, in Article 5.5, on arbitrary or unjustifiable distinctions in levels of protection applied in different but comparable situations, if these distinctions would lead to discrimination or a disguised restriction on trade. The broad ambit given in the case law to the situations that may be considered ‘comparable’ is tempered by the fact that distinctions in the levels of protection applied are only caught by the prohibition if they are arbitrary or unjustifiable. Panels and the Appellate Body have considered factors relating to the level of risk or difficulties of controlling the risk in the situations compared to determine if the differences in the level of protection chosen by a Member in these situations can be justified. However, in some cases, divergence in the appropriate level of protection is grounded in, often irrational, societal preferences rather than objective differences in risk. This is particularly the case with regard to the risks to which people voluntarily expose themselves, due to particular cultural practices. The SPS Committee is instructed, in Article 5.5, to take this into account in developing guidelines for the implementation of Article 5.5. Room has also been made by the Appellate Body for considerations unrelated to the risk at issue, including consumer concerns, to be factored in to the determination of an appropriate level of protection, by finding that such considerations will not render the chosen level of protection a ‘disguised restriction on trade’ for purposes of Article 5.5. This decision implies a positive recognition by the Appellate Body of the important role of societal value judgements in the making of risk management decisions.

The choice of an SPS measure to achieve a Member’s chosen levels of protection is also disciplined in the *SPS Agreement*. Not only must these measures bear a rational relationship to a risk assessment, but, according to Article 5.6 of the *SPS Agreement*, they must also not be more trade-restrictive than required to achieve the appropriate level of protection of the regulating Member. While the least-trade-restrictive discipline is clearly drawn from the ‘necessary test’ of Article XX of the GATT, unlike the GATT the *SPS Agreement* excludes the possibility for strong proportionality testing by explicitly providing that any alternative measure proposed must achieve the regulating Member’s appropriate level of protection. In addition, the technical and economic feasibility of the alternative measures is expressly considered. This ensures that unrealistic limits on a Member’s choice of measure are avoided, in recognition of the fact that resource and capacity constraints play an important role in regulatory decisions. The examination of the space left to Members in the *SPS Agreement* to carry out their risk management policies is indicative of the balancing approach of the *SPS Agreement*.

The *SPS Agreement* allows for risk management choices in the face of insufficient scientific evidence by providing scope, in Article 5.7, for provisional measures. When the four requirements of Article 5.7 are met, the relevant SPS measure is exempted from the scientific disciplines of Articles 2.2 and 5.1 of the *SPS Agreement*. Article 5.7 seems to provide an adequate vehicle for the incorporation of the precautionary principle into the SPS disciplines relating to risk management. By laying down specific requirements for the exercise of the right to take provisional measures, Article 5.7 operates to avoid abuse of this right. It ensures that a framework is in place within which risk management decisions taken in the face of insufficient scientific evidence can be disciplined, to promote rationality.

The examination of the relevant substantive disciplines of the *SPS Agreement* leads to two related conclusions. The first is that the balancing objective of the *SPS Agreement* is unmistakably reflected in the way in which these substantive provisions are framed. As identified above, there are aspects of the interpretation of these provisions that do not fully give effect to the careful balance embodied in their terms. Nevertheless, the provisions themselves seem appropriate to address sensitive trade/health conflict in a way that promotes the liberalisation of agri-food trade while respecting the right of Members to regulate against SPS risks. However, the second conclusion that is evident from the discussion of the relevant substantive rules of the *SPS Agreement* is that these rules impose a regulatory model that is currently not achievable for many Members at lower levels of development. Neither are these Members able to use these substantive rules effectively to procure market access for their products.

The fact that Members at lower levels of development have not been challenged in dispute settlement proceedings to date, should not create the impression that this means that their inability to comply with the disciplines of the *SPS Agreement* has no real consequences for them. Many instances of non-compliance by these Members with the regulatory obligations of the Agreement have been challenged in the multilateral forum of the SPS Committee, or in bilateral discussions between Members. In these situations, it is often difficult for the regulating Member to justify its measure, other than to refer to its capacity constraints. For example, in response to a trade concern raised in 1996 by the US before the SPS Committee against Korea's import clearance measures and practices, Korea responded that while it had taken several measures to comply with the *SPS Agreement* it faced problems common to developing-country Members in doing so. These included 'a low level of sanitary infrastructure, lack of experience and information, and lack of relevant international standards.'<sup>1397</sup> Similarly, Venezuela responded to a complaint regarding its seemingly arbitrary practices in granting the SPS certificates necessary for imports by asking Members not to confuse problems of administrative capacity with a policy of discretionary import licensing.<sup>1398</sup>

Aside from the particular aspects of the interpretation of these substantive rules of the *SPS Agreement*, identified throughout this Part, that leave scope for improvement, it is

<sup>1397</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Resolved Issues*, G/SPS/GEN/204/Rev.8/Add.3, circulated on 27 March 2008, item 2, para. 188.

<sup>1398</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 123, para. 154.

difficult to see how changes can be made to address developing-country constraints without skewing the careful balance sought by the Agreement. The rules themselves seem appropriate for the fulfilment of their function of allowing sufficient room for Members to regulate in a manner that gives effect to their policy priorities in the area of SPS risk, while disciplining such regulation to eliminate the possibilities for disguised protectionism and to reduce the adverse trade effects of legitimate measures. Nevertheless, the very real problem of the constraints that less-developed Members face in complying with, and benefiting from, these rules cannot be disregarded.

The question arises to what extent the remaining provisions of the *SPS Agreement* ameliorate this problem by taking account of the capacity constraints of Members at lower levels of development, both in respect of compliance with the disciplines of the Agreement and in respect of enforcement of these disciplines against other Members in order to gain market access. This question is addressed in Parts IV and V of this book.

## Part IV

---

### **Procedural and institutional mechanisms under the SPS Agreement**

---

## Introduction to Part IV

As seen in Part III of this book, several of the substantive obligations of the *SPS Agreement* aim to set the limits of the policy space left to Members in the area of SPS regulation, by combining the traditional trade disciplines with new scientific disciplines and by encouraging harmonisation. These disciplines together function as a filter, to distinguish measures legitimately aimed at health protection from measures that are a disguised form of protectionism. In this way, the *SPS Agreement* tries to balance the often competing interests of trade liberalisation and health protection.

However, alone, these disciplines would not be sufficient to achieve significant gains in market access for food and agricultural products for Members at lower levels of development. These Members often lack the scientific and technical capacity to identify instances of non-compliance with the complex regulatory disciplines of the *SPS Agreement* and to formulate effective challenges in this regard. In addition, many legitimate SPS regulations that pass muster under the relevant substantive disciplines of the *SPS Agreement* nevertheless form significant trade barriers. This is particularly so for Members that face capacity constraints in keeping track of new and changed measures, understanding their implications and proving their compliance with SPS requirements (including by demonstrating the equivalence of their own SPS requirements, or by gaining recognition of the pest- or disease-free status of their territories or of regions within their territories). Additionally, substantive disciplines on their own are not useful without effective tools to monitor their implementation, and if necessary enforce compliance therewith. It is important to have additional mechanisms in place that address these institutional and procedural matters.

Therefore the *SPS Agreement* contains several provisions dealing, in a stronger or weaker fashion, with institutional or procedural matters. These can be divided into two main categories, addressed in Chapters 1 and 2 of this Part. First, Chapter 1 discusses those provisions in the *SPS Agreement* under which mechanisms creating disciplines of an institutional or procedural nature on Members are established. Often these procedural disciplines are combined with a substantive obligation, yet the procedural mechanism under the provision is key to its potential in improving market access. For example, the substantive obligations on transparency go hand-in-hand with rules requiring Members to follow certain procedures and set up particular institutions with respect to the promotion of transparency of SPS measures. In addition, the substantive obligations to recognise the equivalence of different SPS measures and to adapt SPS measures to regional differences in pest and disease prevalence, are ineffective without procedural disciplines to give effect to these obligations. Due to the weakness of the procedural rules in these provisions, the SPS Committee has developed procedures to further the implementation of the provisions on the recognition of equivalence and regionalisation. There are also disciplines that apply directly to Members' use of procedures, specifically control, inspection and approval procedures, in order to minimise their adverse trade effects and prevent discriminatory application.

A second category of procedural and institutional mechanisms, discussed in Chapter 2, covers those provisions in the *SPS Agreement* that deal, instead, with the institutions and

procedures necessary at WTO level for the smooth and effective implementation of the *SPS Agreement*. These relate to the establishment and functioning of the SPS Committee, the WTO body charged with the administration of the *SPS Agreement*, and to the institutions and procedures in place to settle disputes between Members concerning claims of violation of the *SPS Agreement*.

Both categories of institutional and procedural mechanisms have an important impact on the effectiveness of the *SPS Agreement* in achieving its goals. The procedural disciplines on Members leave undisturbed their policy choices within the bounds of the substantive disciplines of the Agreement, but address the way in which these are achieved in order to minimise as far as possible their trade restrictive effects. The provisions creating institutional and procedural mechanisms at WTO level are essential in promoting and monitoring the implementation of the disciplines of the *SPS Agreement*, resolving conflicts between Members with regard to these disciplines and, if necessary, enforcing compliance therewith. It is therefore useful to examine these provisions to determine the extent to which they are effective tools for exporting Members at different levels of development to gain market access without endangering the ability of importing Members to protect health in their territories.

## CHAPTER 1

### Institutional and procedural obligations on Members

The substantive disciplines of the *SPS Agreement* on the adoption and maintenance of SPS measures, which aim to weed out disguised protectionism, can be undermined if Members are free to use procedural means to make it difficult for exporters to access their markets. Examples of such procedural barriers to trade are a Member's lack of transparency with regard to the SPS requirements in place in its territory, its use of costly, burdensome or lengthy procedures to check conformity with its SPS measures, to approve additives or set tolerances for contaminants; and its application of unreasonable requirements and complicated procedures for the recognition of the equivalence of alternative SPS measures that achieve its level of protection or the recognition of pest- and disease-free areas or areas of low pest or disease prevalence in exporting Members.

In order to prevent the misuse of the procedural aspects of SPS regulation to diminish market access, but yet leave the policy room established by the relevant substantive rules untouched, there are certain procedural mechanisms under the *SPS Agreement*. In particular, there are mechanisms to further the recognition of equivalence and regionalisation of SPS measures (in Articles 4 and 6); to promote the transparency of SPS measures, requiring publication and advance notification (in Article 7 and Annex B); to limit the delays, costs and administrative burden of control, inspection and approval procedures to what is necessary and prevent discriminatory application (in Article 8 and Annex C).

In two cases, those of the recognition of equivalence and regionalisation, the provisions of the *SPS Agreement* at issue have a strong substantive element, while their procedural aspects are weak. However, it is precisely in disciplining the procedures for the recognition of equivalence and adaptation to regional conditions that the greatest potential for market access gains lies. Steps have been taken to address the procedural weakness of these provisions through decisions of the SPS Committee establishing procedural mechanisms to further the implementation of the substantive obligations. Due to the important potential of the procedural mechanisms under these two provisions, they are discussed in this Part, together with other provisions which contain more detailed procedural obligations on Members.

#### 1.1 Recognition of equivalence

Differences between Members with regard to local climatic and geographical conditions, consumer preferences and technical and financial resources, may sometimes make it difficult or even undesirable to harmonise SPS measures.<sup>1</sup> In such cases, the resulting variety

---

<sup>1</sup> For example, the prevalence of particular pests or diseases may differ, as may climatic conditions that may be more or less conducive to the proliferation of pests or the spread of diseases. In addition, it has been noted that developing countries may face rather different developmental and technological conditions which also result in differences in SPS measures. Simonetta Zarrilli, *WTO Sanitary and Phytosanitary Agreement: Issues for Developing Countries*, 3 (South Centre, Geneva) 1999, 17, available at: [www.southcentre.org/publications/s&p/s&p.pdf](http://www.southcentre.org/publications/s&p/s&p.pdf), visited 8 November 2001.

of SPS measures, even those that comply with all the substantive provisions of the *SPS Agreement*, can significantly hinder trade. However, the negative impact of divergent measures can be limited by the recognition that it is possible for different SPS measures to achieve the same level of protection (i.e., be equally effective in reducing risk) and thus by allowing imports of products that comply with different, but equally effective, SPS measures.<sup>2</sup> As a result, it is possible for importing Members to rely on the standards and control and inspection systems in place in exporting Members, even where these may be different from their own, when they have been demonstrated to achieve the level of protection sought by the importing Member, i.e. to be equally effective in reducing risk. This is known as the recognition or acceptance of equivalence. As noted by Joanne Scott:

Equivalence is key to permitting the maintenance of regulatory diversity, while at the same time promoting market integration.<sup>3</sup>

An important, but often overlooked, benefit from the recognition of equivalence is the opportunity for technical learning and assistance it provides. Efforts towards establishing equivalence are based on close cooperation and exchange of information on technical level by regulatory officials. This enables the regulatory authorities of the exporting Member to gain expertise through obtaining detailed technical information regarding the particular regulatory systems in place in the importing Member. Similarly, the importing Member's officials become thoroughly familiar with the different regulatory system in place in the exporting Member and may learn alternative approaches to risk regulation. In some cases, regulatory cooperation is institutionalised and leads to long-term relationships and sharing of information and best practices.<sup>4</sup>

The recognition of equivalence can take various forms. The Chairperson of the SPS Committee made clear in his 2001 report to the General Council the understanding of Members that equivalence does not necessarily require formal equivalence agreements but can be achieved on different levels. He noted:

In the Committee's discussions in November 2000, Members recognized that there were several different levels of equivalence, which ranged from (i) formal agreements recognizing the equivalence of sanitary and phytosanitary systems; to (ii) agreements of equivalence for specific products; to (iii) acceptance, on an ad hoc basis, of the equivalence of specific technical aspects of certain sanitary and phytosanitary measures. In the March 2001 discussions, it was also

<sup>3</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 164.

<sup>4</sup> On this issue see *Ibid.* Scott notes that equivalence: 'serves to induce a healthy destabilization of the sometimes false premises underpinning established approaches to regulation. It opens up measures to contestation, and encourages ongoing policy learning on the basis of information exchange, and dissemination of best practice.' *Ibid.*

suggested that equivalence could be considered for either: (i) inspection and control systems; (ii) processing techniques; and (iii) for product standards.<sup>5</sup>

Thus, Members can accept the equivalence of different SPS measures on an *ad hoc* basis or by means of bilateral or regional equivalence agreements. Acceptance of equivalence on an *ad hoc* basis commonly occurs with regard to specific products or technical aspects of SPS measures.<sup>6</sup> In formal equivalence agreements criteria are set out for the acceptance by an importing Member of different SPS requirements as equivalent to its own, on either a systems-wide or product-by-product basis. This can be seen as a ‘one-way’ recognition of equivalence.<sup>7</sup> Equivalence agreements can also take the form of a ‘two-way’ or reciprocal agreement, in which the parties agree that the requirements and food safety systems used by each of them are sufficient to guarantee the level of protection each aims to secure. As a result, they bind themselves to allow each other’s products to enter their respective markets despite differences in the SPS measures or control systems applied. The latter type of agreements is known as mutual recognition agreements. Both types of equivalence agreement may be concluded for specific food or agricultural products or all food and agricultural products and may apply to only certain food safety requirements (for example only conformity assessment procedures or only food safety requirements) or to all such requirements.

Article 4 of the *SPS Agreement* aims to promote the recognition of equivalence, both on an *ad hoc* basis and by means of formal equivalence agreements and in this way to minimise the trade barriers caused by divergent SPS measures. If effectively implemented, the acceptance of the equivalence of other Members’ SPS measures under Article 4 could go a long way in reducing the barriers created by onerous, but legitimate, SPS measures. It is a useful method of eliminating the trade restrictive effect<sup>8</sup> of SPS measures in the absence of harmonisation.<sup>9</sup> As has been discussed above, Members are not obliged to

---

<sup>5</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence: Consideration of Article 4 of the SPS Agreement: Summary of Informal Discussions on Equivalence. Second Report by the Chairman*, G/L/445, circulated on 21 March 2001, para. 4.

<sup>6</sup> This fact was emphasised in discussions on equivalence in the SPS Committee. This occurs on a technical level and is not reflected in formal bilateral agreements. Committee on Sanitary and Phytosanitary Measures, *Equivalence - Note by the Secretariat*, G/SPS/W/111, circulated on 4 July 2001.

<sup>7</sup> The ‘one-way’/‘two-way’ distinction is made in Bernard O’Connor, *Equivalence of SPS Measures in WTO Law*, ed. O’Connor and Company, vol. 5, Monographs in Trade Law (Brussels), 2002, 83.

<sup>8</sup> See David G. Victor, ‘The Sanitary and Phytosanitary Agreement of the World Trade Organization: An Assessment after Five Years’, *Journal of International Law and Politics* 32 (4), 2000, 865-938, 877-878. Victor notes, ‘Assuming that exporters have an interest in identifying the least trade restrictive measure, this ‘equivalence’ requirement could automatically ensure that SPS rules are not more discriminatory than necessary (...).’ It may perhaps be more correct to say that the result would be rules that are least trade restrictive, since SPS measures need not be discriminatory at all to be caught by the *SPS Agreement*. In this regard, Scott makes the interesting point that Article 4 supplements the least-trade-restrictive-measure obligation by extending it to regulatory alternatives of other Members. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 163.

<sup>9</sup> This may be the case either where no international standards exist in the specific area or where a Member deviates from existing international standards with scientific justification, for example where they do not achieve the level of protection chosen by the importing Member. In these cases, where the *SPS Agreement* does not result in harmonisation of measures, the principle of equivalence could nevertheless result in open markets. It should be noted that the SPS Committee has emphasised that equivalence does not replace the need

adopt harmonised standards where these do not meet their chosen levels of protection.<sup>10</sup> However, by recognising divergent SPS measures as equivalent to their own, where these meet their appropriate levels of protection, Members can avoid creating unnecessary trade barriers while continuing to provide the level of protection they deem appropriate. This is of particular importance to developing-country Members, as their SPS measures and food safety systems often differ from those in place in importing developed-country Members, due to the developmental and technological constraints they face. If their measures nonetheless achieve the level of protection aimed at by the importing Member, they should be recognised as equivalent.<sup>11</sup>

Article 4 is now examined more closely to determine if it is effective in meeting its objective of the promotion of the recognition of equivalence.

### 1.1.1 Acceptance of equivalence

Article 4.1 of the *SPS Agreement* makes provision for the acceptance by WTO Members of equivalence of different SPS measures of exporting Members that achieve the appropriate level of protection chosen by the importing Member. It obliges Members to accept as equivalent different SPS measures that have been proven to achieve their chosen level of SPS protection. This paragraph provides:

Members shall accept the sanitary or phytosanitary measures of other Members as equivalent, even if these measures differ from their own or from those used by other Members trading in the same product, if the exporting Member objectively demonstrates to the importing Member that its measures achieve the importing Member's appropriate level of sanitary or phytosanitary protection. For this purpose, reasonable access shall be given, upon request, to the importing Member for inspection, testing and other relevant procedures.

In order for Members to be obliged to recognise the equivalence of other Members' SPS measures to their own, Article 4 requires that the exporting Member 'objectively demonstrate' to the importing Member that its SPS measures achieve the latter's appropriate level of protection. The burden of proof is therefore clearly on the exporting Member, which must adduce proof of the efficacy of its measure in equally reducing the health risk

---

for the development and use of international standards. Committee on Sanitary and Phytosanitary Measures, *Equivalence - Note by the Secretariat*, G/SPS/W/111, circulated on 4 July 2001, para. 3. See also David G. Victor, 'The Sanitary and Phytosanitary Agreement of the World Trade Organization: An Assessment after Five Years', *Journal of International Law and Politics* 32 (4), 2000, 865-938, 878. Victor refers to the similar concept of 'mutual recognition' in the context of the EC single market which 'created a strong market-opening dynamic by allowing legal production from any European country into any other European national market.' In this regard he refers to Linda Horton, 'Mutual Recognition Agreements and Harmonization', *Seton Hall Law Review* 29, 1998, 692-735, 708-729.

<sup>10</sup> See above, Part III, Section 4.2.

<sup>11</sup> In the meetings of Members in the SPS Committee regarding equivalence, it was stressed that the purpose of equivalence is to facilitate trade and that the recognition of equivalence should enhance developing country access to export markets, including those in developed countries, by allowing them to meet the importer's chosen level of protection by means of alternative measures. Committee on Sanitary and Phytosanitary Measures, *Equivalence: Consideration of Article 4 of the SPS Agreement: Summary of Informal Discussions on Equivalence. Second Report by the Chairman*, G/L/445, circulated on 21 March 2001, para. 7.

posed by its export. In addition, the exporting Member must allow reasonable access to the importing Member on request, to conduct its own inspections, tests and other procedures to verify that this is in fact the case.

### 1.1.2 Agreements on recognition of equivalence

As mentioned, it is possible for the recognition of equivalence to occur not only on an *ad hoc* basis but also by means of bilateral, regional or multilateral agreements in which criteria are set out for acceptance of different SPS measures or systems as equivalent. Therefore, the *SPS Agreement*, in Article 4.2, encourages the conclusion of equivalence agreements between Members by obliging Members to enter into consultations to this end upon request. However, there is no obligation to actually conclude such agreements. Article 4.2 provides:

Members shall, upon request, enter into consultations with the aim of achieving bilateral and multilateral agreements on recognition of the equivalence of specified sanitary or phytosanitary measures.

The weaker requirement in Article 4.2 as compared to that in Article 4.1 attests to the difficulty of negotiating formal equivalence agreements, as opposed to the *ad hoc* recognition of equivalence with respect to specific products or measures. Very few formal agreements on the recognition of equivalence exist. One example of such an agreement is that between Thailand and Canada with regard to fish inspection and control systems. This equivalence agreement is based on the draft guidelines established by the Codex Committee on Food Import and Export Inspection and Certification Systems. Thailand reports that it would like to conclude equivalence agreements on fish inspection and control systems with the EC, US, South Africa, Australia, New Zealand, Brazil and Korea, but lists several constraints, including the time consuming nature of the document review and comparison entailed, the differences in culture and legal structure in the various countries, the differences in policy, procedures and methods that prevail.<sup>12</sup>

Equivalence agreements that take the form of mutual recognition agreements are most likely to be found between countries that have broadly similar preferences with respect to the appropriate level of protection against particular SPS risks and similar technical capabilities with regard to monitoring and enforcing compliance with SPS requirements.<sup>13</sup> An example of this is the mutual recognition agreement between the EU and Canada in respect of trade in live animals, fish and their products, mentioned below.<sup>14</sup>

---

<sup>12</sup> Committee on Sanitary and Phytosanitary Measures, *Experience with Recognition of Equivalence: Statement by Thailand at the Meeting of 14-15 March 2001*, G/SPS/GEN/242, circulated on 6 April 2001.

<sup>13</sup> Bernard O'Connor, *Equivalence of SPS Measures in WTO Law*, ed. O'Connor and Company, vol. 5, Monographs in Trade Law (Brussels), 2002, 82. See also Digby Gascoine, 'Harmonisation, Mutual Recognition and Equivalence - How and What Is Attainable?' presented at the *Conference on International Food Trade Beyond 2000: Science-Based Decisions, Harmonization, Equivalence and Mutual Recognition* (Food and Agriculture Organization of the United Nations, Melbourne Australia) 11-15 October 1999, 5, available at: [www.fao.org/docrep/meeting/X2808e.htm](http://www.fao.org/docrep/meeting/X2808e.htm), visited on 25 June 2007. Gascoine points out that mutual recognition is more likely to occur between countries that have a long tradition of food trade with each other, and are in some kind of political or legal association with each other.

<sup>14</sup> See below, Part IV, Section 1.1.4.

Some Members are reluctant to enter into negotiations for the conclusion of formal equivalence agreements due to the lengthy and costly nature of such negotiations.<sup>15</sup> However, once in place, such formal agreements can make the subsequent recognition of equivalence easier and less costly as the general criteria and conditions for the recognition of equivalence are already established in such agreements.<sup>16</sup>

### 1.1.3 Procedure

While Article 4 sets out substantive obligations on Members, it does not provide detailed procedures for the recognition of equivalence or the conclusion of equivalence agreements.<sup>17</sup> It is thus left to Members to determine how they will give effect to this provision, in particular what procedures they will lay down and which criteria they will apply for the recognition of equivalence.<sup>18</sup>

All that is stipulated in Article 4 is that an importing Member is obliged to recognise the equivalence of a measure if the exporting Member ‘objectively demonstrates’ that its measure achieves the appropriate level of protection of the importing Member. What is required for this objective demonstration is not spelled out. As a result, many Members’ administrative requirements for the recognition of equivalence are so stringent as to render the benefits of Article 4 unavailable, particularly to developing-country Members. With regard to formal equivalence agreements, Article 4.2 provides only for an obligation to enter into consultations, upon request, with the aim to establish equivalence agreements. No procedural rules are laid down with regard to this consultation process.

The Chairperson of the SPS Committee in his 2001 Report to the General Council reported that Members had stressed that regardless of whether equivalence is recognised *ad hoc* or in formal agreements, certain obligations exist for both the importing country and the exporting country. These obligations stem from the fact that the SPS measures of the exporting country, in order to be accepted as equivalent, must meet the appropriate level of protection of the importing country. Therefore, the importing country must clearly identify the level of protection its measure aims to achieve and the exporting country must provide appropriate, science-based technical information to demonstrate that its

<sup>15</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence: Submission from the United States*, G/SPS/GEN/212, circulated on 7 November 2000.

<sup>16</sup> Argentina has suggested that all formal equivalence agreements should contain a section establishing general principles, aims and requirements for the recognition of equivalence, and deal with specific products in annexes to the agreement. Committee on Sanitary and Phytosanitary Measures, *Equivalence - Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures*, G/SPS/GEN/268, circulated on 15 August 2001. See also in this regard Simonetta Zarrilli, *The SPS Agreement and the Developing Countries* (World Bank, Washington D.C.), 2003, 8.

<sup>17</sup> Scott argues that the procedural disciplines of Article 8 and Annex C of the *SPS Agreement*, which deal with control, inspection and approval procedures, apply also to procedures for the recognition of equivalence. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 165, footnote 101. However, Annex C.1 specifies that its requirements apply ‘with respect to any procedure to check and ensure the fulfilment of sanitary and phytosanitary requirements’. The recognition of equivalence, instead, is based on a procedure to check whether alternative SPS requirements (those imposed by an exporting Member) meet the appropriate level of protection of the importing Member. This seems to lie outside the scope of Annex C.

<sup>18</sup> The *Decision on Equivalence*, discussed below, Part IV, Section 1.1.6, now provides non-binding guidelines with regard to the procedure to be followed.

alternative measure meets this level of protection.<sup>19</sup> The WTO Secretariat has noted that, in identifying their appropriate level of protection, Members should take into account the *Guidelines to Further the Practical Implementation of Article 5.5*,<sup>20</sup> which were adopted by the SPS Committee in June 2000.<sup>21</sup> The *Guidelines* incorporate, in paragraph B, the finding by the Appellate Body in *Australia — Salmon*, that although the *SPS Agreement* contains no express obligation on a Member to determine its appropriate level of protection, this obligation is implicit in several provisions including Article 4.<sup>22</sup>

Once the appropriate level of protection of the importing Member is known, and the exporting Member must produce evidence to support its claim that its SPS measure achieves this level of protection, and then the importing Member makes its determination of equivalence. The equivalence of different types of SPS measures (such as ban on a potential host of a pest and a requirement of fumigation treatment prior to importation) could be determined by examining the effectiveness of each by means of scientific evidence. In contrast, when different control and inspection systems are compared, a more subjective element is present as the quality of the system and qualifications of personnel are evaluated.<sup>23</sup>

The notification of the recognition of equivalence, whether *ad hoc* or in formal agreements, is not required by the *SPS Agreement*. In the informal discussions on equivalence in the SPS Committee, several Members expressed concern regarding the lack of transparency with regard to equivalence agreements.<sup>24</sup> A notification obligation in this regard, in the view of these Members, would facilitate the recognition of equivalence of SPS measures of developing-country Members by enabling the latter to become party to an existing equivalence agreement if they can show they meet the conditions set therein, or to conclude a similar bilateral agreement with the importing Member. However, it was pointed out in the SPS Committee meeting that all Members' national Enquiry Points<sup>25</sup> are obliged to respond to questions regarding, *inter alia* the recognition of equivalence and equivalence agreements.<sup>26</sup> Nevertheless, the SPS Committee endorsed a conclusion

<sup>19</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence - Note by the Secretariat*, G/SPS/W/111, circulated on 4 July 2001, para. 6; Committee on Sanitary and Phytosanitary Measures, *Equivalence: Consideration of Article 4 of the SPS Agreement: Summary of Informal Discussions on Equivalence. Second Report by the Chairman*, G/L/445, circulated on 21 March 2001.

<sup>20</sup> Committee on Sanitary and Phytosanitary Measures, *Guidelines to Further the Practical Implementation of Article 5.5*, G/SPS/15, circulated on 18 July 2000. These non-binding guidelines relate to the objective of consistency in the choice of appropriate level of protection and were discussed above, Part III, Section 5.2.3.5.

<sup>21</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence - Note by the Secretariat*, G/SPS/W/111, circulated on 4 July 2001, para. 11.

<sup>22</sup> Appellate Body Report, *Australia — Salmon*, para. 205. In footnote 161 to this paragraph, the Appellate Body stated: 'Articles 4.1 and 4.2 imply, in our view, a clear obligation of the importing Member to determine its appropriate level of protection.'

<sup>24</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence - Note by the Secretariat*, G/SPS/W/111, circulated on 4 July 2001, para. 19.

<sup>25</sup> The Enquiry Points are discussed further below, Part IV, Section 1.3.4.

<sup>26</sup> This obligation is contained in Annex B.3(d) and was confirmed by the SPS Committee in its meeting of 13 March 2001. Committee on Sanitary and Phytosanitary Measures, *Equivalence: Consideration of Article 4 of the SPS Agreement: Summary of Informal Discussions on Equivalence. Second Report by the Chairman*,

stating that Members will inform the SPS Committee of their recognition of the equivalence of the SPS measures of other Members.<sup>27</sup> The Secretariat proposed a format for the notification of determinations of equivalence and equivalence agreements, where such recognition of equivalence may have a significant effect on the trade of the Member which requested the determination or of other Members.<sup>28</sup>

#### 1.1.4 Examples

The absence of notification is not an indication that no recognition of equivalence is taking place at all. Instead, the various examples reported by Members to the SPS Committee in the context of the discussions regarding the implementation of Article 4 show that some practice exists in this area.

In practice, the recognition of equivalence most often takes place informally, on a technical or administrative level for specific products. An example of such recognition of equivalence is that of Australia with regard to Switzerland's measures with respect to hard cheeses.<sup>29</sup> Australia requires pasteurisation or thermisation of milk in the production of cheeses in order to achieve its 'safe food use' level of protection for cheese consumption. Australia, however, allows the manufacture and importation of raw milk cheeses if these achieve an equivalent level of safety protection.<sup>30</sup> In 1997, following a review of sanitary requirements, Australia suspended cheese imports from Switzerland. Switzerland sought to demonstrate that its manufacturing process for cheeses achieved Australia's level of protection by means of a risk assessment.<sup>31</sup> The risk assessment showed, according to Australia, that hard cheeses made following the Swiss process achieved the same level of pathogen destruction as those subject to pasteurisation, but this was not the case with semi-hard cheeses. Australia thus recognised Emmental, Sbrinz and Gruyere as safe due to the equivalence of the Swiss process with regard to hard cheeses.<sup>32</sup> This led to an amendment to the Australian Food Standards Code to allow hard Swiss cheeses to be imported.<sup>33</sup>

<sup>29</sup> This example was reported by Australia in response to the request by the WTO Secretariat for information on concrete experiences with the recognition of equivalence as a basis for discussions on improving the implementation of Article 4. Committee on Sanitary and Phytosanitary Measures, *An Example of Equivalence: Statement by Australia at the Meeting of 14-15 March 2001*, G/SPS/GEN/243, circulated on 9 April 2001.

<sup>30</sup> Australian Standard 4.2.4A Concerning Primary Production and Processing Standard for Specific Cheeses.

<sup>31</sup> Switzerland claimed that an equivalent degree of protection was achieved by 'the combination of heat treating of the milk, continual heating of the curd and the rapid acidification by the added starter cultures as well as the intense brining and long ripening period.' ANZFA *Full Assessment Report*, 3.

<sup>32</sup> Committee on Sanitary and Phytosanitary Measures, *An Example of Equivalence: Statement by Australia at the Meeting of 14-15 March 2001*, G/SPS/GEN/243, circulated on 9 April 2001. Other examples of *ad hoc* recognition of equivalence were provided by New Zealand (see Committee on Sanitary and Phytosanitary Measures, *Experience in Recognizing Equivalence of Phytosanitary Measures: Submission by New Zealand*, G/SPS/GEN/232, circulated on 28 February 2001.).

<sup>33</sup> For a detailed discussion of this example, see Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 169-170.

Anther example of *ad hoc* recognition of equivalence discussed above, is the recognition by the US of Australia's sanitary system for meat as equivalent to its own.<sup>34</sup> The US Food safety Inspection Service does not enter into equivalence agreements in respect of sanitary requirements for meat and poultry imports. Instead, after conducting an equivalence determination process, it amends US legislation to list the relevant country as eligible to export meat or poultry to the US.<sup>35</sup> New Zealand provided another example of *ad hoc* recognition of equivalence, relating to certification requirements. While New Zealand normally requires that cut flower imports be inspected and accompanied by a phytosanitary certificate, it has made an exception for fresh-cut orchids from Singapore that are brought into New Zealand by airline passengers. On the basis of a demonstrated history of compliance by Singapore with New Zealand's phytosanitary requirements, and the low level of pest interceptions related to passenger-carried orchids, New Zealand accepts as equivalent to the required phytosanitary certificates the use of tamper-proof stickers issued by the National Plant Protection Organisation of Singapore.<sup>36</sup>

Currently, the recognition of equivalence by means of formal agreements is taking place in very limited cases. One example, reported by Fiji, is the development of quarantine protocols between Fiji and New Zealand recognising, for specific agricultural products, the use of hot forced air treatment as equivalent to New Zealand's phytosanitary measures.<sup>37</sup> Donna Roberts reports that some equivalence agreements do exist, particularly in the seafood sector, but that these seem to require 'compliance' rather than equivalence.<sup>38</sup>

Equivalence agreements that take the form of mutual recognition agreements in respect of SPS requirements occur mostly in the context of broader bilateral or regional agreements. In particular, they occur between the Member States of the EU, the Members of NAFTA and between Australia and New Zealand in the context of FSNZ.<sup>39</sup> In addition, in certain cases Members have negotiated specific agreements laying down the conditions and requirements for the recognition of each other's SPS measures as equivalent for specific products or sectors. An example of such an equivalence agreement is that concluded between the EU and Canada, in respect of trade in live animals, animal products, fish

---

<sup>34</sup> The recognition of equivalence by the US of the new Australian meat inspection system is discussed above, Part II, Section 2.4.2.2. See further, J.J. Kastner and R. K. Pawsey, 'Harmonising Sanitary Measures and Resolving Trade Disputes through the WTO-SPS Framework. Part II. A Case Study of the USA-Australia Determination of Equivalence in Meat Inspection', *Food Control* 13, 2002, 57-60.

<sup>37</sup> Committee on Sanitary and Phytosanitary Measures, *Experience On "Equivalence": Submission by Fiji*, G/SPS/GEN/238, circulated on 13 March 2001, para. 1.

<sup>38</sup> Donna Roberts *et al.*, 'Sanitary and Phytosanitary Barriers to Agricultural Trade: Progress, Prospects and Implications for Developing Countries', in *Agriculture and the New Trade Agenda - Creating a Global Trading Environment for Development*, M.D. Ingco and L.A. Winters (eds.) (Cambridge University Press, Cambridge), 2004, 329-358, 339. In this respect Roberts cites the following report: 'Major Exporting Countries Seek Help to Comply with US Seafood HACCP Rule', *World Food Chemical News*, 11 July 1997, 11.

<sup>39</sup> For examples of the recognition of equivalence in the EU and NAFTA and the mutual recognition agreement between Australia and New Zealand (which has since been replaced by a joint food authority, FSNZ), see Simonetta Zarrilli, *The SPS Agreement and the Developing Countries* (World Bank, Washington D.C.), 2003, 17-18. On equivalence within free trade areas, see also Bernard O'Connor, *Equivalence of SPS Measures in WTO Law*, ed. O'Connor and Company, vol. 5, Monographs in Trade Law (Brussels), 2002, 91-108.

and fishery products.<sup>40</sup> This agreement establishes a mechanism for the mutual recognition of equivalence, laying down criteria and setting out the procedures to be followed. In addition, it lists those sectors that, at the time of the entry into force of the agreement, are recognised as equivalent between the parties.<sup>41</sup> Similarly, Canada and Australia have signed a Memorandum of Understanding, accepting each others' inspection systems for fish and fishery products as equivalent.<sup>42</sup>

### 1.1.5 Problems with implementation

The implementation of Article 4 of the *SPS Agreement* to date leaves much to be desired. As stated above, despite the fact that the substantive obligations it lays down for Members are clear and binding,<sup>43</sup> the procedural aspects of the determination of equivalence are not. This weakness in Article 4 has led to problems with its implementation.

The 'objective' demonstration required by Article 4 for the recognition of equivalence is expressly related to ability of the measure of the exporting Member to meet the level of protection of the importing Member. Article 4 also expressly recognises that *different* SPS measures can achieve the same level of protection. However, developing-country Members have repeatedly raised the concern that developed-country Members demand 'sameness' rather than equivalence of SPS requirements and control and inspection systems.<sup>44</sup> This deprives Members of the flexibility in their choice of measures that Article 4 intends to achieve, undermining its effectiveness.

In addition, the difficulty of providing an objective basis for the demonstration of equivalence in the absence of procedural rules has led to lengthy and burdensome equivalence procedures. Often Members have difficulty in ascertaining the level of protection their measures must meet in order to be recognised as equivalent, or cannot meet the level of scientific proof required by the importing Member as objective demonstration of equivalence. Importing Members often do not give clear, scientifically-justified, reasons for rejecting the equivalence of the measures imposed by an exporting Member. Further,

---

<sup>40</sup> *Agreement between the European Community and the Government of Canada on Sanitary Measures to Protect Public and Animal Health in Respect of Trade in Live Animals and Animal Products*, OJ L 071, 18 March 1999. Other mutual recognition agreements have been concluded between the EU and the US, New Zealand, Switzerland and the Czech Republic.

<sup>41</sup> For a more detailed description of this agreement see Bernard O'Connor, *Equivalence of SPS Measures in WTO Law*, ed. O'Connor and Company, vol. 5, Monographs in Trade Law (Brussels), 2002, 65-67.

<sup>42</sup> *Memorandum of Understanding Concerning the Inspection and Certification of Fish and Fishery Products*, Agreement between Australia and Canada, 28 June 1993. Canada has similar agreements with New Zealand (1966), Thailand (1997) and Indonesia (2002). See further Christel Elvestad, *Equivalence and Mutual Recognition Agreements in Relation to Technical Measures*, Working paper 2002-36 (Norwegian Agricultural Economics Research Institute, Oslo), 2002, 9-11, available at: [www.nilf.no/Publikasjoner/Notater/2002/N200236Hele.pdf](http://www.nilf.no/Publikasjoner/Notater/2002/N200236Hele.pdf), visited on 3 March 2003.

<sup>43</sup> It is interesting to contrast the clear obligation in Article 4 of the *SPS Agreement*, which actually requires the recognition of equivalence when certain requirements are met, with the weaker equivalence provision in Article 2.7 of the *TBT Agreement*, which requires only that Members 'give positive consideration' to accepting as equivalent the technical regulations of other Members, if they are satisfied that they adequately fulfil the objectives of their own regulations. The latter is only an obligation of conduct.

<sup>44</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence: Consideration of Article 4 of the SPS Agreement: Summary of Informal Discussions on Equivalence. Second Report by the Chairman*, G/L/445, circulated on 21 March 2001, para. 5.

the procedures and requirements for recognition of equivalence vary between importing Members, making it difficult for an exporting Member to access various markets even if it has obtained recognition of equivalence by one importing Member. For example, Fiji has reported that although New Zealand has accepted hot forced air treatment as an equivalent phytosanitary measure for imports of paw-paws, mangoes and eggplants from Fiji, Australia has refused to do so. Fiji has provided Australia with the requested data on its hot forced air treatment facilities, but AQIS has stated that Fiji must conduct further research on this treatment as it is not satisfied with the data provided. Consequently, Fiji cannot export paw-paw, mangoes and eggplants to Australia.<sup>45</sup> Fiji has proposed that importing Members should provide the scientific basis for decisions to reject the equivalence of measures of exporting Members.<sup>46</sup> This would enable exporting Members to take steps to address the problems in their measures that result in non-achievement of appropriate level of protection of the importing Member.

This burdensome nature of procedures for the recognition of equivalence is particularly the case for formal equivalence agreements. As a result, some importing Members, such as the US, are of the opinion that the negotiation of formal equivalence agreements or determinations are too time consuming and resource intensive, imposing administrative burdens on both the importing and the exporting countries, whereas the gains in trade achieved thereby are limited.<sup>47</sup> They therefore hold the view that recourse to other provisions of the *SPS Agreement* (such as the rules on risk assessment, transparency, technical assistance and control and inspection procedures) would yield more immediate trade benefits in the form of market access.<sup>48</sup> However, developing-country Members, such as Argentina, note that although importing Members may view the administrative burden of an equivalence agreement as unjustified with regard to the limited trade benefits it can bring, the improved market access through the formal recognition of equivalence can be very important for developing countries. This is especially the case where the exports of these Members are concentrated in a small number of products and involve few enterprises. The formal recognition that these products meet the level of protection of the importing Member through the use of equivalent measures or procedures would result in significant gains for trade in the exporting Member.<sup>49</sup>

<sup>45</sup> Committee on Sanitary and Phytosanitary Measures, *Experience On "Equivalence": Submission by Fiji*, G/SPS/GEN/238, circulated on 13 March 2001, paras 1 and 3.

<sup>46</sup> *Ibid.*, para. 8.

<sup>47</sup> See Committee on Sanitary and Phytosanitary Measures, *Equivalence: Submission from the United States*, G/SPS/GEN/212, circulated on 7 November 2000, para. 16.

<sup>48</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence - Note by the Secretariat*, G/SPS/W/111, circulated on 4 July 2001, para.5. See also Committee on Sanitary and Phytosanitary Measures, *Equivalence: Submission from the United States*, G/SPS/GEN/212, circulated on 7 November 2000, para. 20.

<sup>49</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence - Note by the Secretariat*, G/SPS/W/111, circulated on 4 July 2001, para. 6. Argentina has pointed out that its narrow range of exports and their concentration in a small number of exporters facilitate control of exporting plants and products. It has therefore called for the recognition of equivalence to be focused on these export products rather than on the whole national SPS system. Committee on Sanitary and Phytosanitary Measures, *Actions Aimed Implementing the WTO Agreement on the Application of Sanitary and Phytosanitary Measures*, G/SPS/GEN/286, circulated on 26 October 2001, 6.

In its first periodic review of the implementation of the *SPS Agreement*,<sup>50</sup> the SPS Committee noted that although there had been an increase in the recognition of equivalence and in the negotiations towards bilateral agreements in this respect, greater efforts in this area were necessary. The Committee pointed in this regard to the importance of the recognition of equivalence for developing-country Members. The Committee requested Members to provide more information on equivalence agreements they have concluded bilaterally. In addition, the work of Codex and other international organisations to promote the recognition of equivalence was welcomed by the SPS Committee.<sup>51</sup>

### 1.1.6 The Equivalence Decision

The concerns of developing-country Members with the lack of implementation of Article 4, mentioned above, created a strong impetus for discussions to develop guidelines on this issue. At the same time, some developed-country Members supported this initiative as they wished to develop agreed guidelines for the practical implementation of the rather vague obligation in Article 4. Preparatory work was conducted informally on this issue by a small group of developed-country Members.<sup>52</sup>

At its Special Session on Implementation on 18 October 2000, the General Council referred the issue of implementation of Article 4 to the SPS Committee.<sup>53</sup> The SPS Committee held informal and special meetings on equivalence and also addressed the issue in its regular meetings.<sup>54</sup> In these discussions it was emphasised that the aim of equivalence is to facilitate trade and enhance developing country access to markets, including those in developed countries, by allowing them to meet the importing country's level of protection by alternative means.<sup>55</sup> It was also emphasised that equivalence is not a substitute for harmonisation and should not lead to discrimination or additional trade barriers. Discussions in the SPS Committee were based on concrete experiences of Members

<sup>50</sup> Committee on Sanitary and Phytosanitary Measures, *Review of the Operation and Implementation of the Agreement on the Application of Sanitary and Phytosanitary Measures: Report of the Committee*, G/SPS/12, circulated on 11 March 1999, para. 20.

<sup>51</sup> Gretchen Stanton, 'A Review of the Operation of the *SPS Agreement*', presented at the *Conference on Agriculture and the New Trade Agenda in the WTO 2000 Negotiations*, Geneva, Switzerland) 1-2 October 2000, 5.

<sup>52</sup> Digby Gascoine *et al.*, *Private Voluntary Standards within the WTO Multilateral Framework* (United Kingdom Department for International Development, London), March 2006, para. 57. Some of this group's preparatory work also took place under the auspices of the Codex Committee on Food Import and Export Inspection and Certification Systems. Gascoine *et al* report that this work provided the basis for the agreement eventually reached in the SPS Committee.

<sup>53</sup> The General Council requested the SPS Committee 'to examine the concerns of developing countries regarding the equivalence of SPS measures and to come up with concrete options as to how to deal with them.' (see General Council Special Session on Implementation, *Minutes of Meeting - Held in the Centre William Rappard on 18 October 2000*, WT/GC/M/59, circulated on 13 November 2000, para.12.).

<sup>54</sup> The informal meetings on equivalence were held on 7 November 2000, 13 March 2001 and 9 July 2001. The formal meetings where equivalence was considered were those of 8-9 November 2000 and 10-11 July 2001. In addition, two Special Meetings on equivalence were held on 18-19 September and 24 October 2001.

<sup>55</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence: Consideration of Article 4 of the SPS Agreement: Summary of Informal Discussions on Equivalence. Second Report by the Chairman*, G/L/445, circulated on 21 March 2001, para. 7.

with regard to the recognition of equivalence.<sup>56</sup> Input was also obtained from the CAC and OIE.<sup>57</sup>

The result of these discussions was the adoption, in November 2001, of the *Decision on the Implementation of Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures* (the *Equivalence Decision*) by the SPS Committee.<sup>58</sup> It was adopted under the authority of the SPS Committee to carry out the functions necessary to implement and further the objectives of the *SPS Agreement* under Article 12.1 of the *SPS Agreement*.<sup>59</sup>

At its meeting of 19-21 March 2002, the SPS Committee adopted a work programme for further work on equivalence, setting out the main issues for discussion in 2002 and 2003. The work programme included discussions regarding the clarification of specific paragraphs of the *Equivalence Decision*. These discussions culminated in the adoption of clarifying texts, incorporated into the revised versions of the *Equivalence Decision*.<sup>60</sup> In addition, the issue of equivalence remains a standing agenda item for meetings of the SPS Committee.

In its preamble, the *Equivalence Decision* recognises that equivalence ‘can be applied between all Members, irrespective of their level of development.’ It further takes account of the specific concerns raised by developing-country Members regarding their difficulties in having the equivalence of their SPS measures recognised by other Members. It states the desire to make operational the provisions of Article 4.

The *Equivalence Decision* starts in its first paragraph by stating in mandatory terms that a Member, when so requested, ‘shall seek to accept’ the equivalence of a measure related

---

<sup>56</sup> Members were asked to provide specific information with regard to their experiences with the recognition of equivalence. Responses were received from Argentina, Australia, Chile, Egypt, the EC, Fiji, India, New Zealand, the Philippines (on behalf of ASEAN countries), Thailand, the US and the CAC. The responses are summarised in Committee on Sanitary and Phytosanitary Measures, *Equivalence - Note by the Secretariat*, G/SPS/W/111, circulated on 4 July 2001.

<sup>57</sup> Committee on Sanitary and Phytosanitary Measures, *Draft Paper on the Judgement of Equivalence of Sanitary Measures Relating to International Trade in Animals and Animal Products. Submission by the Office International Des Epizooties (OIE)*, G/SPS/W/119, circulated on 18 March 2002; Committee on Sanitary and Phytosanitary Measures, *Relevant Codex Documents on Equivalence of Sanitary Measures: Information Submitted by the Codex Alimentarius Commission (Codex)*, G/SPS/GEN/210, circulated on 6 November 2000; Committee on Sanitary and Phytosanitary Measures, *Relevant Codex Documents on Equivalence of Sanitary Measures: Information Submitted by the Codex Alimentarius Commission (Codex)*, G/SPS/GEN/211, circulated on 6 November 2000.

<sup>58</sup> Committee on Sanitary and Phytosanitary Measures, *Decision on the Implementation of Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures*, G/SPS/19, circulated on 24 October 2001. This decision was adopted *ad referendum*. The Ministerial Conference at Doha took note of this Decision. Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001, para. 3.3.

<sup>59</sup> On the legal status of the *Equivalence Decision*, see below, Part IV, Section 2.1.1.

<sup>60</sup> Committee on Sanitary and Phytosanitary Measures, *Decision on the Implementation of Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Decision by the Committee. Addendum*, G/SPS/19/Add.1, circulated on 15 November 2002; Committee on Sanitary and Phytosanitary Measures, *Decision on the Implementation of Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures - Revision*, G/SPS/19/Rev.2, circulated on 23 July 2004; Committee on Sanitary and Phytosanitary Measures, *Decision on the Implementation of Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Decision by the Committee - Addendum*, G/SPS/19/Add.3, circulated on 26 March 2004.

to a product or category of products. It further provides that Members ‘may’ seek more comprehensive and broad ranging agreements on equivalence.<sup>61</sup> While noting that in the former case an evaluation of product-related infrastructure and programmes may be necessary, this is clarified in footnote to refer to ‘testing, inspection and other relevant requirements specific to product safety.’<sup>62</sup> This footnote was added to secure agreement with the *Equivalence Decision* by some Members that were concerned by the possibility that non-product related PPMs could be regarded as relevant to the consideration of equivalence.<sup>63</sup> Further, the distinction between *ad hoc* recognition of equivalence with regard to specific products, and more comprehensive recognition of equivalence reflected in agreements seems based on concerns raised by Members with regard to the burdensome nature of the latter category. While product-related equivalence allows flexibility to exporting Members to use different means to achieve the same level of product safety, systems-based equivalence is far more intrusive and costly to demonstrate. In this regard it is useful to recall Argentina’s argument that while a developing-country Member could easily show equivalence in respect of export products, it would be most unlikely to be able to show systems-wide equivalence. Further, the costs of such a global equivalence demonstration would be too high, bearing in mind the relatively small number of products exported by developing countries.<sup>64</sup>

In subsequent paragraphs, the *Equivalence Decision* sets out procedural guidelines for any Member who requests the recognition of equivalence of their SPS measures and for the importing Member who is the addressee of such a request. These requirements reflect the recognition in the preamble of the *Equivalence Decision* that ‘transparency, exchange of information and confidence-building by both the importing and exporting Member are essential to achieving an agreement on equivalence.’ In particular, the Decision states that the importing Member should, on request, supply information regarding the aim and rationale of its SPS measure, clearly identify the risks it addresses and indicate the appropriate level of protection chosen by the Member.<sup>65</sup> The explanation should be accompanied by a copy of the underlying risk assessment for the measure or a technical justification not based on a relevant international standard, guideline or recommendation.<sup>66</sup> The importing Member must respond in a timely manner to the request for recognition of equivalence, normally within six months.<sup>67</sup> The exporting Member must provide science-based and

---

<sup>61</sup> Para. 1 of the *Equivalence Decision*.

<sup>62</sup> Footnote 1 to the *Equivalence Decision*.

<sup>63</sup> As noted below, the *Equivalence Decision*, like several other decisions of the SPS Committee, was adopted on an *ad referendum* basis, meaning that a decision is provisionally adopted pending the expiry of a specified period during which Members may still raise objections to the decision. As concerns were raised with regard to para. 1 of the *Equivalence Decision*, the Chairperson of the SPS Committee undertook discussions to resolve these concerns, culminating in the inclusion of footnote 1 clarifying this paragraph. See further Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 48, footnote 20.

<sup>64</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence: Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Communication from Argentina, G/SPS/GEN/268*, circulated on 15 August 2001, Annex, para. 4 (c) and (d).

<sup>65</sup> Para. 2 of the *Equivalence Decision*. Further, this paragraph states that the importing Member should provide any additional information which may assist the exporting Member to provide an objective demonstration of the equivalence of its own measure.

<sup>66</sup> *Ibid.*

<sup>67</sup> Para. 3 of the *Equivalence Decision*.

technical information to show that its measure achieves the appropriate level of protection identified by the importing Member and provide reasonable access for testing and inspection.<sup>68</sup> The importing Member should evaluate the scientific and technical information with a view to determining if the SPS measure of the exporting Member achieves the level of protection provided by its own SPS measure.<sup>69</sup> It is clear that there is a variance between these last two provisions. While the exporting Member must demonstrate that its measure achieves the appropriate level of protection *identified* by the importing Member, the latter is asked to evaluate whether the exporting Member's measure achieves the same level of protection as its own *SPS measure*. As established in the case law on Article 5.5, a Member's level of protection is not to be inferred from its SPS measure unless it fails to adequately identify its level of protection. To do so would undermine a Member's right to determine for itself the level of protection it deems appropriate and would assume that SPS measures applied necessarily succeed in achieving the level they aim at.<sup>70</sup> As stated above, Article 4.1 of the *SPS Agreement* expressly makes the obligation to recognise equivalence dependent on the objective demonstration that the exporting Member's measures achieve the *appropriate level of protection* of the importing Member. As the *Equivalence Decision* cannot amend the provisions of the *SPS Agreement*,<sup>71</sup> this provision of the Decision must be read as requiring the importing Member to evaluate the information provided with a view to establishing whether the exporting Member's measure achieves its appropriate level of protection.

In view of the technical constraints that developing-country Members face in using Article 4, the *Equivalence Decision* provides that Members shall give full consideration to requests for technical assistance for the implementation of Article 4, in accordance with Article 9 of the *SPS Agreement*.<sup>72</sup> This technical assistance may be in the form of help in identifying and implementing equivalent measures, otherwise enhancing market access opportunities or the development and provision of science-based information to support the recognition of equivalence request.

To address Members' concerns that requests for the recognition of equivalence may have adverse effects on trade, the *Equivalence Decision* provides that the consideration of equivalence shall not be a reason to disrupt or suspend on-going imports of the

---

<sup>68</sup> Para. 4 of the *Equivalence Decision*. This paragraph provides that such information may include, *inter alia*, relevant risk assessments or relevant international standards.

<sup>69</sup> Para. 7 of the *Equivalence Decision*.

<sup>70</sup> The Appellate Body in *Australia – Salmon* has noted that this is not the case. See above, Part III, Section 5.2.4.3. Scott argues, however, that reading Article 4.1 in accordance with existing case law would be problematic in that it results in denial of recognition of equivalence of measures that achieve the same, or a higher, level of protection than the SPS measures actually in place in the importing Member, but do not achieve the appropriate level of protection identified by a Member. While this is undoubtedly the case, another reading of Article 4 seems excluded by the fact that it specifically requires that the measure achieve the appropriate level of protection of the importing Member, which is defined as the level *deemed* appropriate by a Member in establishing its SPS measure. If Article 4 was intended to provide for a comparison of the level of protection *achieved* by the measure of the importing country and that achieved by the measure of the exporting country, it could have easily been phrased to reflect this objective. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 166-167.

<sup>71</sup> On the competence of the SPS Committee and the legal status of its decisions, see below, Part IV, Section 2.1.1.

<sup>72</sup> Para. 8 of the *Equivalence Decision*.

relevant product from the exporting Member.<sup>73</sup> In addition, the procedure for determining equivalence should be accelerated for products historically imported from the exporting Member.<sup>74</sup>

In view of the potential usefulness of international guidelines on the recognition of equivalence, the Decision provides that Members should actively participate in the work of the international standard-setting bodies on equivalence and should consider facilitating the participation of developing-country Members in these bodies.<sup>75</sup> These bodies are further formally encouraged by the SPS Committee to elaborate guidelines on the recognition of equivalence or complete ongoing work in this respect.<sup>76</sup>

In order to promote transparency in this area, the *Equivalence Decision* states that the SPS Committee shall revise its *Recommended Transparency Procedures* to provide for the notification of equivalence agreements, and to reinforce the obligation in Annex B.3(d) of the *SPS Agreement* for Enquiry Points to provide information on bilateral or multi-lateral equivalence agreements.<sup>77</sup> The SPS Committee adopted the revised notification format and procedures in 2002.<sup>78</sup> These cover not only the recognition of equivalence of specific measures related to a certain product or product category, but also on a systems-wide basis.<sup>79</sup> Significant changes to existing equivalence arrangements, including their suspension or rescission should also be notified.<sup>80</sup> Members are further encouraged to notify bilateral equivalence agreements to the SPS Committee and to regularly provide it with information on their experiences with the implementation of Article 4 of the *SPS Agreement*, under a standing agenda item in SPS Committee meetings.<sup>81</sup>

The *Equivalence Decision* mandates the creation of a specific work programme to further the implementation of Article 4, with particular consideration of the problems of developing-country Members, and provides that the SPS Committee shall review the Decision in the light of Members' experiences and the work of the CAC, OIE and IPPC.<sup>82</sup> The results of the additional work programme on the *Equivalence Decision*, now incorporated into its provisions, clarify paragraph 5 (regarding accelerated steps for determining equivalence for products historically imported from the exporting Member); paragraph 6 (with respect to the relationship between current imports and potential compliance problems) and para-

<sup>76</sup> Para. 10 of the *Equivalence Decision*.

<sup>77</sup> Para. 11 of the *Equivalence Decision*.

<sup>78</sup> Committee on Sanitary and Phytosanitary Measures, *Notification of Determination of the Recognition of Equivalence of Sanitary and Phytosanitary Measures. Decision by the Committee. Addendum, G/SPS/7/Rev.2/Add.1*, circulated on 25 July 2002.

<sup>79</sup> *Ibid.*, 3.

<sup>80</sup> *Ibid.* The proposed format stated that notification should be made not only of formal equivalence agreements but also less formal arrangements, provided that the recognition of equivalence 'may have a significant effect on trade' of the exporting Member or other Members. Committee on Sanitary and Phytosanitary Measures, *Proposed Format for the Notification of Agreements of Equivalence. Note by the Secretariat, G/SPS/W/114*, circulated on 19 February 2002, paras 3-4. However this language was not taken up in the final version of the notification procedures and format.

<sup>81</sup> Para. 12 of the *Equivalence Decision*.

<sup>82</sup> Para. 13 of the *Equivalence Decision*.

graph 7 (regarding the examination of scientific and technical information to determine equivalence of SPS measures) of the Decision.

Despite the inclusion of equivalence agreements in the revised *Recommended Transparency Procedures*, there have been only two notifications of the recognition of equivalence to date, both involving a developing-country Member's recognition of an aspect of the SPS system of a developed-country Member. The first-ever notification of the recognition of equivalence was made by Panama in 2007. Panama notified that it recognises all of the US's SPS systems and related regulatory systems for meat, poultry and processed food for human or animal consumption.<sup>83</sup> Subsequently, the Dominican Republic notified its recognition of the inspection system of the US Food Safety Inspection Service with respect to imports of beef, pork and poultry products as equivalent to the Dominican inspection system.<sup>84</sup> It remains to be seen if developed-country Members will similarly notify their recognition of the equivalence of developing-country Members' SPS systems or measures.

In their responses to the questionnaire circulated by the WTO Secretariat in preparation for the Workshop on Transparency held in 2007, Members indicated quite diverse reasons for the poor use of the procedure for notification of equivalence, namely that Members are unable to reach agreement on equivalence; that Members are using mechanisms other than equivalence to gain market access; and that the *Equivalence Decision's* procedures are being used but not being notified.<sup>85</sup> The reluctance of importing Members to notify equivalence determinations has been ascribed by Joanne Scott to the possibility that transparency in this area would encourage more Members to request notifying importing Members to recognise the equivalence of their SPS measures, creating the associated heavy resource demands. In addition, she notes that exporting Members who have been successful in obtaining recognition of the equivalence of their SPS measures from importing Members may be reluctant to share the trade advantage this signifies by notifying this to other Members.<sup>86</sup>

### 1.1.7 International guidelines on equivalence

Since the *SPS Agreement* itself does not lay down specific substantive criteria for the recognition of equivalence, and the *Equivalence Decision* is limited to procedural rules, international guidelines in this regard are useful.<sup>87</sup> International guidelines also reduce the

<sup>83</sup> Committee on Sanitary and Phytosanitary Measures, *Notification of Determination of the Recognition of Equivalence of Sanitary and Phytosanitary Measures*, G/SPS/N/EQV/PAN/1, circulated on 9 August 2007.

<sup>84</sup> Committee on Sanitary and Phytosanitary Measures, *Notification of Determination of the Recognition of Equivalence of Sanitary and Phytosanitary Measures*, G/SPS/N/EQV/DOM/1, circulated on 19 June 2008.

<sup>85</sup> Committee on Sanitary and Phytosanitary Measures, *Analysis of Replies to the Questionnaire on the Operation of Enquiry Points and National Notification Authorities. Note by the Secretariat. Revision*, G/SPS/GEN/751/Rev.1, circulated on 18 June 2007, para. 29.

<sup>86</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 176.

<sup>87</sup> In discussions on equivalence in the SPS Committee, Members noted with regard to the concern about the time and resources needed to conclude equivalence agreements, that international guidelines for systemic application of the principle would be useful. The progress made by the CAC in this regard was noted. Committee on Sanitary and Phytosanitary Measures, *Equivalence: Consideration of Article 4 of the SPS Agreement: Summary of Informal Discussions on Equivalence. Second Report by the Chairman*, G/L/445, circulated on

costs of equivalence negotiations by providing a framework against which equivalence can be judged.<sup>88</sup> In fact, the *Equivalence Decision* itself draws upon work in the international standard-setting bodies on the issue of equivalence.<sup>89</sup>

In order to lend impetus to the development of international guidelines for the recognition of equivalence, as stated above, the *Equivalence Decision* mandates the SPS Committee to formally encourage the CAC to complete its work with regard to equivalence as expeditiously as possible, and to formally encourage the OIE and IPPC to elaborate guidelines on equivalence as appropriate.<sup>90</sup> All three standard-setting bodies have now done so.

In order to facilitate the recognition of equivalence among trading partners,<sup>91</sup> the CAC has established international guidelines on the development of equivalence agreements<sup>92</sup> and on the design, operation, assessment and accreditation of food import and export inspection and certification systems<sup>93</sup> as well as guidelines for the judgement of equivalence of sanitary measures associated with food inspection and certification systems.<sup>94</sup>

The OIE's *Terrestrial Animal Health Code* recognises the possibility that different sanitary measures can achieve the same level of protection, by recommending alternative measures to address several diseases or pathogenic agents addressed in its provisions.<sup>95</sup>

---

21 March 2001, para. 7.

<sup>88</sup> It has been noted that in the absence of guidelines on the methodology for judging equivalence, specific bilateral issues are more likely to arise and the methodological concerns of developing countries are more likely to be neglected. See Simonetta Zarrilli, *The SPS Agreement and the Developing Countries* (World Bank, Washington D.C.), 2003, 8.

<sup>89</sup> Scott notes that the acknowledgement of the relevance of historic trade in equivalence determinations and the recognition of the need to prevent equivalence applications from being used as an excuse to disrupt existing trade are both informed by the Codex Guidelines on food import and export inspection and certification (CAC/GL 17, CAC/GL 20 and CAC/GL 26).

<sup>90</sup> Committee on Sanitary and Phytosanitary Measures, *Decision on the Implementation of Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures - Revision*, G/SPS/19/Rev.2, circulated on 23 July 2004, para. 10.

<sup>91</sup> One of the recommendations resulting from an FAO conference in 1999, under the heading 'Food trade and implementation of WTO Agreements,' was the recognition of the urgency of the development of Codex guidelines on the judgement of equivalence, initially in a generic sense and subsequently in relation to specific topics such as equivalence of inspection and certification systems and food hygiene measures. Food and Agriculture Organization, 'Report of the Conference on International Food Trade Beyond 2000: Science-Based Decisions, Harmonization, Equivalence and Mutual Recognition', presented at the *Conference on International Food Trade Beyond 2000: Science-Based Decisions, Harmonization, Equivalence and Mutual Recognition*, Melbourne Australia) 11-15 October 1999, Appendix II A.2, available at: [www.fao.org/docrep/meeting/X4015e.htm](http://www.fao.org/docrep/meeting/X4015e.htm), visited on 25 June 2007.

<sup>92</sup> Codex Alimentarius Commission, *Guidelines for the Development of Equivalence Agreements Regarding Food Import and Export Inspection and Certification Systems*, CAC/GL34-1999 (Joint FAO/WHO Food Standards Programme, Rome), 1999.

<sup>93</sup> Codex Alimentarius Commission, *Guidelines for the Design, Operation, Assessment and Accreditation of Food Import and Export Inspection and Certification Systems*, CAC/GL 26-1997 (Joint FAO/WHO Food Standards Programme, Rome), 1997.

<sup>94</sup> These guidelines were referred to the 24<sup>th</sup> Session of the CAC on 2-7 July 2001 for adoption at step 5 or 8 (ALINORM 01/30A para. 98 and Appendix III). Due to the fact that several countries raised concerns regarding these guidelines, the CAC decided to adopt them at step 5 only so that they could be considered further by the Codex Committee on Food Import and Export Inspection and Certification Systems. These guidelines were finally adopted at the 26<sup>th</sup> Session of the CAC in 2003. Codex Alimentarius Commission, *Report of the Twenty-Sixth Session*, ALINORM 03/41 (Joint FAO/WHO Food Standards Programme, Rome), 30 June - 7 July 2003, Appendix I.

<sup>95</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence - Article 4. Update from the World*

In response to the SPS Committee's call to develop specific guidelines on the recognition of equivalence, the OIE in 2002 submitted draft guidelines on procedures for the recognition of equivalence of animal health measures to the SPS Committee.<sup>96</sup> In 2005, the OIE notified the SPS Committee that it had adopted guidelines for reaching a judgement of equivalence of sanitary measures.<sup>97</sup> These guidelines provide substantive criteria and procedural steps to help OIE members to establish whether measures forming part of different animal health and production systems provide the same level of sanitary protection. These guidelines apply whether equivalence is being determined at a measure-specific or systems-wide level, and whether it is established for a particular product or for trade in general.<sup>98</sup>

The IPPC also generally recognises the principle of equivalence, as reflected in several ISPMs.<sup>99</sup> In response to the SPS Committee's request that it develop guidelines for the recognition of equivalence, the IPPC notified the SPS Committee in 2002 of the view of the ICPM that a prerequisite for the development of guidelines on equivalence was the establishment of guidance on the concept of efficacy of phytosanitary measures.<sup>100</sup> In 2003, the IPPC reported that an EWG was established to address this issue, including the factors to be taken into account when determining equivalence of measures.<sup>101</sup> The ICPM work program in 2003 identified both efficacy of phytosanitary measures and equivalence as priorities for ISPMs. The EWG on efficacy of measures produced a draft ISPM which was submitted to the Standards Committee.<sup>102</sup> The Standards Committee returned the draft to the EWG due to additional issues that had to be addressed in its view.<sup>103</sup> The revised draft ISPM was resubmitted to the Standards Committee in May 2004, but work on this ISPM is currently still pending, until completion of work on the draft ISPMs on sampling of consignments and the appropriate level of protection.<sup>104</sup> In September 2003,

an EWG was convened to develop an ISPM on equivalence. The report of the EWG was presented to the Standards Committee for review in May 2004.<sup>105</sup> In 2005, the CPM adopted the guidelines for the determination and recognition of equivalence of phytosanitary measures.<sup>106</sup>

## 1.2 Regionalisation

SPS conditions, and in particular the incidence of pests and diseases, are not determined by national borders, and may differ between various regions within a country. This may be the case due to variations in climatic, environmental or geographic conditions within a country and/or due to the efforts of the regulatory authorities to eradicate a pest or disease from specific areas. If importing Members were to adapt their SPS measures to the pest or disease conditions prevailing in the region of origin of the product, this could greatly improve market access possibilities. Such adaptation of SPS measures to regional conditions in the exporting Member is especially significant for large developing countries, where conditions vary greatly from region to region, as the costs of eradicating a pest or disease or keeping pest- or disease-free status can be limited by focusing on specific areas.

In practice, however, it is common to ban products from an entire country where it has been established that a pest or disease of significance for the importing country occurs, even if its prevalence is limited to certain regions.<sup>107</sup> In addition, sometimes importing Members do not adapt their measures to the pest- or disease status of an exporting Member and impose SPS restrictions against exporting Members that are in fact free of the pest or disease at issue. An example of this is the failure of the EC to recognise the status of South Africa as free of foot and mouth disease, despite the fact that this status was officially recognised by the OIE.<sup>108</sup>

SPS characteristics in *importing* Members are also of importance to take into account in establishing SPS measures. Some importing Members are already infested by the pest or disease their import restriction aims to keep out. However, it frequently occurs that the pest or disease status of the importing Member is not taken into account in applying

---

<sup>105</sup> Committee on Sanitary and Phytosanitary Measures, *Equivalence. Statement by the International Plant Protection Convention (IPPC) at the Meeting of 28 - 30 October 2003*, G/SPS/GEN/439, circulated on 27 October 2003, para. 5.

<sup>106</sup> *Guidelines for the Determination and Recognition of Equivalence of Phytosanitary Measures*, ISPM 24 (2005) Committee on Sanitary and Phytosanitary Measures, *International Plant Protection Convention (IPPC) Standard Setting Work Programme (up-to-Date June 2008)*, G/SPS/GEN/848, circulated on 18 June 2008, para. 1.

<sup>107</sup> For example, in 1995 Ecuador banned the importation of fruit hosts of the oriental fruit fly from the US after a few oriental fruit flies had been detected in Southern California. This example was noted in David S. Johanson and William L. Bryant, 'Eliminating Phytosanitary Trade Barriers: The Effects of the Uruguay Round Agreements on California Agricultural Exports', *San Joaquin Agricultural Law Review* 6, 1996, 1-26, 7.

<sup>108</sup> Committee on Sanitary and Phytosanitary Measures, *The Failure of the European Communities to Amend EC Directive 2001/661/EC Allowing the Import of Bone in Meat from Ovine/Caprine Species from Countries Zoned Free from Foot and Mouth Disease without Vaccination. Communication from South Africa*, G/SPS/GEN/373, circulated on 26 February 2003.

import restrictions. For example, the US maintains import restrictions on goat imports due to the risk of scrapie, while the presence of scrapie in US sheep is currently widespread.<sup>109</sup> In addition, the climactic and geographical conditions in the importing Member may reduce the threat of introduction of a particular pest or disease, rendering their SPS measure superfluous. A good example of the reduction in trade barriers that results from the recognition of this type of SPS condition in the importing Member is provided by the situation of the US ban on hass avocado imports from Mexico due to concerns of potential importation of pests (fruit flies, weevils and seed moth), which for several years formed the subject of one of the most contentious SPS disputes between these two Members.<sup>110</sup> Mexico argued that its main avocado-producing region has low prevalence of pests of quarantine significance, and that its systems approach to risk management in this area eliminates the threat of transmission of pests in any event. The US avocado industry strongly contests this. After four years of negotiations on this point, the US Department of Agriculture partially eased its ban by allowing hass avocado imports from Mexico into its north-eastern states in the winter months, when the risk of establishment of pests is mitigated by the winter weather.

In order to promote the adaptation of SPS measures to national or regional SPS conditions (commonly termed ‘regionalisation’) Article 6 of the *SPS Agreement* lays down substantive obligations coupled with procedural requirements. Article 6.1 requires, in general terms, that Members ensure that their sanitary or phytosanitary measures are adapted to the sanitary or phytosanitary characteristics of the area from which the product originated and to which the product is destined, taking into account specific factors. Article 6.2 is more specific, requiring the recognition of pest- or disease-free areas and areas of low pest or disease prevalence. Finally, Article 6.3 outlines some procedural requirements to give effect to the obligation of adaptation to regional conditions. These are discussed in more detail below.

### 1.2.1 Adaptation to regional conditions

The basic obligation of regionalisation is set out in Article 6.1 of the *SPS Agreement*. It provides:

Members shall ensure that their sanitary or phytosanitary measures are adapted to the sanitary or phytosanitary characteristics of the area - whether all of a country, part of a country, or all or parts of several countries - from which the product originated and to which the product is destined. In assessing the sanitary or phytosanitary characteristics of a region, Members shall take into account, *inter alia*, the level of prevalence of specific diseases or pests, the existence of

---

<sup>109</sup> European Commission, *Report on United States Barriers to Trade and Investment* (European Commission, Brussels), December 2003, 33, available at: [http://trade-info.cec.eu.int/doclib/docs/2003/december/tradoc\\_115383.pdf](http://trade-info.cec.eu.int/doclib/docs/2003/december/tradoc_115383.pdf), visited on 3 January 2004.

<sup>110</sup> This dispute is discussed in David Orden *et al.*, ‘Least Trade-Restrictive SPS Policies: An Analytic Framework Is There but Questions Remain’, in *The Economics of Quarantine and the SPS Agreement*, Kym Anderson, *et al.* (eds.) (Centre for International Economic Studies, Adelaide), 2001, 183-215, 188; Council of the Organisation for Economic Co-Operation and Development, *A Synthesis of Empirical Studies of SPS Regulations and a Proposal for Future Work*, COM/AGR/TD/WP/(2002)72, OECD, 27 August 2002.

eradication or control programmes, and appropriate criteria or guidelines which may be developed by the relevant international organizations.

Some guidance is provided in Article 6.1 as to the criteria to be taken into account in adaptation to regional conditions, unlike the situation in Article 4 with respect to the recognition of equivalence. In determining what the sanitary or phytosanitary characteristics of a region are, Article 6.1 obliges Members to take into account the level of prevalence of specific pests or diseases, the existence of eradication or control programmes and guidelines developed by international organisations. This is not a closed list of factors, as indicated by the term '*inter alia*'. Thus Members may consider additional relevant factors in decisions on regionalisation.

The reference to the guidelines developed by international organisations would seem to require consideration of OIE or IPPC guidelines on pest- or disease- prevalence and in particular on the recognition of pest- or disease-free areas. In this light, it can be argued that the official recognition of the pest-free status of a Member by the OIE and the publication of this in the official Bulletin of the OIE should be taken into account as an important part of the necessary evidence for an objective demonstration of disease-free status. Similarly, the self-declaration of a Member of its pest- or disease free status in accordance with the specific OIE guidelines for the disease at issue should be among the factors considered when adapting an SPS measure to regional conditions. However, this is not the same as requiring Members to automatically accept the pest- or disease-free status of a Member that has established such status according to the relevant international guidelines. Other factors, such as the reliability of the competent authorities of the exporting Member and the veterinary or phytosanitary structures in place to maintain the status, including monitoring and verification also play a role.<sup>111</sup>

### **1.2.2 Recognition of pest- or disease-free areas or areas of low pest or disease prevalence**

The regionalisation obligation of Article 6 is made more concrete in paragraph 2 thereof. This paragraph deals with the most controversial aspect of adaptation to regional conditions, namely the recognition of areas that are free of pests of diseases and areas where the prevalence of pests or diseases is low. Article 6.2 states:

Members shall, in particular, recognize the concepts of pest- or disease-free areas and areas of low pest or disease prevalence. Determination of such areas shall be based on factors such as geography, ecosystems, epidemiological surveillance, and the effectiveness of sanitary or phytosanitary controls.

Once again, an open list of factors that Members must consider is provided. Further, Annex A.6 of the *SPS Agreement* defines a pest- or disease-free area as an area, which can be all or part of a country or of several countries, as identified by the competent authorities, in which a pest or disease does not occur. This area may adjoin an area where the

---

<sup>111</sup> Committee on Sanitary and Phytosanitary Measures, *Comments on the Background Document on Issues in the Application of Article 6 of the SPS Agreement (G/SPS/GEN/640)*. Communication from the European Communities, G/SPS/W/190, circulated on 30 May 2006, para. 6.

pest or disease does occur, but is subject to regional control measures such as protection, surveillance or buffer zones that confine or eradicate the pest or disease. An area of low pest- or disease prevalence is defined as an area, which can be all or part of a country or of several countries, as identified by the competent authorities, in which a pest or disease occurs at low levels and is subject to effective surveillance, control or eradication measures.

### 1.2.3 Procedure

To give effect to the regionalisation obligations in Article 6.1 and 6.2, some procedural requirements are outlined in Article 6.3. It provides:

Exporting Members claiming that areas within their territories are pest- or disease-free areas or areas of low pest or disease prevalence shall provide the necessary evidence thereof in order to objectively demonstrate to the importing Member that such areas are, and are likely to remain, pest- or disease-free areas or areas of low pest or disease prevalence, respectively. For this purpose, reasonable access shall be given, upon request, to the importing Member for inspection, testing and other relevant procedures.

Clearly, the limited procedural requirements of Article 6.3 are very similar to those provided in Article 4.1 on the recognition of equivalence. In terms of Article 6.3, an exporting Member that claims that regions within its territory are pest- or disease-free or have low pest or disease prevalence must provide the necessary evidence to ‘objectively demonstrate’ this fact to the importing Member. For this purpose, it must give the importing Member reasonable access for inspection, testing and other relevant procedures. The criteria set out in Article 6.1 and 6.2 give some content to what must be considered in a regionalisation decision in general, and more specifically in a decision regarding the recognition of pest- or disease-free areas or areas of low pest- or disease prevalence, and therefore by implication to what information a Member should bring to ‘objectively demonstrate’ this status. However, no further procedural disciplines are set out in Article 6, leaving it open to Members to maintain complex and lengthy procedures in this regard.<sup>112</sup>

### 1.2.4 Examples

The case of an avian influenza outbreak in Chile offers a good example of regionalisation.<sup>113</sup> In May 2002, Chile was confronted with the first-ever outbreak of avian influenza

---

<sup>112</sup> As with procedures for the recognition of equivalence, also with procedures to adapt to regional conditions Scott argues that the procedural disciplines of Article 8 and Annex C of the *SPS Agreement*, which deal with control, inspection and approval procedures, apply. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 185, footnote 198. However, as stated above, Annex C.1 specifies that its requirements apply ‘with respect to any procedure to check and ensure the fulfilment of sanitary and phytosanitary requirements’. The adaptation of SPS measures to regional conditions, instead, is based on a procedure to ascertain the SPS characteristics of the relevant area, including the prevalence of pests and diseases, in order to change the SPS measure applied to products from that area accordingly. This seems to lie outside the scope of Annex C.

<sup>113</sup> See C. Orozco, ‘The *SPS Agreement* and Crisis Management: The Chile-EU Avian Influenza Experience’, in: P. Gallagher, P. Low and A.L. Stoler, *Managing the Challenges of WTO Participation*, (Cambridge University Press, 2005), pp. 150-168.

on its territory. In response to this, the European Commission adopted an import ban on 23 July 2002. Three months later, when the Chilean government had the disease under control, it requested the Commission to consider the 'regionalisation of the Chilean territory' for the purposes of imports in accordance with Article 6 of the *SPS Agreement*. After the Chilean authorities presented sufficient evidence, the Commission adopted a decision on 14 October 2002 allowing for the temporary regionalization of Chile for the purposes of imports and allowed for importation of areas which were designated disease-free.

Another example is that of Ecuador's phytosanitary restrictions to prevent the introduction of oriental fruit flies.<sup>114</sup> In November 1995, following the detection of a limited number of these flies outside growing areas in Southern California, Ecuador imposed an import ban on all potential hosts, mainly fruit, from the US. The US promptly initiated informal bilateral consultations with Ecuador on the basis of Article 6 of the *SPS Agreement*. Ecuador agreed to revise its measure and allow importation of non-Californian fruit.<sup>115</sup>

A third example of regionalisation is that discussed in Part II above,<sup>116</sup> in respect of Indonesia's fumigation and cold-treatment requirements to prevent the introduction of fruit flies through imports of fresh fruit and vegetables. To address the problem caused by these measures to its fruit industry, Australia promptly and successfully conducted high-level technical discussions with the Indonesian authorities, leading to the recognition by Indonesia of three regions and one State in Australia as fruit-fly free regions.<sup>117</sup>

The use of international guidelines in regionalisation decisions is illustrated by the lifting by Mauritius of its bans on chilled, processed pork products from France and live cattle, sheep and goats from certain regions in South Africa. In April 2001, Mauritius had imposed a ban on all meat products from the EC, except poultry and canned pork, due to the outbreak of foot-and-mouth disease.<sup>118</sup> In the same month it imposed a temporary suspension on imports of live cattle, sheep and goats from Zimbabwe and South Africa, due to the prevalence of foot-and-mouth disease in these countries.<sup>119</sup> However, in November of that year, Mauritius notified that, following the September 2001 report of the OIE on the foot-and-mouth disease situation in different countries, it would lift its ban on chilled,

---

<sup>114</sup> A similar example exists with regard to China's restrictions to prevent the introduction of Mediterranean fruit fly. Due to detections of this pest in the Los Angeles area, China imposed an import restriction on all citrus, apples, table grapes and cherries from the US. The US raised this issue in 1994, the context of China's negotiations towards accession to the WTO and the requirement that it bring its SPS measures into conformity with WTO rules. In March 1995, China agreed to evaluate the risk of introduction of Mediterranean fruit fly on a commodity basis, and to allow regions outside the fruit fly quarantine area in California to export to China. David S. Johanson and William L. Bryant, 'Eliminating Phytosanitary Trade Barriers: The Effects of the Uruguay Round Agreements on California Agricultural Exports', *San Joaquin Agricultural Law Review* 6, 1996, 1-26, 7.

<sup>115</sup> *Ibid.* In addition fresh fruit from California was permitted if fumigated with methyl bromide before leaving customs.

<sup>116</sup> See above, Part II, Section 2.4.2.4.

<sup>117</sup> Australian Government Department of Agriculture Fisheries and Forestry, *Annual Report 2006-07: Growing Australia through Sustainable, Innovative and Profitable Agriculture, Fisheries and Forestry* (Commonwealth of Australia, Canberra), September 2007, 109, available at: [http://www.daff.gov.au/\\_data/assets/pdf\\_file/0005/439493/2\\_AR\\_06-07\\_ROP\\_WEB.pdf](http://www.daff.gov.au/_data/assets/pdf_file/0005/439493/2_AR_06-07_ROP_WEB.pdf), visited on 17 January 2008.

<sup>118</sup> Committee on Sanitary and Phytosanitary Measures, *Notification of Emergency Measures*, G/SPS/N/MUS/4, circulated on 10 April 2001.

<sup>119</sup> Committee on Sanitary and Phytosanitary Measures, *Notification of Emergency Measures*, G/SPS/N/MUS/5, circulated on 23 April 2001.

processed pork products from France, and on live cattle from foot-and-mouth disease free zones in South Africa.<sup>120</sup> In April 2002, based on the same OIE report, Mauritius extended the lifting of its ban to all pork and pork products from the EC, except the UK, and to all live cattle, sheep and goats from foot-and-mouth disease free zones in South Africa.<sup>121</sup>

An example of the successful use of regionalisation between two developing-country Members, at different levels of development, was reported by Trinidad and Tobago in 2006.<sup>122</sup> In this example, Trinidad and Tobago conducted a pest risk analysis to determine the risks associated with importation of fresh fruit from Argentina, and established that the main risk related to the Mediterranean fruit fly in respect of which the most effective quarantine treatment was cold treatment. The literature also indicated that there were fruit-fly free production areas in Argentina. However, Trinidad and Tobago had no expertise in the application of cold treatment and had insufficient data to establish the pest-free status of fruit production areas in Argentina. It therefore requested technical assistance from Argentina to help it to determine first hand the pest-free status of the relevant regions; to evaluate the data on the pest-free status of these regions; to evaluate the pest-free status of the harvested fruits; and to use cold treatment as a quarantine measure. Argentina responded by sponsoring the visit of an Argentine scientist to Trinidad and Tobago, and the visit of two Crop Protection Officers from Trinidad and Tobago to Argentina. The latter officials visited production sites in the Patagonia area of Argentina where natural barriers prevent the entry of fruit flies. They observed in practice several phytosanitary measures applied by Argentina against the spread of fruit flies.<sup>123</sup> They also examined fruit fly trapping records for the Patagonia valley. In addition they were given a demonstration of cold treatment. On the basis of this visit, the officials verified that the strict phytosanitary system in place in Argentina was effective in ensuring the fruit-fly free status of the Patagonia region.<sup>124</sup> A recommendation was therefore issued to the Plant Protection Committee of Trinidad and Tobago to allow the importation of apples, grapes and pears from the Patagonia region of Argentina when accompanied by a phytosanitary certificate indicating the region of origin and adherence to Trinidad and Tobago's phytosanitary requirements. This fruit will not be subject to cold treatment, due to its pest-free status. However, Argentina must bear the costs of an annual audit visit by crop protection personnel of Trinidad and Tobago.

---

<sup>120</sup> Committee on Sanitary and Phytosanitary Measures, *Notification*, G/SPS/N/MUS/7, circulated on 8 November 2001. The same lifting of the ban was notified again in 2002. Committee on Sanitary and Phytosanitary Measures, *Notification*, G/SPS/N/MUS/8, circulated on 8 April 2002.

<sup>121</sup> Committee on Sanitary and Phytosanitary Measures, *Notification*, G/SPS/N/MUS/9, circulated on 8 April 2002.

<sup>122</sup> Committee on Sanitary and Phytosanitary Measures, *Some Experiences of Trinidad and Tobago in the Application of the SPS Agreement. Communication from Trinidad and Tobago*, G/SPS/GEN/680, circulated on 31 March 2006.

<sup>123</sup> For example, they participated in fruit cutting in the field, observed fruit-fly trapping in rural and urban areas, observed the breeding and release of sterile male fruit flies, visited quarantine checkpoints and observed physical checks, visited a freight inspection facility and observed export fruit inspection and sampling for fruit flies, visited a packing house to observe the preparation, storage and packing of export fruits.

<sup>124</sup> Committee on Sanitary and Phytosanitary Measures, *Some Experiences of Trinidad and Tobago in the Application of the SPS Agreement. Communication from Trinidad and Tobago*, G/SPS/GEN/680, circulated on 31 March 2006, para. 6.

### 1.2.5 Problems with implementation

Despite the potential of regionalisation to limit the trade restrictive effect of SPS measures by facilitating the lifting of unnecessary SPS requirements with respect to pest- or disease free regions, as illustrated by the successful examples above, or by adjusting strict requirements to take account of low pest- or disease prevalence, to date implementation of Article 6 of the *SPS Agreement* has been very limited. This has been attributed not to a problem with the substantive obligations in Article 6 but rather to the weakness of its procedural rules. Therefore Members have proposed strengthening the operation of this provision through developing administrative procedures for its implementation.<sup>125</sup> In addition, Members have addressed the need to further specify the criteria to be taken into account in regionalisation decisions, and in particular the role to be played by international recognition of pest- or disease-free status, and the importance of trust in the competent authority of the exporting Member.<sup>126</sup>

There are many examples of situations where the failure to adapt SPS requirements to the particular pest or disease status of the area of origin of the product (whether a country, part of a country or parts of several countries) has caused unnecessary trade restrictions. They are often raised as specific trade concerns in SPS Committee meetings.<sup>127</sup>

One such example is that raised by South Africa before the SPS Committee in 2003.<sup>128</sup> It concerned the EC's restrictions on meat imports due to the risk of introduction of foot-and-mouth disease (FMD). South Africa and Namibia are officially recognised as zones free of FMD by the OIE. While the EC Directive at issue allowed fresh meat imports from South Africa, except from within the FMD control zone,<sup>129</sup> it imposed additional sanitary requirements for ovine and caprine meat from zones recognised as FMD free without vaccination. These requirements were that the meat be deboned, mature, with the lymph nodes removed and that importation take place only three weeks after slaughter. South Africa argued that these additional requirements were contrary to the OIE *Terrestrial Animal Health Code*, which does not require deboning if the meat originates from FMD-free countries or zones where vaccination is not practiced.<sup>130</sup> The EC agreed to review its measure in light of the FMD situation in South Africa after its new Directive came into force in January 2005.<sup>131</sup> However, no solution to this problem has been reported to date.

---

<sup>125</sup> For a summary of the procedural steps proposed by various Members in this regard, see Committee on Sanitary and Phytosanitary Measures, *Issues on the Application of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Background Document. Note by the Secretariat. Revision*, G/SPS/GEN/640/Rev.1, circulated on 14 September 2006, paras 27-47.

<sup>126</sup> *Ibid.*, para. 8.

<sup>127</sup> *Ibid.*, para. 4. Further, the SPS Committee has reported that also outside the context of its specific trade concerns mechanism, in general Committee discussions, Members have specifically highlighted difficulties in obtaining prompt recognition of their pest- or disease-free status by importing Members.

<sup>128</sup> Committee on Sanitary and Phytosanitary Measures, *The Failure of the European Communities to Amend EC Directive 2001/661/EC Allowing the Import of Bone in Meat from Ovine/Caprine Species from Countries Zoned Free from Foot and Mouth Disease without Vaccination. Communication from South Africa*, G/SPS/GEN/373, circulated on 26 February 2003.

<sup>129</sup> Council Directive 2001/661.

<sup>131</sup> Council Directive 99/2002, which updated EC legislation to reflect the fact that certain virus strains (SAT and

During discussions at the SPS Committee with regard to the inadequate implementation of Article 6 of the *SPS Agreement*,<sup>132</sup> Members have identified various problems.<sup>133</sup> In particular, national administrative procedures applied by importing Members in respect of regionalisation have been criticised as being often untransparent, complex, lengthy and expensive, and lacking clearly defined time-limits for a response to a request.<sup>134</sup> This is illustrated by the example provided in Part II above regarding Jamaica's still-pending request for the recognition by the US of the existence of areas free of weevils, in order to lift fumigation requirements for yam exports from these regions.<sup>135</sup> In addition, the lack of consistency in the various administrative procedures applied by different importing Members for the acceptance of regionalisation has been identified as a problem.<sup>136</sup> Further, it has been noted that inconsistencies exist in the application of regionalisation

---

Asiat 1) were no longer considered differently from FMD.

<sup>132</sup> In 2004, New Zealand provided a useful summary of the implementation problems raised by Members. In 2006, the WTO Secretariat circulated a similar summary covering the submissions made until September 2006. These two documents been drawn upon for the discussion in this section. Committee on Sanitary and Phytosanitary Measures, *Monitoring of International Harmonization: Regionalization. Submission by New Zealand*, G/SPS/W/151, circulated on 29 September 2004, paras 5-6; Committee on Sanitary and Phytosanitary Measures, *Issues on the Application of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Background Document. Note by the Secretariat. Revision*, G/SPS/GEN/640/Rev.1, circulated on 14 September 2006.

<sup>133</sup> For examples of specific submissions in this regard, see Committee on Sanitary and Phytosanitary Measures, *Implementation of Regionalization Principle: Communication by Argentina*, G/SPS/GEN/433, circulated on 22 October 2003; Committee on Sanitary and Phytosanitary Measures, *Decision on the Implementation of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures - Proposal by Canada*, G/SPS/W/145, circulated on 16 March 2004; Committee on Sanitary and Phytosanitary Measures, *Comments on Chapter 6 of the SPS Agreement - Regionalization. Communication by Mexico*, G/SPS/GEN/388, circulated on 1 May 2003; Committee on Sanitary and Phytosanitary Measures, *Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Adaptation to Regional Conditions, Including Pest- or Disease-Free Areas of Low Pest or Disease Prevalence. Proposal by Peru*, G/SPS/W/148, circulated on 7 July 2004; Committee on Sanitary and Phytosanitary Measures, *Articles 6(2), 6(3) and Annex A(3)(B): Recognition of the Concept of Pest- or Disease-Free Areas as an International Standard, Guideline or Recommendation: Submission by South Africa*, G/SPS/GEN/139, circulated on 2 November 1999; Committee on Sanitary and Phytosanitary Measures, *Regionalization - Communication by the United States*, G/SPS/GEN/477, circulated on 16 March 2004.

<sup>134</sup> See for example Committee on Sanitary and Phytosanitary Measures, *Peru Initiates a Process for the Declaration and Recognition of Areas Free from and of Low Prevalence of Fruit Flies *Ceratitis capitata* and *Anastrepha* Spp.* Communication from Peru, G/SPS/GEN/417, circulated on 1 August 2003. It has been stated that the time taken to recognise an area free from a certain pest or disease can vary from a few months to several years.

<sup>135</sup> See above, Part II, Section 2.6.2.3.

<sup>136</sup> While some Members have no established guidelines, other Members have procedures with a number of stages.

to different exporting Members. This may be due to factors that ‘can either generate or erode importing Members’ trust<sup>137</sup> in the exporting Member’s regulatory system, which influence an importing Member’s acceptance of pest- or disease-free areas. This has often proved a difficulty for exporting Members at lower levels of development, in cases where their SPS regulatory regimes are underdeveloped and do not inspire confidence in importing Members.

Members have noted that the uncertainties in the national procedures to obtain recognition of pest- or disease-free areas for market access threatens the sustainability of such areas. In view of the significant investments required to establish and maintain pest- or disease-free areas, the maintenance of these areas depends on the commercial gains that producers can achieve from trade resulting from pest- or disease-free status.<sup>138</sup> Therefore, market access is the main objective for investing in the establishment and maintenance of pest- or disease-free areas.

In the discussions on this issue, importing Members have stressed the need for confidence in the SPS status of exporting Members and for the provision of accurate information in their evaluation of requests for recognition of free status.<sup>139</sup> One way to address these challenges that has been suggested is the consideration of the relationship between the work of the SPS Committee and the work of the international standards setting bodies.<sup>140</sup> However, in their early submissions to the SPS Committee, Members pointed to the then non-existence of international guidelines by the OIE or IPPC for national administrative procedures for the recognition of pest- or disease-free areas or areas of low pest or disease prevalence, including the absence of specified time-limits for a response to a request for such recognition. In addition, with regard to the possibilities that could be provided by the official recognition for pest- or disease-free areas or areas of low pest or disease prevalence by the IPPC and by the OIE, it was noted that there is limited provision of official recognition by the OIE and none by the IPPC. The OIE conducts evaluations, upon request, and grants recognition of sanitary status in respect of only four animal diseases.<sup>141</sup> However, Members have expressed concerns that some importing Members

---

<sup>137</sup> Committee on Sanitary and Phytosanitary Measures, *Issues on the Application of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Background Document. Note by the Secretariat. Revision*, G/SPS/GEN/640/Rev.1, circulated on 14 September 2006, para. 7.

<sup>138</sup> Committee on Sanitary and Phytosanitary Measures, *Regionalisation. Communication by Peru*, G/SPS/GEN/607, circulated on 6 December 2005.

<sup>139</sup> Committee on Sanitary and Phytosanitary Measures, *Issues on the Application of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Background Document. Note by the Secretariat. Revision*, G/SPS/GEN/640/Rev.1, circulated on 14 September 2006, paras 4-5. The EC has stated in this regard that: ‘the ultimate decision to recognize remains with the importing Member and very much depends on the trust in the competent authority of the exporting Member. This trust builds on the veterinary/phytosanitary system in place and previous experience with the exporting Member. Consequently, the recognition process varies from one case to another, hence the need for predictability and transparency.’ Committee on Sanitary and Phytosanitary Measures, *Comments on the Background Document on Issues in the Application of Article 6 of the SPS Agreement (G/SPS/GEN/640). Communication from the European Communities*, G/SPS/W/190, circulated on 30 May 2006, para. 6.

<sup>140</sup> In particular, a suggestion was made that the eradication measures applied to establish a pest- or disease free area follow the provisions of the OIE *Terrestrial Animal Health Code* concerning the declaration of a disease free area. While the IPPC does not have pest-specific eradication guidelines, ISPM 9 provides more general *Guidelines for Pest Eradication Programmes*.

<sup>141</sup> As previously mentioned, these are foot-and-mouth disease, rinderpest, BSE and contagious bovine

do not automatically or promptly accept such OIE recognition. Reasons given for this are the fact that the procedures and information required for OIE verification do not fully meet the concerns of some Members; and that the lack of transparency in the international procedure for verification of disease free status makes it difficult to determine if the conditions for recognition of disease-free status applied by the importing Member have been met.<sup>142</sup> The IPPC does not grant recognition of pest- or disease-free areas or areas of low pest or disease prevalence but has developed standards for Members to use to in national determinations of pest-free areas.

### 1.2.6 Regionalisation Decision

The abovementioned problems were raised in the context of the first review of the implementation of the *SPS Agreement*, concluded in 1999. As a result, the report of the SPS Committee on this review noted that while adaptation to regional conditions, including the recognition of pest- or disease-free areas or areas of low pest or disease prevalence, was of great importance for trade in agricultural products, Members faced difficulties in the implementation of Article 6 of the Agreement.<sup>143</sup> In June 2003, discussions between WTO Members in the SPS Committee were initiated regarding the operationalisation of Article 6 of the *SPS Agreement*. Some Members suggested that a work programme, along the lines of that undertaken with regard to equivalence, be set up regarding the regionalisation provision. Informal meetings were held on this matter from 2003 to 2006.<sup>144</sup> In its second review of the implementation of the *SPS Agreement*, concluded in 2005, the SPS Committee agreed to develop a proposal for a decision on the effective application of Article 6, on the basis of the various proposals submitted by Members and the discussions in the Committee.<sup>145</sup>

---

pleuropneumonia. Further, OIE members can also declare themselves free of other diseases by following the requirements set out for this in the OIE Terrestrial Animal Health Code chapter dealing with the specific disease.

<sup>142</sup> Committee on Sanitary and Phytosanitary Measures, *Issues in the Application of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Japanese Comments and Proposals*, circulated on 30 May 2006, G/SPS/W/192, para. 7(a). In this respect, Japan argues that the fact that there is a disclaimer in the official recognition of disease-free status by the OIE indicates a probability of inaccuracy. Further, Japan states that in order to use official recognition as a basis for a decision to speed up the procedure on the recognition of disease-free status it is important that not only the data submitted to the OIE is shared with the importing Member, but also that details of the discussion in the OIE leading to the granting of official recognition are accessible to the importing Member.

<sup>143</sup> Committee on Sanitary and Phytosanitary Measures, *Review of the Operation and Implementation of the Agreement on the Application of Sanitary and Phytosanitary Measures: Report of the Committee*, G/SPS/12, circulated on 11 March 1999, para. 21. Some problems mentioned here were: 'divergences in interpretation and implementation of international guidelines; an excessively lengthy administrative process in importing countries for recognizing pest- or disease-free areas or areas of low pest or disease prevalence; and the complexities often involved in risk assessment.' *Ibid.*

<sup>144</sup> The relevant meeting reports are the following: October 2003 (G/SPS/R/31, paras 90-103); March 2004 (G/SPS/R/33, paras 108-119); June 2004 (G/SPS/R/34, paras 83-97); October 2004 (G/SPS/R/35, paras 120-137); March 2005 (G/SPS/R/36, paras 115-136); June 2005 (G/SPS/R/37, paras 98-114); February 2006 (G/SPS/R/38 and Corr.1 and G/SPS/R/39 and Corr.1, paras 121-146), March 2006 (G/SPS/R/40, paras 72-78 and June 2006 (G/SPS/R/42).

<sup>145</sup> Committee on Sanitary and Phytosanitary Measures, *Review of the Operation and Implementation of the Agreement on the Application of Sanitary and Phytosanitary Measures. Report Adopted by the Committee on 30 June 2005*, G/SPS/36, circulated on 11 July 2005, Attachment, para. 23.

At the SPS Committee meeting of 9-10 March 2005, a draft decision on regionalisation was circulated by the Secretariat, setting out a proposed work programme in this area. This work programme would make regionalisation a standing agenda item for SPS Committee meetings, and would mandate information gathering through questions to Members regarding the implementation of Article 6. In 2006, the WTO Secretariat drafted a compilation of the issues involved in the regionalisation discussion,<sup>146</sup> and a small group of interested WTO Members, led by New Zealand, commenced work on a compromise text. Input into this work has been provided by Members, in the form of papers reporting on their experiences;<sup>147</sup> and by the IPPC and the OIE in the form of reports on their activities in providing guidance for Members who wish to establish, or to be recognised for pest- or disease-free status.<sup>148</sup>

After five years of discussion within the SPS Committee and one year of work by the group of WTO Members working on this issue, provisional agreement was reached on non-binding guidelines for implementing Article 6 of the *SPS Agreement*, known as the *Regionalisation Decision*.<sup>149</sup> This Decision was provisionally adopted at the SPS Committee meeting on 2-3 April 2008, under the authority of the SPS Committee in terms of Article 12.1 of the *SPS Agreement*.<sup>150</sup> Some members of the group charged with work on the guidelines expressed their disappointment at the weakness of the compromise text in avoiding undue delay in the recognition of a region's status.<sup>151</sup> However, they were urged by others to accept the compromise so that what has been agreed so far can be implemented, with the understanding that the guidelines can be revised in the future on the basis of experience. These Members therefore did not raise objections and *Regionalisation Decision* was finally adopted on 15 May 2008.<sup>152</sup>

The *Regionalisation Decision* expressly states that the guidelines it provides are aimed at improving transparency, exchange of information, predictability, confidence and cred-

---

<sup>146</sup> Committee on Sanitary and Phytosanitary Measures, *Issues on the Application of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Background Document. Note by the Secretariat. Revision*, G/SPS/GEN/640/Rev.1, circulated on 14 September 2006.

<sup>147</sup> Some of these papers were already submitted in 1998 and predate the formal initiation of discussions on ways to address the problems of implementation of Article 6.

<sup>148</sup> A compendium of all these submissions is provided in Committee on Sanitary and Phytosanitary Measures, *Compendium of Documents Regarding Article 6 of the SPS Agreement - Regionalization*, G/SPS/GEN/636/Rev.1, circulated on 30 October 2006.

<sup>149</sup> On the legal status of the *Regionalisation Decision*, see below, Part IV, Section 2.1.1.

<sup>150</sup> Committee on Sanitary and Phytosanitary Measures, *Guidelines to Further the Practical Implementation of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures: Submission by New Zealand on Behalf of the Small Group Process on Article 6*, G/SPS/W/218, circulated on 22 February 2008.

<sup>151</sup> This is reported in the WTO news item on this development, at an informal meeting on regionalisation held on 1 April 2008. 'Members set to Agree on Regionalization, Improved SPS Transparency' WTO News Items 2008, available at: [http://www.wto.org/english/news\\_e/news08\\_e/sps\\_apr08\\_e.htm](http://www.wto.org/english/news_e/news08_e/sps_apr08_e.htm), visited on 8 April 2008.

<sup>152</sup> The SPS Committee had formally agreed that if no Member objected by 15 May 2008, the guidelines would be adopted. This is officially termed adoption 'ad referendum' (see discussion below, Part IV, Section 2.1). As no objections were received, the guidelines were considered finally adopted on 15 May 2008. They are contained in Committee on Sanitary and Phytosanitary Measures, *Guidelines to Further the Practical Implementation of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures*, G/SPS/48, circulated on 16 May 2008.

ibility between importing and exporting Members, and are not intended to duplicate the technical and administrative guidance provided to Members by the IPPC and OIE.<sup>153</sup>

The *Regionalisation Decision* starts by setting out some general principles that Members should comply with in respect of their procedures to recognise pest- or disease-free areas or areas of low pest or disease prevalence, namely transparency;<sup>154</sup> avoidance of undue delays;<sup>155</sup> non-discrimination in the application of the recognition process;<sup>156</sup> and consideration of relevant factors such as the strength and credibility of the veterinary or phytosanitary infrastructure of the exporting Member,<sup>157</sup> any relevant knowledge of and prior experience with the authorities of the exporting Member,<sup>158</sup> and in cases where the request is being resubmitted, all information previously provided, if the continuing validity of the information has been verified by the exporting Member.<sup>159</sup> In addition, the Decision states that the importing Member, upon request, should provide information on the stage of the exporting Member's request in its recognition process, and that, in the case of multiple requests by the same exporting Member, that Member's indication of priority among these requests must be taken into account.<sup>160</sup>

Thereafter, the *Regionalisation Decision* addresses the initial discussions regarding a request for the recognition of pest- or disease-free areas or areas of low pest or disease prevalence. It provides that the importing Member should, upon request, engage in discussions with the exporting Member to clarify the general procedure and the information requirements it applies.<sup>161</sup> These initial discussions should take place within a reasonable period of time, normally 90 days from the request unless otherwise mutually agreed.<sup>162</sup> However, discussions may be postponed for a reasonable period if the importing Member has limited resources to undertake work on new requests for recognition.<sup>163</sup>

---

<sup>153</sup> *Ibid.*, para. 1.

<sup>154</sup> Paragraph 4 of the *Regionalisation Decision* provides that Members should publish the basis for recognition of pest- or disease-free areas and areas of low pest or disease prevalence, as well as a description of the general procedures, including the information generally required to evaluate requests and a contact point to which requests can be addressed. Paragraph 7 provides more generally that 'Members should endeavour to maintain transparency in all aspects of the recognition process'.

<sup>155</sup> *Regionalisation Decision*, para. 5.

<sup>156</sup> *Regionalisation Decision*, para. 6.

<sup>157</sup> *Regionalisation Decision*, para. 8. This provision further states that the exporting Member's veterinary or phytosanitary authorities should be able to 'demonstrate their ability to maintain freedom from specified pests or diseases to encourage confidence on the part of the importing Member.'

<sup>158</sup> *Regionalisation Decision*, para. 9.

<sup>159</sup> *Regionalisation Decision*, para. 10.

<sup>160</sup> *Regionalisation Decision*, paras 11 and 12.

<sup>161</sup> Specifically, the discussions should clarify the importing Member's general process for the evaluation of requests for the recognition of pest- or disease-free areas and areas of low pest or disease prevalence; its general information requirements to evaluate the request; the information-exchange process relating to the request (including a contact point); and if possible, an anticipated timeframe for completion of the recognition process. *Regionalisation Decision*, para. 14 (a)-(d). Clarifications should be appropriately recorded to avoid misunderstandings. *Regionalisation Decision*, para. 16.

<sup>162</sup> *Regionalisation Decision*, para. 15.

<sup>163</sup> *Regionalisation Decision*, para. 17. Postponement decisions should take into account the number of requests the importing Member has received; the priority indication of the exporting Member where it has submitted multiple requests, and the capacity to undertake work on new requests. If postponement occurs, the importing Member should inform the exporting Member and provide an explanation in writing for the delay. *Regionalisation Decision*, para. 18.

While recognising the right of Members to determine their own administrative procedures for the evaluation of requests for recognition of pest- or disease-free areas or areas of low pest or disease prevalence, the *Regionalisation Decision* sets out nine steps that are typically part of such procedures.<sup>164</sup> These are the following. First, the exporting Member requests information about the importing Member's requirements and procedures for the evaluation of requests for recognition of pest- or disease-free areas or areas of low pest or disease prevalence.<sup>165</sup> A request for recognition may be accompanied by supporting scientific and technical information, including international recognition of the area as a pest- or disease-free area or an area of low pest or disease prevalence.<sup>166</sup> Second, the importing Member explains its requirements and procedures.<sup>167</sup> Third, the exporting Member sends the required documentation demonstrating compliance with the importing Member's requirements as well as any further information that could assist in the determination.<sup>168</sup> Fourth, the importing Member acknowledges the receipt of documentation, evaluates it, and gives feedback to the exporting Member, which may include an indication that additional information or an on-site verification is necessary, where justified.<sup>169</sup> Fifth, the exporting Member responds to the feedback by providing any requested clarifications, additions or modifications.<sup>170</sup> Sixth, the importing Member evaluates the additional information provided and gives further feedback.<sup>171</sup> Seventh, if applicable, the importing Member conducts an on-site verification of the information provided.<sup>172</sup> A report on the on-site verification is provided to the exporting Member. Eighth, if requested in the inspection report, the exporting Member provides further clarifications, additions or modifications.<sup>173</sup> Ninth, the importing Member makes a determination on whether or not to recognize the pest- or disease-free area or area of low pest or disease prevalence. In case of a negative determination, the importing Member provides the technical grounds for this decision to enable the exporting Member to modify its system with a view to future requests.<sup>174</sup> If the determination is positive, the importing Member takes the necessary administrative or legal steps to facilitate trade from the exporting Member.<sup>175</sup>

The *Regionalisation Decision* expressly provides the possibility for an importing Member to apply an expedited process for the recognition of pest- or disease-free areas or ar-

<sup>164</sup> *Regionalisation Decision*, paras 20-31 setting out steps A to I.

<sup>165</sup> This request may be made prior to formally requesting recognition of an area as a pest- or disease-free area or an area of low pest or disease prevalence, or at the time of the request for recognition. *Regionalisation Decision*, para. 20.

<sup>166</sup> *Regionalisation Decision*, para. 21.

<sup>167</sup> *Regionalisation Decision*, para. 22. For example, the importing Member may require answers to a specific questionnaire.

<sup>168</sup> Where relevant the exporting Member provides information showing that the procedures it used to identify that area as pest- or disease-free or of low pest or disease prevalence are based on an international standard, guideline or recommendation. *Regionalisation Decision*, para. 23.

<sup>169</sup> *Regionalisation Decision*, para. 24.

<sup>170</sup> *Regionalisation Decision*, para. 25.

<sup>171</sup> If further clarification is needed the fifth and sixth steps are repeated. *Regionalisation Decision*, para. 26.

<sup>172</sup> This site visit examines the administrative structure of the regulatory bodies and their sanitary or phytosanitary programmes and evaluates the strength and credibility of the veterinary or phytosanitary infrastructure of the exporting region. *Regionalisation Decision*, para. 26.

<sup>173</sup> *Regionalisation Decision*, para. 29.

<sup>174</sup> *Regionalisation Decision*, para. 30.

<sup>175</sup> Where necessary, the importing Member modifies its sanitary or phytosanitary regulations or elaborates new ones to give effect to its determination. *Regionalisation Decision*, para. 31.

eas of low pest or disease prevalence.<sup>176</sup> The decision on whether to apply an expedited process should involve consideration of factors including: when there has been official recognition by a relevant international organisation of an area as a pest- or disease-free area or an area of low pest or disease prevalence; if after an outbreak in an area previously recognised as a pest- or disease-free area or an area of low pest or disease prevalence, the area is restored to its former status as determined by the importing Member in accordance with the relevant international standards, guidelines or recommendations; if as a result of existing trade relations the importing Member is familiar with the infrastructure and operation of the responsible veterinary or phytosanitary service of the exporting Member; and if no previously notified occurrence of the pest or disease exists in the exporting Member and the importing Member agrees that the surveillance procedures and other measures of the exporting Member establish the non-existence of the pest or disease on its territory.<sup>177</sup>

The *Regionalisation Decision* requires the SPS Committee to monitor the implementation of Article 6 under a standing agenda item.<sup>178</sup> To facilitate this, Members are encouraged to notify the SPS Committee of their requests for, and determinations of, the recognition of pest- or disease-free areas or areas of low pest or disease prevalence. It also encourages Members to provide information on their experiences in the implementation of Article 6 and to provide relevant background information on their decisions to other interested Members upon request.<sup>179</sup> In June 2008, Chile submitted a communication to the SPS Committee, in terms of the *Regionalisation Decision* as well as under the permanent agenda item on regionalisation in meetings of the SPS Committee.<sup>180</sup> In this communication, Chile notifies its preliminary recognition of the whole of the US, except the state of Arkansas, as free of avian influenza.<sup>181</sup> This recognition will become final once the US submits the additional information required by Chile. In addition, Chile notifies its final decision on the recognition of three states of Brazil as free of Newcastle disease, based on the certification of the disease-free status of these states by the competent authority in Brazil, as confirmed by an inspection visit.<sup>182</sup> In this communication, Chile emphasises that while it is a country free of the main pests and diseases identified by the OIE and IPPC and that it maintains a high appropriate level of protection, in conformity with the *SPS Agreement* it bases its SPS measures on scientific evidence.<sup>183</sup>

---

<sup>176</sup> An expedited process is stated to ‘involve exclusion of one or more stages or some parts of a stage of the importing Member’s general process for the recognition of pest- or disease-free or areas of low pest or disease prevalence.’ *Regionalisation Decision*, para. 32.

<sup>177</sup> *Regionalisation Decision*, para. 32(a)-(d).

<sup>178</sup> *Regionalisation Decision*, para. 34.

<sup>179</sup> *Regionalisation Decision*, para. 34.

<sup>180</sup> Committee on Sanitary and Phytosanitary Measures, *Recognition of Areas Free of Pests or Diseases. Communication by Chile to the SPS Committee Meeting of 24-25 June 2008*, G/SPS/GEN/862, circulated on 7 July 2008.

<sup>181</sup> *Ibid.*, paras 2-3. Chile states that the result of this recognition is that day-old chicks and fertilised eggs are not effected by trade restrictions. With regard to Arkansas, where avian influenza was detected, chilled or frozen poultry exports to Chile are prohibited, but boneless processed poultry products that have been subjected to heat-treatment are permitted.

<sup>182</sup> *Ibid.*, para. 4.

<sup>183</sup> *Ibid.*, para. 5.

### 1.2.7 International guidelines on regionalisation

It is significant that international guidelines are mentioned in Article 6 of the *SPS Agreement* as a factor that must be had regard to in assessing the SPS characteristics of a region for purposes of regionalisation. Both the OIE and the IPPC have been active in drawing up guidelines on this issue.

The OIE has specific procedures in place according to which it officially recognises the disease free status of a country or region with regard to only four animal diseases, namely FMD,<sup>184</sup> rinderpest,<sup>185</sup> contagious bovine pleuropneumonia and BSE after an investigation and evaluation of evidence. Country status is evaluated under the auspices of the Technical Commission of the OIE and recommendations are forwarded to the International Committee for adoption. The Director-General of the OIE publishes a list of countries that meet the requirements for disease free status.<sup>186</sup> With regard to these and other diseases the OIE lays down guidelines according to which a country can declare itself or a *zone* or *compartment* within the country free of a particular disease.<sup>187</sup> In such a case, the country must provide epidemiological information that conforms to the standards laid down in the *Terrestrial Animal Health Code*, to the importing country in support of its declaration.<sup>188</sup> In May 2006, the International Committee of the OIE adopted new texts on zoning and compartmentalisation, and revised a chapter of the *Terrestrial Animal Health Code* to incorporate the concept of compartmentalisation.<sup>189</sup> In 2008, a new text was adopted for inclusion in the *Terrestrial Animal Health Code* containing general guidelines on compartmentalisation and the concept of a 'containment zone' as a trade facilitation mechanism in the event of a disease incursion.<sup>190</sup> The OIE expressly notes the

<sup>184</sup> OIE International Committee, *Establishment of a list of foot and mouth disease (FMD) free countries where vaccination is not practised*, Resolution XI, 63rd General Session, (1995).

<sup>185</sup> OIE International Committee, *Procedure for the recognition of the foot and mouth disease status of Member Countries*, Resolution XII, 63rd General Session, (1995). It should be noted that with regard to rinderpest, only whole countries and not regions can be officially recognised as rinderpest-free by the OIE.

<sup>186</sup> The evaluation and approval procedure applied by the OIE in this regard are set out in Committee on Sanitary and Phytosanitary Measures, *Official OIE Recognition of Member Countries' Health Status. Communication from the World Organization for Animal Health (OIE). Addendum*, G/SPS/GEN/542/Add.1, circulated on 2 March 2005.

<sup>187</sup> A zone is a clearly defined *part of a country* containing an animal sub-population with a distinct health status with respect to a particular disease. A compartment refers to *premises* where animals are kept under a biosecurity management system containing an animal sub-population with a distinct health status with respect to a particular disease. Thus a zone is defined on a geographical basis (by reference to natural, artificial or legal boundaries) whereas a compartment is defined by reference to risk management practices Committee on Sanitary and Phytosanitary Measures, *Update on Activities Relating to Disease Regionalisation. 39th Meeting of the SPS Committee. Communication from the World Organisation for Animal Health (OIE)*, G/SPS/GEN/789, circulated on 26 June 2007, paras 1-2.

<sup>188</sup> The *Terrestrial Animal Health Code* contains recommendations for zones or compartments for those diseases for which the concept are appropriate. The recommendations reflect the epidemiology of the disease, environmental factors, biosecurity measures that are required and feasible, and the conduct of required disease surveillance. *Ibid.*, para. 11.

<sup>189</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Eight Annual Report Adopted by the Committee on 28 June 2006*, G/SPS/42, circulated on 4 August 2006, para. 23.

<sup>190</sup> Committee on Sanitary and Phytosanitary Measures, *Report on OIE Activities to the Meeting of the SPS Committee to Be Held on 24-25 June 2008*, G/SPS/GEN/853, circulated on 20 June 2008, para. 10. A containment zone is a mechanism to facilitate rapidly regaining disease-free status after an incursion of a disease into a previously disease-free country or zone. Specific technical criteria are specified for a containment zone.

dependence of zoning and compartmentalisation on the existence in the exporting country of the necessary veterinary infrastructure to develop, implement and certify the relevant zone or compartment. Without this, an importing country will not agree to recognise the zone or compartment for trade purposes.<sup>191</sup> As noted above, a lack of confidence exists in the SPS regulatory systems of many less-developed countries, making the recognition of zones and compartments in their territories by other countries unlikely.

While the IPPC does not have a mechanism in place to officially recognise pest- and disease-free areas itself, it has laid down guidelines for national authorities in the establishment of pest free areas<sup>192</sup> and for the determination of pest status in an area.<sup>193</sup> Further, it has set out guidelines for the establishment of pest free production sites and areas of production,<sup>194</sup> and for the establishment of areas of low pest prevalence.<sup>195</sup> In addition, guidelines have been adopted for the establishment of pest free areas for fruit flies specifically.<sup>196</sup> In its seventh session in April 2005, the Interim Commission on Phytosanitary Measures (ICPM), which was then the governing body of the IPPC as mentioned above, convened a working group to address possible ways to recognise pest-free regions.<sup>197</sup> The report of this working group recommended that guidelines for the recognition of pest-free regions be urgently developed. This process commenced with a meeting of the IPPC Standards Committee on 25 April 2005.<sup>198</sup> In March 2007, guidelines for the bilateral recognition of pest-free areas and areas of low pest prevalence were adopted by the CPM.<sup>199</sup> They contain a useful flow chart outlining the procedure set out in the guidelines.<sup>200</sup> The CPM has also adopted terms of reference to assess the feasibility of undertaking international recognition of pest-free areas.<sup>201</sup>

---

<sup>191</sup> Committee on Sanitary and Phytosanitary Measures, *Update on Activities Relating to Disease Regionalisation. 39th Meeting of the SPS Committee. Communication from the World Organisation for Animal Health (OIE)*, G/SPS/GEN/789, circulated on 26 June 2007, para. 17.

<sup>199</sup> Committee on Sanitary and Phytosanitary Measures, *ISPM 29: Recognition of Pest-Free Areas and Areas of Low Pest Prevalence. Submission by the Secretariat of the International Plant Protection Convention (IPPC)*, G/SPS/GEN/782, circulated on 19 June 2007.

<sup>200</sup> *Ibid.*, Appendix 1.

<sup>201</sup> These terms of reference are set out in Committee on Sanitary and Phytosanitary Measures, *Update of Activities of the International Plant Protection Convention (IPPC) June 2006. Pest- and Disease-Free Areas*

The abovementioned international guidelines should facilitate the implementation of Article 6, as they clarify what is meant by a pest- or disease-free country or region and how this can be established by means of specific technical criteria. This creates an objective basis for the recognition of the pest or disease status of an area. However, concerns have been raised that pest- and disease-free areas established, through the investment of significant resources, in accordance with international guidelines are often not recognised by importing Members. In fact, even the official recognition of a Member as disease-free by the OIE is in practice not considered at all by other Members as an element of the ‘objective demonstration’ of disease-free status and the exporting Member is required to supply anew all the evidence it has in support of its claim of disease-free status to the importing country.<sup>202</sup> This situation seems to be contrary to the aim of Article 6.

### 1.3 Transparency obligations

An important, and perhaps underestimated, aspect of the *SPS Agreement* is its insistence on transparency of SPS measures. The significance of transparency disciplines lies in two main areas, which could be called the *ex ante* and the *ex post* effects of transparency.

The *ex ante* effect of transparency can be described as follows. Exporters of food and agricultural products are affected by regulatory decisions taken in foreign jurisdictions, yet they traditionally have no say in the decision-making process involved. Foreign regulators take into account national priorities and interests when making SPS decisions. This raises the problem which Robert Keohane has called the ‘external accountability gap’<sup>203</sup> which term describes the situation which arises in a globalising world where the impact of the actions of a state no longer coincide with its jurisdiction but go beyond it, affecting the lives of persons outside it.<sup>204</sup> Imposing *ex ante* transparency obligations on regulating countries ensures that exporting countries are informed of proposed new or amended SPS measures and that affected foreign traders have the opportunity, through their governments, to raise concerns regarding these proposals and to have these comments taken into account in the regulatory process.

---

- Article 6. Statement by the IPPC at the Meeting of 27-28 June 2006, G/SPS/GEN/707, circulated on 26 June 2006, Annex 1. Committee on Sanitary and Phytosanitary Measures, *Issues on the Application of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures. Background Document. Note by the Secretariat. Revision*, G/SPS/GEN/640/Rev.1, circulated on 14 September 2006, para. 22.

<sup>202</sup> Committee on Sanitary and Phytosanitary Measures, *Articles 6(2), 6(3) and Annex a(3)(B): Recognition of the Concept of Pest- or Disease-Free Areas as an International Standard, Guideline or Recommendation: Submission by South Africa*, G/SPS/GEN/139, circulated on 2 November 1999.

<sup>203</sup> Robert Keohane, ‘Global Governance and Democratic Accountability’, in *Taming Globalization: Frontiers of Governance*, David Held and Mathias Koenig-Archibugi (ed.) (Polity Press, Cambridge), 2003, 130-159, 141.

<sup>204</sup> Scott addresses the question whether judicial review of SPS regulations in the WTO could be seen as a way to mitigate the accountability gap identified by Keohane, ‘and hence to reinforce democracy in an age where the concept of statehood no longer captures all dimensions of power.’ See Joanne Scott, *European Regulation of GMOs: Thinking About ‘Judicial Review’ in the WTO*, Jean Monnet Working Paper 04/04 (Jean Monnet Program, New York), 2004, 13, available at: [www.jeanmonnetprogram.org/papers/04/040401.pdf](http://www.jeanmonnetprogram.org/papers/04/040401.pdf), visited on 14 September 2004.

The second important aspect of transparency, lies in its *ex post* effects. A significant hurdle to exporters of food and agricultural products is the paucity of information that is available regarding the SPS measures that they must comply with on their export markets. SPS measures are often complex and subject to change; as a result of which exporters have no certainty that their products will have access to the markets of the country of destination. Obtaining necessary information regarding the SPS measures they have to comply with is often a costly and burdensome process for exporters. Transparency obligations requiring publication of adopted SPS measures are crucial in facilitating market access for exports from Members by greatly reducing the cost and difficulty of obtaining information on their trading partners' SPS measures.

Not only is the *ex post* effect of transparency important for traders, but it is also essential in enabling WTO Members to exercise their rights and police the implementation of the obligations of the *SPS Agreement*.<sup>205</sup> Lack of information regarding the existence, content and scientific basis of SPS measures makes it difficult for Members whose exporters are faced with SPS barriers to trade to determine whether they have legal grounds to challenge these measures in terms of the disciplines of the *SPS Agreement*. Transparency with regard to SPS measures aims to ensure that Members obtain full information about these measures in order to identify whether they are consistent with the *SPS Agreement* or not. It also makes it possible for traders to be well informed as to SPS measures affecting their exports and to lobby their governments to take action in this regard. Consequently, Members can try to resolve their trade concerns in bilateral discussions with the relevant Member,<sup>206</sup> in multilateral discussions at SPS Committee meetings,<sup>207</sup> or in formal dispute-settlement proceedings.<sup>208</sup>

For the reasons mentioned above, the *SPS Agreement* has rules in place to promote transparency in SPS regulation. There are contained in Article 7, Annex B and Article 5.8 of the *SPS Agreement*.<sup>209</sup> In particular, Article 7 of the *SPS Agreement*, under the heading 'Transparency', provides:

Members shall notify changes in their sanitary or phytosanitary measures and shall provide information on their sanitary or phytosanitary measures in accordance with the provisions of Annex B.

Annex B contains detailed provisions with regard to publication of adopted SPS measures and prior notification of proposed new SPS measures or changes in existing SPS

---

<sup>205</sup> Scott refers to this as the 'all-important accountability function' of transparency, which operates to enable other Members to evaluate and contest proposed SPS regulation. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 192-193.

<sup>206</sup> Wolfe notes that the WTO Secretariat 'knows that the real reason many experts attend [SPS] Committee meetings is to hold private unrecorded bilateral meetings with each other.' Robert Wolfe, 'See You in Geneva? Legal (Mis)Representations of the Trading System', *European Journal of International Relations* 11 (3), 2005, 339-364, 353.

<sup>207</sup> The mechanism for raising specific trade concerns at SPS Committee meetings is discussed below, Part IV, Section 2.1.2.

<sup>208</sup> The dispute settlement system is discussed below, Part IV, Section 2.2.

<sup>209</sup> Note that transparency is also required in Annex C.1 with respect to control, inspection and approval procedures. See further below, Part IV, Section 1.4.5.

measures. Annex B is an integral part of the *SPS Agreement*, as are all the Annexes, in terms of Article 1.3 of the *SPS Agreement*. Article 7 expressly refers to Annex B. Therefore Article 7 must be read together with Annex B, and a violation of the latter necessarily entails a violation of the former.

An additional transparency obligation is contained in Article 5.8 of the *SPS Agreement*, which states:

When a Member has reason to believe that a specific sanitary or phytosanitary measure introduced or maintained by another Member is constraining, or has the potential to constrain, its exports and the measure is not based on the relevant international standards, guidelines or recommendations, or such standards, guidelines or recommendations do not exist, an explanation of the reasons for such sanitary or phytosanitary measure may be requested and shall be provided by the Member maintaining the measure.

Thus, these provisions comprise, broadly speaking, three categories of transparency obligations: the obligation to publish all adopted SPS measures, the obligation to notify, in advance, draft SPS regulations to the WTO and the requirement to provide, upon request, an explanation for the reasons behind an SPS measure. These transparency obligations have different implications for Members at different levels of development, both in terms of the compliance burden they impose and in terms of the potential benefits they offer. The content of these obligations will be examined in more detail below.

### 1.3.1 Publication obligation

Publication of SPS requirements is one way to give effect to the *ex post* benefits of transparency, discussed above. The publication obligation is first reflected in Article 7 of the *SPS Agreement*. Article 7 obliges Members, *inter alia*, to provide information on their SPS measures in accordance with Annex B. In terms of Annex B.1:

Members shall ensure that all sanitary and phytosanitary regulations which have been adopted are published promptly in such a manner as to enable interested Members to become acquainted with them.

The Appellate Body in *Japan – Agricultural Products II* addressed the object and purpose of Annex B.1, and noted that it is ‘to enable interested Members to become acquainted with’ the SPS regulations adopted or maintained by other Members and ‘thus to enhance transparency regarding these measures.’<sup>210</sup>

#### 1.3.1.1 Scope of application

It is useful to start by identifying the scope of application of this publication requirement. Annex B.1 requires the prompt publication of ‘SPS regulations which have been adopted’. The meaning of ‘SPS regulations’ is clarified in a footnote to Annex B.1 which defines them as ‘sanitary and phytosanitary measures such as laws, decrees or ordinances

---

<sup>210</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 106.

which are applicable generally.<sup>211</sup> On the basis of these provisions, the Panel in *Japan – Agricultural Products II* identified three requirements for a measure to be subject to the publication requirement in Annex B namely:

- (1) the measure ‘[has] been adopted’; (2) the measure is a ‘phytosanitary regulation, namely a phytosanitary measure such as a law, decree or ordinance, which is (3) ‘applicable generally’.<sup>212</sup>

The first requirement has not been addressed in the case law thus far.<sup>213</sup> Adoption seems to require an action by the government of a Member, but should not be taken to mean that the measure must be legally enforceable. The Panel in *Japan – Agricultural Products II* emphasised that neither Annex B.1 nor Annex A.4 require the measures falling there under to be mandatory or legally enforceable.<sup>214</sup> It noted the fact that terms such as ‘measure’, ‘requirement’ and ‘restriction’ in other WTO agreements (which form the context for interpretation of the *SPS Agreement*) as interpreted in the case law, indicate that a non-mandatory government measure is also subject to WTO disciplines, ‘in the event compliance with this measure is necessary to obtain an advantage from the government or, in other words, if sufficient incentives or disincentives exist for that measure to be abided by.’<sup>215</sup>

The second requirement for the application of Annex B.1 raises the question of the relationship between an ‘SPS regulation’ and an ‘SPS measure’. It is surprising that Annex B.1 refers to SPS regulations rather than SPS measures, despite the fact that the obligation in Article 7 explicitly applies to SPS measures. The question thus arises whether SPS measures that do not take the form of SPS regulations are covered by the publication requirement.<sup>216</sup> What is clear from the wording of Annex B.1 and its footnote is that the publication applies to a narrower category of measures than those covered by the definition of SPS measures in Annex A.1. This was found by the Panel in *EC – Approval and Marketing of Biotech Products*, which saw SPS regulations for purposes of Annex B.1 as a ‘sub-category’ of the wider concept of SPS measures.<sup>217</sup> The fact that the publication obligation does not apply to all SPS measures is indicated by three factors. First there is the fact that the illustrative list of measures in the footnote is different from, and seem-

<sup>211</sup> Footnote 1 to Annex B of the *SPS Agreement*.

<sup>212</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.109.

<sup>213</sup> In *Japan – Agricultural Products II* it was undisputed that this requirement had been met. In *EC – Approval and Marketing of Biotech Products* it was unnecessary to address this requirement since the measures at issue fell outside the scope of application of Article B.1 for other reasons, discussed below.

<sup>214</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.111.

<sup>215</sup> *Ibid.* Here the Panel referred to Panel Report, *Japan – Film*, para. 10.49; GATT Panel Report, *EEC – Parts and Components*, para. 5.21; and GATT Panel Report, *Japan – Semi-Conductors*, para. 109.

<sup>216</sup> The confusion caused by this difference in terminology and its impact on the implementation of the transparency obligations was pointed out by Canada, which recalled the need identified in the second review of the operation of the *SPS Agreement* to clarify the relevant terms. Committee on Sanitary and Phytosanitary Measures, *Second Review of the Operation and Implementation of the Agreement on the Application of Sanitary and Phytosanitary Measures. Clarification of the Terms “Measures” and “Regulations” as contained in the SPS Agreement. Submission by Canada*, G/SPS/W/186, circulated on 20 March 2006.

<sup>217</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1455. According to the Panel, the fact that under Article 1.3 of the *SPS Agreement* Annexes are an integral part of the Agreement means that the reference to ‘SPS measures’ in the footnote to Annex B.1 must be interpreted in the light of the Annex A.1 definition of ‘SPS measures’.

ingly more limited than, that in Annex A.1.<sup>218</sup> Second, there is the additional requirement in the footnote Annex B.1 that the SPS measures relevant to the publication requirement are only those ‘which are applicable generally.’ Third, Annex B.1 is limited to SPS regulations ‘that have been adopted’.<sup>219</sup>

The Appellate Body in *Japan – Agricultural Products II* noted that the scope of application of the transparency provision must be interpreted in the light of the object and purpose of Annex B.1, mentioned above.<sup>220</sup> It therefore stated with regard to the definition of SPS regulations:

We consider that the list of instruments contained in the footnote to paragraph 1 of Annex B is, as is indicated by the words ‘such as’, not exhaustive in nature. The scope of application of the publication requirement is not limited to ‘laws, decrees or ordinances’, but also includes, in our opinion, other instruments which are applicable generally and are similar in character to the instruments explicitly referred to in the illustrative list of the footnote to paragraph 1 of Annex B.<sup>221</sup>

As a result, the Appellate Body found that the measure at issue, Japan’s varietal testing requirement, was covered by the publication obligation in Annex B.1, despite the fact that the Panel had found the measure to be ‘not mandatory – in that exporting countries can demonstrate quarantine efficiency by other means’.<sup>222</sup> In *EC – Approval and Marketing of Biotech Products*, however, the Panel noted that even a purposive interpretation of Annex B.1 does not entitle a panel to ‘expand the scope of the publication requirement negotiated by Members’ even if the panel were to consider that ‘it might in principle be desirable to do so.’<sup>223</sup> At issue in this dispute was the question whether the EC was obliged to publish its general *de facto* moratorium on the approval of biotech products. As the Panel had found the moratorium not to be an SPS measure itself but rather to amount to the administration or operation of an SPS measure, something not falling within the text of Annex B.1, it was therefore outside the scope of application of the publication requirement.<sup>224</sup> Thus, for Annex B.1 to apply there must first be an ‘SPS measure’, similar in character to the instruments mentioned in the illustrative list, although it does not have to take the form of one of the instruments expressly mentioned.

The third requirement, namely general applicability, was addressed by the Panel in *EC – Approval and Marketing of Biotech Products*. It held that ‘general applicability is a

<sup>218</sup> The waters are muddied in this respect by the fact that, while in Annex A.4 ‘regulations’ are listed *together* with other instruments including laws and decrees as examples of SPS measures, in the footnote to Annex B.1 laws and decrees are *examples* of SPS regulations. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 196.

<sup>219</sup> This last requirement has not been addressed in dispute settlement yet.

<sup>220</sup> See above, Part IV, Section 1.3.1.

<sup>221</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 105.

<sup>222</sup> *Ibid.*, para. 103.

<sup>223</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1461.

<sup>224</sup> *Ibid.* Here the Panel compared the text of Annex B.1 and Article 7 of the *SPS Agreement* to the text of Article 18.5 of the *Anti-Dumping Agreement*, which requires notification by a Member of ‘any changes in its laws and regulations relevant to this Agreement and in the *administration* of such laws and regulations’ (emphasis added). The extension of the publication requirement to the administration of regulations would have been made explicit in the *SPS Agreement* if it had been intended, according to the Panel. *Ibid.*, para. 7.1460.

necessary definitional element of the term “SPS regulations”.<sup>225</sup> The term ‘applicable generally’ has not been clearly defined in the case law under Annex B of the *SPS Agreement* thus far. However, it does not seem to mean that the SPS regulation must apply to all WTO Members.<sup>226</sup> Such a requirement would not make sense as SPS measures are directed at specific health risks which most often are found in products from one or more particular Member/s. Guidance can be drawn from the interpretation of the term ‘of general application’ used in Article X of the GATT 1994 with regard to the publication and administration of measures, which has been fleshed out in the jurisprudence. In *US – Underwear*, the Appellate Body agreed with the Panel that the fact that a measure is country-specific does not exclude the possibility of it being a measure of general application. To the extent that the measure affected ‘an unidentified number of economic operators, including domestic and foreign producers’ it was held to be a measure of general application.<sup>227</sup> In this line, the *Recommended Transparency Procedures* adopted by the SPS Committee, which although not an authoritative interpretation of the transparency obligations does reflect the agreement of Members on their application, clarify the scope of application of the publication requirement to encompass not only ‘generic’ measures but also measures affecting bilateral or plurilateral trade. This indicates agreement that to be generally applicable a measure does not have to affect all Members. The example given in the *Recommended Transparency Procedures* is of a restriction imposed by Colombia on fresh fruit from Brazil.

What would seem to be excluded by the requirement of general applicability are individual instances of application of SPS measures. This is in line with case law on the ‘general application’ condition for the applicability of the publication obligation in Article X of the GATT 1994.<sup>228</sup> In *EC – Approval and Marketing of Biotech Products* the Panel found that the ‘product specific measures’ at issue in that dispute, namely the individual instances of the application of the EC’s approval procedures to particular requests for approval, fell outside the publication requirement of Annex B.1 due to a failure to meet the requirement of general applicability.<sup>229</sup> As noted by the Panel with regard to the product specific measures:

<sup>225</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1776.

<sup>226</sup> In *Japan – Agricultural Products II* the meaning of ‘generally applicable’ was not addressed as it was undisputed that the measure at issue was generally applicable. Appellate Body Report, *Japan – Agricultural Products II*, para. 107.

<sup>227</sup> Panel Report, *US – Underwear*, para.7.65 as upheld in Appellate Body Report, *US – Underwear*, 21. The Panel and Appellate Body in this case held that administrative rulings may be measures of general application. In *Japan – Film* the Panel further clarified the scope of Article X as follows: ‘[ I]t stands to reason that inasmuch as the Article X:1 requirement applies to all administrative rulings of general application, it also should extend to administrative rulings in individual cases where such rulings establish or revise principles or criteria applicable in future cases.’ Panel Report, *Japan – Film*, para. 10.388.

<sup>228</sup> With regard to the ‘general application’ condition in Article X of the GATT 1994, in *US – Underwear* the Appellate Body agreed with the Panel’s finding that: ‘If, for instance, the restraint was addressed to a specific company or applied to a specific shipment, it would not have qualified as a measure of general application.’ Panel Report, *US – Underwear*, para.7.65 as upheld in Appellate Body Report, *US – Underwear*, 21. In *EC – Poultry*, the Appellate Body stated: ‘Article X:1 of the GATT 1994 makes it clear that Article X does not deal with specific transactions, but rather with rules “of general application”. . . . Although it is true, as Brazil contends, that any measure of general application will always have to be applied in specific cases, nevertheless, the particular treatment accorded to each individual shipment cannot be considered a measure ‘of general application’ within the meaning of Article X.’ Appellate Body Report, *EC – Poultry*, paras 111 and 113.

<sup>229</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1775-7.1776. Although, elsewhere,

[E]ach of these measures affects an application concerning a specific biotech product. None of these measures is applicable to all biotech products generally, or at least to all biotech products that fall within the scope of the relevant EC approval procedures and require approval.<sup>230</sup>

By contrast, the general applicability criterion was regarded as met by the general *de facto* moratorium on approvals, as it was ‘applicable to all applications which were pending between June 1999 and August 2003.’<sup>231</sup> However, as the moratorium was found not to be an SPS measure, as stated above, it was not subject to the publication requirement. Instead, the Panel noted that the transparency requirements contained in Annex C.1(b), applicable to control, inspection and approval procedures, were relevant to the *de facto* moratorium.<sup>232</sup>

### 1.3.1.2 Prompt publication

Once it is established that an SPS measure constitutes an SPS regulation falling under the scope of application of Annex B.1, the Member adopting the measure is required to publish it ‘promptly in such a manner as to enable interested parties to become acquainted with [it].’ This obligation has not been clarified in the case law thus far.<sup>233</sup>

In the *Transparency Handbook* drawn up by the WTO Secretariat to assist Members in implementing their transparency obligations, Members are encouraged to publish their SPS regulations on the Internet, if possible.<sup>234</sup> This preference is explained with reference to the greater transparency this offers and the ease of access to documents provided thereby, minimising the work involved in requesting documents and processing these requests.<sup>235</sup> This suggestion has been taken up in the *Recommended Transparency Procedures* adopted by the SPS Committee in 2002.<sup>236</sup> However, as both of these documents establish non-binding guidelines, rather than obligations, it is clear that it is up to Members to decide how to give effect to the publication obligation in Annex B.1,

---

the Panel found that the product-specific measures were not ‘SPS measures’ at all, as discussed above, Part III, Section 2.1.1, in respect of its finding under Annex B.1 the Panel found it unnecessary to address this issue.

<sup>230</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1775.

<sup>231</sup> *Ibid.*, para. 7.1775.

<sup>232</sup> *Ibid.*, para. 7.1464. In this dispute, only the US had alleged a violation of Annex C.1(b) by the *de facto* moratorium. The obligations of Annex C.1 are discussed below, Part IV, Section 1.4.

<sup>233</sup> Note that the publication obligation is a general obligation on Members and does not relate specifically to the work of the National Notification Authority or the Enquiry Point of a Member. Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, para. 57. The National Notification Authority and the Enquiry Point are discussed below, Part IV, Section 1.3.4.

<sup>234</sup> WTO Secretariat, *How to Apply the Transparency Provisions of the SPS Agreement* (World Trade Organization, Geneva), September 2002, para. 92, available at: [http://www.wto.org/english/tratop\\_e/sps\\_e/spshand\\_e.doc](http://www.wto.org/english/tratop_e/sps_e/spshand_e.doc), visited on 25 June 2007.

<sup>235</sup> *Ibid.*, para. 92(a)-(c).

<sup>236</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7). Revision*, G/SPS/7/Rev.2, circulated on 2 April 2002, para. 47. The *Recommended Transparency Procedures* are discussed further below, Part IV, Section 1.3.7.

provided that the manner that they choose meets the requirement of enabling interested parties to become acquainted with the SPS regulation.

This requirement is somewhat undermined by the stipulation, in the ‘*General Reservations*’ provision of Annex B.11, that nothing in the *SPS Agreement* shall be construed as requiring the publication of texts ‘other than in the language of the Member’. In practice, many Members publish their SPS measures, particularly those that take the form of legislation or administrative regulations, in their Government Gazettes in their own official languages. This may mean that many exporting Members at lower levels of development that lack the resources to undertake translations, and the producers of such Members, are not in a position to ‘become acquainted’ with the published regulation in a timely manner.<sup>237</sup>

An example of a complaint regarding non-implementation of the publication requirement in Annex B.1 of the *SPS Agreement*, is that brought by Nicaragua with respect to Mexico’s measures restricting the importation of black beans.<sup>238</sup> According to Mexican officials, these restrictions were imposed in order to address the ‘associated risk’ with imports of dried beans.<sup>239</sup> However, Mexico failed to publish the specific phytosanitary requirements for the importation of black beans from Nicaragua and its officials refused to furnish importers with the document containing these requirements. In March 2003, Nicaragua officially initiated dispute settlement proceedings against Mexico in this regard, by requesting consultations with Mexico.<sup>240</sup> A year later Nicaragua notified the DSB of the withdrawal of its request for consultations since a mutually agreed solution had been found between the two Members.<sup>241</sup>

### 1.3.1.3 Reasonable adaptation period

An important benefit from improved transparency, as noted above, is the opportunity it provides for early adaptation to new SPS requirements. However, for this to be effective, exporters need to be given a period, before the new requirements come into force, to adapt their products or production processes. In Members at lower levels of development, an adequate adaptation period may be particularly important as it may be difficult

<sup>237</sup> The exception to this provision in Annex B.8 of the *SPS Agreement*, requiring developed-country Members, upon request, to provide translations in one of the three WTO working languages (English, French or Spanish) applies only to documents covered by a specific notification. This means that while requesting Members may gain access to a proposed draft SPS measure in a language they understand, they cannot oblige the Member imposing the measure to publish the final adopted SPS regulation in a language other than its own language.

<sup>238</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Resolved Issues*, G/SPS/GEN/204/Rev.8/Add.3, circulated on 27 March 2008, item 164.

<sup>239</sup> The issue was first raised before the SPS Committee by the US, which requested that Mexico provide an explanation for the reasons for its measure. Committee on Sanitary and Phytosanitary Measures, *Mexican Restrictions on US Dry Beans - Request for Explanation (Article 5.8). Submission by the United States*, G/SPS/GEN/379, circulated on 31 March 2003.

<sup>240</sup> Dispute Settlement Body, *Mexico-Certain Measures Preventing the Importation of Black Beans from Nicaragua*, WT/DS284/1, G/L/614, G/LIC/D/37, G/SPS/GEN/375, circulated on 20 March 2003.

<sup>241</sup> Dispute Settlement Body, *Mexico - Certain Measures Preventing the Importation of Black Beans from Nicaragua. Communication from Nicaragua*, WT/DS284/4, circulated on 11 March 2004. This communication indicates that the ‘excellent political and trade relations’ between the two Members had enabled them to find a positive solution through periodic talks on the matter. It is rather unusual to notify a withdrawal of a request for consultations, since this has no legal purpose. Instead, it would be more logical to notify the mutually agreed solution itself.

for producers to access the necessary technology and the financial resources for its implementation that may be entailed by the new SPS requirements.<sup>242</sup> In order to enable producers in exporting Members to adjust to new or changed SPS requirements without losing market access during the adjustment period, Annex B.2 provides:

Except in urgent circumstances, Members shall allow a reasonable interval between the publication of a sanitary or phytosanitary regulation and its entry into force in order to allow time for producers in exporting Members, and particularly in developing country Members, to adapt their products and methods of production to the requirements of the importing Member.

To take into account the fact that delaying the entry into force of new SPS regulations is not always possible, due to the urgent nature of some of these regulations in the face of serious threats to health, Annex B.2 creates an exception for ‘urgent circumstances’. However, it does not define urgency. This, together with the lack of guidance as to what a ‘reasonable interval’ for adaptation is, has led to implementation problems with regard to this provision.<sup>243</sup>

In view of the often-heard complaint that little or no adaptation period was provided with respect to new SPS measures, in the *Implementation Decision* adopted at the Doha Ministerial Conference in 2001, it was agreed that the ‘reasonable interval’ between publication of an SPS measure and its entry into force shall be no less than six months, except if the new or changed measure has a trade liberalising effect.<sup>244</sup>

### 1.3.2 Notification obligation

The *ex ante* benefit of transparency in enabling producers in exporting Members to respond to draft SPS measures before they are adopted, is given effect in the notification obligations of the *SPS Agreement*. To this purpose, Article 7 of the *SPS Agreement* requires not only the publication of adopted SPS measures, but also the prior notification of changes in SPS measures, in accordance with Annex B. The notification requirement is further worked out in Annex B.5-10. As already noted, a violation of Annex B automatically entails a violation of Article 7.

#### 1.3.2.1 Scope of application

It is first necessary to examine in what situations the notification obligation applies. Annex B.5 provides that Members must notify proposed ‘SPS regulations’ according to its requirements:

---

<sup>242</sup> The *SPS Agreement* encourages, in Article 10.2, the provision of a longer period for compliance in respect of products of interest to developing-country Members. This SDT provision is discussed below, Part V, Section 1.2.

<sup>243</sup> On the implementation problems with regard to the transparency obligations of the *SPS Agreement*, see below, Part IV, Section 1.3.6.

<sup>244</sup> Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001, para. 3.2. The reasonable adaptation period is discussed further below, Part V, Section 1.3.

[w]henever an international standard, guideline or recommendation does not exist or the content of a proposed sanitary or phytosanitary regulation is not substantially the same as the content of an international standard, guideline or recommendation, and if the regulation may have a significant effect on trade of other Members, ...

Although the term ‘SPS regulation’ is not clarified in this provision, there seems to be no reason to interpret it differently to the same term in Annex B.1.<sup>245</sup> As a result, the same considerations regarding the type of instrument and the general applicability of the SPS measure apply, as discussed above.<sup>246</sup> Logically, as Annex B.5 deals with ‘proposed’ SPS regulations, there is no notification obligation with respect to existing SPS regulations.

The applicability of the notification obligation to an SPS regulation is subject to two further requirements, namely: (1) that its content is not ‘substantially the same’ as an international standard, or no such standard exists; and (2) that it ‘may have a significant effect on trade’. These requirements need to be examined.

The question arises whether an SPS regulation that is ‘substantially the same’ as an international standard for purposes of Annex B.5 (and thus does not fall within the scope of application of the prior notification requirement) is the same as an SPS measure that is ‘based on’ an international standard under Article 3.1, or instead as an SPS measure that ‘conforms to’ an international standard under Article 3.2 of the *SPS Agreement*. Although the reason for the difference in terminology used in Annex B.5 as compared to Article 3 is not clear, it would appear that a measure ‘not substantially the same’ as an international standard is a measure that does not ‘conform to’ the international standard under Article 3.2. The case law clarifying the meaning of ‘based on’ under Article 3.1 establishes that this refers to a measure that stands, is founded or is built upon an international standard, and incorporates some but not all elements of the international standard.<sup>247</sup> This seems to suggest something much less than a measure that is ‘substantially the same’ as international standard. The term ‘substantially the same’ is more likely to refer to measures that ‘conform to’ international standards. This view is supported by the fact that measures which do ‘conform to’ international standards benefit from a presumption of consistency with the *SPS Agreement* and thus also with its Annexes including the transparency provisions of Annex B, whereas measures which are simply ‘based on’ international standards do not. Therefore, if a measure is merely ‘based on’ an international standard, it seems likely that it will be regarded as ‘not substantially the same’ as the international standard for purposes of Annex B.5 and will have to be notified.

In 2004, New Zealand suggested that the SPS Committee amend its notification guidelines to encourage Members to notify all new SPS measures, including those that *are* substantially the same as international standards so as to enable the SPS Committee to fully

---

<sup>245</sup> As noted by Scott, the term is defined in Annex B.1 which is the first place it occurs in the Annex, and the identical term is used throughout the Annex, indicating that the definition is applicable throughout the Annex. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 195.

<sup>246</sup> See above, Part IV, Section 1.3.1.1.

<sup>247</sup> For the discussion on the meaning of ‘based on’ in Article 3.1 of the *SPS Agreement*, see above, Part III, Section 4.2.1.

monitor the process of international harmonisation.<sup>248</sup> The EC and Canada made similar submissions. The EC convincingly argued that the lack of notification of the adoption of a new SPS measure identical to an international standard has the result that other Members are faced, without warning, with obstacles to their trade without having time to adapt their production to the new requirements.<sup>249</sup> This is particularly the case in view of the absence of a mechanism in the CAC, OIE or IPPC to notify adoption of their international standards. General support for this suggestion led to it being taken up in the third revision to the *Recommended Transparency Procedures* adopted by the SPS Committee at its meeting on 2-3 April 2008.<sup>250</sup> It should be noted, however, that this revision does not create an *obligation* on Members to make such notifications as this would amount to an amendment of the *SPS Agreement*, the notification obligation of which is expressly limited to SPS regulations ‘not substantially the same’ as international standards.<sup>251</sup>

In addition, the notification procedures of Annex B.5 apply only if the relevant SPS measure ‘may have a significant effect on trade of other Members’. This is a stricter criterion than that which is used in Article 1.1 to demarcate the scope of application of the *SPS Agreement*. In the latter case, it is only required that a measure ‘may, directly or indirectly, affect international trade’. Clearly the notification obligation has narrower application.

The SPS Committee has established non-binding guidelines for what is meant by a ‘significant effect on trade’ in its *Recommended Transparency Procedures*.<sup>252</sup> According to these guidelines, this term may refer to the import-enhancing or import-reducing effect on trade in a specific product, group of products or products in general of a single SPS measure or various SPS measures in combination, between two or more Members. The guidelines further set out various factors that Members should take into account when determining if there is a significant effect on trade. These are the value or importance of the imports in respect of the importing or exporting Members concerned; the potential development of such imports; and the difficulties for producers in other Members to comply with the proposed SPS regulations.

In *Japan – Apples*, the US claimed that Japan had violated Article 7 and Annex B.5 and B.7 of the *SPS Agreement* due to its failure to notify changes that had been made to its fire blight measures since the entry into force of the *SPS Agreement* in 1995. The Panel thus had to determine whether the relevant changes constituted changes which were required to be notified under Article 7 because, *inter alia*, they ‘may have a significant effect on

---

<sup>248</sup> Committee on Sanitary and Phytosanitary Measures, *The Second Review of the Operation and Implementation of the SPS Agreement. Further Elaboration of Issues for Consideration by New Zealand*, G/SPS/W/157, circulated on 12 October 2004, para. 10.

<sup>249</sup> Committee on Sanitary and Phytosanitary Measures, *Review of the Operation and Implementation of the SPS Agreement. Submission by the European Communities*, G/SPS/W/159, circulated on 14 October 2004, paras 7 and 9.

<sup>250</sup> The SPS Committee formally agreed that if no Member objected by 30 May 2008, the revised guidelines would be adopted. Officially, this is termed adoption ‘*ad referendum*’. See further below, Part IV, Section 2.1.

<sup>251</sup> Amendments to WTO agreements can only be made by the Ministerial Conference by means of the procedure for amendments in Article X of the *WTO Agreement*, and not by decisions of subsidiary organs. See further below, Part IV, Section 2.1.1 and note 44.

<sup>252</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7). Revision*, G/SPS/7/Rev.2, circulated on 2 April 2002, para. 6.

trade of other Members' in the context of the introductory paragraph to Annex B.5. The Panel referred to the guidelines on this concept adopted by the SPS Committee in its *Recommended Transparency Procedures* and held that:

...the most important factor in this regard is whether the change affects the conditions for market access for the product concerned, that is, would the exported product (apple fruit from the United States in this case) still be permitted to enter Japan if they complied with the prescription contained in the previous regulations. If this is not the case, then we must consider whether the change could be considered to potentially have a *significant* effect on trade of other Members. In this regard it would be relevant to consider whether the change has resulted in any increase in production, packaging and sales costs, such as more onerous treatment requirements or more time-consuming administrative formalities.<sup>253</sup>

The crux of the issue is therefore whether the changes have an actual or potential significant effect on the conditions for market access. If so, the changes must be notified.

When all the conditions of Annex B.5 are met, Members have to comply with the notification procedure set out in the rest of the Annex.

### 1.3.2.2 Notification procedures

Paragraphs 5 to 10 of Annex B set out the prior publication and notification procedure to be followed when proposed SPS regulations fall within the scope of application of the notification obligation. In terms of this procedure, the proposal to introduce an SPS regulation must be published at an early stage and in such a manner as to allow other Members to become acquainted with the proposal.<sup>254</sup> In addition, the products to be covered and the objective and rationale for the proposed SPS regulation must be notified to other Members through the WTO Secretariat.<sup>255</sup> This notification must occur at an early stage when comments can still be taken into account and amendments introduced to the draft measure.<sup>256</sup> Upon request, copies of the proposed regulation must be provided, identifying where possible the parts that deviate in substance from international standards, guidelines or recommendations.<sup>257</sup> It is recommended that requested documents be provided within five working days.<sup>258</sup> The notifying Member must allow a 'reasonable time' for comments in writing from other Members. According to the *Recommended Transparency Procedures* adopted by the SPS Committee, the comment period should be normally at

<sup>253</sup> Panel Report, *Japan – Apples*, para. 8.314. After comparing the two existing measures (which predated the *SPS Agreement*) with the two new measures, the Panel did not consider that the changes in one measure could have a significant effect on the trade of other Members, and was unable to determine if the changes to the second measure were strictly editorial or introduced substantial changes. It therefore found that the US had failed to make a *prima facie* case of violation of Article 7 of the *SPS Agreement*. *Ibid.*, paras. 8.324 and 8.326.

<sup>254</sup> Annex B.5(a) of the *SPS Agreement*.

<sup>255</sup> Annex B.5(b) of the *SPS Agreement*.

<sup>256</sup> Annex B.5(b) of the *SPS Agreement*.

<sup>257</sup> Annex B.5(c) of the *SPS Agreement*.

<sup>258</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision, G/SPS/7/Rev.3*, circulated on 20 June 2008, para. 19.

least 60 days, except if the proposed measure facilitates trade or is substantially the same as an international standard.<sup>259</sup> The comments must be discussed upon request and must be taken into account by the Member imposing the SPS measure.<sup>260</sup>

In emergency situations, namely where ‘urgent problems of health protection arise or threaten to arise’, Members may follow a shorter procedure under Annex B.6.<sup>261</sup> They must, however, immediately notify other Members, through the Secretariat of the regulation, its rationale and product coverage and the nature of the urgent problem.<sup>262</sup> Copies of the regulation must be provided upon request and written comments on the regulation must be allowed, discussed and taken into account.<sup>263</sup> The frequency with which some Members, particularly developing-country Members, use the emergency notification procedure, including in cases where the urgency of the problem is not apparent, is problematic.<sup>264</sup> In some cases it seems that the emergency procedure is used in order to reduce the administrative burden of notification, or to omit the comment period when the notification has been made too late and the measure has already come into force by the time the notification is made. This concern is reflected in the *Recommended Transparency Procedures*, which expressly state that the late notification of an SPS regulation is not a sufficient reason for the use of the emergency procedure.<sup>265</sup> Concerns have been raised in discussions in the SPS Committee that SPS regulations notified as emergency measures simply became permanent measures. It was suggested that notifications under the emergency procedure indicate the period of application, including the end date, of the notified measure.<sup>266</sup>

---

<sup>259</sup> *Ibid.*, para. 13. It is useful to recall here that although SPS regulations that are substantially the same as an international standard are not covered by the notification obligation in Annex B.5 of the *SPS Agreement*, the revised *Recommended Transparency Procedures* adopted by the SPS Committee encourage Members to notify these measures as well, if they are expected to have a significant effect on trade of other Members. *Ibid.*, para. 8. The *Recommended Transparency Procedures* are discussed below, Part IV, Section 1.3.7.

<sup>260</sup> Annex B.5(d) of the *SPS Agreement*.

<sup>261</sup> Annex B.6 allows Members to omit such steps of the notification procedure in Annex B.5 as it finds necessary, where urgent problems of health protection arise or threaten to arise.

<sup>262</sup> Annex B.6(a) of the *SPS Agreement*.

<sup>263</sup> Annex B.6(b)-(c) of the *SPS Agreement*.

<sup>264</sup> The notification practice of the developing-country Members that were used as examples in Part II of this book, provides a practical illustration of this. Mauritius has submitted 12 notifications of proposed SPS measures, 6 of which were notified under the emergency procedure. Jamaica has notified 11 proposed SPS measures, 8 of which are notified as emergency measures and provide no comment period. While some of these measures, such as those taken in response to outbreaks of BSE or foot-and-mouth disease are clearly emergency measures, others, such as Jamaica’s fumigation requirement for wooden pallets (G/SPS/N/JAM/6), are more difficult to categorise as such. See further below, Part IV, Section 1.3.5.

<sup>265</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, para. 15.

<sup>266</sup> Committee on Sanitary and Phytosanitary Measures, *Workshop on Transparency Held on 15 - 16 October 2007. Note by the Secretariat*, G/SPS/R/47, circulated on 8 January 2008, para. 36. It should be noted, however, that the fact that a regulation is notified under the emergency procedure due to the need for quick action does not necessarily imply that it is a provisional measure not based on a risk assessment as a result of insufficiency of the scientific information regarding the risk at issue. Where a proper risk assessment already exists and is used as the basis for the measure, it may be maintained indefinitely despite the fact that it was notified under the shorter procedure for urgent measures.

Notifications must be made in one of the three working languages of the WTO, namely English, French or Spanish.<sup>267</sup> However, particulars and the documents relating to the notification are not required to be provided in a language other than that of the notifying Member.<sup>268</sup> An exception is provided in case of developed-country Members, which are required, upon request, to provide the documents relating to their notifications in English, French or Spanish except in the case of voluminous documents in which case a summary in one of these languages suffices.<sup>269</sup> Members are not obliged to disclose confidential information that could hamper the enforcement of their SPS measures or prejudice the legitimate interests of enterprises.<sup>270</sup>

The *Recommended Transparency Procedures* adopted by the SPS Committee make provision for Members to provide supplementary information, in addition to their original notifications, in three different forms.<sup>271</sup> First, Members may submit addenda to provide additional information or notify changes in the status of a notified draft measure (such as extensions of the comment period, the adoption or coming into force of the notified regulation; the withdrawal of the notified regulation; or changes to the content or scope of application of a notified draft regulation). Second, corrigenda may be used to correct an error in the original notification. Third, revisions may be submitted to replace an original notification if the draft regulation was substantially redrafted or if the notification contained a large number of errors. Specific formats are provided for these three additional forms of notification.<sup>272</sup>

Notifications received by the WTO Secretariat are circulated to Members and interested international organisations, as required by Annex B.9 of the *SPS Agreement*, including by electronic mail.<sup>273</sup> In 1999, the WTO Secretariat decided to circulate, in addition, a monthly list of all notifications received in a particular month with a brief summary of the products covered by the notification, the country or regions identified as likely to be affected by the notified measure (where provided), the nature of the measure notified, and the deadline for the submission of comments on the notification.<sup>274</sup> This decision was taken in terms of the obligation on the WTO Secretariat in Annex B.9 to draw the attention of developing-country Members of notifications relating to products of particular interest to them.<sup>275</sup>

As of 31 August 2007, WTO Members had submitted 5,621 routine notifications (and 1,401 addenda or corrigenda thereto); and 986 emergency notifications (and 193 addenda or corrigenda thereto).<sup>276</sup> In addition, two notifications of the recognition of equivalence

<sup>267</sup> Annex B.7 of the *SPS Agreement*.

<sup>275</sup> This is discussed further in Part V of this book.

<sup>276</sup> Committee on Sanitary and Phytosanitary Measures, *Overview Regarding the Level of Implementation of*

had been submitted, as mentioned above.<sup>277</sup> By the same date, of the then-151 Members, 94 (62 percent) had submitted at least one notification.<sup>278</sup> Developed-country Members submitted 57.4 percent of the notifications received by 31 August 2007,<sup>279</sup> developing-country Members had submitted a further 42.3 percent,<sup>280</sup> and least-developed-country Members the remaining 0.3 percent.<sup>281</sup> The Secretariat has pointed out that the upward trend in the number of notifications submitted over the years does not necessarily indicate the extent to which actual new or changed SPS regulations are being notified to the WTO. The specific trade concerns raised at SPS Committee meetings still often refer to failures to notify SPS regulations.<sup>282</sup> In addition, the number of notifications says nothing about the conformity of their content with the requirements of Annex B.5. Several problems remain in this area, as discussed below.<sup>283</sup>

A good example of the potential of the prior notification and comment mechanism for facilitating the discussion and resolution of trade concerns with SPS measures at technical level is provided by the EC's notification of its draft amendments to its regulation laying down health rules concerning animal by-products not intended for human consumption.<sup>284</sup> The regulation only allowed imports when the country or region of origin is free from certain diseases without vaccination; furthermore it excluded imports of blood from animals treated with certain substances having a hormonal or thyrostatic action and of  $\beta$ -agonists. The EC received numerous comments concerning the aspects of its regulation dealing with trade on blood and blood fractions for uses other than human consumption such as animal feed or technological uses.<sup>285</sup> In response to the comments received and consequent to more recent risk analysis, the EC changed its draft amendment. In particular, it deleted the condition that blood products of ruminants are allowed only if the region of origin is eligible for the import of live animals into the Community. The changed draft measure also now allows imports of untreated blood products of ruminants

*the Transparency Provisions of the SPS Agreement: Note by the Secretariat, G/SPS/GEN/804, circulated on 11 October 2007, para. 7.*

<sup>277</sup> See above, Part IV, Section 1.1.6.

<sup>278</sup> Committee on Sanitary and Phytosanitary Measures, *Overview Regarding the Level of Implementation of the Transparency Provisions of the SPS Agreement: Note by the Secretariat, G/SPS/GEN/804, circulated on 11 October 2007, para. 12.*

<sup>279</sup> The US alone was responsible for 28.8% of all notifications received by 31 August 2007 (2,367 notifications). It was followed by the EC with 6.3% (517 notifications), New Zealand with 5.6% (464 notifications) and Canada with 5.5% (449 notifications). *Ibid.*, Table 1.

<sup>280</sup> The developing-country Member submitting the greatest number of notifications by 31 August 2007 was Brazil, with 5.4% of all notifications (446 notifications); followed by Chile with 3.6% (292 notifications); China with 3.2% (261 notifications) and Mexico with 2.9% (236 notifications). *Ibid.*

<sup>281</sup> *Ibid.*, para. 13. The categorisation of countries into levels of development used by the Secretariat to develop these statistics relies on WTO working definitions as identified in the Integrated Database for analytical purposes. *Ibid.*, footnote 8.

<sup>282</sup> *Ibid.*, para. 10.

<sup>283</sup> See below, Part IV, Section 1.3.6.

<sup>284</sup> Regulation (EC) No.1774/2002 of the European Parliament and of the Council of 3 October 2002 laying down health rules concerning animal by-products not intended for human consumption, Official Journal L273, 10 October 2002 pp.1-95, notified in G/SPS/N/EEC/103, circulated on 24 November 2000. The regulation provides for rules concerning the means of disposal and uses of animal by-products, including milk for animal feed.

<sup>285</sup> As regards to heat-treated blood fractions from non-ruminant animals which have undergone ante-mortem inspection, the draft amendment is contained in Document SANCO/10586/2006 Rev.6, notified in G/SPS/N/EEC/103/Add.20, circulated on 21 November 2007.

from countries or regions which are free from foot-and-mouth disease with vaccination under the condition that imported blood is channelled to the place of destination under secure conditions for further processing. Further it extends the lists of third countries authorised to export blood products intended for technical purposes, to include countries which are able to comply with the EC treatment requirements. It allows the import into the Community of blood derived from animals treated with certain substances having a hormonal or thyrostatic action and of  $\beta$ -agonists; and updates the requirements related to the import of blood products from poultry and other avian species by referring to the international standards laid down in the *Terrestrial Animal Health Code* of the OIE.<sup>286</sup> The much revised draft is expected to be adopted soon.

Compliance with the notification procedures set out in Annex B.5-8 are the responsibility of the National Notification Authority that each Member is required to designate under Annex B.10. This institutional obligation is discussed below.<sup>287</sup>

### 1.3.3 Explanation of reasons for SPS measures

As pointed out above, effective enforcement by Members of their rights under the *SPS Agreement* necessitates information beyond that on the existence and content of SPS measures. It also requires information regarding the scientific basis of the measure and other aspects of the reasons for its imposition. Lack of this information makes it difficult for exporting Members to determine whether they have legal grounds to challenge the relevant SPS measures in terms of the disciplines of the *SPS Agreement*. However, notifications and publication of SPS measures rarely contain more than the briefest statement of the purpose of the particular measure. To address this problem, an additional transparency provision has been included, namely Article 5.8 of the *SPS Agreement*. According to this provision, a Member may request another Member to provide the reasons for the latter's SPS measure where it is not based on international standards and it constrains or could potentially constrain the former Member's exports. The importing Member is then obliged to provide such reasons to the requesting Member.

#### 1.3.3.1 Scope of application

The obligation contained in Article 5.8 of the *SPS Agreement* is not generally applicable to all SPS measures. Instead, it applies only when three conditions are met.

First, the obligation to provide reasons only applies *upon request* by an exporting Member. It is therefore up to the Member whose exporters are facing problems due to the SPS measure at issue to proactively seek information from the importing Member. This may mean that Members who lack the capacity to keep track of all published SPS measures, and whose channels of communication with its export industries are not effective, may not be in a position to make full use of the potential offered by this provision. As discussed above, this will often be the case for Members at lower levels of development.

---

<sup>286</sup> Committee on Sanitary and Phytosanitary Measures, *Notification. Addendum*, G/SPS/N/EEC/103/Add.21, circulated on 3 April 2008.

<sup>287</sup> See below, Part IV, Section 1.3.4.

Second, similar to the situation with the prior notification obligation, the obligation to provide reasons only applies to SPS measures that are not based on the relevant international standards, guidelines or recommendations or where no relevant standards, guidelines or recommendations exist. Measures based on international standards are thus not covered by this obligation. Note, however, that whereas the notification provision in Annex B.5 of the *SPS Agreement* refers to SPS measures that are not ‘substantially the same’ as international standards, which was argued above to cover those measures that do not ‘conform to’ international standards, Article 5.8 refers to SPS measures that are not ‘based on’ such standards. This means that in respect of SPS measures that adopt some but not necessarily all the elements of the international standard, Members are exempt from the obligation to provide reasons.<sup>288</sup> This is in line with the idea, discussed above,<sup>289</sup> that the scientific justification for an SPS measure ‘based on’ an international standard is to be found in the risk assessment relied upon by the relevant international standard-setting body when elaborating the standard. Thus it has been argued above that SPS measures that are based on international standards are saved from challenges under the rigorous scientific disciplines of the Agreement. Therefore also, the Member imposing a measure based on an international standard does not have to provide, upon request, the justification for such a measure.

Third, the obligation to provide reasons applies only when the exporting Member has reason to believe that the SPS measure at issue ‘is constraining or has the potential to constrain’ its exports. This requirements clearly sets a lower threshold than that the measure ‘may have a significant effect on trade’ as required in the notification obligation.<sup>290</sup> The extent to which exports are, or may be, constrained is not specified in this provision, thereby extending the obligation to provide reasons, upon request, to SPS measures with any actual or potential trade restrictive effect. The term ‘has reason to believe’ rather than just ‘believes’ indicates that there must be an objective basis for the belief of the exporting Member that this is in fact the case. This condition can easily be met by showing that the SPS measure at issue applies to specific exports of the requesting Member and sets requirements which these exports currently do not meet.

### 1.3.3.2 Obligation to provide an explanation of reasons

The obligation contained in Article 5.8 is an informational requirement. It should not be understood as shifting the burden of proof to the Member imposing the SPS measure to justify its measure in dispute settlement proceedings. Overturning a ruling of the Panel to that effect, the Appellate Body in *EC – Hormones* held:

<sup>288</sup> For the meaning of an SPS measure ‘based on’ international standards, see above, Part III, Section 4.2.1.

<sup>289</sup> See the discussion of the consequences of choosing to base an SPS measure on an international standard, above, Part III, Section 4.2.1.

<sup>290</sup> The reason for this different threshold seems to lie in the difference in the administrative burden imposed by each of the two provisions. While *all* draft SPS measures meeting the requirements of Annex B.5 must be notified in advance and comments thereon considered and responded to, the obligation in Article 5.8 is limited to SPS measures in respect of which an exporting Member *requests* reasons. Therefore a lower threshold for the required trade effect under Article 5.8 will not result in an overwhelming administrative burden on importing Members.

Article 5.8 of the *SPS Agreement* does not purport to address burden of proof problems; it does not deal with a dispute settlement situation. To the contrary, a Member seeking to exercise its right to receive information under Article 5.8 would, most likely, be in a pre-dispute situation, and the information or explanation it receives may well make it possible for that Member to proceed to dispute settlement proceedings and to carry the burden of proving on a *prima facie* basis that the measure involved is not consistent with the *SPS Agreement*.<sup>291</sup>

Thus, despite the fact that it does not address the burden of proof, the obligation contained in Article 5.8 can play a significant role in dispute settlement proceedings by assisting a Member in establishing a *prima facie* case that another Member's SPS measure is not based on a risk assessment or sufficient scientific evidence. This possibility was addressed in *Japan – Agricultural Products II*, where the US argued that the Panel had imposed an impossible burden of proof on it by requiring it to prove a negative under Article 2.2 of the *SPS Agreement*, namely that there were no relevant studies supporting Japan's measure. The Appellate Body disagreed with the US, noting that the US only had to raise a presumption that there were no such relevant studies. As pointed out by the Appellate Body, the US could have raised a *prima facie* case that there was insufficient scientific evidence for Japan's measure in the following way:

The United States could have requested Japan, pursuant to Article 5.8 of the *SPS Agreement*, to provide 'an explanation of the reasons' for its varietal testing requirement, in particular, as it applies to apricots, pears, plums and quince. Japan would, in that case, be obliged to provide such explanation. The failure of Japan to bring forward scientific studies or reports in support of its varietal testing requirement as it applies to apricots, pears, plums and quince, would have been a strong indication that there are no such studies or reports.<sup>292</sup>

This, once again, elucidates the *ex post* benefits of transparency in enabling Members to enforce their rights under the *SPS Agreement* by ensuring that they have the means at their disposal to obtain the necessary information regarding the SPS measures of their trading partners. Several Members have made use of this possibility. For example, in 1999, Argentina submitted a series of questions to Korea under Article 5.8 of the *SPS Agreement* regarding Korea's restrictions on fresh bovine meat from Argentina due to concerns regarding foot-and-mouth disease, despite Argentina's status as free from that disease without vaccination. Among these questions, circulated to the SPS Committee for the information of other Members,<sup>293</sup> Argentina asked Korea to indicate the scientific basis for its ban, which was not based on OIE recommendations and to provide full information regarding the risk analysis carried out in terms of Article 5 of the *SPS Agreement*. Korea responded that its measure was consistent with OIE recommendations and with the *SPS Agreement*. Korea stated that it had been free of foot-and-mouth disease for 60 years, and only imported from countries free of foot-and-mouth disease without vaccination for

<sup>291</sup> Appellate Body Report, *EC – Hormones*, para. 102.

<sup>292</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 137.

<sup>293</sup> Committee on Sanitary and Phytosanitary Measures, *Restrictions on the Exportation of Fresh Bovine Meat to the Republic of Korea: Statement by Argentina at the Meeting of 7-8 July 1999*, G/SPS/GEN/130, circulated on 21 July 1999.

at least 12 months. At the time of Korea's review of Argentina's sanitary status in April 1996, Argentina did not meet this requirement. Korea indicated that the matter should be discussed and resolved bilaterally.<sup>294</sup> The matter has not been reported resolved, but may be so since it has not been raised again.<sup>295</sup>

Compliance with the obligation under Article 5.8 is among the responsibilities of the Enquiry Point which each Member is required to have under Annex B.3 of the *SPS Agreement*. This institutional obligation is discussed below.

### 1.3.4 Infrastructure for transparency

Members are required by the *SPS Agreement* to create the necessary institutional infrastructure for the implementation of their transparency obligations. Under Annex B.10, Members must designate a *single* authority, commonly known as the National Notification Authority, as responsible for implementing the notification procedures in Annex B.5-8 at national level. This authority must be a central government body. As noted in the *Handbook on Transparency* most often Members designate as their National Notification Authority an existing government department or agency with responsibilities in sanitary or phytosanitary matters, or a government department responsible for disseminating information.<sup>296</sup> Even if SPS responsibilities are divided among several government departments, only one National Notification Authority may be designated. The National Notification Authority need not have SPS experts on its staff, but it must have access to or relationships with the technical experts responsible for drafting SPS regulations.<sup>297</sup> The WTO Secretariat should be informed of the designation or change of a Member's National Notification Authority,<sup>298</sup> and it regularly updates and circulates lists of these authorities to all Members.<sup>299</sup>

The responsibilities of the National Notification Authority include ensuring that a notice of proposed regulations is published at an early stage; notifying other Members through the WTO Secretariat of proposed SPS regulations at an early stage, preferably using the

<sup>294</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 7-8 July 1999: Note by the Secretariat*, G/SPS/R/15, circulated on 20 September 1999, paras 13-14.

<sup>295</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 65.

<sup>296</sup> WTO Secretariat, *How to Apply the Transparency Provisions of the SPS Agreement* (World Trade Organization, Geneva), September 2002, para. 9, available at: [http://www.wto.org/english/tratop\\_e/sps\\_e/spshand\\_e.doc](http://www.wto.org/english/tratop_e/sps_e/spshand_e.doc), visited on 25 June 2007.

<sup>297</sup> *Ibid.*, para. 11.

<sup>298</sup> The *SPS Agreement* does not expressly oblige Members to notify the Secretariat of this designation. However, this seems logical to read the 'designation' obligation as including the requirement that the WTO Secretariat be informed of such designation. In this line, the *Recommended Transparency Provisions* encourage Members to do so, and specify further that it would be useful to include particular contact information of the designated authorities. Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, para. 5.

<sup>299</sup> These can be found in the G/SPS/NNA/\* series of official WTO documents.

recommended format;<sup>300</sup> providing copies of the proposed regulations, upon request; and ensuring that comments received on notified regulations are handled correctly.<sup>301</sup>

Also as part of the infrastructure necessary for transparency, the Annex B.3 of the *SPS Agreement* obliges each Member to ensure that *one* national Enquiry Point exists. The aim of the Enquiry Point is to provide a single contact point to enable Members to easily obtain information regarding SPS matters without having to identify and approach the agency responsible for the relevant matter.<sup>302</sup> This Enquiry Point need not be a government body, but may also be an independent agency. It must be able, however, to obtain the necessary answers from the relevant national bodies in order to reply to the requests for information received. Therefore, it needs to have established relationships with the relevant sanitary and phytosanitary officials to facilitate prompt access to the requested information. As noted in the *Handbook on Transparency*, most commonly Members designate an existing standards information office or the government department that is most concerned with responsibilities falling under the *SPS Agreement* as their Enquiry Point.<sup>303</sup> Once again, the WTO Secretariat should be kept informed of the designated authority,<sup>304</sup> and it maintains an updated list of Enquiry Points, which it circulates to Members.<sup>305</sup>

The responsibilities of a Member's Enquiry Point are to provide answers to all reasonable questions from other Members as well as provide relevant documents regarding: any adopted or proposed SPS regulations in its territory; the risk assessment basis for the measure; the determination of the appropriate level of protection; control and inspection procedures, production and quarantine treatment, pesticide tolerance and food additive approval procedures in its territory; and the Member's (or its relevant bodies') membership of and participation in international or regional SPS systems as well as bilateral or multilateral agreements within the scope of the *SPS Agreement*.<sup>306</sup> Requested copies of documents must be supplied to other Members at the same price as to nationals.<sup>307</sup> In the *Handbook on Transparency* prepared by the WTO Secretariat, Members are encouraged

---

<sup>300</sup> The *Recommended Transparency Procedures* adopted by the SPS Committee contain recommended formats for routine and emergency notifications. See further below, Part IV, Section 1.3.7.

<sup>301</sup> WTO Secretariat, *How to Apply the Transparency Provisions of the SPS Agreement* (World Trade Organization, Geneva), September 2002, para. 8, available at: [http://www.wto.org/english/tratop\\_e/spse/spshand\\_e.doc](http://www.wto.org/english/tratop_e/spse/spshand_e.doc), visited on 25 June 2007.

<sup>302</sup> *Ibid.*, para. 15.

<sup>303</sup> *Ibid.*, para. 18.

<sup>304</sup> As is the case with the National Notification Authorities, there is no express obligation in the *SPS Agreement* to keep the WTO Secretariat informed as to which body has been designated as the Enquiry Point of a Member. However, as the aim of an Enquiry Point is to provide a single contact point to which questions and requests for documentation can be addressed, making available the contact details of the designated Enquiry Point is essential to the fulfilment of this objective. Effective treaty interpretation therefore seems to require notification of the designated Enquiry Point and its contact details to other Members, most easily done by notifying the WTO Secretariat which will circulate the information to all Members. To this end, the *Recommended Transparency Provisions* encourage Members to inform the Secretariat of their designated Enquiry Point and its contact information. Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, para. 5.

<sup>305</sup> These can be found in the G/SPS/ENQ/\* series of official WTO documents.

<sup>306</sup> Annex B.3 (a)-(d) of the *SPS Agreement*.

<sup>307</sup> Annex B.4 of the *SPS Agreement*. Delivery costs may however differ from those charged to nationals.

not to charge for requested documents, as a gesture of goodwill, taking into account that it is not very cost effective to recover the small amounts involved.<sup>308</sup>

The resources needed for the operation of the Enquiry Point and the National Notification Authority have been identified by the WTO Secretariat as being, at a minimum, office facilities with some form of word-processing capability, a photocopier and access to postal facilities and a telephone. Existing office infrastructure and services may be utilised.<sup>309</sup> If possible, a fax machine is recommended as it speeds up communication with the WTO Secretariat and other Members. In order to ensure more efficient operation of the infrastructure for transparency, Members are encouraged to obtain and use e-mail and Internet resources. These speed up communication and allow documents to be sent and received electronically, eliminating the delay between the making of a notification and its receipt by the Secretariat. Internet access enables Members to download all documents circulated on the WTO website and all SPS regulations that have been published by Members on their own websites. Thus, although the minimum resources needed are small, the additional resources that will ensure that the Enquiry Point and National Notification Authority operate speedily and efficiently may be difficult to obtain for Members where computer facilities and Internet access are not readily available or are too costly for the budget they have to work with. Added to the infrastructure resources identified above are the human resources needed to process and distribute SPS notifications and answer requests for information. As noted by the WTO Secretariat, while this workload is not particularly onerous, 'depending on the size and workload of the existing body, this could put an additional strain on already finite resources.'<sup>310</sup>

Some Members have decided to designate the same body as both their National Notification Authority and their Enquiry Point. This minimises the financial and physical resources needed and allows building up trade policy expertise in a single dedicated body.<sup>311</sup> It also removes the need for coordination between two separate bodies. Other Members have allocated these roles in two different bodies. Still others have designated more than one Enquiry Point to address different areas of SPS regulation (food safety, and animal and plant health),<sup>312</sup> despite the obligation to 'ensure that *one* enquiry point exists' (emphasis added) in Annex B.3.<sup>313</sup>

<sup>308</sup> WTO Secretariat, *How to Apply the Transparency Provisions of the SPS Agreement* (World Trade Organization, Geneva), September 2002, para. 85, available at: [http://www.wto.org/english/tratop\\_e/sps\\_e/spshand\\_e.doc](http://www.wto.org/english/tratop_e/sps_e/spshand_e.doc), visited on 25 June 2007.

<sup>309</sup> *Ibid.*, para. 21.

<sup>310</sup> *Ibid.*, para. 17.

<sup>311</sup> *Ibid.*

<sup>312</sup> For example, India and Kenya have designated three Enquiry Points each, one for food safety issues, one for animal health issues and one for phytosanitary issues, within the three different government departments with responsibilities in these areas. Committee on Sanitary and Phytosanitary Measures, *National Enquiry Points. Note by the Secretariat*, G/SPS/ENQ/23, circulated on 27 March 2008, 26 and 28-29.

<sup>313</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, footnote 1. In practice, more than one Enquiry Point is tolerated but not more than one National Notification Authority. Committee on Sanitary and Phytosanitary Measures, *Workshop on Transparency Held on 15 - 16 October 2007. Note by the Secretariat*, G/SPS/R/47, circulated on 8 January 2008, para. 25.

By October 2007, of the then 151 WTO Members, 131 had designated National Notification Authorities and 139 had designated Enquiry Points.<sup>314</sup> Other than Kuwait, all the Members not having established an Enquiry Point and/or National Notification Authority were either developing-country Members, or least-developed-country Members.<sup>315</sup>

### 1.3.5 Implementation of transparency obligations by selected Members

An illustration of the varying degrees of implementation of the transparency provisions of the *SPS Agreement* by Members at different levels of development can be provided by looking at the notification practice of the four Members selected as examples in Part II of this book.

Australia has established a single dedicated agency as both its National Notification Authority and its Enquiry Point under Article 7 and Annex B of the *SPS Agreement*. This is the Australian SPS Contact Point, an agency within the Department of Agriculture, Forestry and Fisheries.<sup>316</sup> Australia reports that it has a dedicated administrative officer to collect and distribute all SPS notifications received and to transmit Australia's comments back to other national Enquiry Points.<sup>317</sup> It maintains electronic address lists to ensure that notifications are distributed promptly to the relevant national agencies and other stakeholders.<sup>318</sup> As a result, interested parties receive notifications quickly, allowing them the maximum time for review of and comment on notified documents. The Enquiry Point also coordinates responses to requests from other Members for further information under Article 5.8 of the *SPS Agreement*.<sup>319</sup> Australia uses e-mail as an efficient means of communication, which it states 'enables SPS Enquiry Points to act as effective conduits for communicating information to the relevant national authorities.'<sup>320</sup> Australia notes that frequently a notification indicates the website where full documentation on the proposed SPS measure can be found.<sup>321</sup> However, when the relevant documents are very large, some Members experience difficulty in downloading them. Australia has adopted

<sup>314</sup> Committee on Sanitary and Phytosanitary Measures, *Implementation of the Transparency Obligations as of 8 October 2007: Note by the Secretariat*, G/SPS/GEN/27/Rev.17, circulated on 9 October 2007.

<sup>315</sup> The following Members had established neither an Enquiry Point nor a National Notification Authority as of 8 October 2007: Burundi, Cambodia, Central African Republic, Chad, Congo, Democratic Republic of the Congo, Guinea, Guinea Bissau, Lesotho, Rwanda, Sierra Leone and Togo. On that date, an Enquiry Point, but no National Notification Authority had been established by: Burkina Faso, Côte d'Ivoire, Former Yugoslav Republic of Macedonia, Ghana, Kuwait, Maldives, Namibia, Nepal and Niger. Only Georgia had established a National Notification Authority but no Enquiry Point. As noted by the Secretariat, of the Members that had not designated a National Notification Authority, 12 were least-developed-country Members and 7 were developing-country Members. Of the Members that had not established an Enquiry Point, 11 were least-developed-country Members and one was a developing-country Member.

<sup>316</sup> Committee on Sanitary and Phytosanitary Measures, *National Notification Authorities. Note by the Secretariat*, G/SPS/NNA/13, circulated on 27 March 2008, 13; Committee on Sanitary and Phytosanitary Measures, *National Enquiry Points. Note by the Secretariat*, G/SPS/ENQ/23, circulated on 27 March 2008, 13.

<sup>317</sup> Committee on Sanitary and Phytosanitary Measures, *Special Meeting of the SPS Committee on Enquiry Points - 31 October 2003: Comment by Australia*, G/SPS/GEN/429, circulated on 14 October 2003, para. 3.

<sup>318</sup> The distribution lists operate through self-nomination, ensuring that interested parties receive relevant notifications. *Ibid.*

<sup>319</sup> *Ibid.*

<sup>320</sup> *Ibid.*, para. 6.

<sup>321</sup> *Ibid.*, para. 4.

the approach suggested in the *Recommended Transparency Procedures* of including an executive summary of the relevant information on the same site as larger documents and has also initiated the provision of compact disc copies of larger documents to facilitate their distribution, especially abroad. It also provides hard copies by mail, but notes that this significantly reduces the period available for comment.<sup>322</sup>

To date Australia has submitted 226 notifications of 225 draft regulations,<sup>323</sup> only 14 of which were notifications of emergency measures with no comment period. Australia usually provides a sixty-day comment period for routine notifications, the expiry of which is well before the expected date of adoption of the measure and its entry into force.<sup>324</sup> However, there are instances of routine notifications in which Australia has not provided a comment period.<sup>325</sup> Usually, Australia indicates the website where the draft documents related to the notification can be found, and indicates the postal address where they can be requested. Australia notifies both draft risk analysis reports<sup>326</sup> and the outcome of the risk analysis process.<sup>327</sup> Australia has also notified its proposed changes to the IRA process for

---

<sup>322</sup> *Ibid.*

<sup>323</sup> See G/SPS/N/AUS/1-226. One notification (G/SPS/N/AUS/141) was mistakenly resubmitted (as G/SPS/N/AUS/142) and was then withdrawn by means of an addendum.

<sup>324</sup> For example, Australia's notification of a draft assessment report regarding an application to amend the *Australia New Zealand Food Standards Code* to approve the use of steviol glycosides as intense sweeteners and flavour enhancers in a range of foods, which was circulated on 25 May 2007 (G/SPS/N/AUS/213), provided a comment period ending on 27 July 2007. It indicated in the box for the proposed date of adoption that a notification to its government was anticipated in December 2007 with adoption (gazettal) to follow, pending Government consideration. The proposed date of entry into force was indicated as being the date of Gazettal pending Government consideration.

<sup>325</sup> For example, Australia's most recent routine notification (G/SPS/N/AUS/226) was circulated on 25 July 2008, but was adopted and came into force on 14 July 2008, thus providing no comment period and no adaptation period. This measure relates to amendments in Australia's quarantine system for imports of horses to prevent the reintroduction of equine influenza after its successful eradication. The notification states that a formal horse import risk analysis will be undertaken, during which comments will be accepted from stakeholders, including WTO Members. It appears therefore that this is a provisional measure, pending a full risk assessment, and should have been notified as an emergency measure.

<sup>326</sup> An example of this is Australia's notification of the report of an assessment regarding an application seeking to amend the *Australia New Zealand Food Standards Code* to increase the current maximum level of cadmium in peanuts from 0.1 mg/kg to 0.5 mg/kg (G/SPS/N/AUS/223, circulated on 6 May 2008). Australia's notification states that all applications to change the *Australia New Zealand Food Standards Code*, 'must be assessed in the context of the following objectives: (a) the protection of public health and safety; (b) the provision of adequate information relating to food to enable consumers to make informed choices; and (c) the prevention of misleading or deceptive conduct.' It states the website and postal address where the assessment report can be obtained and provides a comment period until 20 June 2008.

<sup>327</sup> For example, in May 2007 Australia notified a draft policy review open for public comment in respect of salt and heat treated eggs and alkalized eggs of ducks from Chinese Taipei (G/SPS/N/AUS/212). On 4 October 2007, Australia's Director of Animal and Plant Quarantine made a policy determination in respect of these eggs, based on the conclusions and recommendations of the final policy review that included consideration of comments received on the draft policy review. The outcome of the final determination, namely that salt and heat-treated duck eggs do not require risk management while alkalised duck eggs require risk management for four diseases of quarantine concern (notifiable avian influenza viruses, Newcastle disease virus, and *Salmonella enteritidis* and multi-drug resistant *S. typhimurium*), was notified as an addendum to the original notification on 18 October 2007 (G/SPS/N/AUS/212/Add.1). Australia's practice of notifying both draft IRAs and the outcome of the IRA process is reported in Trade Policy Review Body, *Trade Policy Review: Australia - Report by the Secretariat. Revision*, WT/TPR/S/178/Rev.1, circulated on 1 May 2007, Section IV para. 57.

plant and animal health, and the coming into force of these changes.<sup>328</sup> Where the content or scope of the draft regulation changes, Australia follows the recommended practice of submitting an addendum to the original notification.<sup>329</sup> It also submits revisions to its notifications in case of significant changes,<sup>330</sup> and corrigenda in case of small errors.<sup>331</sup>

Mauritius reports that it has achieved a ‘reasonable level of compliance’<sup>332</sup> with the transparency provisions of the *SPS Agreement*. It has designated an Enquiry Point within the Division of Plant Pathology and Quarantine, namely the Principal Research & Development Officer of the National Plant Protection Office, Ministry of Agro- Industry and Fisheries.<sup>333</sup> The Enquiry Point receives and responds to requests for information regarding national SPS measures.<sup>334</sup> It has also been effective in promptly circulating the notifications of other WTO Members of their SPS measures to interested parties in Mauritius.<sup>335</sup> This has facilitated the formulation of Mauritian positions on these notifications, which are sent to the SPS Committee as appropriate.<sup>336</sup> The Enquiry Point is an

<sup>328</sup> On 27 October 2006, Australia notified proposed reforms to its Import Risk Analysis (IRA) process (G/SPS/N/AUS/203). On 17 September 2007, Australia notified that the *Quarantine Amendment Regulation 2007* (No.1) came into force on 5 September 2007. Its notification stated: ‘These regulations are an important part of the legal framework for the reforms to Australia’s IRA system and include the regulation of the key steps, and overall time frames, for IRAs. The commencement of the new regulations was accompanied by the release of an updated *IRA Handbook 2007* which provides detailed information regarding the new IRA process’ (G/SPS/N/AUS/203/Add.1).

<sup>329</sup> For example, Australia submitted an addendum to its notification of emergency measures to suspend imports of fresh produce and nursery stock of tomatoes, capsicum, eggplant, pepino, potato and chilli from New Zealand to manage the risk of introduction to and spread in Australia of an undescribed species of the genus *Candidatus Liberibacter* (G/SPS/N/AUS/224) in order to include a further three potential hosts of *Candidatus Liberibacter*: tamarillo, cape gooseberry and tomatillos (G/SPS/N/AUS/224/Add.1).

<sup>330</sup> An example of a revision can be found in G/SPS/N/AUS/199/Rev.1, circulated on 4 December 2006, revising Australia’s quarantine measures on fresh corm taro (*Colocasia esculenta*) (previously notified in G/SPS/N/AUS/199) to ensure the suspension on the importation the *antiquorum* variety of this plant can be effectively enforced. The revision was necessary due to the indication in available scientific literature *Colocasia esculenta* var. *antiquorum* has a high capacity to propagate even when topped and free from all foliage including petiole bases and therefore presents an increased risk of introducing pests and diseases of quarantine concern to Australia.

<sup>331</sup> For example, Australia submitted a corrigendum to notification G/SPS/N/AUS/192 soon after the original notification was made, to indicate that the notification concerned an amendment to the conditions for importation of hatching eggs of domestic *turkeys* from approved countries, rather than eggs of domestic *hens* as the original notification incorrectly stated (G/SPS/N/AUS/192/Corr.1).

<sup>332</sup> Committee on Sanitary and Phytosanitary Measures, *The Mauritian Experience with the SPS Agreement from the Indian Ocean Perspective*, G/SPS/GEN/526, circulated on 25 October 2004, para. 8.

<sup>333</sup> Committee on Sanitary and Phytosanitary Measures, *National Enquiry Points. Note by the Secretariat*, G/SPS/ENQ/23, circulated on 27 March 2008, 33.

<sup>334</sup> Committee on Sanitary and Phytosanitary Measures, *The Mauritian Experience with the SPS Agreement from the Indian Ocean Perspective*, G/SPS/GEN/526, circulated on 25 October 2004, para. 8.

<sup>335</sup> In the private sector of Mauritius, among farmers and other producers, there is little understanding of the *SPS Agreement*, as a result of which one may expect that few producers will lobby the relevant authorities to take steps under this Agreement to address export barriers they face. Exceptions to this are representative bodies such as the Chamber of Commerce and Industry and the Chamber of Agriculture, as well as representatives of producers of certain commodities such as sugar and pineapples, which are reported to be well informed as to the disciplines of the *SPS Agreement*. Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume II: Procedures Followed by Selected International Standard-Setting Organisations and Country Reports on TBT and SPS* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2004, 152.

<sup>336</sup> *Ibid.*, 151. However, it is interesting to note that Mauritius has, to date, never raised a specific trade concern at a meeting of the SPS Committee or supported any concern raised by another Member. See further below,

active participant in all SPS-related national decision-making. The head of the Enquiry Point used to attend meetings of the SPS Committee in Geneva at least once a year. This required substantial financial resources so at other meetings Mauritius is represented by its Permanent Mission in Geneva.<sup>337</sup> In 2006, however, Mauritius reported that resource constraints prevented the participation of capital-based representatives at SPS Committee meetings.<sup>338</sup>

Notification to the WTO of Mauritian SPS measures is carried out by the Secretary for Foreign Affairs of the Ministry of Foreign Affairs, International Trade and Regional Cooperation (its designated National Notification Authority)<sup>339</sup> and coordinated by the Division of Plant Pathology and Quarantine. Mauritius has made 12 notifications so far, of which six were emergency measures.<sup>340</sup>

Jamaica has established the infrastructure necessary for transparency in SPS matters, but its operation leaves much to be desired. The Plant Quarantine/Produce Inspection (PQ/PI) Unit of the Ministry of Agriculture and Lands has been designated as Jamaica's Enquiry Point and the Ministry of Foreign Affairs and Foreign Trade as its National Notification

<sup>337</sup> *Ibid.*, 151.

<sup>338</sup> Committee on Sanitary and Phytosanitary Measures, *Experience with the Implementation of the SPS Agreement. Information for the Workshop on 31 March 2006. Communication from Mauritius, G/SPS/GEN/657*, circulated on 27 March 2006, para. 2. The representation of Mauritius at SPS Committee meetings is discussed below, Part IV, Section 2.1.

<sup>339</sup> Committee on Sanitary and Phytosanitary Measures, *National Notification Authorities. Note by the Secretariat, G/SPS/NNA/13*, circulated on 27 March 2008, 18.

<sup>340</sup> See WT/SPS/N/MUS/1-12. The first notification of Mauritius in September 1999 was rather unusual in that, instead of notifying a specific proposed SPS regulation, it set out a series of steps taken *prior* to the notification to address concerns with dioxin contamination, following the dioxin detection in Belgium. It notified that on 5 June 1999 a ban with immediate effect had been imposed on all food products from Belgium, followed by a ban imposed on 18 June 1999 on all meat products from the EC. On 25 June, the ban was lifted for meat and poultry products from the EC excluding Belgium, if the exports were accompanied by a veterinary certificate from the exporting Member's competent authority certifying that the product was not contaminated by dioxin. As of 30 July, food products from the EC, excluding Belgium, were allowed to be imported into Mauritius if accompanied by the required certification. All these steps, including the adoption of the final measure predated the notification and thus no comment period was provided. The second, third, fourth, fifth and sixth notifications of Mauritius all related to emergency measures, whose entry into force predated the circulation of the notification thus providing for no comment or adaptation period. These measures were: a temporary ban on fish and fish products from South Africa due to cholera outbreaks and four temporary bans to prevent the introduction of foot-and mouth disease (namely a ban on all livestock and livestock products from the UK; a ban on all meat products from the EC, except poultry and canned pork; a temporary ban on live cattle, sheep and goats from Zimbabwe and South Africa; and a temporary ban on imports of horses and other equidae from the UK). The seventh, eighth and ninth notifications of Mauritius related to the lifting of some of these bans, following the OIE report of 2001 on the foot-and-mouth disease situation in different countries. Normally, as set out in the *Recommended Transparency Provisions* discussed above, this type of change in a measure should be notified as an addendum to the original notification rather than as a new notification. Mauritius's tenth notification is also rather unusual in that it does not relate to a proposed SPS regulation of Mauritius that may affect trade of other Members, but rather notifies an agreement between Mauritius and Madagascar to eliminate the risk of BSE transmission through animal feed exports to Madagascar, by ensuring that no meat meal or bone meal would be used as animal feed ingredients in Mauritius. The eleventh and twelfth notifications of Mauritius are of emergency measures, one temporarily banning imports of fruit and vegetables from Kenya due to the detection of fruit flies on the Kenyan coastal region; and the other banning imports of live poultry and pigs as well as their frozen or chilled products from South Africa following reports of highly-pathogenic avian influenza in ostriches in South Africa.

Authority.<sup>1</sup> While hard copies of SPS notifications are received by the Ministry of Foreign Affairs and Trade, it does not have the resources to sort and prioritise them or distribute them to stakeholders for comments. Jamaica's Enquiry Point, the PQ/PI Unit, has taken over the responsibility for this. However, Reid has noted that while the PQ/PI Unit is already on the WTO's list of Enquiry Points, all that has happened is that one officer from the Unit has been trained and the Enquiry Point has been given the necessary software by the US Department of Agriculture.<sup>2</sup> The software downloads new notifications, without any sorting or prioritisation, and distributes them as a newsletter to 18 persons in the Jamaican government.<sup>3</sup> Problems with the software following changes to the WTO website resulted in no newsletters being produced between May 2001 and February 2002, until the software was amended. Inadequate computer access and human resource constraints have also hindered Jamaica in benefiting from notifications. The PQ/PI Unit has made a request for a person with a computer dedicated to the task of monitoring notifications alone.<sup>4</sup> There is no system in place to manage the flow of information between technocrats, SPS policy makers and producers in Jamaica. In addition, problems have been identified with internal communication between the various government departments and agencies dealing with SPS issues,<sup>5</sup> making the operation of the Enquiry Point inefficient.<sup>6</sup> Reid points out that Jamaica 'needs much more in terms of managing the Enquiry Point and the information systems needed to support it.'<sup>7</sup>

Jamaica has notified eleven SPS measures to the WTO, in terms of the transparency requirements of the *SPS Agreement*. Eight of these notifications relate to emergency measures and provide no comment period. In addition, one routine notification provides no comment period, and adaptation periods are either not provided or not specified.<sup>8</sup>

<sup>5</sup> *Ibid.*

<sup>6</sup> The ITC/Commonwealth Secretariat report notes that by September 2001, the PQ/PI Unit had received three requests for information following notifications by Jamaica (from the US, Canada and Mexico) but had been unable to respond to any due to difficulties in obtaining the necessary information. *Ibid.*, 116.

<sup>7</sup> Janice Reid, *Needs Analysis of the Readiness of Jamaican Institutions for WTO-SPS: Executive Summary* (Inter-American Institute for Cooperation on Agriculture, Kingston), April 2000, 7, available at: [www.agroinfo.org/caribbean/iicacarc/jamaica/summary.pdf](http://www.agroinfo.org/caribbean/iicacarc/jamaica/summary.pdf), visited on 7 January 2008.

<sup>8</sup> See G/SPS/N/JAM/1-11. Jamaica's first notification related to standards for jerk seasoning (including chemical and microbiological specifications). The deadline for comments was given in the same month (July 1996) in which the notification was made but specifies no date, and the date of adoption and entry into force were both October 1996, thus providing no adaptation period. The second notification was of the proposed adoption of the HACCP system for the production of canned ackee in brine. A two-month comment period was given, and the dates of adoption and entry into force of the new requirements were not specified. Jamaica's eighth notification related to draft regulations laying down import conditions for fruits, vegetables, plants and plant parts. A comment period of almost two months was given. The proposed date of adoption of the regulations, however, coincided with the end of the comment period, meaning that no time was provided for consideration

Bangladesh has designated the Director-3 WTO Cell of its Ministry of Commerce as both its Enquiry Point and its National Notification Authority under the *SPS Agreement*.<sup>9</sup> However, Bangladesh experiences difficulties meeting its notification obligations under WTO rules, including those under the *SPS Agreement*.<sup>10</sup> In fact, it has, to date, never notified an SPS measure to the WTO. As a least-developed-country Member, Bangladesh benefited from a five-year transition period for implementation of the *SPS Agreement*, including its transparency obligations. However, Bangladesh is of the view that this transition period was too short.

### 1.3.6 Problems with implementation

The inadequate implementation of the transparency provisions of the *SPS Agreement* was among the implementation concerns raised in the run-up to the Seattle Ministerial Conference. India emphasised the problems caused by this poor implementation for developing-country Members.<sup>11</sup> It noted that SPS measures are often developed in a non-transparent manner and that developing-country Members invariably are not given an adequate opportunity to respond to the proposed measures. Further, referring to the obligations in the *SPS Agreement* to provide a reasonable interval between the publication of an SPS measure and its entry into force (Annex B.2), and to grant ‘longer time-frames for compliance’ for developing-country Members (Article 10.2), it pointed out that:

The basic purpose of these provisions is to provide sufficient time to producers in developing countries to adopt their products to the requirements of new regulations. In practice, compliance of these provisions by countries introducing new measures has been largely non-existent.<sup>12</sup>

---

of comments received. The actual adoption of the regulations, however, was notified by Jamaica almost a year later, by means of an addendum to its eighth notification (G/SPS/N/JAM/8/Add.1). All the remaining notifications related to emergency measures. The third and fourth notifications were of precautionary measures restricting imports of certain animal products (including untreated milk) and straw/fodder from Uruguay and from the UK, Ireland, France, the Netherlands and Argentina due to outbreaks of FMD. The fifth notification was of a precautionary measure against imports of beef and beef products from the EC due to concerns with regard to BSE. Jamaica’s sixth notification was of a measure laying down fumigation and certification requirements on wood pallets from Trinidad and Tobago to prevent the importation of two quarantine pests. Three months later, Jamaica submitted an addendum to that notification, stating that one of the pests addressed in its notification was already present in Jamaica and thus not considered a quarantine pest. Jamaica’s seventh notification, related to a temporary suspension of imports of beef and beef products and bovine-derived pharmaceuticals from the US due to BSE risks. Jamaica’s ninth, tenth and eleventh notifications related to emergency measures on wooden pallets used as packaging for floor tiles, to prevent the introduction of a wood boring pest from India, Thailand and Indonesia. All these emergency notifications post-dated the entry into force of the measure involved and therefore did not provide for any comment period.

<sup>9</sup> Committee on Sanitary and Phytosanitary Measures, *National Enquiry Points. Note by the Secretariat, G/SPS/ENQ/23*, circulated on 27 March 2008; Committee on Sanitary and Phytosanitary Measures, *National Notification Authorities. Note by the Secretariat, G/SPS/NNA/13*, circulated on 27 March 2008, 3.

<sup>10</sup> Trade Policy Review Body, *Trade Policy Review: Bangladesh - Report by the Secretariat, WT/TPR/S/68*, circulated on 3 April 2000, Part II para. 25 and Table II.23.

<sup>11</sup> General Council, *Preparations for the 1999 Ministerial Conference. Proposals Regarding the Agreement on Sanitary and Phytosanitary Measures in Terms of Paragraph 9(a)(1) of the Geneva Ministerial Declaration. Communication from India, WT/GC/W/202*, circulated on 14 June 1999.

<sup>12</sup> *Ibid.*, para. 1.

The *Implementation Decision* adopted in 2001 at the Doha Ministerial Conference, as discussed above, aims to address the problem of short compliance periods by providing that each of these two periods should be at least six-months.<sup>13</sup> However, problems remain with the inadequate implementation of these and other transparency obligations, as highlighted by China in 2003, when it submitted an analysis of the SPS notifications submitted in 2002.<sup>14</sup> This analysis showed that of the 374 routine notifications submitted in that year only 14 notifications (3.7 percent of routine notifications) provided an adaptation period of at least 6 months, 128 notifications (34.2 percent) provided an adaptation period of less than 6 months and 232 notifications (62.1 percent) did not specify the date of adoption and/or the date of entry into force.<sup>15</sup>

The analysis conducted by China also identified problems in the provision of a ‘reasonable time’ for comments as required by Annex B.5(d) and specified as normally at least 60 days in the *Recommended Transparency Procedures*. As noted by China, in view of the major difficulties faced by many developing-country Members in keeping track of the flood of notifications, a too short comment period may make it impossible for these Members to make use of this possibility to have their concerns taken into account. Of the 374 routine notifications submitted in 2002, only 79 (21.1 percent) allowed at least 60 days for comments, and 230 notifications (61.5 percent) allowed a comment period of less than 60 days. The final dates for comments for 11 notifications (2.9 percent) were earlier than the dates of circulation of the notification, depriving Members of their right to comment on the notifications altogether. In 54 notifications (14.5 percent) no final dates for comments were specified.<sup>16</sup> An additional problem identified by China, aside from the too short comment periods provided in most notifications, is that time is needed between the date of submission of a notification and its circulation to Members by the WTO Secretariat for the review and translation of the document by the Secretariat. This eats into the comment period.<sup>17</sup> In addition, China pointed out that the requirement in Annex B.5(d) that comments shall be taken into account is undermined by the fact that

---

<sup>13</sup> Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001, paras 3.1 and 3.2. The reasonable adaptation period and the longer compliance period for developing-country Members are discussed further below, Part V, Sections 1.2 and 1.3.

<sup>14</sup> Committee on Sanitary and Phytosanitary Measures, *Report of the Analysis on SPS Notifications in 2002. Submission by China*, G/SPS/GEN/378, circulated on 31 March 2003.

<sup>15</sup> As the notification format provided to Members in the second revision of the *Recommended Transparency Procedures* provided boxes for the date of adoption and the date of entry into force of a measure but not for the date of publication, this calculation was made on the assumption that the measure was published on the date of its entry into force. *Ibid.*, para. 12. This omission has been corrected in the latest revision of the *Recommended Transparency Procedures*.

<sup>16</sup> *Ibid.*, para. 10.

<sup>17</sup> Consequently, China has proposed that the comment period not be indicated by means of a specific deadline for comments, but rather by an indication of the number of days from the *date of circulation* of the notification by the Secretariat (normally 60 days) provided for comments. Committee on Sanitary and Phytosanitary Measures, *Proposal for Amending the Recommended Transparency Procedures Relating to the Comment Period of SPS Notifications. Submission by China*, G/SPS/W/131, circulated on 31 March 2003. However, several Members, including Australia and the US, stated that their domestic regulatory procedures require them to specify the *date* at which the comment period expires. New Zealand emphasised that the determination of when a comment period begins or ends is the sovereign right of a Member and cannot be left to the Secretariat to determine. Further Japan pointed out that the date of circulation is unpredictable and was thus not an appropriate date from which to calculate the comment period.

no period is provided for between the last day for comments and the date of adoption of the measure. Of the 374 routine notifications examined by China, only 67 notifications (17.9 percent) provided at least one day between the expiry of the comment period and the date of adoption for the consideration of comments from other Members. The remaining 307 notifications (82.1 percent) did not provide any interval for the consideration of comments, or the final date for comments and/or the proposed date of adoption were not available. It was even the case in 38 notifications that the date of adoption was *earlier* than the final date for comments.<sup>18</sup>

More recently, in 2007, the WTO Secretariat undertook a similar, though more limited, review of the level of implementation of the transparency obligations of the *SPS Agreement*. This review indicated that in the period June-August 2007, while 73 percent of notifications submitted provided a comment period, the average period they allowed was only 40 days. In addition, 22 percent of notifications submitted did not provide a comment period at all. A remaining five percent provided a comment period which ended before the date of circulation of the notification.<sup>19</sup>

Not only are the comment periods and adaptation periods provided by Members often inadequate, but other aspects of notifications are also in need of improvement. Members are required to indicate the products covered by their notifications under Annex B.5(b). According to the *Recommended Transparency Procedures*, in order to ensure a clear indication of the product, this should be done by indicating the tariff item number of the product as contained in the notifying Member's national schedule of commitments.<sup>20</sup> However, Members rarely do so.<sup>21</sup> In addition, very few notifications identify the Members or regions most likely to be affected by the notified regulation, despite the encouragement to do so in the *Recommended Transparency Procedures*.<sup>22</sup> In addition, contrary to the obligation in Annex B.5(c) of the *SPS Agreement* to identify the parts of the proposed regulation that deviate in substance from international standards, where possible, very few notifications do so.<sup>23</sup>

Another problem that has been raised with regard to transparency relates to language. As noted above, while the notification of a proposed SPS regulation must be made in one of

---

<sup>18</sup> Committee on Sanitary and Phytosanitary Measures, *Report of the Analysis on SPS Notifications in 2002. Submission by China*, G/SPS/GEN/378, circulated on 31 March 2003, para. 14.

<sup>19</sup> Committee on Sanitary and Phytosanitary Measures, *Overview Regarding the Level of Implementation of the Transparency Provisions of the SPS Agreement: Note by the Secretariat*, G/SPS/GEN/804, circulated on 11 October 2007, Table 3.

<sup>20</sup> The national schedule of commitments of each Member contains its tariff bindings, usually classified according to the Harmonised System of Tariff Classification (HS) developed by the World Customs Organisation. In such cases the HS chapter and heading number of the products covered should be provided in the notification of an SPS regulation.

<sup>21</sup> Committee on Sanitary and Phytosanitary Measures, *Overview Regarding the Level of Implementation of the Transparency Provisions of the SPS Agreement: Note by the Secretariat*, G/SPS/GEN/804, circulated on 11 October 2007, para. 16.

<sup>22</sup> *Ibid.* This report indicates that in June-August 2007, only 16% of notifications identified a group of countries or region affected. Others refer generally to 'all countries' or 'all trading partners'.

<sup>23</sup> *Ibid.*, Figure 5. This overview indicates that 13.3% of notifications refer to CAC standards, 9% to OIE standards, 8% to IPPC standards and the remaining 69.8% do not refer to international standards at all. In some cases this may be due to the fact that no relevant international standards exist, but it is unlikely that this is the situation in almost 70% of cases.

the three WTO official languages,<sup>24</sup> the obligation to provide translations of documents relating to notified regulations (or in the case of voluminous documents summaries thereof) in one of the official languages of the WTO is limited to developed-country Members, and then only upon request.<sup>25</sup> No translation obligation at all exists in respect of the publication of the final measure. As a result, many Members that lack the resources to undertake translations of the relevant documentation, are unable to familiarise themselves with the content of the proposed SPS regulation and benefit from the *ex ante* effects of transparency.<sup>26</sup> Other Members that do have the capacity to undertake translations but have insufficient resources to do so promptly may find that the comment period has expired by the time they have the notified draft regulation in a language they can understand. Once again, this undermines their ability to benefit from the transparency disciplines of the *SPS Agreement*. China suggested that Members submit to the WTO Secretariat, with their notifications, the draft SPS regulation being notified and that the Secretariat translate the draft when it translates the notification. This was rejected as placing an unmanageable translation burden on the Secretariat.<sup>27</sup>

Implementation problems relate not only to notifications and publication of measures, but also to requests for information. The inadequate implementation of Article 5.8, evinced by the frequent lack of responses to the requests by Members for information under this Article, was highlighted by the EC in 1999.<sup>28</sup> In addition, there are often lengthy delays in responding to requests for information. In 2007, a survey by the Secretariat indicated that the time taken to respond to queries varied between one and 60 days.<sup>29</sup> Members have

<sup>24</sup> Annex B.7 of the *SPS Agreement*. Notifications are translated into the other two WTO official languages by the WTO Secretariat and are circulated to all Members.

<sup>25</sup> The *Recommended Transparency Procedures* adopted by the SPS Committee suggest that where a translation of a requested document or its summary exists in the WTO working language used by the requesting Member, it should automatically be sent with the original of the document requested. If such translation does not exist, the notifying Member should inform the requesting Member of any other Members that have requested a copy of the document so that the requesting Member can approach them to determine if they are willing to share any translation that they have or will be making. Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, paras 25 and 27.

<sup>26</sup> This problem was pointed to already in October 1996, when Argentina expressed its regret that the regulations notified by Japan and Korea were not available in one of the three WTO working languages. The Chairman of the SPS Committee recalled the obligation on developed-country Members in Annex B.8 of the *SPS Agreement* to provide documents (or summaries thereof) in a WTO working language, if requested to do so by another Member. Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 13.

<sup>27</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 24-25 June 2003: Note by the Secretariat*, G/SPS/R/30, circulated on 4 September 2003, para. 83. The Secretariat noted, in addition, that this translation burden would relate to documents that were only draft regulations and not final texts. A mechanism has instead been created to enable Members to make available the unofficial translations of the documents relating to a notification that they may have made. On this mechanism, see below, Part IV, Section 1.3.7.

<sup>28</sup> Committee on Sanitary and Phytosanitary Measures, *Implementation of the SPS Agreements - Trade Concerns. Submission by the European Communities at the Meeting of 7 - 8 July 1999*, G/SPS/GEN/132, circulated on 21 July 1999. In this document, the EC lists eighteen requests for information it made under Article 5.8 of the *SPS Agreement*, some made on bilateral basis and some in the form of documents circulated to all Members to draw the attention of the SPS Committee to its questions to a particular Member. Of the listed requests, only two had received an answer.

<sup>29</sup> This data was taken from 58 responses by Members to a questionnaire circulated by the Secretariat. Committee

indicated difficulty in obtaining access to full texts of regulations. While it was recognised that national SPS websites could facilitate such access, the costly nature of this option for certain developing-country Members and least-developed-country Members was noted. Some Members suggested that the Secretariat provide assistance in this regard.<sup>30</sup>

The challenges faced by Members at lower levels of development in the operation of National Notification Authorities and Enquiry Points have been pointed to as an implementation problem.<sup>31</sup> The Enquiry Points of some Members do not have access to the necessary facilities in order to function effectively.<sup>32</sup> Some Enquiry Points do not have established contacts with the relevant government bodies from which answers must be obtained in order to be able to reply to requests for information. They are thus unable to respond to requests within the recommended five days. In addition, not all National Notification Authorities have effective links with the technical officials that are responsible for drafting and amending SPS measures. This makes it difficult for them to provide accurate information in the notification of a proposed measure, and to ensure that the comments they receive from interested Members with regard to the notified measures are properly taken into account. In 2006, the US, Australia and New Zealand noted the need to address the question of how the SPS Committee can best assist the Members that have not designated an Enquiry Point or National Notification Authority in doing so, and how it can better ensure that the Enquiry Points that have been identified are operational and working to further the full implementation of the Agreement.<sup>33</sup> They urged the Committee to initiate a detailed study of these and other transparency-related problems.<sup>34</sup> In their responses to the Secretariat's questionnaire on the operation of Enquiry Points and National Notification Authorities, Members indicated a strong preference for enhanced interaction between Members' bodies, to facilitate information sharing and the development of best practices. Twinning<sup>35</sup> or mentoring arrangements were suggested.<sup>36</sup>

---

on Sanitary and Phytosanitary Measures, *Analysis of Replies to the Questionnaire on the Operation of Enquiry Points and National Notification Authorities. Note by the Secretariat. Revision*, G/SPS/GEN/751/Rev.1, circulated on 18 June 2007, para. 23.

<sup>30</sup> Committee on Sanitary and Phytosanitary Measures, *Workshop on Transparency Held on 15 - 16 October 2007. Note by the Secretariat*, G/SPS/R/47, circulated on 8 January 2008, para. 34.

<sup>31</sup> On the difficulties of Malawi, an LDC Member, in upgrading the facilities of the Malawi Bureau of Standards to cope with the additional function of being an SPS Enquiry Point, see Committee on Sanitary and Phytosanitary Measures, *Establishment of National WTO TBT/SPS Enquiry Point. Project Proposal. Submission by Malawi*, G/SPS/GEN/349, circulated on 24 October 2002.

<sup>32</sup> For example, Malawi reports that its Bureau of Standards, which will function as its Enquiry Point, currently has a small technical paper library for national, foreign national, regional and international standards, as well as other publications. It receives over 10,000 documents in a year, which creates problems for its limited space. In addition, some documents, mainly national standards, are stored and retrieved on three outdated IBM computers, subject to frequent breakdowns and lack of spare parts. This has led to loss of information or the inability to access information. The computers also process data slowly, rendering computer services ineffective and inefficient. *Ibid.*, para. 3.

<sup>33</sup> Committee on Sanitary and Phytosanitary Measures, *Second Review of the Operation and Implementation of the SPS Agreement. Review of the Implementation of Transparency Provisions. Communication from Australia, New Zealand and the United States*, G/SPS/W/197, circulated on 13 June 2006, paras 4-5.

<sup>34</sup> For a description of the work undertaken by the SPS Committee in this regard, see below, Part IV, Section 1.3.7.

<sup>35</sup> Twinning refers to an arrangement whereby an Enquiry Point or National Notification Authority in a less-developed Member is paired with the corresponding body in a developed-country Member, in order to benefit from technical advice and knowledge sharing from the latter.

<sup>36</sup> Committee on Sanitary and Phytosanitary Measures, *Analysis of Replies to the Questionnaire on the*

Some of the ‘implementation problems’ relating to the transparency provisions of the *SPS Agreement* do not relate, strictly speaking, to the difficulty of enforcing or complying with these provisions, but rather to the capacity constraints that limit the benefits that Members at lower levels of development can derive from them. Among these constraints are institutional problems, such as the insufficient coordination between government ministries,<sup>37</sup> limiting the flow of information regarding notified draft SPS regulations and undermining the possibilities for framing responses that reflect national positions. Also, capacity constraints in managing the great inflow of notifications have been identified.<sup>38</sup> In addition, weak links with private sector stakeholders have been recognized as a challenge,<sup>39</sup> having the effect that information on new or changed SPS measures is not promptly communicated to producers,<sup>40</sup> reducing their opportunities to adjust to the new requirements in a timely manner, or to communicate their concerns with the new measure to their government so that these may be taken on board in discussions with the notifying Member. Some transparency problems have their source in deeper capacity problems going to the core of the *SPS Agreement*, namely the weakness of scientific capacity in some less-developed Members. As noted by Wolfe:

Without a scientific establishment at home able to understand the technical basis of another country’s notification, it is hard to know whether it should be challenged in the committee, especially when hundreds of new notifications arrive every year.<sup>41</sup>

This indicates that efforts to address implementation problems relating to the transparency obligations of the *SPS Agreement* by improving the institutions and procedures for transparency, while necessary, will not be sufficient on their own. They must be supported by concerted efforts to address underlying problems with inadequate SPS regulatory capacity.<sup>42</sup>

---

*Operation of Enquiry Points and National Notification Authorities. Note by the Secretariat. Revision, G/SPS/GEN/751/Rev.1, circulated on 18 June 2007, para. 11(a). A mentoring mechanism was developed in 2008, as discussed below, Part V, Section 2.7.*

<sup>37</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting of 18-19 October 2007. Note by the Secretariat, G/SPS/R/46, circulated on 2 January 2008, para. 41(b).*

<sup>38</sup> *Ibid.*, para. 41(e). As indicated in the Secretariat’s analysis of replies to its questionnaire on the operation of Enquiry Points and National Notification Authorities, this area is one where Members have strongly indicated the need for technical assistance and guidance from best practices. Committee on Sanitary and Phytosanitary Measures, *Analysis of Replies to the Questionnaire on the Operation of Enquiry Points and National Notification Authorities. Note by the Secretariat. Revision, G/SPS/GEN/751/Rev.1, circulated on 18 June 2007, para. 11(b).* This has also been identified as a problem in Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume I: Background Information, Findings from Case Studies and Technical Assistance Needs* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2003, 66.

<sup>39</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting of 18-19 October 2007. Note by the Secretariat, G/SPS/R/46, circulated on 2 January 2008, para. 41(c).*

<sup>40</sup> Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. <sup>41</sup> Robert Wolfe, ‘Regulatory Transparency, Developing Countries and the WTO’, *World Trade Review* 2 (2), 2003, 157-182, 169.

<sup>42</sup> The issue of SPS-related technical assistance and capacity building is addressed below, Part V, Section 2.5.

### 1.3.7 Work on improving the implementation of the transparency provisions

In 1996 the SPS Committee established detailed *Recommended Notification Procedures*, to facilitate compliance by Members with their notification obligations.<sup>43</sup> These recommended procedures contain guidelines for notifications under both the normal and the urgent procedure, including specific formats to be used for routine and emergency notifications. The formats are useful in that they specify the information that a Member should provide in each notification, and present this in a standardised form. The *Recommended Notification Procedures* explicitly do not add to or detract from the rights and obligations of Members under the *SPS Agreement*, nor do they provide a legal interpretation or modification of the Agreement.<sup>44</sup> These guidelines have been revised three times to address Members' concerns regarding issues such as the period for comments on notified measures, the timing of notifications, the provision of documents relating to a notification, the handling of comments on notifications, the use of addenda, corrigenda and revisions to notifications, and the notification of measures that conform to international standards.<sup>45</sup>

More specifically, the second revision extends the coverage of the recommended procedures to cover not only notification, but also the other transparency obligations of the *SPS Agreement*. It is therefore known as the *Recommended Transparency Procedures*. This revision states that where previously notified measures are changed so as to apply to new Members or new products they should be re-notified by means of the submission of a Revision. An additional sixty days are allowed for comments in such cases. The revision was originally proposed by New Zealand in response to an implementation proposal of Brazil<sup>46</sup> that called for the re-notification of measures if they may have negative trade effects on trade opportunities of developing countries.<sup>47</sup> An addendum to the second revision incorporates into procedures for the notification of the recognition of equivalence, and a special format for such notifications.<sup>48</sup>

<sup>43</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Notification Procedures*, G/SPS/7, circulated on 11 June 1996.

<sup>44</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, para. 3. On the legal status of the *Recommended Transparency Procedures*, see below, Part IV, Section 2.1.1.

<sup>45</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Notification Procedures. Revision*, G/SPS/7/Rev.1, circulated on 26 November 1999; Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7). Revision*, G/SPS/7/Rev.2, circulated on 2 April 2002; Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008.

<sup>46</sup> Committee on Sanitary and Phytosanitary Measures, *Agreement on the Application of Sanitary and Phytosanitary Measures. Proposal by Brazil*, G/SPS/W/108, circulated on 22 June 2001.

<sup>47</sup> Brazil's proposal followed a dispute with Canada in February 2001 due to a ban by Canada of Brazilian beef imports due to BSE concerns. The ban was based on a previously notified regulation and was therefore not notified to the WTO although it was applied to Brazil for the first time. *Bridges Weekly Trade News Digest*, 26 March 2002.

<sup>48</sup> Committee on Sanitary and Phytosanitary Measures, *Notification of Determination of the Recognition of Equivalence of Sanitary and Phytosanitary Measures. Decision by the Committee. Addendum*, G/SPS/7/Rev.2/Add.1, circulated on 25 July 2002. As noted above, to date two notifications of the recognition of equivalence have been received.

The third revision, adopted in April 2008, includes new procedures and forms for notifications and details of new on-line databases where notifications of SPS measures and other relevant information are compiled.<sup>49</sup> It also encourages WTO Members also to notify when they adopt SPS measures that are based on, conform to or are substantially the same as international standards.<sup>50</sup> To address the problem that the comment period is shortened due to delays in circulating notifications, the revised procedures provide that, where domestic regulatory mechanisms allow, the comment period should start at the date of circulation of the notification by the WTO Secretariat.<sup>51</sup> If the guidelines on regionalisation, discussed above, were not adopted, their transparency provisions were to be inserted into the revised text of the guidelines on notification. However, with the adoption of the *Regionalisation Decision* its own transparency provisions apply.<sup>52</sup> The third revision of the *Recommended Transparency Procedures* was adopted *ad referendum* in April 2008,<sup>53</sup> and as no objections were received the adoption was confirmed on 30 May 2008.<sup>54</sup>

In addition, as discussed below, in order to improve transparency regarding the provision of SDT to developing-country Members, in November 2004, the SPS Committee adopted a *Procedure to Enhance Transparency of SDT*.<sup>55</sup> This non-binding Decision essentially follows the *Recommended Transparency Procedures*, but adds new actions to make provision for raising compliance difficulties in comments on notified draft SPS regulations or adopted regulations; the discussion of these comments; and the notification of the decision taken on SDT by means of an Addendum to the original notification. The *Recommended Transparency Procedures* encourage Members to make use of the

---

<sup>49</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, para. 63.

<sup>50</sup> *Ibid.*, para. 8. The Secretariat's analysis of the responses to its questionnaire on the operation of Enquiry Points and National Notification Authorities indicates that the large majority of respondents prefer WTO Members to notify all new or changed SPS regulations, whether or not based on international standards. However, some warn about the excessive number of notifications that this may generate, when Members are already struggling to handle the existing volume of notifications. Committee on Sanitary and Phytosanitary Measures, *Analysis of Replies to the Questionnaire on the Operation of Enquiry Points and National Notification Authorities. Note by the Secretariat. Revision*, G/SPS/GEN/751/Rev.1, circulated on 18 June 2007, para. 11(f).

<sup>51</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, para. 13.

<sup>52</sup> As noted above, the *Regionalisation Decision* encourages Members to notify the SPS Committee of their requests for, and determinations of, the recognition of pest- or disease-free areas or areas of low pest or disease prevalence. One such notification has been received thus far. See further above, Part IV, Section 1.2.6.

<sup>53</sup> The term '*ad referendum*' means that a decision is provisionally adopted, and the adoption becomes final if no Member objects by a certain deadline, *in casu* 30 May 2008. On adoption *ad referendum*, see further below, Part IV, Section 2.1.

<sup>54</sup> The recommendations will come into effect on 1 December 2008 as time is needed to prepare the new notification formats, and for the WTO Secretariat to adapt the electronic system it uses to manage and circulate the notifications to the rest of the membership. The recommendations were circulated to Members in Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008.

<sup>55</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members. Decision by the Committee of 27 October 2004*, G/SPS/33, circulated on 2 November 2004. This Decision is discussed below, Part V, Section 1.8.

procedures in the *Procedure to Enhance Transparency of SDT*.<sup>56</sup> By 31 August 2007, no notification had been submitted under this new procedure. In their responses to a questionnaire circulated by the WTO Secretariat, a significant number of Members indicated as a reason for the lack of use of this procedure the difficulties faced by developing-country Members in screening notifications quickly enough to identify compliance difficulties that could be addressed through SDT. However, some Members stated that although the steps set out in this procedure for raising and discussing compliance difficulties were being followed, the use of the procedure and its outcome was not being notified.<sup>57</sup>

In 2000, the WTO Secretariat drafted a clear explanation of the rules in the *SPS Agreement* on transparency, contained in the handbook *How to Apply the Transparency Provisions of the SPS Agreement* (referred to as the *Handbook on Transparency*).<sup>58</sup> These are particularly aimed at providing practical guidance to help developing-country Members comply with their transparency obligations, in response to requests from several developing- and least-developed-country Members.

The WTO Secretariat has organised three workshops for Members on the transparency provisions of the *SPS Agreement*. The first of these was held in November 1999,<sup>59</sup> just prior to the expiry of the transitional period granted in the *SPS Agreement* to LDC Members,<sup>60</sup> to assist these and other Members to address problems and concerns relating to notification obligations and the functioning of Enquiry Points and National Notification Authorities. Officials from the Enquiry Points and National Notification Authorities of all Members were invited. The Secretariat, using a Trust Fund provided by Norway, funded the participation of officials from the eight LDC Members that had notified either their Enquiry Point or their National Notification Authority (or both) to the WTO.<sup>61</sup>

---

<sup>56</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, para. 34.

<sup>57</sup> Committee on Sanitary and Phytosanitary Measures, *Analysis of Replies to the Questionnaire on the Operation of Enquiry Points and National Notification Authorities. Note by the Secretariat. Revision*, G/SPS/GEN/751/Rev.1, circulated on 18 June 2007, para. 11(i). Other respondents indicated that developing-country Members are using other channels to request SDT.

<sup>58</sup> New Zealand made a significant contribution to developing the first draft, introduced in 1999 at the first workshop on transparency organised by the WTO Secretariat. The Handbook was published in 2000 after comments had been taken into account. It has since been revised and the latest version of the handbook is contained in: WTO Secretariat, *How to Apply the Transparency Provisions of the SPS Agreement* (World Trade Organization, Geneva), September 2002, available at: [http://www.wto.org/english/tratop\\_e/sps\\_e/spshand\\_e.doc](http://www.wto.org/english/tratop_e/sps_e/spshand_e.doc), visited on 25 June 2007. The guidelines are non-binding and are not intended as a legal interpretation of the relevant provisions of the *SPS Agreement*.

<sup>59</sup> Committee on Sanitary and Phytosanitary Measures, *Summary of the Special Meeting of the SPS Committee on the Transparency Provisions of the SPS Agreement, 9 November 1999. Note by the Secretariat*, G/SPS/R/16, circulated on 20 January 2000.

<sup>60</sup> Article 14 of the *SPS Agreement*. The transition period for least-developed-country Members expired on 31 December 1999, after which they were obliged to comply with all the disciplines of the *SPS Agreement*, including those on transparency. The transition period for other developing-country Members excluded the transparency provisions in Article 7 and Annex B.5 of the *SPS Agreement*, which were required to be implemented immediately. On the transition periods, see further below, Part V, Section 1.4.

<sup>61</sup> These LDC Members were Bangladesh, Burkina Faso, Djibouti, Madagascar, Malawi, Tanzania, Uganda and Zambia. Committee on Sanitary and Phytosanitary Measures, *Summary of the Special Meeting of the SPS Committee on the Transparency Provisions of the SPS Agreement, 9 November 1999. Note by the Secretariat*, G/SPS/R/16, circulated on 20 January 2000, para. 3.

In October 2003, the SPS Committee held a special meeting regarding the operation of Enquiry Points, organised by the WTO Secretariat. To facilitate participation by Members, the workshop was organised back-to-back with the SPS Committee meeting. Two Members provided funding for the participation of ten officials from Enquiry Points of developing-country Members. The purpose of this meeting was to identify the specific problems faced by developing-country Members that restrict the effective operation of their Enquiry Points and to suggest possible solutions. Prior to the meeting a questionnaire was circulated by the WTO Secretariat among Members regarding the operation of Enquiry Points and National Notification Authorities,<sup>62</sup> leading to the submission of information by several Members on their experiences in this regard. Selected developing-country Members gave presentations on the constraints they face in this regard and others presented the mechanisms they had found to overcome their constraints.<sup>63</sup>

In October 2007, the WTO Secretariat organised a third workshop on the transparency provisions of the *SPS Agreement*, to enhance the implementation of transparency provisions and identify best practices to enable Members to benefit fully from these provisions. Again, participation was facilitated by organising the workshop back-to-back with the SPS Committee meeting. As a result, almost 100 Members were present, with more than 163 total participants. Prior to the workshop, the Secretariat circulated, and analysed responses to, a revised questionnaire on the operation of Enquiry Points and National Notification Authorities.<sup>64</sup> At the workshop Members identified several concrete actions to improve the implementation of the transparency provisions.<sup>65</sup> Further, New Zealand and Australia conducted a practical workshop on how to manage an Enquiry Point and National Notification Authority.<sup>66</sup> They subsequently prepared a draft step-by-step procedural manual on this issue.<sup>67</sup>

<sup>62</sup> Committee on Sanitary and Phytosanitary Measures, *Questionnaire on the Operation of SPS Enquiry Points and National Notification Authorities*, G/SPS/W/103/Rev.1, circulated on 15 September 2003.

<sup>63</sup> The presentations of the participants have been compiled and are available in Committee on Sanitary and Phytosanitary Measures, *Special Meeting of the SPS Committee on the Operation of Enquiry Points, 31 October 2003. Presentations by Participants*, G/SPS/GEN/458, circulated on 12 December 2003.

<sup>64</sup> Committee on Sanitary and Phytosanitary Measures, *Questionnaire on the Operation of SPS Enquiry Points and National Notification Authorities. Note by the Secretariat. Revision*, G/SPS/W/103/Rev.2, circulated on 8 December 2006. The 58 responses received are analysed in Committee on Sanitary and Phytosanitary Measures, *Analysis of Replies to the Questionnaire on the Operation of Enquiry Points and National Notification Authorities. Note by the Secretariat. Revision*, G/SPS/GEN/751/Rev.1, circulated on 18 June 2007.

<sup>65</sup> Brief presentations were given by the Secretariat and the Enquiry Point of Chile, after which participants worked in break-out sessions to identify concrete actions which could be taken at the national and international level to enhance the use and usefulness of the transparency provisions. This resulted in the identification of several recommendations for follow-up action at different levels. Committee on Sanitary and Phytosanitary Measures, *Workshop on Transparency Held on 15 - 16 October 2007. Note by the Secretariat*, G/SPS/R/47, circulated on 8 January 2008, para. 4.

<sup>66</sup> *Ibid.*, paras 6-7.

<sup>67</sup> Committee on Sanitary and Phytosanitary Measures, *Availability of Draft Procedural Manual on the Operation of SPS Enquiry Points and National Notification Authorities. Note by the Secretariat* G/SPS/GEN/824, circulated on 11 March 2008. The draft manual itself is contained in Ministry of Agriculture and Forestry (MAF) Biosecurity New Zealand, Department of Agriculture Fisheries and Forestry of the Government of Australia and Ministry of Commerce and Industry of the Sultanate of Oman, *Procedural Manual for National Notification Authority & National Enquiry Point*, Version 1-2007, World Trade Organization, Geneva, 2007, 80, available at: [http://members.WTO.org/WTO\\_resources/SPS/files/Draft\\_Procedural\\_Manual.doc](http://members.WTO.org/WTO_resources/SPS/files/Draft_Procedural_Manual.doc), visited on 26 March 2008.

As noted above, only developed-country Members are obliged, upon request, to provide translations of documents relating to a notification in one of the official languages of the WTO.<sup>1</sup> In order to facilitate access to documents relating to a notification in the working language of the requesting Member where no such official translation exists, a new mechanism was created by the WTO Secretariat in 2004. Under this mechanism, any Member possessing an unofficial translation of such a document, after informing the notifying Member, should submit a supplement to the original notification.<sup>2</sup> This supplement should indicate the address at which the unofficial translation can be requested or the website at which it can be found.<sup>3</sup> By 31 August 2007, 12 supplementary notifications of the availability of unofficial translations had been made, by the US and Canada.<sup>4</sup> No further translations have been notified. A format for such a supplement was added to the *Recommended Transparency Procedures* in 2008.<sup>5</sup> It is to be hoped that developed-country Members that have the necessary resources to translate notified SPS measures and frequently do so when the measure is of interest to them, will make fuller use of the mechanism to circulate information on the availability of these unofficial translations.

Due to the problem of identification of the product coverage of notified SPS regulations, in the absence of an indication of the HS code of the product by the notifying Member, the WTO's Central Registry of Notifications has taken the task of assigning HS codes upon itself.<sup>6</sup>

To address the challenge faced by the Secretariat and Members in managing the vast increase in SPS-related documents and information, the WTO Secretariat has made available to Members an extensive database on SPS-related information known as the SPS Information Management System (SPS IMS). This facility includes all SPS notifications, all SPS-related official WTO documents, all trade concerns raised at the SPS Committee, and the contact details of Members Enquiry Points and National Notification Authorities. The SPS IMS has advanced searching and reporting functions to make it easier for Members to find quickly the specific information they need.<sup>7</sup> Since 2003, the WTO's Central Registry of Notifications has been assigning around 60 predefined keywords (such as avian influenza, pesticides, zoonoses etc.) to notifications to facilitate searching in the SPS IMS. The public website version of the SPS IMS was launched during the 2007 workshop, with hands-on demonstrations to introduce its functions and

<sup>5</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008, para. 28 and Annex D.

<sup>6</sup> Committee on Sanitary and Phytosanitary Measures, *Overview Regarding the Level of Implementation of the Transparency Provisions of the SPS Agreement: Note by the Secretariat*, G/SPS/GEN/804, circulated on 11 October 2007, para. 16.

<sup>7</sup> Committee on Sanitary and Phytosanitary Measures, *Workshop on Transparency Held on 15 - 16 October 2007. Note by the Secretariat*, G/SPS/R/47, circulated on 8 January 2008, paras 20-21.

capabilities to interested participants.<sup>8</sup> Discussions held at the launch of the SPS IMS indicated that many Members expected to use the system to filter and assess incoming notifications more easily and to alert relevant stakeholders promptly.<sup>9</sup> In addition, the importance of complementarities between the SPS IMS and other databases, such as the FAO's International Portal on Food Safety, Animal and Plant Health, and the International Phytosanitary Portal of the IPPC were noted.

In response to a need identified during the 2007 Workshop on Transparency, the WTO Secretariat created a new facility to facilitate access to notified draft SPS measures. This facility enables Members who wish to do so to provide an electronic version of their notified proposed SPS measure as an attachment to the notification.<sup>10</sup> These attachments will be stored on a WTO server and be accessible through a hyperlink in the notification itself.<sup>11</sup>

Finally, in 2008, to meet the need identified by several Members in the context of transparency discussions in the SPS Committee, to clarify the times frames between the various steps involved in drafting, notifying and adopting SPS measures, the Secretariat developed useful guidelines.<sup>12</sup> These guidelines, presented in the form of a chart, set out the Secretariat's understanding of the relevant periods on the basis of the obligations in the *SPS Agreement*, the specifications in the *Doha Implementation Decision*, and the *Recommended Transparency Procedures* adopted by the SPS Committee. The relevant time frames are laid down for the notification of a draft proposed measure, the provision of a comment period, the adoption of the measure, its publication, its entry into force, and the period of time for compliance. Only non-urgent SPS measures are considered, since time frames are not specified in the *SPS Agreement* or the transparency procedures where urgent measures are at issue.

#### 1.4 Rules regarding control, inspection and approval procedures

In order to ensure that their SPS requirements are complied with, Members usually have control, inspection and approval procedures in place. If these procedures are complex, lengthy or costly, they may effectively restrict market access.

An illustration of the problems that can arise for exporters of a developing-country Member in such cases is provided by the pre-shipment inspection requirements imposed on Costa Rican fish exports. Costa Rica's testing facilities are limited,<sup>13</sup> but its trading

<sup>13</sup> Valverde reports that Costa Rica faces equipment problems with regard to national testing for heavy metals. The single machine for mercury testing is malfunctioning. It is expected that lead testing will begin soon. Max Valverde, *Sanitary and Environmental Trade Barriers in Costa Rican Fisheries*, Project on Standards

partners impose a large number of mandatory tests leading to large cost increases for exporters. While Costa Rican regulations require fish processing plants to conduct 16 histamine tests per year, which costs around US\$ 500 a year, the US FDA requires at least two tests per ton of exported fish, which would cost a large plant exporting 15 000 kilograms of fish per week about US\$52 000 per year, in histamine tests only.<sup>14</sup> This problem is compounded by the fact that testing procedures differ between countries.<sup>15</sup> While the EU accepts national methods of analysis that are equivalent to those mandated in EC Directives, Costa Rican technicians are unfamiliar with EU methods and thus cannot assess if their own methods are equivalent. Offers of exchange opportunities from the EU to Costa Rican laboratory technicians have never materialised.<sup>16</sup>

To address the trade restrictive effects of control, inspection and approval procedures, Article 8 of the *SPS Agreement* provides:

Members shall observe the provisions of Annex C in the operation of control, inspection and approval procedures, including national systems for approving the use of additives or for establishing tolerances for contaminants in foods, beverages or feedstuffs, and otherwise ensure that their procedures are not inconsistent with the provisions of this Agreement.

Annex C contains detailed rules on control inspection and approval procedures, which broadly aim to ensure that procedures are not more lengthy and burdensome than is reasonable and necessary and that they do not discriminate against imports. As stated above, Article 1.3 of the *SPS Agreement* provides that the Annexes are an integral part of the Agreement. In addition, Article 8 expressly refers to Annex C. It is therefore essential to read Article 8 together with Annex C. A violation of Annex C automatically results in a violation of Article 8 of the *SPS Agreement*.<sup>17</sup>

In particular, Annex C.1 contains a list of nine requirements in subparagraphs (a) to (i) applicable to procedures to check and ensure the fulfilment of SPS measures. In an additional unnumbered subparagraph, Annex C.1 addresses prior approval systems. The remaining two paragraphs of Annex C are rather limited in scope, dealing with two specific situations in a facultative way, imposing no obligations on importing Members. In particular, Annex C.2 addresses the situation where SPS measures specify control at the level of production, and requires Members in whose territory the production takes place (i.e. the exporting Member) to facilitate such control as well as the work of the control-

and Trade, Strengthening Developing Countries' Capacity to Respond to Health Sanitary and Environmental Requirements (UNCTAD and IDRC, Geneva), 16-17 May 2001, para. 93, available at: [http://r0.unctad.org/trade\\_env/test1/meetings/standards/mariacostarica1.doc](http://r0.unctad.org/trade_env/test1/meetings/standards/mariacostarica1.doc), visited on 10 June 2008.

<sup>14</sup> *Ibid.*

<sup>15</sup> Valverde relates that a shipment of Costa Rican fish was rejected by US authorities, on the grounds that sampling and testing had detected histamine presence. The shipment was re-imported to Costa Rica and tested at public and private facilities, revealing no histamine presence. Valverde suggests that a possible explanation for this divergence in test results may be that the samples were sent by US officials to testing facilities by mail, under inappropriate temperature conditions, resulting in the development of histamine. *Ibid.*, para. 94. An alternative explanation could be that the testing methods used in the US are more advanced and detect lower levels of histamine than do those of Costa Rica.

<sup>16</sup> *Ibid.*, para. 95.

<sup>17</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1569.

ling authorities. Annex C.3 provides that nothing in the *SPS Agreement* shall prevent Members from carrying out reasonable inspection in their own territories.

As the substantive disciplines on control, inspection and approval procedures are to be found in Annex C.1, this provision is now addressed in more detail.

#### 1.4.1 Scope of application

The first issue to be examined is the precise coverage of the disciplines of Annex C.1. A footnote to the title of Annex C specifies that:

Control, inspection and approval procedures include, *inter alia*, procedures for sampling, testing and certification.<sup>18</sup>

Further, the introductory sentence of Annex C.1 states that its obligations apply ‘with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures’. However, these procedures are themselves SPS measures in their own right as evinced by the fact that among the illustrative list of SPS measures in Annex A.1 is ‘testing, inspection, certification and approval procedures’. As a result, such procedures are subject not only to Article 8 and Annex C, but also to all the relevant rules of the *SPS Agreement*. This is expressly stated in Article 8, as cited above.<sup>19</sup>

It would therefore seem that control, inspection and approval procedures are a particular category of SPS measures, which take the form of procedures to check compliance with other SPS measures, and are subject to the additional requirements of Article 8 as specified in Annex C.

Other SPS measures of a substantive nature are not subject to Article 8 and Annex C. This was found in *Australia – Salmon (Article 21.5 – Canada)*, where Canada invoked a violation by Australia of Annex C.1(c) of the *SPS Agreement*. The Australian measure at issue was its requirement that Canada prove that: the exported fish were from a population for which there was a documented health monitoring and surveillance system; the fish were not juveniles or sexually mature adults; and the fish were not derived from a population slaughtered as an official disease control measure. The Panel thus had to address the question whether the measure at issue fell within the scope of application of Annex C.1. It noted that only ‘procedures to check and ensure the fulfilment of sanitary or phytosanitary measures’ fall under the scope of Annex C.1. The Panel considered that the three Australian information requirements were ‘substantive sanitary measures in their own right’ and not ‘procedures to check and ensure the fulfilment of sanitary or phytosanitary measures’. The Panel thus concluded that Annex C.1 was not applicable and consequently no violation of paragraph 1(c) could be found.<sup>20</sup> The Panel clearly distinguished

<sup>18</sup> Footnote 7 to Annex C of the *SPS Agreement*.

<sup>19</sup> It is interesting to note that the US in *Japan – Apples* did not challenge the inspection and control requirements that formed part of Japan’s phytosanitary regime for apples under the disciplines of Annex C.1. Instead, it challenged their scientific basis as part of a cumulative set of requirements, under Articles 2.2 and 5.1 of the *SPS Agreement*. This did not present any problems since control and inspection procedures are, as just explained, themselves SPS measures and subject to all the relevant disciplines of the *SPS Agreement*.

<sup>20</sup> Panel Report, *Australia – Salmon (Article 21.5 - Canada)*, paras 7.154-7.157.

substantive SPS measures from procedural SPS measures for purposes of determining the applicability of Annex C.1.<sup>21</sup>

The question whether the *application* of control, inspection and approval procedures that are *not* themselves challenged, can be examined under Annex C.1 was addressed by the Panel in *EC – Approval and Marketing of Biotech Products*. The complainants did not challenge the EC's prior approval system for biotech products itself,<sup>22</sup> but instead claimed that the general *de facto* moratorium on the approval of biotech products and the product-specific measures in place in the EC, were inconsistent, *inter alia*, with Annex C.1. The Panel found that the EC's prior approval procedures for biotech products were SPS measures in the form of 'procedures to check and ensure the fulfilment of SPS measures' as referred to in Annex C.1.<sup>23</sup> However, it found that the challenged *de facto* moratorium and product specific measures were not themselves SPS measures,<sup>24</sup> but only the 'application' of approval procedures. As Annex C.1 disciplines approval procedures, the Panel found that the EC was obliged to comply with the provisions of Annex C.1 in its 'application' of its approval procedures.<sup>25</sup>

It is now necessary to examine the disciplines which Annex C.1 sets out for control, inspection and approval procedures. These are contained in subparagraphs (a) to (i) of Annex C.1, as well as in a final, unnumbered subparagraph thereof. This final subparagraph will be examined first, before proceeding to look at the obligations contained in the numbered subparagraphs of Annex C.1.

#### 1.4.2 Systems of prior approval and tolerance determination

Stuck at the end of Annex C.1, after its list of disciplines, in subparagraphs (a) to (i), on procedures to check and ensure fulfilment of SPS measures, almost as an afterthought, is a provision dealing with systems for prior approval and the establishment of tolerance levels for contaminants. This unnumbered subparagraph states:

Where an importing Member operates a system for the approval of the use of food additives or for the establishment of tolerances for contaminants in food, beverages or feedstuffs which prohibits or restricts access to its domestic markets for products based on the absence of an approval, the importing Member shall consider the use of a relevant international standard as the basis for access until a final determination is made.

<sup>21</sup> Scott criticises this distinction as unnecessary on the basis that whether the SPS measures are substantive or procedural, they still have to meet the science-based requirements of the *SPS Agreement*. If they fail to do so, judicial economy could be used so as not to turn to Annex C. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 220. However, the distinction seems to retain its relevance to the question whether Article C is applicable at all. Even if no violation of the science-based rules of the *SPS Agreement* is found, a measure that takes the form of a substantive SPS measure rather than a procedure to check compliance with another SPS measure cannot be tested under the requirements of Annex C.

<sup>22</sup> On this issue, see below, Part IV, Section 1.4.2.

<sup>23</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1491.

<sup>24</sup> On the Panel's interpretation of the term 'SPS measures' in this case, see above, Part III, Section 2.1.1.

<sup>25</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1492 (with regard to the *de facto* moratorium) and para. 7.1785 (with regard to the product specific measures).

While the rest of Annex C.1 deals with conformity assessment procedures in relation to other SPS measures in general, this subparagraph addresses a more specific situation. This is the situation where the procedures in place condition market access for food or feed<sup>26</sup> on prior approval of the relevant additives by the importing Member or restrict access pending the determination of a tolerance level for the relevant contaminants. This amounts to a provisional import ban or import restriction, pending the decision on approval or tolerance level. Such a ban or restriction is not based on an assessment of risk, but is rather a precautionary measure.

Two situations can be distinguished in this regard. The first is where the regulating Member maintains the import ban or restriction temporarily, while an assessment is made of whether the food additive is safe, or what level of contaminants are safe and should be tolerated. In some cases, the complex risk assessment procedures in place in the regulating Member may result in long delays before a final decision is taken on approval or on the tolerance level. Examples of this situation abound in the area of food-safety. One illustration is that mentioned in Part II of this book with regard to Australia's application of a 'limit of determination' level for residues of agricultural or veterinary chemicals in food, pending the conduct of a risk assessment to determine the safe residue level. Another example is the ban in place in Australia on novel foods, irradiated foods, and genetically-modified foods until such time as their safety has been established by means of a risk assessment.<sup>27</sup> In principle, the importing Member will proceed to obtain the necessary evidence to carry out a risk assessment on which to base its final determination.

However, a second type of situation arises where an importing Member does not have a strong interest in the product involved, for example with respect to exotic fruits which are imported in small quantities, or the harmful substance at issue, for example outdated pesticides, and is therefore unwilling to commit the necessary resources to conduct a risk assessment on the basis of which to decide on approval or tolerance levels. In such a situation, the market access restriction remains in place indefinitely, or until the exporting Member can bring sufficiently convincing scientific evidence assessing the risk and establishing its safety to the satisfaction of the importing Member. Examples have been mentioned in Part II of the significant problems faced by Mauritius and Jamaica due to the application of a 'limit of determination' residue level on their traditional products such as tropical fruits, yams and callaloo, due to the absence of commercial support to conduct the experimental trials necessary to establish tolerance levels for pesticides on these products.<sup>28</sup> In 2003, a number of developing-country Members indicated their concerns

---

<sup>26</sup> It is interesting to note that the obligation of Annex C.1 to consider conditioning market access on the relevant international standards is limited to food or feed and does not apply to risks from pests or diseases that are not food-related. However, prior approval systems are often in place for imports of plants, animals or their products. For example it is very common to require that the exporting Member submit a pest risk assessment showing the absence of risk from the proposed import, as a condition for the granting of an import permit. The exclusion of this situation from Annex C.1 may be due to the fact that international standards are not of much help in the case of prior approval systems relating to pests or diseases that are not food-related, since these are based on the specific pest or disease prevalence in the exporting country involved and thus involve a factual country-specific determination. An exception to this may be the case of officially recognised disease-free status by the OIE.

<sup>27</sup> See above, Part II, Section 2.4.2.2.

<sup>28</sup> See above, Part II, Sections 2.5.2.1 (Mauritius) and 2.6.2.1 (Jamaica).

with regard to the EC's new approach to the determination of tolerance levels for pesticides.<sup>29</sup> The EC had notified Members of a new draft regulation, according to which 325 chemical substances would be reassessed to update the available information and to set new MRLs.<sup>30</sup> In all cases where a particular pesticide had not been not authorised on a particular product or when no data was available to prove that its residues posed no danger to consumer health, the MRL was set at 0.01 mg/kg, which is the enforceable default for zero. Many developing-country Members expressed concerns, noting their lack of technological and analytical capacity to comply with this MRL and its serious adverse effects on their agri-food exports.<sup>31</sup> They enquired as to the risk assessment basis for this measure. The EC indicated that the re-assessment of risks was being conducted on the basis of scientific information provided by the pesticide industry. However, the industry was no longer interested in marketing some of the older pesticides and was not keen to fund research in this regard. As a result, no data was available for a risk assessment and the default MRL was applied to these substances.

The last subparagraph of Annex C.1 applies a very weak discipline to prior approval systems. It establishes only that Members 'shall consider' conditioning market access in such cases on the relevant international standard, until a final determination is made. This is a far cry from the disciplines in the rest of the *SPS Agreement* which require that a measure *must* either be based on an international standard, or on a risk assessment meeting the requirements in the relevant provisions of the Agreement.<sup>32</sup> Provisional measures are only allowed where scientific evidence is insufficient to permit a risk assessment, and where the imposing Member has complied with the remaining requirements of Article 5.7, including the obligation to seek to obtain the necessary information for a proper risk assessment and to review the measure within a reasonable period.<sup>33</sup>

Systems of prior approval and tolerance determination sit uncomfortably with these disciplines of the *SPS Agreement*. This is because the *SPS Agreement* is premised on the idea that the need for precaution is exceptional, arising only in situations of insufficient scientific evidence. In other cases, measures must be firmly based on science, embodied in either an international standard or a risk assessment. However, in the second situation mentioned above, systems of prior approval and tolerance determination adopt a precautionary approach not due to the insufficiency of available scientific evidence, but due to the limited resources a Member has to dedicate to conducting risk assessments on the basis of the available evidence prior to adopting an SPS measure. To ensure safety in the absence of a risk assessment and a final determination, Members impose provisional bans on such products or adopt very restrictive measures, such as 'limit of determination'

---

<sup>29</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 169.

Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 169, para 169.

<sup>32</sup> These disciplines are discussed above, Part III, Sections 4.2 and 5.1.

<sup>33</sup> On the requirements under Article 5.7 of the *SPS Agreement*, see above, Part III, Section 5.2.5.

residue levels. In cases falling under the second situation mentioned above, Members choose not to prioritise the assessment of risks from products that are not significant for them, perhaps because they are not produced domestically or are imported in very small amounts. As a result, approval or tolerance decisions may be delayed for extended periods (or even indefinitely) even where scientific evidence is available or can be obtained on which a risk assessment could be conducted. In other cases, falling under the first situation mentioned above, provisional bans or very restrictive measures, such as ‘limit of determination’ residue levels are imposed pending a future risk assessment and final determination. However, lengthy delays may result from the complexity of the risk analysis procedure operated by a Member, as is the case with Australia.<sup>34</sup>

The question of the relationship between the last subparagraph of Annex C.1 and the rest of the *SPS Agreement* is problematic. As stated above, Annex C is an integral part of the *SPS Agreement* and must be read together with it. The way in which the *SPS Agreement* is drafted results in all SPS measures falling within its scope of application, also those covered by the last subparagraph of Annex C.1, being subject to all the disciplines of the *SPS Agreement* relevant to them. This is also made explicit in Article 8, as stated above.

The object and purpose of Annex C.1, as seen from its remaining provisions, appears to be to bring discipline to control, inspection and approval procedures to prevent them undermining the gains from the substantive disciplines of the *SPS Agreement*. This is in keeping with the overall balancing objective of the *SPS Agreement*, which aims to reduce the trade restrictive effects of legitimate SPS measures by disciplining those aspects that can unnecessarily increase their negative impact on trade. Consequently, reading the last subparagraph of Annex C.1 in the context of Article 8, and in the light of the object and purpose of Annex C.1 and the balancing objective of the *SPS Agreement* as a whole, this subparagraph should be seen as establishing an additional discipline on the types of systems covered by it, rather than creating a wide loophole for such systems. In this light, the last subparagraph of Annex C.1 can be regarded as aiming to reduce the great trade restrictive effect of the use of systems of prior approval and tolerance determination by encouraging reference to international standards to fill the gap pending the final approval or tolerance determination on the basis of scientific risk assessment.

However, the application of all the relevant disciplines of the *SPS Agreement* to systems for prior approval and tolerance determination would make redundant the Annex 1.C provision dealing specifically with these systems. The flexibility allowed by its weak discipline would effectively be eliminated entirely by the application of the normal SPS disciplines on harmonisation and risk assessment. Such a result is contrary to the principle of effective treaty interpretation. In view of the fact that this absurdity would result from the application of the normal rules of interpretation to this provision, regard may be had to the negotiating history of the *SPS Agreement*.

As discussed above, the disciplines to be applied to prior approval systems were a contentious aspect of the negotiations towards the *SPS Agreement*, and various options were considered to address the trade restrictive effect of such systems, while recognising the

---

<sup>34</sup> See the discussion of the lengthy risk analysis procedures of Australia, with repeated stakeholder consultations and technical reviews of data, above Part II, Section 2.4.2.

right of Members operating them to restrict market access pending a final approval.<sup>35</sup> Some of the options imposed a strong obligation to rely on international standards, where they existed, pending the approval decision, or to comply with the rest of the obligations in the *SPS Agreement* in the operation of approval procedures. In the end, however, agreement was reached to include only the very watered-down discipline we currently find in the last subparagraph of Annex C.1. Nevertheless, no explicit carve-out was provided for prior approval systems.

This seems to indicate an instance of ‘constructive ambiguity’<sup>36</sup> resulting from a compromise reached in the negotiations on this contentious issue. This is borne out by the subsequent practice in this regard, whereby Members have not challenged prior approval systems under the substantive disciplines of the *SPS Agreement*, despite the widespread use of such systems by developed-country Members and the great trade restrictive effect they have.

A treaty interpreter, faced with a challenge to a system of prior approval or tolerance determination under the last subparagraph of Annex C.1, would be obliged to give some meaning to this provision, in light of the principle of effective treaty interpretation. In view of all the considerations mentioned above, it is proposed here that this provision could best be interpreted as providing a (rather weak) additional discipline to prior approval and tolerance determination systems in the first situation mentioned above. In this situation, during the reasonable period of time allowed by Article 5.7 for seeking additional information to review a provisional measure, Annex C.1 would oblige Members to consider allowing market access for products conforming to relevant international standards. The normal requirements of Article 5.7 would continue to apply as well. However, measures that do not meet the requirements of Article 5.7, due to the fact that they are taken in the second type of situation mentioned above, where scientific evidence is not ‘insufficient’ or there are no efforts to seek additional information or to conduct a risk assessment, would, under the proposed interpretation, not be ‘saved’ from the operation of the relevant substantive disciplines of the *SPS Agreement* by the weak discipline of the last subparagraph of Annex C.1. Instead, such systems would fall foul of the scientific obligations of the *SPS Agreement* and not meet the requirements of Article 5.7 for exemption from these disciplines, leaving no room for the application of Annex C.1.

The disconnect between the general disciplines of the *SPS Agreement* and the position of systems of prior approval is illustrated by the *EC – Approval and Marketing of Biotech Products* dispute. As repeatedly noted by the Panel in that case, the complainants chose *not* to challenge the pre-marketing approval system of the EC for biotech products as such.<sup>37</sup> It would appear that this decision by the complainants was motivated by their desire to avoid opening this can of worms in view of the general prevalence of prior-approval systems in many Members and the fact that they jar with the general regime

---

<sup>35</sup> For a discussion of the four options considered during the negotiations on the *SPS Agreement*, see above, Part III, Section 1.2.2.

<sup>36</sup> As noted by former WTO Director-General Mike Moore, WTO negotiators resorted to what has been called ‘constructive ambiguity’ in framing controversial treaty provisions as a diplomatic means of enabling consensus on WTO rules. Mike Moore, *A World Without Walls – Freedom, Development, Free Trade and Global Governance*, (Cambridge University Press, Cambridge), 2003, 111.

<sup>37</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.1353 and 7.1693.

of the *SPS Agreement*. As stated by the Panel, one of the consequences of the EC's prior approval system is that the marketing of the biotech products for which approval is sought is provisionally banned pending the final approval decision. In the absence of a challenge to this system, the Panel was obliged to assume for purposes of the dispute that both the prior approval system and the provisional ban were WTO consistent.<sup>38</sup> As a result, the Panel could only address the complainants' challenges to the EC's decision to delay the approval procedures, as evinced in its general *de facto* moratorium and the product specific measures. As set out above, this decision to delay was seen by the Panel as not constituting an 'SPS measure'<sup>39</sup> but only the 'application' of an approval procedure which was itself an SPS measure.<sup>40</sup> The Panel therefore addressed both the general *de facto* moratorium and the product specific measures only under the procedural disciplines of Annex C.1, to the exclusion of the substantive disciplines of the *SPS Agreement*. Due to the lack of independent challenges to the approval system, not only were the substantive disciplines of the *SPS Agreement* found inapplicable in the absence of a challenge to an 'SPS measure', but also the procedural rules of Annex C.1 were difficult to apply. The way the challenge was framed meant that only the prohibition on undue delays in Annex C.1 could be applied.

The last subparagraph of Annex C.1 was not at issue in this case since the complainants did not allege a violation thereof. It is unlikely that relevant international standards existed for the biotech products at issue, and in any case the weakness of the obligation in this provision makes it ineffectual in bringing discipline to prior approval systems. The complainants therefore preferred to base their claims of violation on the stronger procedural disciplines in numbered subparagraphs of Annex C.1. These are discussed below.

### 1.4.3 Undue delay

Lengthy control, inspection and approval procedures can have an important trade restrictive effect, especially in the case of perishable products.<sup>41</sup> In addition, in Members operating prior approval systems based on complex risk analysis procedures, as is the case with Australia as seen above,<sup>42</sup> procedures may go on for several years, during which market access is provisionally denied. The first obligation imposed by Annex C.1, contained in paragraph (a), seeks *inter alia* to avoid undue delays in the operation of control, inspection and approval procedures. It provides:

Members shall ensure, with respect to any procedure to check and ensure the fulfilment of sanitary or phytosanitary measures, that:

<sup>38</sup> *Ibid.*, para. 7.1353.

<sup>39</sup> For a discussion on this point, with regard to the scope of application of the *SPS Agreement*, see above, Part III, Section 2.1.1.

<sup>40</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1382 (with regard to the general *de facto* moratorium) and para. 7.1690 (with regard to the product specific measures).

<sup>41</sup> For example, in 2003, the EC reported that a variety of its exports to the US had experienced problems due to lengthy delays in US customs sampling and inspection procedures, leading to damage to the products and commercial losses. It expressed the view that adequate steps should be taken to ensure that perishable goods are dealt with expeditiously in US control and inspection procedures. European Commission, *Report on United States Barriers to Trade and Investment* (European Commission, Brussels), December 2003, 35, available at: [http://trade-info.cec.eu.int/doclib/docs/2003/december/tradoc\\_115383.pdf](http://trade-info.cec.eu.int/doclib/docs/2003/december/tradoc_115383.pdf), visited on 3 January 2004.

<sup>42</sup> See above, Part II, Section 2.4.2.2.

- (a) such procedures are undertaken and completed without undue delay and in no less favourable manner for imported products than for like domestic products;

In *EC – Approval and Marketing of Biotech Products*, the complainants claimed that the EC's approval procedures for biotech products were carried out in a manner inconsistent with Annex C.1(a). The Panel thus had to examine whether the measures at issue were 'undertaken and completed without undue delay'.

The Panel noted that what matters for purposes of this obligation is not the length of the delay, but rather whether there is a legitimate reason or justification for it.<sup>43</sup> This must be determined on a case-by-case basis. Logically, a Member is only responsible for delays that are attributable to it (thus not for delays caused by the applicant). The Panel considered that Members applying approval procedures must be allowed to take the time reasonably needed to determine with adequate confidence that their SPS requirements are met. The Panel examined and rejected the EC's arguments that the delays were justified by the perceived inadequacy of its existing legislation and the prudent and precautionary approach it applied due to the fact that the relevant science was evolving and in a state of flux.<sup>44</sup> The Panel then examined a particular approval procedure to determine if the EC's *de facto* moratorium had led to undue delay and readily found this to be the case.<sup>45</sup> It therefore found that the general *de facto* moratorium constituted a violation of the procedural prohibition in Annex C.1(a) and consequently of Article 8 of the *SPS Agreement*.<sup>46</sup> Similarly, with respect to the product-specific measures challenged in this dispute, the Panel examined the procedures followed with regard to the 27 products specified by the complainants and determined that there had been 'undue delay' in 24 of the 27 cases, contrary to Article 8 and Annex C.1(a).<sup>47</sup>

#### 1.4.4 Less favourable treatment

Not only undue delays, but also discriminatory application of control, inspection and approval procedures are a cause for concern. Discriminatory treatment of imports is addressed in the *second* clause of Annex C.1(a), cited above, by means of a prohibition on less favourable treatment of imported products than of like domestic products.

In *EC – Approval and Marketing of Biotech Products*, Argentina claimed that the EC's product-specific measures were inconsistent with the second clause of Annex C.1(a). It argued that the EC had undertaken approval procedures in a less favourable manner for the biotech products that were the subject of the product-specific measures challenged by Argentina than for 'like' novel, non-biotech products. Argentina averred that undue

<sup>43</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.1496-7.1498.

<sup>44</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.1511-7.1530. While the Panel agreed that limited availability of scientific evidence may mean that deferring decisions might allow for better decisions to be taken, it pointed out that the core obligation of Annex C.1(a) is for Members to come to a substantive decision. This decision need not give 'a straight yes or no answer to applicants'. Instead, a Member, for example, may reject an application subject to later review, or give a time-limited approval. *Ibid.*, para. 7.1527.

<sup>45</sup> *Ibid.*, para. 7.1567.

<sup>46</sup> *Ibid.*, para. 7.1567.

<sup>47</sup> The analysis was carried out for large number of approval procedures (*ibid.*, paras. 7.1779-7.2389). The Panel then summarised its conclusions in the form of a table. See *ibid.*, para. 7.2391.

delays had taken place only in the processing of applications concerning biotech products, not in those concerning non-biotech products.

According to the Panel, in order to establish a violation of the second clause of Annex C.1(a), it is necessary to establish:

- (i) that imported products have been treated in a “less favourable manner” than domestic products in respect of the undertaking and completion of approval procedures, and (ii) that the imported products which are alleged to have been treated less favourably are “like” the domestic products which are alleged to have been treated more favourably.<sup>48</sup>

Turning to the first requirement, the Panel noted that it clearly lays down a national treatment obligation, and it therefore considered it useful to ‘look to the jurisprudence on Articles III:1 and III:4 of the GATT 1994 for appropriate interpretative guidance.’<sup>49</sup> Reading Article C.1(a), second clause, in the light of this jurisprudence, it considered that:

... in undertaking and completing its approval procedures, a Member may, in principle, differentiate between products that have been found to be like because this would not, by itself, mean that the relevant approval procedures have been undertaken or completed in less favourable manner for the group of like imported products than for the group of like domestic products. In particular, a mere showing that a Member has undertaken or completed a particular approval procedure in a manner which is unfavourable for a given imported product would not be sufficient to establish a “less favourable manner” of undertaking or completing approval procedures if the relevant Member’s conduct is explained by factors or circumstances unrelated to the foreign origin of the product.<sup>50</sup>

Turning to examine Argentina’s arguments, it noted that Argentina had not alleged that the manner of processing applications under the relevant legislation differed depending on the *origin* of the products. It therefore found that it was ‘not self-evident’ that the alleged less favourable manner of processing applications regarding the imported biotech products at issue was explained by the foreign origin of these products rather than, for instance, by a ‘perceived difference between biotech products and novel non-biotech products in terms of the required care in their safety assessment, risk for the consumer, etc.’<sup>51</sup> According to the Panel, Argentina had not succeeded in raising a presumption that the alleged less favourable treatment was explained by the foreign origin of the relevant biotech products.<sup>52</sup> It thus found no violation of the second clause of Annex C.1(a).

This, while in line with the recent finding of Appellate Body in *Dominican Republic – Import and Sale of Cigarettes*,<sup>53</sup> seems to depart from the previous case law on the

<sup>48</sup> *Ibid.*, para. 7.2400.

<sup>49</sup> *Ibid.*, para. 7.2401. The Panel examined the findings regarding the national treatment obligation in Appellate Body Report, *EC – Asbestos*, para. 100 and Appellate Body Report, *Dominican Republic – Import and Sale of Cigarettes*, para. 96. These findings are discussed above, Part III, Section 1.1.1.

<sup>50</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2408.

<sup>51</sup> *Ibid.*, para. 7.2411.

<sup>52</sup> *Ibid.*, para. 7.2411.

<sup>53</sup> As mentioned above, Part III, Section 1.1.1, the Appellate Body held in *Dominican Republic – Import and*

national treatment obligation, in that it allows different treatment of like products if this is explained by something other than their foreign origin (in this case by a ‘perceived difference’).<sup>54</sup> It seems that the Panel requires the complainant to show that the *reason* behind the difference in treatment is related to the foreign origin of the product, rather than merely that the structure, design and architecture of the measure are such that predominantly imported products are subject to the delays and predominantly domestic products are approved without delay.

In view of the fact that, different from the situation under the GATT 1994, there is no general exception in the *SPS Agreement* that could justify discriminatory treatment, and the less favourable treatment in Annex C.1(a) is not qualified by the requirement that it be arbitrary or unjustifiable, the Panel’s examination of the possible justification for the different treatment in its examination of the ‘less favourable treatment’ criterion may be understandable.<sup>55</sup>

#### 1.4.5 Operation of procedures

Annex C.1(b) sets out rules that aim at due process in the operation of control, inspection and approval procedures. It requires that, with respect to any procedure to check and ensure the fulfilment of SPS measures:

... the standard processing period of each procedure is published or that the anticipated processing period is communicated to the applicant upon request; when receiving an application, the competent body promptly examines the completeness of the documentation and informs the applicant in a precise and complete manner of all deficiencies; the competent body transmits as soon as possible the results of the procedure in a precise and complete manner to the applicant so that corrective action may be taken if necessary; even when the application has deficiencies, the competent body proceeds as far as practicable with the procedure if the applicant so requests; and that upon request, the applicant is informed of the stage of the procedure, with any delay being explained;

Two of the complainants in the *EC – Approval and Marketing of Biotech Products* dispute, namely the US and Argentina, claimed a violation of Annex C.1(b).<sup>56</sup> According to

---

*Sale of Cigarettes* that there is no less favourable treatment if the detrimental effect of the measure on imports can be explained by factors unrelated to the foreign origin of the product. Appellate Body Report, *Dominican Republic – Import and Sale of Cigarettes*, para. 96.

<sup>54</sup> Note that this finding was made in the context of the less-favourable treatment analysis, and not the like product analysis under Article C.1(a). It therefore does not follow that perceived differences, particularly those unrelated to the product itself (here the care required in assessing the risks), may now be taken into account when determining whether products are ‘like’ for purposes of the *SPS Agreement*.

<sup>55</sup> Joanne Scott sees this finding as coming close to endorsing a ‘quasi-exception within the [national treatment] rule itself’ similar to the ‘mandatory requirements’ doctrine in the EC. She notes that this exception is broader than that in Article XX of the GATT, as it makes room for new and diverse concerns. However, she regards the allocation of the burden of proof on the complainant to demonstrate that the differential treatment is explained by factors other than the foreign origin of the products as ‘less than appropriate’. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 230.

<sup>56</sup> Only the US claimed that the general *de facto* moratorium violated Annex C.1(b). Both the US and Argentina claimed that the product-specific measures that they challenged violated this provision.

the Panel, this provision contains ‘five separate, but related, obligations to be observed by Members in the operation of approval procedures.’<sup>57</sup> These it identified as relating to:

- (i) the publication or communication to applicants of the processing period of each procedure;
- (ii) the examination of the completeness of the documentation and the communication to applicants of deficiencies;
- (iii) the transmission of the results of the procedure;
- (iv) the processing of applications which have deficiencies; and
- (v) the provision of information about the stage of a procedure and the provision of an explanation of any delay.<sup>58</sup>

With respect to the first obligation (publication or communication of the processing period) the US argued that, due to the EC’s *de facto* moratorium as well as its failure to consider the product specific applications for final approval, the ‘standard’ processing period published in the EC approval legislation was not followed. According to the US, the actual ‘effective’ processing period was neither published nor communicated to the applicants.<sup>59</sup> The Panel disagreed, holding that the processing period to be published ‘is the period which is intended to be the norm for all approval procedures of a particular type.’<sup>60</sup> With respect to the product-specific measures, the Panel held that deviation from the published period in a single approval procedure would not justify the conclusion that there was a new, unpublished, effective ‘standard’ processing period.<sup>61</sup> Even if there was a new standard processing period, the Panel regarded the failure to publish this period as not due to the *de facto* moratorium or the product-specific measures, but rather as an independent failure by the EC to publish its processing period.<sup>62</sup> The Panel further noted that communication of the anticipated processing period is only required ‘upon request’, and the US had not shown that such a request had been made and that it had been denied by the EC.<sup>63</sup> Therefore no violation of the first obligation of Annex C.1(b) was found.

<sup>57</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1574.

<sup>58</sup> *Ibid.*, para. 7.1574.

<sup>59</sup> *Ibid.*, paras 7.1584 and 7.1589 (with regard to the *de facto* moratorium) and paras 7.2439 and 7.2443 (with regard to the product specific-measures). Argentina made no arguments in relation to the first obligation of Annex C.1(b).

<sup>60</sup> *Ibid.*, para. 7.2440. According to the Panel, the word ‘standard’ in this context should be understood as meaning ‘normal’. *Ibid.*

<sup>61</sup> *Ibid.*, para. 7.2440. The Panel recalled (in footnote 1660) that the measures at issue were the individual product-specific measures, and not the product-specific measures taken collectively or the general *de facto* moratorium. Still, it seems strange that this narrow focus was applied, in disregard for the fact that the EC’s failure to proceed to final approval of applications was the norm, as evinced not only in each of the product specific measures but also the general *de facto* moratorium. This factual context seems relevant to the assessment of the ‘standard processing period’, even where the claim related to a specific measure.

<sup>62</sup> *Ibid.*, para. 7.1587 (with regard to the *de facto* moratorium) and para. 7.2441 (with regard to the product-specific measures).

<sup>63</sup> *Ibid.*, para. 7.1592 (with regard to the *de facto* moratorium) and para. 7.2443 (with regard to the product-specific measures). The US had brought arguments regarding the failure of the EC Regulatory Committee and of the Commission at the post-Regulatory Committee stage, to inform the applicant of deficiencies in the documentation. However, the competent body that received the application was the lead Member State to which the application was submitted for initial assessment. In any event, the Panel found no proof that deficiencies in the documentation had been identified by the Regulatory Committee or the Commission. *Ibid.*,

With regard to the second obligation of Annex C.1(b), regarding the examination of the completeness of the documentation, the Panel held that it is when the ‘competent body’ receives an application that the applicant must be informed of deficiencies in the documentation, not during the evaluation later in the approval process.<sup>64</sup> As no concrete evidence was brought by the US or Argentina in this regard, the Panel found no violation of this obligation.

The third obligation of Annex C.1(b), requiring the prompt transmission of the results of the procedure, was held to be inapplicable to the case at hand by the Panel in *EC – Approval and Marketing of Biotech Products*. This was due to the fact that the *de facto* moratorium and the product specific measures had the effect that no final results of the procedures were achieved. Thus there were no results to be promptly transmitted.<sup>65</sup> Therefore, clearly in the Panel’s view the only results to be communicated are the final results of the procedure. The results of interim stages of the procedure were not regarded as falling within this obligation. Considering that this obligation applies ‘so that corrective action may be taken if necessary’<sup>66</sup> it seems odd to wait until a final decision, when it may no longer be possible to allow for corrective action, to transmit the results. At this late stage, any corrective action could only be taken into account in a new control, inspection or approval procedure, thereby delaying the possibility to gain market access. Obliging the transmission of the outcome of interim stages in the procedure would be preferable in that it allows the applicant to promptly address any problems and thus influence the outcome of the final decision.

With regard to the fourth obligation of Annex C.1(b), namely that the competent body must proceed as far as practicable with the procedure even if the application has deficiencies, and the fifth obligation, namely that the applicant must be informed of the stage of the procedure and any delay must be explained, the Panel pointed out that both these obligations expressly apply only ‘if the applicant so requests’ or ‘upon request’. As no evidence had been brought that such a request had been made, and had been denied by the EC, the Panel found no violation of this obligation.<sup>67</sup>

With regard to each of the obligations of Annex C.1(b), the Panel in *EC – Approval and Marketing of Biotech Products* emphasised that any possible violation thereof, even if one were found to exist, would not be a necessary result of the general *de facto* moratorium or the product-specific measures, but would be a result of a separate and independent failure of the EC to comply with the obligation at issue. Consequently, the Panel held that in this case the complainants had not brought sufficient evidence to show a violation of the obligations of Annex C.1(b).<sup>68</sup>

<sup>65</sup> *Ibid.*, para. 7.1589 (with regard to the *de facto* moratorium) and para. 7.2448 (with regard to the product-specific measures).

<sup>66</sup> Annex C.1(b) of the *SPS Agreement*, cited above in this Section.

<sup>67</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.1598 and 7.1601 (with regard to the *de facto* moratorium) and paras 7.2466 and 7.2469 (with regard to the product-specific measures).

<sup>68</sup> *Ibid.*, para. 7.1604 (with regard to the US’s claim in respect of the general *de facto* moratorium) and para. 7.2474 (with regard to the claims of the US and Argentina in respect of the product-specific measures).

### 1.4.6 Information requirements

One important cause of delays in control, inspection and approval procedures is the information requirements imposed on an exporter, in order to demonstrate compliance with the SPS requirements of the importing Member. Annex C.1(c) addresses this situation by requiring that:

... information requirements are limited to what is necessary for appropriate control, inspection and approval procedures, including for approval of the use of additives or for the establishment of tolerances for contaminants in food, beverages or feedstuffs.

In *EC – Approval and Marketing of Biotech Products*, Argentina argued that the EC had acted inconsistently with this provision through its undue delays in the consideration of particular applications, by requiring excessive submissions of information. In particular, Argentina challenged the EC's requirement that applications made under Directive 90/220 had to be resubmitted under the subsequent legislation, Directive 2001/18 which resulted in numerous requests for additional information in the approval procedures.<sup>69</sup> The EC countered that if Argentina considered the requirement in its new approval legislation to resubmit an updated dossier upon entry into force of Directive 2001/18, it should have challenged this Directive under the *SPS Agreement*.<sup>70</sup>

The Panel noted that the product-specific measures challenged by Argentina were the undue delays of the EC in considering particular approval applications. This delay, according to the Panel, did not itself impose information requirements which were not necessary.<sup>71</sup> As Argentina had not challenged the information requirements in the new legislation, but only the undue delays in the application of approval procedures, no inconsistency with Annex C.1(c) could be established. In any event, Argentina had not explained why the information requirements imposed were 'excessive' and thus not necessary.<sup>72</sup> Consequently, the claim regarding Article C.1(c) had not been proven.<sup>73</sup>

It appears that, had Argentina challenged the approval procedures themselves, rather than the delays in their application, under Annex C.1(c), and brought arguments to show why the numerous requests for additional information were in fact not necessary for 'appropriate' approval procedures, it would have had a chance of success. This seems likely if the requests for additional information could be shown to have formed part of a concerted plan by the European Commission and certain EC Member States to delay the approval procedures. However, as noted above, Members are reluctant to open a can of worms by challenging prior approval systems *per se* under the rules of the *SPS Agreement*, due to the fact that, while they are maintained by many Members, they jar with the regime created by the Agreement.

<sup>72</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2483.

<sup>73</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2485.

### 1.4.7 Requirements on individual specimens

There are situations when procedures for control and inspection, for example sampling and testing requirements, are applied in an excessive manner to individual specimens of the product involved. This may unnecessarily raise the cost and administrative burden of the procedure for exporters. To address this problem, in subparagraph (e), Annex C.1 obliges Members to ensure that requirements for control, inspection and approval of ‘individual specimens’ of a product are ‘limited to what is reasonable and necessary’.

In *EC – Approval and Marketing of Biotech Products* Argentina claimed, with respect to the product-specific measures, that the application of the EC’s approval procedures was not limited to what was reasonable and necessary, in violation of Annex C.1(e).<sup>74</sup> However, the Panel clarified that this measure entailed the failure to complete the approval procedures for specific biotech products without undue delay. It therefore does not impose any requirements on individual specimens of the relevant biotech products. As a result, the product specific measures cannot give rise to an inconsistency with Annex C.1(e).<sup>75</sup>

It seems that the type of procedural measure intended to be caught by Annex C.1(e) is of the type that was at issue in a specific trade concern raised by Thailand against Australia in 2000.<sup>76</sup> This measure was a pre-shipment inspection requirement for durian fruit. Australia required that for shipments of less than 1000 fruits, random samples of 450 fruits be cut open to check for the presence of seed borers, and for shipments of more than 1000 fruits, samples of 600 fruits be thus opened. The result of these requirements was that in many cases for each fruit to be exported to Australia, a pre-shipment volume of two fruits was necessary, in effect doubling the cost of each shipment. Thailand raised its concerns regarding this measure with reference to Annex C.1(e).<sup>77</sup>

### 1.4.8 Remaining obligations

The remaining obligations contained in subparagraphs (d) and (f) to (i) of Annex C.1 have not yet been addressed in dispute settlement proceedings. A brief look at the disciplines contained therein is taken to complete the picture of the manner in which the *SPS Agreement* tries to minimise the trade-restrictive impact of control, inspection and approval procedures.

<sup>74</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2491.

<sup>75</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2494.

<sup>76</sup> Committee on Sanitary and Phytosanitary Measures, *Australia’s Import Restrictions on Durian: Statement by Thailand at the Meeting of 8-9 November 2000*, G/SPS/GEN/217, circulated on 22 November 2000.

<sup>77</sup> In response, Australia noted that its requirement was in conformity with the internationally accepted approach, but amended its requirement to allow culled fruits to be included in samples taken from the shipment to reduce its economic impact. Committee on Sanitary and Phytosanitary Measures, *Australia’s Import Restrictions on Durian: Response by Australia to Thailand’s Statement at the Meeting of 8-9 November 2000*, G/SPS/GEN/218, circulated on 22 November 2000. Thailand continued to reiterate its concern with the cutting requirement and the excessive sample size, in response to which Australia indicated that it was willing to consider alternatives to destructive sampling if their efficacy is shown. Joint trials with x-ray technology were undertaken. Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 25-26 June 2002. Note by the Secretariat*, G/SPS/R/27, circulated on 2 August 2002, paras 133-134.

Subparagraph (d) of Annex C.1 contains a non-discrimination rule, requiring no less favourable respect for the confidentiality of information about imported products provided in the context of control, inspection and approval procedures than is applied for domestic products. Further, this respect must be in such a manner as to protect legitimate commercial interests. This obligation takes account of the fact that control procedures may require the submission of proprietary information such as the disclosure of ingredients and processing methods.

In subparagraph (f) of Annex C.1 is found a requirement of equitable application of fees imposed for the procedures at issue. What is equitable is stated in relation to the fees charged to domestic producers and other Members. The criterion of equity rather than no less favourable treatment in respect of fees seems to be intended to reflect the fact that actual costs of procedures may differ depending on the origin of the products (for example, if inspectors have to travel further to inspect a production site in a particular Member, or if the SPS status of a Member necessitates more controls and testing than that of another). Further, subparagraph (f) provides that the fees 'should' be no higher than the actual cost of the service. This is purely hortatory and thus allows higher fees when considerations of equity would not prevent this. Read in the light of Article 10.1 of the *SPS Agreement* that obliges Members to take account of developing-country Members' needs in applying their SPS measures, equity could be seen to require Members to consider applying differential fees for Members at different levels of development.<sup>78</sup>

Subparagraphs (g) and (h) of Annex C.1 contain disciplines to minimise the trade effects of procedures. In particular, subparagraph (g) requires Members to minimise inconvenience to applicants, importers, exporters and their agents by using the same criteria for imported and domestic products when it comes to decisions on the selection of product samples and the location of the facilities used for the relevant procedures. Subparagraph (h) addresses the situation where a product's specifications have been changed after it has been through control and inspection procedures. The new procedure for the modified product may not exceed what is necessary to establish whether adequate confidence exists that the product still meets the applicable SPS requirements.

Finally, subparagraph (i) contains due process requirements. It mandates the existence of a review procedure for complaints regarding the operation of control, inspection and approval procedures and a procedure for corrective action where such complaints are justified.

## 1.5 Conclusion

The balance struck in the relevant substantive rules of the *SPS Agreement* in order to distinguish legitimate health protection from disguised protectionism can be undermined if the procedures used in SPS regulation are undisciplined. These procedures may be abused to throw down practical barriers that restrict the possibilities for exporters to access the markets of their trading partners. In other words, in many cases it is not *what* is done

---

<sup>78</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 221-222.

but the *way* in which it is done that creates problems. These problems may be especially burdensome for Members at lower levels of development, due to their lack of resources to devote to compliance with complex procedural requirements.

The *SPS Agreement* contains some rules dealing directly with procedures imposed by Members to check compliance with their SPS measures. These are contained in Article 8 and Annex C, which address control, inspection and approval procedures. Annex C.1 sets out a list of disciplines on various aspects of control, inspection and approval procedures, which broadly speaking aim to ensure that procedures are not more lengthy and burdensome than is reasonable and necessary, and that they do not discriminate against imports. A few of these disciplines have been clarified by the Panel in *EC – Approval and Marketing of Biotech Products*. Further clarification and a rigorous application of these rules are called for, to give full effect to the potential of Annex C.1 to discipline the relevant procedures. Further, Annex C.1 contains a weak additional discipline for systems of prior approval of additives and establishment of tolerances for contaminants, requiring consideration of the use of international standards pending a final determination. While these systems sit uncomfortably with the general regime established by the *SPS Agreement*, they do fall within the definition of SPS measures and are covered by all the disciplines of the Agreement, not just Annex C.1. Members are, however, reluctant to challenge prior approval systems as such under the *SPS Agreement*. This is evinced by the fact that the only challenge relating to a prior approval system to date is that in *EC – Approval and Marketing of Biotech Products*, which did not challenge the system itself but only the delays in its application, as reflected in the *de facto* moratorium and product-specific measures.

The additional procedural arrangements under the *SPS Agreement* aim to operationalise certain of its substantive obligations. The substantive obligations on Members in respect of the recognition of equivalence, the adaptation of their SPS measures to regional conditions and transparency in respect of their SPS measures would achieve little without procedural arrangements to give effect to them. Yet, the procedural aspects of the provisions on these matters in the *SPS Agreement*, aside from the provisions on transparency, are extremely weak. This has led to very poor implementation of the obligations on equivalence and regionalisation, rendering ineffective these provisions despite the very significant potential they hold for market access improvements.

These potential benefits are of particular relevance for Members at lower levels of development. As discussed above, the recognition of equivalence, unlike harmonisation rules, allows for differences between Members, including those relating to consumer preferences and technical and financial resources, that lead to divergent SPS measures. Yet it limits the trade restrictive effect of the divergent measures by acknowledging that it is possible for different SPS measures to achieve the same level of protection. Thus by recognising equivalence an importing Member would allow imports of products that comply with different, but equally effective, SPS measures. This leaves flexibility for Members at lower levels of development to apply SPS measures suited to their capacities and still gain market access, provided the measures achieve the importing Member's chosen level of protection. Similarly, regionalisation holds great potential by recognising that SPS conditions, and in particular the incidence of pests and diseases, are not determined by national borders, and may differ between various regions within a country. In some large

developing countries, conditions may vary greatly from region to region, due to variations in climate, environmental or geographic conditions within the country and/or due to the efforts of the regulatory authorities to eradicate a pest or disease from specific areas. Adaptation of SPS measures of importing Members to the pest or disease conditions of the region of origin of the product could greatly improve market access possibilities. This enables the exporting Member to limit the costs of eradicating a pest or disease or keeping pest- or disease-free status by focusing on specific areas.

In order to realise the potential of the obligations on the recognition of equivalence and adaptation to regional conditions, the SPS Committee has developed procedural arrangements. These procedures do not amend the substantive obligations, but instead provide guidelines for their effective implementation. Developed on the basis of concrete information provided by Members on their experiences in the relevant areas, and elaborated in technical discussions among SPS regulatory officials, these procedures illustrate the potential of the SPS Committee to find cooperative solutions to implementation problems, as discussed further below.<sup>79</sup>

The substantive transparency obligations regarding prior notification of changes to SPS measures, publication of adopted measures and the explanation, upon request, of reasons for SPS measures also hold great potential to improve market access possibilities. Prior notification enables exporting Members to be informed of proposed new or amended SPS measures and to transmit this information to their exporters. This gives Members, and through them their exporters, the opportunity to make comments regarding these proposals at an early stage and to have these comments taken into account in the regulatory process. They can also raise concerns on notified measures in multilateral discussions at SPS Committee meetings, as discussed below.<sup>80</sup> The publication requirement for adopted SPS measures is crucial in facilitating market access for exports from Members by greatly reducing the cost and difficulty of obtaining information on their trading partners' SPS measures. It also enables exporting Members to exercise their rights and police the implementation of the obligations of the *SPS Agreement*, by ensuring that Members obtain full information on the content of the SPS measures of importing Members in order to identify whether they are consistent with the *SPS Agreement*. The provision of an adaptation period before the entry into force of a published measure is of particular importance to developing-country Members as their exporters may need more time to adjust to new requirements. The obligation to provide reasons supplements the other transparency provisions by enabling Members to obtain information beyond that on the existence and content of SPS measures, such as that regarding the scientific basis of the measure, the level of protection it seeks to achieve and other aspects of the reasons for its imposition. This information enables an exporting Member to raise its concerns regarding the measure in a focused manner, by pointing to specific inconsistencies with the *SPS Agreement* in bilateral discussions or in the multilateral forum of the SPS Committee. It can also play a useful role in dispute settlement proceedings by assisting an exporting Member in establishing a *prima facie* case, for example, that an importing Member's SPS measure is not based on a risk assessment or sufficient scientific evidence. To give effect

---

<sup>79</sup> See below, Part IV, Section 2.1.1.

<sup>80</sup> See below, Part IV, Section 2.1.2.

to these transparency obligations, the *SPS Agreement*, in Annex B, contains some procedural rules, particularly in respect of notification. However, these procedural rules are not sufficiently detailed and have given rise to difficulties of implementation, undermining the effect of the substantive obligations.

The impact of the transparency obligations for Members at different levels of development varies, both in terms of the compliance burden they impose and in terms of the potential benefits they offer. Both the implementation of transparency obligations and managing the inflow of information resulting from increased transparency require institutional infrastructure and human and financial resources. This is illustrated by an examination of the greatly varying transparency practice of the four Members selected as examples in this book. To facilitate compliance with the transparency obligations and to assist Members to derive full benefits from them, the SPS Committee has adopted recommended transparency procedures and formats for notifications. The procedures, while not binding, are commonly followed by Members, and have resulted in great improvements in transparency. On the basis of experience with their use and new suggestions for improvement, the procedures have been revised three times and they can be regarded as a 'work in progress'. Transparency procedures have also been adopted by the SPS Committee in respect of determinations on equivalence and regionalisation, as well as with regard to requests for SDT and responses to such requests. The *Recommended Transparency Procedures* currently also incorporate references to mechanisms designed by the WTO Secretariat, on the initiative of Members, to address constraints faced by developing-country Members. Examples are the mechanisms to improve access to unofficial translations of documents; to provide access to a database, known as the SPS IMS, where notifications of SPS measures and other relevant sources of information are compiled; and to facilitate access to notified draft SPS measures by storing documents electronically on the WTO server and enabling access to these documents through hyperlinks in notifications. In this way, the work of the SPS Committee, supported by the WTO Secretariat, with regard to improving the procedural arrangements for transparency under the *SPS Agreement* has been instrumental in furthering the realisation of the benefits of transparency while reducing some of its costs.

## CHAPTER 2

### Institutional and procedural arrangements for administration and enforcement

As noted above, crucial to the effectiveness of the *SPS Agreement* are its provisions to create institutions and procedures at WTO level to facilitate and promote its proper implementation and to enable Members to enforce its provisions. These two aspects are addressed in detail in this Chapter. First, the provisions relating to the establishment and functions of the SPS Committee contained in Article 12 of the *SPS Agreement*, are discussed. Second, this Chapter proceeds to examine the rules, contained in Article 11 of the *SPS Agreement*, read together with the *Dispute Settlement Understanding*, setting out the procedure for the settlement of disputes arising under the *SPS Agreement*.

#### 2.1 The SPS Committee

The Committee on Sanitary and Phytosanitary Measures (the SPS Committee) is established under Article 12.1 of the *SPS Agreement* to carry out the functions necessary to implement the provisions of the *SPS Agreement* and to further its objectives.

The SPS Committee is composed of representatives of all WTO Members. Members are free to determine the composition of their delegations to the meetings of the SPS Committee as they see fit. Members at higher levels of development tend to send technocrats from the relevant national ministries, such as officials from their food safety authorities or veterinary or plant health officials to meetings of the SPS Committee.<sup>1</sup> Through creating a forum for regular interaction between key regulatory officials, the SPS Committee promotes regulatory learning and creates possibilities for building professional networks. The importance of continuous regulatory learning through monitoring and feedback mechanisms, such as those provided by the SPS Committee, has been identified as a key aspect of the type of governance needed in areas relating to complex systems, including SPS systems.<sup>2</sup>

However, many Members are not in a position to make full use of the opportunities provided by the SPS Committee for regulatory learning. Those Members that do not have the resources to send an SPS expert from their capital are represented in meetings of the SPS Committee by diplomats from their mission in Geneva, lacking in the necessary technical

---

<sup>1</sup> Until 2005, the Secretariat provided a list of representatives to the SPS Committee. See for example, Committee on Sanitary and Phytosanitary Measures, *List of Representatives*, G/SPS/INF/16, circulated on 8 June 2005. No such list has been circulated subsequently.

<sup>2</sup> Rosie Cooney and Andrew T.F. Lang, 'Taking Uncertainty Seriously: Adaptive Governance and International Trade', *European Journal of International Law* 18 (3), 2007, 523-551, 524. Rosie Cooney and Andrew Lang develop a model of 'adaptive governance' that is necessary to respond to the pervasive uncertainty facing regulators in areas of SPS regulation. They point out that complex systems require a dynamic and responsive regulatory approach, based on learning, monitoring and feedback, and pluralism, through the identification of alternative regulatory options. This adaptive governance is made possible through 'open forums for discursive and communicative interaction – discussion, mutual sharing of information, problem centred negotiation – in the formulation of policy.' *Ibid.*, 538

knowledge.<sup>3</sup> There are also some Members that are unable to send any representative to most SPS Committee meetings.<sup>4</sup> For example, Kenya rarely sends a representative. On a few occasions, staff from Kenya's permanent mission in Geneva has attended SPS Committee meetings.<sup>5</sup> Most often, however, Kenya is not represented at meetings of the SPS Committee at all.<sup>6</sup> Unusually, in 2001 and 2002 a Kenyan official from the capital attended the SPS Committee meetings where EC requirements regarding cut flowers were on the agenda, as this product is of significant export interest to Kenya. The Kenyan official supported expressions of concern raised by other Members regarding measures notified by the EC with regard to cut flowers.<sup>7</sup> While the attendance of African Members, aside from Egypt, in meetings of the SPS Committee is weak, the attendance of South and Central American and Caribbean countries has improved greatly due to a technical assistance initiative of the Inter-American Institute for Agricultural Cooperation (IICA).<sup>8</sup> Costa

---

<sup>3</sup> For example, Zimbabwe reports that it is represented by its Geneva-based trade representatives or other international officials in SPS Committee meetings, but that its veterinary experts from the capital have not been involved in SPS Committee meetings. Committee on Sanitary and Phytosanitary Measures, *Implementation of the SPS Agreement: Information for the Workshop on 31 March*. Communication from Zimbabwe, G/SPS/GEN/663, circulated on 28 March 2006, para. 2. Similarly, Uganda states that its attendance of SPS Committee meetings is irregular, and that when it does attend it is represented by Geneva-based trade representatives without any technical data or input from the capital. Committee on Sanitary and Phytosanitary Measures, *Implementation of the SPS Agreement. Information for the Workshop on 31 March 2006*. Communication from Uganda, G/SPS/GEN/673, circulated on 31 March 2006, para. 1.

<sup>4</sup> In 2006, the Gambia reported that the March 2006 meeting was the first SPS Committee meeting to which it had sent a representative. Committee on Sanitary and Phytosanitary Measures, *Implementation of the SPS Agreement. Information for the Workshop on 31 March 2006*. Communication from Gambia, G/SPS/GEN/664, circulated on 28 March 2006, para. 2.

<sup>5</sup> It should be noted that Kenya's mission in Geneva has only three persons working on WTO issues, all of whom have economic or business degrees. There is no legal expert among them, despite the fact that the WTO is a rules-based system and an understanding of legal issues is indispensable to ensure that Kenya enforces the market access rights available to it under WTO law. These three persons not only have to deal with all WTO issues, including negotiations, attendance of meetings etc, but also have to cover matters related to the World Intellectual Property Organization, the EU, bilateral donors, investors in Kenya and Kenyan investors in Europe. James Gathii, 'A Critical Appraisal of the Nepal Agenda in Light of Africa's Place in the World Trade Regime in an Era of Market Centred Development', *Transnational Law and Contemporary Problems* 13, 2003, 179-210, 202.

<sup>6</sup> Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume II: Procedures Followed by Selected International Standard-Setting Organisations and Country Reports on TBT and SPS* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2004, 130.

<sup>7</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Revision*, G/SPS/GEN/204/Rev.3, circulated on 26 March 2003, paras 217-218. The EC notification addressed four harmful non-native organisms that were often found on certain products including cut flowers: *Amauromyza maculosa*, *Bemisia tabaci*, *Liriomyza sativae* and *Thrips palmi*. As most cut flowers were not subject to plant health checks but were a pathway for the organisms in question, the EC believed that control measures needed to be strengthened. Ecuador and Israel raised trade concerns on this matter at the SPS Committee meeting of 31 October - 1 November 2001. Kenya asked to receive a copy of the EC response to Ecuador's questions. The issue was raised again by Israel at the SPS Committee meeting of November 2002 and Kenya expressed its hope that a solution would be found to the problem. The European Communities agreed to bilateral consultations with Israel and Kenya. There has been no notification of an agreed solution resulting from such consultations thus far. See also Committee on Sanitary and Phytosanitary Measures, paras 45-48; Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 7-8 November 2002*. Note by the Secretariat, G/SPS/R/28, circulated on 5 February 2003, para. 178.

<sup>8</sup> Since October 2002, IICA's SPS Initiative for the Americas has facilitated participation in SPS Committee meetings of a total of 223 capital-based experts from 32 countries. This initiative is not limited to attendance

Rica reports that due to this initiative it has been able to send at least one expert delegate from capital to all SPS Committee meetings since 2004 and two since 2005 (one from its Ministry of Trade and the other from its Ministry of Agriculture). In addition, its Geneva mission includes one person responsible for SPS issues, amongst other areas or responsibility, who provides support to the capital-based experts. Costa Rica has expressed its concern with the phasing out of financial assistance by IICA from 2006 onwards. It argues that, if no alternative funding is found, the efforts and achievements that participation in the Committee has brought the Initiative's beneficiary countries may be wasted.<sup>9</sup> Costa Rica notes that in its experience, the ideal level of participation is the presence of at least one person responsible for trade and one person responsible for agriculture at all SPS Committee meetings.<sup>10</sup>

In respect of the four Members used as illustrative examples in this book, it is useful to note the differences in their representation. Australia is represented at meeting of the SPS Committee by several ministry officials with specific expertise on trade-related SPS issues. Its delegation includes representatives from the International Division of the Department of Agriculture, Fisheries and Forestry and officials from the Department of Foreign Affairs and Trade.<sup>11</sup> These delegates participate very actively in both formal and informal SPS Committee meetings. Not only do they make use of the possibility provided by the SPS Committee to discuss trade concerns, but they have also played a key role in the elaboration of Committee decisions, for example the *Decision on Regionalisation*.<sup>12</sup> By contrast, Mauritius's participation in the informal and formal meetings of the SPS Committee is rather poor. Representation by capital-based officials has decreased due to local economic constraints. While this used to occur once or twice yearly, Mauritius reports that its government is currently unable to fund the participation of capital-based

---

of meetings but also promotes the establishment of offices at national level to follow the activities of SPS-related international bodies, particularly the SPS Committee. In view of the aim of gradually transferring financial responsibility to the supported Members, the financial assistance granted is being progressively reduced. Currently only air travel is funded. As a result, of the 28 Members that are part of the Initiative, 15 (53 %) sent capital-based experts to the SPS Committee meeting of March 2008. Committee on Sanitary and Phytosanitary Measures, *Actions for Implementing the WTO Agreement on Sanitary and Phytosanitary Measures. Information Presented by the Inter-American Institute for Agricultural Cooperation (IICA)*, G/SPS/GEN/835, circulated on 27 March 2008, paras 2-4. Scott reports that due to the role of the US in funding this Initiative, Venezuela and Cuba are excluded from benefiting. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 49.

<sup>9</sup> Committee on Sanitary and Phytosanitary Measures, *Implementation of the SPS Agreement. Information for the Workshop on 31 March 2006. Communication from Costa Rica*, G/SPS/GEN/679, circulated on 31 March 2006, paras 2-3.

<sup>10</sup> *Ibid.*, para. 3.

<sup>11</sup> Australian Government Department of Agriculture Fisheries and Forestry, *Annual Report 2006-07: Growing Australia through Sustainable, Innovative and Profitable Agriculture, Fisheries and Forestry* (Commonwealth of Australia, Canberra), September 2007, 107, available at: [http://www.daff.gov.au/\\_data/assets/pdf\\_file/0005/439493/2\\_AR\\_06-07\\_ROP\\_WEB.pdf](http://www.daff.gov.au/_data/assets/pdf_file/0005/439493/2_AR_06-07_ROP_WEB.pdf), visited on 17 January 2008. In 2005, Australia was represented at meetings of the SPS Committee by the General Manager and one other official of Technical Market Access Strategy Division, of the Australian Government Department of Agriculture, Fisheries and Forestry, and two officials from the Office for Trade Negotiations of the Australian Government Department of Foreign Affairs and Trade. Committee on Sanitary and Phytosanitary Measures, *List of Representatives*, G/SPS/INF/16, circulated on 8 June 2005.

<sup>12</sup> See above, Part II, Section 2.4.3.

experts to the SPS Committee.<sup>13</sup> Instead, Mauritius is represented at SPS Committee meetings by the technical advisor to its Permanent Mission to the UN in Geneva.<sup>14</sup> However given the technical/scientific nature of discussions of the SPS Committee, this representative finds it difficult to contribute to the SPS Committee effectively and to initiate follow-up action.<sup>15</sup> Jamaica's attendance of meetings of the SPS Committee is sporadic at best due to resource constraints.<sup>16</sup> At those meetings that Jamaica has attended, it has been represented by its permanent mission in Geneva, under instruction from the ministries involved in SPS and trade matters.<sup>17</sup> On one occasion, a FSPID official from the capital attended a meeting of the SPS Committee.<sup>18</sup> The representation of Bangladesh at SPS Committee meetings is better. SPS Committee meetings are regularly attended by officials from the Ministry of Commerce or from the permanent mission of Bangladesh in Geneva.<sup>19</sup> However, depending on the issues being discussed at a particular meeting, an official from a different ministry may participate in the meeting. In particular, SPS Committee meetings where measures on shrimp products are on the agenda are attended by officials from the Ministry of Fisheries and Livestock.<sup>20</sup>

The SPS Committee meets formally at least three times a year, with additional informal meetings as the need arises.<sup>21</sup> In March 1995, the SPS Committee adopted working procedures for the conduct of its meetings.<sup>22</sup> In March 1997, the SPS Committee agreed that the *Rules of Procedure* for meetings of the General Council<sup>23</sup> shall apply *mutatis mutandis* to its meetings, except as otherwise provided in the Working Procedures.<sup>24</sup> Meetings of the

<sup>20</sup> *Ibid.*

<sup>21</sup> In 2007, the SPS Committee held three formal meetings. World Trade Organization, *Report (2007) on the Activities of the Committee on Sanitary and Phytosanitary Measures*, G/L/842, circulated on 20 November 2007, para. 2.

<sup>22</sup> Committee on Sanitary and Phytosanitary Measures, *Working Procedures of the Committee - Adopted by the Committee at Its Meeting of 29-30 March 1995*, G/SPS/1, circulated on 4 April 1995.

<sup>23</sup> General Council Chairman.

<sup>24</sup> Committee on Sanitary and Phytosanitary Measures, *Rules of Procedure for Meetings of the Committee*

SPS Committee are chaired by an annually appointed Chairperson.<sup>25</sup> The SPS Committee is supported by officials of the Agriculture and Commodities Division of the WTO Secretariat. Reports of the meetings of the SPS Committee are published promptly on the WTO website, and a yearly summary of its activities is drawn up by the Chairperson for submission to the General Council.<sup>26</sup>

Observer status in the SPS Committee is accorded to non-Member governments that have been granted Observer status in higher WTO bodies,<sup>27</sup> as well as to certain international inter-governmental organisations with a mandate in the area of sanitary or phytosanitary issues.<sup>28</sup> After initially agreeing to grant Observer status to the CAC, OIE, IPPC, FAO, WHO, ISO, ITC, and UNCTAD,<sup>29</sup> in 1999, the SPS Committee agreed to adopt criteria for deciding on requests for observer status. These are: the mandate, scope and area of work of the applicant organisation; its contribution to the work of the SPS Committee; and reciprocity with regard to the grant of observer status to the WTO.<sup>30</sup> However, due to concerns by Members with regard to granting Observer status to other intergovernmental organisations, the Committee agreed, as an interim step, to apply these criteria on an *ad hoc*, meeting-by-meeting basis with regard to other requests for Observer status. The SPS Committee conducts informal consultations with various international intergovernmental organisations regarding the recognition of their Observer status at meetings of the SPS Committee. Observer status on an *ad hoc* meeting-by-meeting basis was granted in November 1999 to the ACP Group, the European Free Trade Area (EFTA), the IICA, the OECD, the Regional International Organization for Plant Protection and Animal Health (OIRSA), and the Latin American Economic System (SELA).<sup>31</sup> In practice, all of these organizations have been invited to attend all SPS Committee meetings since November

---

*on Sanitary and Phytosanitary Measures: Approved by the Council for Trade in Goods on 11 June 1997, G/L/170, circulated on 20 June 1997. The Committee on Trade in Goods approved the rules of procedure for the SPS Committee on 11 June 1997.*

<sup>25</sup> The Council for Trade in Goods selects the Chairperson of the SPS Committee, in consultation with the Committee. The selection is preceded by the submission by the SPS Committee of a list of candidates to the Council for Trade in Goods. The Chairperson does not have to be selected from amongst persons on this list. The Chairperson does not participate in meetings of the SPS Committee as a representative of a Member. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, footnote 23.

<sup>26</sup> For the 2007 report, see World Trade Organization, *Report (2007) on the Activities of the Committee on Sanitary and Phytosanitary Measures*, G/L/842, circulated on 20 November 2007.

<sup>27</sup> Observer status is granted to countries that are in the process of accession to the WTO.

<sup>28</sup> Committee on Sanitary and Phytosanitary Measures, *Criteria for Observer Status. Note by the Secretariat*, G/SPS/GEN/229, circulated on 23 February 2001. For an example of the information provided under these three criteria in the recent application for observer status of the Gulf Cooperation Council Standardization Organization, see Committee on Sanitary and Phytosanitary Measures, *Applicants for Observer Status: Note by the Secretariat (Addendum)*, G/SPS/GEN/121/Add.3, circulated on 5 October 2007.

<sup>29</sup> At its first meeting, in line with the Working Procedures, the SPS Committee granted observer status to the CAC, OIE and IPPC. In June 1995, Observer status was granted to FAO and WHO; in November 1995 to ISO and ITC; and in March 1996 to UNCTAD.

<sup>30</sup> Committee on Sanitary and Phytosanitary Measures, *Consideration of Requests for Observer Status. Note by the Secretariat*, G/SPS/W/98, circulated on 19 February 1999, para. 7. These criteria were adopted at the meeting of the SPS Committee of March 1999. Committee on Sanitary and Phytosanitary Measures, *Summary of the Meeting Held on 10-11 March 1999: Note by the Secretariat*, G/SPS/R/14, circulated on 7 May 1999.

<sup>31</sup> Committee on Sanitary and Phytosanitary Measures, *International Intergovernmental Organisations. Requests for Observer Status in the Committee on Sanitary and Phytosanitary Measures. Revision*, G/SPS/W/78/Rev.3, circulated on 3 July 2007.

1999, with the decision being renewed at each meeting.<sup>32</sup> Requests for Observer status from the Asian and Pacific Coconut Community (APCC), the Convention on Biological Diversity (CBD), Gulf Cooperation Council Standardization Organization (GSO) and the International Vine and Wine Office (OIV) have proved controversial and are still pending. Observers may be invited to speak and may table papers but do not participate in decision-making in the Committee.

Decisions of the SPS Committee are taken by consensus of the Members, as required by Article 12.1 of the *SPS Agreement*. Interestingly, the procedure for adoption of decisions practiced by the *SPS Agreement*, known as adoption ‘*ad referendum*’, provides an opportunity for Members not present at the relevant SPS Committee meeting where adoption is decided upon, to participate in decision-making. This practice entails that a decision is provisionally adopted if there is consensus in favour of adoption among the Members present at the relevant SPS Committee meeting. However, final adoption is dependant on the absence of objections to the decision by a specified deadline. This provides the opportunity for Members not present at the meeting where provisional adoption took place to consider the proposed decision and raise objections, preventing the final adoption of the decision. Where objections have been raised by Members to decisions adopted *ad referendum* their concerns have been addressed in further discussions in the SPS Committee, as with the decision on transparency of SDT, or through proactive consultations conducted by the Chairperson of the SPS Committee, as with the *Equivalence Decision*.<sup>33</sup> In doing so, this practice ensures broad support for the decisions adopted by the SPS Committee, which is particularly important to secure implementation thereof in view of their legal status.<sup>34</sup>

The SPS Committee is entrusted with various tasks under Article 12.<sup>35</sup> These tasks will now be discussed with particular attention to the work the Committee has undertaken in fulfilment of its mandate.

### 2.1.1 Furtherance of the implementation of the SPS Agreement

Article 12.1 gives the SPS Committee the general mandate to carry out the functions necessary to implement the *SPS Agreement* and to further its objectives. The SPS Committee has undertaken a broad range of activities under this mandate.

In particular, the norm-creating role of the SPS Committee in fulfilment of this mandate is significant. Rosie Cooney and Andrew Lang refer, in this regard, to the SPS Committee’s ‘softer or more informal modes of revision’ of the *SPS Agreement* than could occur through amendment or authoritative interpretations thereof. They state:

---

<sup>32</sup> Committee on Sanitary and Phytosanitary Measures, *Criteria for Observer Status. Note by the Secretariat*, G/SPS/GEN/229, circulated on 23 February 2001, para. 5.

<sup>33</sup> See above, Part IV, Section 1.1.6. The proactive role of the Chairperson is noted by Joanne Scott. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 48, footnote 20.

<sup>34</sup> On the legal status of the decisions of the SPS Committee, see below, Part IV, Section 2.1.1.

<sup>35</sup> The SPS Committee also has a task relating to SDT of developing countries in terms of Article 10.3 of the *SPS Agreement*, which is discussed below, Part V, Section 1.5.

It is important to remember that the WTO legal system is more than just the WTO texts as interpreted by the Appellate Body and Panels - these rules are embedded within, and shaped by, a wide variety of informal understandings and social norms at play within the trading system. Particularly where legal texts are ambiguous, little known or poorly understood ... normative guidance is provided, not so much by the rules themselves, but by semi-formal consensus concerning how they are to be implemented, and how they apply in particular circumstances. The point is that the SPS Committee is one venue in which such semi-formal norms are generated and revised...<sup>36</sup>

As already discussed, several decisions have been adopted by the SPS Committee to promote the implementation of the provisions of the *SPS Agreement*. The decisions of the SPS Committee do not lay down enforceable obligations, but instead provide guidelines to facilitate the implementation of specific provisions. In particular, in order to promote the implementation of the transparency obligations in the *SPS Agreement* (Article 7 and Annex B), the SPS Committee adopted and revised three times the *Recommended Transparency Procedures* for SPS measures, which set out guidelines for compliance with the notification and publication obligations of the *SPS Agreement*, including formats for the notification of routine and emergency measures. In addition, as stated above the SPS Committee has adopted non-binding guidelines for the implementation of Article 5.5 (on consistency in the appropriate level of protection), Article 4 (on equivalence) and Article 6 (on regionalisation) of the *SPS Agreement*.<sup>37</sup> As discussed below, it has also adopted a decision to enhance the transparency of SDT.<sup>38</sup> Wolfe points out that:

most 'clarification' of the SPS agreement seems to come, not from Appellate Body decisions, but from how officials understand the WTO 'acquis' through their ongoing negotiations with each other...<sup>39</sup>

The decisions of the SPS Committee, as has been seen above, are typically based on technical discussions based on concrete experiences of Members regarding specific provisions of the *SPS Agreement*. These discussions may take place in furtherance of an express mandate in the *SPS Agreement*, such as that contained in Article 5.5, which requires the development by the SPS Committee of guidelines for the practical implementation of that Article; or that in Articles 3.5 and 12.4 which mandate the development of procedures to monitor the process of international harmonisation. Discussions leading to a decision may also occur in response to a mandate provided by the General Council, for example that with regard to the implementation problems arising with regard to the provision on the recognition of equivalence. Further, these discussions may be initiated by Members, for example, the discussions that led to the adoption of the decision on transparency of SDT, discussed below, that originated in proposals of Egypt and Canada.<sup>40</sup> Finally, as

<sup>36</sup> Rosie Cooney and Andrew T.F. Lang, 'Taking Uncertainty Seriously: Adaptive Governance and International Trade', *European Journal of International Law* 18 (3), 2007, 523-551, 548.

<sup>37</sup> See above, Part III, Section 5.2.3.5 and Part IV, Sections 1.1.6 and 1.2.6.

<sup>38</sup> See below, Part V, Section 1.8.

<sup>39</sup> Robert Wolfe, 'See You in Geneva? Legal (Mis)Representations of the Trading System', *European Journal of International Relations* 11 (3), 2005, 339-364, 353.

<sup>40</sup> See below, Part V, Section 1.8.

was the case with the guidelines to further the practical implementation of Article 6 on regionalisation, the discussions in the SPS Committee may be initiated by the Committee itself.<sup>41</sup> As input into the discussions, Members are encouraged to provide information on their practical experiences in respect of the relevant provision under discussion. This process of information sharing promotes regulatory learning between Members and ensures that the decisions of the SPS Committee are congruent with the practices of those actors whose conduct they aim to guide.<sup>42</sup> The practice of adopting decisions *ad referendum*, as discussed above, improves the opportunities for participation by Members at lower levels of development that may lack the resources to send a delegate with sufficient expertise on the subject matter of the decision, or any delegate at all, to the relevant SPS Committee meetings. In addition, the fact that the SPS Committee maintains the subjects of its decisions, such as transparency, equivalence, regionalisation and SDT, as agenda items at its meetings and often revises its decisions on the basis of ongoing discussion, ensures responsiveness to evolving practice, and allows for ‘learning by doing’.<sup>43</sup>

The legal status of the various decisions adopted by the SPS Committee brings up interesting questions. As stated above, these decisions were adopted under the authority of the SPS Committee to carry out the functions necessary to implement and further the objectives of the *SPS Agreement* under Article 12.1 of the *SPS Agreement*. The authority of the SPS Committee does not extend to amending, or making authoritative interpretations of, the provisions of the *SPS Agreement*.<sup>44</sup> Therefore, the decisions expressly state that they do not add to or detract from the existing rights and obligations of Members under the *SPS Agreement* or any other WTO agreement, and that they do not provide an authoritative interpretation or modification to the *SPS Agreement* itself.

<sup>41</sup> The initiation of these discussions in 2003, flowed from the recognition, at the conclusion of the first review of the *SPS Agreement* in 1999, ‘that adaptation to regional conditions, including the recognition of pest- or disease-free areas or areas of low pest or disease prevalence, was of significant importance for trade in agricultural products’ and that ‘Members faced difficulties in the implementation of Article 6 of the Agreement.’ This is stated in the preamble to the *Regionalisation Decision*.

<sup>42</sup> Robert Wolfe notes that in order to ensure the legitimacy of the results of decision-making at the WTO, ‘the process needs to engage the actors whose conduct will be regulated. The effect of the most elegantly drafted agreement will be minimal if it is incongruent with the informal practices and mutual expectations of actors in the trading system.’ Robert Wolfe, ‘Decision-Making and Transparency in the ‘Medieval’ WTO: Does the Sutherland Report Have the Right Prescription?’ *Journal of International Economic Law* 8 (3), 2005, 631-645, 633.

<sup>43</sup> The need for review is often provided for in the Decisions themselves. See Committee on Sanitary and Phytosanitary Measures, *Decision on the Implementation of Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures*, G/SPS/19, circulated on 24 October 2001, para. 13; Committee on Sanitary and Phytosanitary Measures, *Guidelines to Further the Practical Implementation of Article 6 of the Agreement on the Application of Sanitary and Phytosanitary Measures*, G/SPS/48, circulated on 16 May 2008, para. 3; Committee on Sanitary and Phytosanitary Measures, *Procedure to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members. Decision by the Committee of 27 October 2004*, G/SPS/33, circulated on 2 November 2004, para. 4.

<sup>44</sup> Authoritative interpretations of the WTO agreements lie in the exclusive authority of the Ministerial Conference and the General Council, in terms of Article IX:2 of the *WTO Agreement*. The authority to amend WTO agreements is reserved for the Ministerial Conference under Article X of the *WTO Agreement*. The SPS Committee is authorised under Article 12.7 of the *SPS Agreement* to make proposals to the Council for Trade in Goods for amendments to the *SPS Agreement*, following the periodic review of the Agreement. Such proposals may be submitted by the Council for Trade in Goods to the Ministerial Conference under Article X:1 of the *WTO Agreement*. However, neither of the two periodic reviews of the *SPS Agreement* conducted so far have led to proposals for amendments. On the periodic reviews, see further below, Part IV, Section 2.1.4.

However, this does not detract from the fact that the SPS Committee has been given the authority to make decisions within its area of competence. Decisions of the SPS Committee cannot be enforced directly in dispute settlement proceedings, since they are not ‘covered agreements’ for purposes of the DSU, and only claims under a ‘covered agreement’ fall within the jurisdiction of panels or the Appellate Body.<sup>45</sup> However, arguably the decisions of the SPS Committee must be had regard to in the interpretation of the relevant Articles of the *SPS Agreement* in dispute settlement proceedings. This is because they can be seen as constituting subsequent agreements between WTO Members regarding the interpretation of the *SPS Agreement* in terms of Article 31.3(a) of the *Vienna Convention on the Law of Treaties*, which reflects customary international law with regard to treaty interpretation.<sup>46</sup> As stated by the International Law Commission in its Commentary on Article 31.3(a):

An agreement as to the interpretation of a provision reached after the conclusion of the treaty represents an authentic interpretation by the parties which must be read into the treaty for purpose of its interpretation.<sup>47</sup>

As such subsequent agreements, the decisions of the SPS Committee must be considered together with the context for interpreting the *SPS Agreement*, despite the fact that they do not constitute ‘authoritative interpretations’ of the *SPS Agreement* under Article IX:2 of the *WTO Agreement*.

Reference has been made to decisions of the SPS Committee in dispute settlement proceedings twice thus far. In *Japan – Apples*, in interpreting the meaning of the term ‘significant effect on trade’ in Annex B.5 of the *SPS Agreement*, the Panel referred in footnote to the *Recommended Transparency Provisions*<sup>48</sup> adopted by the SPS Committee, which clarify this concept.<sup>49</sup> In *EC – Approval and Marketing of Biotech Products*, the Panel relied on the SPS Committee’s *Guidelines on Article 5.5* for its interpretation of the scope of application of Article 5.5 of the *SPS Agreement*.<sup>50</sup> This use of the decisions of the SPS Committee is to be commended, as it makes it possible for Members, through technical discussions among their delegates to the SPS Committee, to reach agreements ‘fleshing

<sup>45</sup> Article 3.1 and 3.2 of the DSU.

<sup>46</sup> It is useful to note that the Appellate Body in *US – Shrimp*, in support of its interpretation of the *chapeau* of Article XX of the GATT 1994 to require serious efforts to negotiate a multilateral solution before imposing a unilateral measure, referred to a report of the Committee on Trade and Environment, which was also part of the report of the General Council to the Singapore Ministerial Conference. It used this report to show that WTO Members endorsed and supported the idea that multilateral solutions based on international cooperation are the best solution to transboundary environmental problems. Appellate Body Report, *US – Shrimp*, para. 168.

<sup>47</sup> International Law Commission, ‘Commentary on the draft Vienna Convention’, *Yearbook of the International Law Commission*, 1966, II, 221.

<sup>48</sup> Specifically, the Panel referred to Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7). Revision*, G/SPS/7/Rev.2, circulated on 2 April 2002, para. 7.

<sup>49</sup> Panel Report, *Japan – Apples*, para. 8.314, footnote 422.

<sup>50</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1415. In particular, the Panel relied on the provision in para. B.1 of the *Guidelines on Article 5.5* (stating that the concept of appropriate level of protection is applied in practice through SPS measures) for its finding that although Article 5.5 does not expressly refer to SPS measures, for it to apply there must be an SPS measure imposed to achieve a particular appropriate level of protection. *Ibid.*, para. 7.1416.

out' the weaker provisions of the *SPS Agreement* thereby operationalising them. Such agreements are far more likely to be reached at this technical level than through more political negotiations at the General Council or Ministerial Conference under the procedures for authoritative interpretations or amendments. Of course, however, the decisions made by the SPS Committee cannot amend the provisions of the *SPS Agreement* or alter the rights and obligations contained therein.<sup>51</sup>

This limit to the legal status of the decisions of the SPS Committee is in fact useful, in that it facilitates consensus decision-making in the SPS Committee. As argued by Joanne Scott, if the decisions of the SPS Committee were to be given specific authority in dispute settlement proceedings, the activities of the SPS Committee would be impeded as Members might be reluctant to adopt decisions that would later be subject to interpretation and enforcement by panels or the Appellate Body.<sup>52</sup> Currently the SPS Committee has proved an effective decision-maker, enabling Members to effect much-needed improvements to the regime of the *SPS Agreement*, particularly through the development of appropriate procedures for the operationalisation of its provisions. In addition, the opportunity for review of the decisions of the SPS Committee means that they can be revised and improved on the basis of Members' experiences with their use.

It would thus be mistaken to view the importance of the decisions of the SPS Committee as limited to their possible role in dispute settlement proceedings. Instead, their main achievement lies in the facilitation of the implementation by Members of their obligations. For example, despite the fact that non-compliance with the *Recommended Transparency Procedures* of the SPS Committee cannot be challenged directly in dispute settlement, these procedures and the notification formats contained therein are commonly used by Members in the fulfilment of their transparency obligations.

### 2.1.2 Forum for consultations

An important advantage arising from the establishment of the SPS Committee is the opportunity it offers for regular information exchange between regulatory officials with regard to specific issues that arise with regard to SPS matters, in order to achieve cooperative solutions. To make full use of this opportunity, Article 12.2 mandates the SPS Committee to 'encourage and facilitate *ad hoc* consultations or negotiations among Members on specific sanitary or phytosanitary issues.' Coupled with the transparency obligations, this provision goes a long way towards helping Members to solve SPS conflicts in a low-cost manner, without necessarily having to resort to dispute settlement. This has particularly important potential benefits for developing-country Members.

---

<sup>51</sup> As noted by Rosie Cooney and Andrew Lang, the activities of the SPS Committee (in respect of guidance regarding and clarification of the provisions of the *SPS Agreement*) are 'carefully circumscribed so as not to change the formal rights and obligations under the *SPS Agreement*, and they are certainly not authoritative interpretations in the sense of Article IX:2. Nevertheless they perform crucial functions of norm generation and revision, which some have described as quasi-legislative in nature.' Rosie Cooney and Andrew T.F. Lang, 'Taking Uncertainty Seriously: Adaptive Governance and International Trade', *European Journal of International Law* 18 (3), 2007, 523-551, 549.

<sup>52</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 74.

The SPS Committee has carried out its task under this provision in three main ways. Namely, through the creation of a permanent agenda item for the discussion of specific trade concerns with regard to notified measures at meetings of the SPS Committee; through discussions at SPS Committee meetings of specific issues that arise (such as the issue of private standards and the problems faced by Members arising from the IPPC standard on wood packaging material); and through the development of a mechanism for making use of the good offices of the Chairperson of the SPS Committee to facilitate the resolution of disputes between Members.<sup>53</sup> These are now discussed in more detail.

To give effect to Article 12.2, at each of its regular meetings, the SPS Committee maintains a standing agenda item for the specific trade concerns of Members regarding SPS measures of other Members. The specific trade concerns are often raised in response to notifications of new or amended SPS measures received and circulated by the WTO Secretariat under the transparency provisions of Article 7 and Annex B. These specific trade concerns are compiled into a document by the Secretariat, by means of periodic revisions.<sup>54</sup>

Members raising specific trade concerns are required to notify the Secretariat and the Member concerned in advance.<sup>55</sup> They must also provide an outline of the trade concern. They do so in practice by giving the Secretariat copies of their correspondence with the Member concerned regarding the inclusion of the item on the agenda, or by providing the Member concerned with a copy of their request to the Secretariat for inclusion of the specific trade concern on the agenda.<sup>56</sup> However, sometimes Members do not provide the required outline of their specific concerns.

Most often, bilateral discussions on trade concerns placed on the agenda are held in the margins of SPS Committee meetings. When sufficient progress is made bilaterally on resolving the matter, the concern may be withdrawn from the agenda of the SPS Committee meeting. If no solution is achieved bilaterally, discussions take place in the SPS Committee with regard to the specific trade concerns raised. The exporting Member raising the concern is first given the floor, after which other interested Members are

---

<sup>53</sup> Committee on Sanitary and Phytosanitary Measures, *Ad Hoc Consultations and Resolution of Trade Concerns*, G/SPS/GEN/781, circulated on 15 June 2007, para. 3.

<sup>54</sup> The revisions since 2005 follow a different format, in that they are divided into several parts to facilitate information retrieval and the circulation of the document. See Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum: Part 4*, G/SPS/GEN/204/Rev.5/Add.3, circulated on 25 February 2005; Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Revision: Part 1*, G/SPS/GEN/204/Rev.5, circulated on 25 February 2005; Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum: Part 2*, G/SPS/GEN/204/Rev.5/Add.1, circulated on 25 February 2005; Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum: Part 3*, G/SPS/GEN/204/Rev.5/Add.2, circulated on 25 February 2005. In 2007, 16 new trade concerns were raised.

<sup>55</sup> Although the *Working Procedures* of the SPS Committee do not make express provision for raising specific trade concerns, the SPS Committee applies the procedure for matters relating to notifications also to the raising specific trade concerns at Committee meetings. According to this procedure, matters relating to notifications can be raised in the course of any meeting. A Member proposing to raise a matter relating to a particular notification in a meeting must notify this intention to the relevant notifying Member and the Secretariat, together with an outline of its concerns, as far as possible in advance of the meeting.

<sup>56</sup> Where it does not appear that the other Member concerned has been duly informed, the Secretariat may remind the requesting Member of this requirement. Committee on Sanitary and Phytosanitary Measures, *Ad Hoc Consultations and Resolution of Trade Concerns*, G/SPS/GEN/781, circulated on 15 June 2007, para. 7.

invited to comment. Often several other interested Members may join in supporting the specific trade concern raised, increasing the pressure on the Member involved to address the problems identified. Finally, the floor is given to the Member maintaining the measure, so that it can respond.<sup>57</sup> The discussions could lead to the revision of the notified measure or to further bilateral consultations between the Members involved. Sometimes technical or financial assistance may be provided to facilitate compliance with the contested measure.<sup>58</sup> Through the use of the specific trade concerns mechanism, disputes can often be resolved without recourse to the expensive and time-consuming process of formal dispute settlement. In addition, Members learn from each other and obtain clarity with regard to the operation of the different SPS regimes in place in other Members. As aptly put by Joanne Scott:

In a significant number of cases, the back and forth contestation and reasoned justification leads to a change in behaviour of Member States. Not only does it serve to induce compliance in situations where this was otherwise lacking, but it also serves to elucidate what it is that compliance demands.<sup>59</sup>

In addition to the direct benefits of the specific trade concerns mechanism in relation to the resolution of disputes, indirect benefits are reaped from this mechanism. These flow from increased familiarity of Members with each other's regulatory systems due to the regular contact and sharing of experiences between Members' officials. Members may gain confidence in the regulatory capacity of the alternative SPS regimes maintained by other Members. This confidence has an impact on issues such as the recognition of equivalence and of pest- or disease free areas. Another indirect benefit relates to improvements in SPS governance. Cooney and Lang view the specific trade concern mechanism as well-suited to problem-centred information exchange. This is valued by the adaptive approaches to governance that are necessitated in respect of complex systems, such as SPS systems.<sup>60</sup>

An example of the direct and indirect benefits of this mechanism is provided by the specific trade concern against the EC's notification of a proposed reduction in its MRL for aflatoxins. This concern was raised by Australia, Argentina, Bolivia, Brazil, Gambia, India, Indonesia, Malaysia, the Philippines, Senegal and Thailand and supported by Canada, Colombia, Mexico, Pakistan, Paraguay, Peru, South Africa, Turkey, the US and Uruguay.<sup>61</sup> These Members argued that the proposed MRL would drastically affect trade

---

<sup>57</sup> *Ibid.*, para. 9. It is open to Members who wish to do so to circulate documents with more detailed information on the matter at issue, either in advance of or at the time of the Committee meeting.

<sup>58</sup> As noted by Joanne Scott: 'The readiness of States to cooperate in problem-solving in the [SPS] committee, including in the provision of technical assistance to developing country Members, stands in contrast to the difficulties associated with formal attempts to re-draw the parameters of special and differential treatment for developing countries within the SPS frame.' Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 46. On the attempts to operationalise special and differential treatment, see below, Part V, Section 1.7.

<sup>59</sup> *Ibid.*, 75.

<sup>60</sup> Rosie Cooney and Andrew T.F. Lang, 'Taking Uncertainty Seriously: Adaptive Governance and International Trade', *European Journal of International Law* 18 (3), 2007, 523-551, 550. These adaptive approaches are called for in respect of complex systems due to the prevalence of uncertainty.

<sup>61</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat.*

but would have insignificant health benefits.<sup>62</sup> They also claimed that no risk assessment seemed to have been conducted and that the sampling procedure was unduly costly and burdensome.<sup>63</sup> At the time, the Codex Committee on Food Additives and Contaminants was considering an aflatoxin standard but while many members supported the proposed standard, the EC did not. The US encouraged the EC to take account of the FAO/WHO risk assessments regarding MRLs for consumer-ready products.<sup>64</sup> Bolivia stressed the effect of the proposed MRL on its nut exports and requested to see the risk assessment on which it was based. In response to the comments of Bolivia and other Members, the EC extended the comment period and revised its proposal, raising the MRL for nuts. However, Bolivia remained concerned with the trade effect of the EC measure. In November 1998, the Chairperson of the SPS Committee reported that bilateral consultations between the EC and Bolivia, which he had been asked to facilitate, had been fruitful.<sup>65</sup> Bolivia was better able to understand the rationale behind the EC measure and the procedures to be followed. The EC's understanding of the effect of its measure on Bolivia was improved.<sup>66</sup> Following this exchange, Bolivia presented a plan to improve its production of Brazil nuts, a specific type of nut, and indicated that this would be a good case for the application of SDT.<sup>67</sup> An EC expert visited Bolivia in May 2000 and a EuropeAid project was initiated to address weaknesses in the production chain and the equipment used in Bolivia. In addition, the EC proposed a certification procedure to allow three Bolivian laboratories to issue internationally recognised certificates. After some delays in the implementation of the promised technical assistance, in June 2003, Bolivia reported that a favourable outcome had been reached and Bolivia would soon be granted permission to export its nuts to the EC.<sup>68</sup>

From 1995 until the end of 2007, 261 specific trade concerns had been raised by Members.<sup>69</sup> The greatest number of concerns raised relate to measures addressing animal health issues including zoonoses,<sup>70</sup> accounting for 42 percent of the total. 28 percent of

<sup>69</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Revision*, G/SPS/GEN/204/Rev.8, circulated on 27 March 2008, para. 7. In 2007 alone, 16 new trade concerns were raised.

<sup>70</sup> Of these concerns, 36% relate to transmissible spongiform encephalopathy, 23% to food and mouth disease, 9% to avian influenza and the remaining 32% to a variety of other animal health concerns. *Ibid.*

the total number of concerns raised related to measures addressing plant health issues and 26 percent to food-safety measures. The remaining four percent of concerns concern other issues such as certification requirements or translation.<sup>71</sup>

To establish the extent of the impact of the specific trade concern mechanism on WTO Members at different levels of development, it is interesting to examine a breakdown of the participation of WTO Members at each of the different income levels in this mechanism. In particular, the extent to which specific trade concerns are raised or supported by WTO Members at each of the different income levels, and the extent to which trade concerns are raised against measures maintained by Members at the different income levels is set out below.

**Graph 40: Specific Trade Concerns: Participation by WTO Members by Income Level, 1995-2007**

Source: Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns*. Note by the Secretariat. Revision, G/SPS/GEN/204/Rev.8, circulated on 27 March 2008.

Often more than one Member has raised or supported a specific trade concern. Similarly, sometimes more than one Member has maintained the measures complained of.<sup>72</sup> By the end of 2007, in respect of the 261 trade concerns raised,<sup>73</sup> the Members raising the concern were high-income Members 175 times,<sup>74</sup> they were upper-middle-income Members 78 times, they were lower-middle-income Members 52 times and they were low-income Members seven times, two of which were least-developed-country Members.<sup>75</sup>

<sup>71</sup> *Ibid.*

<sup>72</sup> For example, Switzerland has raised a single concern regarding measures maintained in relation to BSE by Argentina, Australia, Austria, Belgium, Brazil, Canada, Chile, the Czech Republic, France, Germany, Italy, the Netherlands, Poland, Romania, Singapore, the Slovak Republic, Slovenia, Spain and the US.

<sup>73</sup> The number of Members raising a trade concern exceeds the number of trade concerns raised as a single trade concern is sometimes raised by more than one Member. In total Members were involved in raising specific trade concerns 307 times. The number of Members indicated here does not refer to 307 *different* WTO Members, as in many cases a single Member raises several trade concerns and is then counted separately in respect of each trade concern raised.

<sup>74</sup> The European Communities was counted as one Member, but if one or more Member States of the European Communities individually raised a concern, they were counted separately.

<sup>75</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns*. Note by the Secretariat. Revision, G/SPS/GEN/204/Rev.8, circulated on 27 March 2008, para. 8.

High-income Members have supported other Members raising a specific trade concern 140 times, compared to 103 times for upper-middle-income Members, 83 times for lower-middle-income Members and 13 times for low-income Members, one of which was a least-developed-country Member. Most often by far, trade concerns relate to measures of high-income Members, these accounting for 179 of the concerns raised, compared to 64 concerns with regard to measures of an upper-middle-income Member, 42 with regard to measures of a lower-middle-income Member, and 8 with regard to measures of a low-income Member (India). No trade concerns have been raised with regard to measures of least-developed-country Members.<sup>76</sup>

The latest report of the WTO Secretariat regarding specific trade concerns states that developing countries have featured strongly in the SPS Committee discussions, both as initiators or supporters of issues raised, and as subjects of concerns raised. However, closer examination shows that the number of different developing countries raising SPS issues to date has been limited. They are mainly members of the Cairns group of the main agriculture exporting countries.<sup>77</sup> Thus, the statistics reflect that fact that a limited number of (larger) developing countries is quite active in raising specific trade concerns, rather than that developing countries in general are making active use of the possibility to raise trade concerns at SPS Committee meetings.<sup>78</sup> Similarly, the number of different WTO Members that supported trade concerns raised by other Members, which occurred 339 times, is limited to 14 high-income Members (140 times), 14 upper-middle-income Members (103 times), 19 lower-middle-income Members (83 times) and 5 low-income Members (13 times).<sup>79</sup> The Members maintaining SPS measures that are the subject of concerns raised are also limited to a relatively small number of different Members. These are 30 high-income Members (179 times), 17 upper-middle-income Members (64

---

<sup>76</sup> *Ibid.*, para. 8.

<sup>77</sup> Michael Friis Jensen points out, in 2002, that almost all developing-country trade concerns came from the developing countries that are part of the Cairns group of agricultural exporting Members and from India and Mexico, while African and least-developed-country trade concerns are almost non-existent. Michael Friis Jensen, *Reviewing the SPS Agreement: A Developing Country Perspective*, CDR Working Paper 02.3 (Centre for Development Research, Copenhagen), February 2002. Currently, the Cairns Group accounts for 84 of the trade concerns raised by non-high-income Members.

<sup>78</sup> The concentration of the use of the specific trade concerns mechanism in a limited number of different Members occurs on all income levels. At most income levels, except high-income, Cairns Group members as well as China and India are most active in raising specific trade concerns. The 175 times that specific trade concerns were raised by high-income Members, they were in fact raised by only 14 high-income Members (3 of which are Cairns Group members accounting for 33 of the concerns raised). 17 upper-middle-income Members were responsible for the 78 times that an upper-middle-income Member raised a trade concern (with 7 Cairns Group members accounting for 59 of these concerns); 14 lower-middle-income Members were responsible for the 52 times that a lower-middle-income Member raised a trade concern (with 6 Cairns Group members accounting for 25 of these concerns and China for a further 18); and 5 low-income Members were responsible for the 7 times that a low-income Member raised a trade concern (with India as the most active Member in this category). Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat: Revision*, G/SPS/204/Rev.8, circulated on 27 March 2008, 6.

<sup>79</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.1, circulated on 27 March 2008; Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008; Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Resolved Issues*, G/SPS/GEN/204/Rev.8/Add.3, circulated on 27 March 2008.

times), 12 lower-middle-income Members (42 times) and 1 low-income Member (India) (8 times).<sup>80</sup>

To see these statistics in a factual context, it is useful to look specifically at the four Members used as illustrative examples in this book, of which the specific situation is known. Australia has raised only eight specific trade concerns to date, two of which were later reported resolved.<sup>81</sup> In most cases, Australia's proactive approach in dealing promptly with problems arising from the SPS measures of its trading partners through bilateral technical discussions has enabled it to resolve these problems without the need to raise specific trade concerns.<sup>82</sup> Australia has supported another 21 trade concerns raised by other Members. Australia has also had 16 trade concerns raised against SPS measures maintained by it, six of which were reported resolved.<sup>83</sup> For example, in 2004, a concern was raised by Chile, and supported by the EC and New Zealand, regarding undue delays experienced by exporters of table grapes pending the completion of an IRA by Australia. Australia clarified that Biosecurity Australia had become the responsible agency for IRAs in December 2004, and had shortly thereafter reissued several draft IRAs. The final IRA for table grapes was notified in September 2005 and Chilean table grapes were authorised under certain conditions. In March 2006, Chile reported that a joint work plan had been agreed to resolve the issue.<sup>84</sup> Another trade concern, raised by New Zealand in 2005, against an Australian measure was that discussed above concerning Australia's quarantine measures on apples aimed at avoiding the transmission of fire blight.<sup>85</sup> The lack of success in resolving this matter in discussions led to the initiation of formal dispute settlement proceedings by New Zealand.<sup>86</sup>

By contrast, Mauritius, Jamaica and Bangladesh have never raised a specific trade concern, nor have they ever had a specific trade concern raised against a measure maintained by them. However, there has been at least one occasion when Mauritius has 'actively considered' raising a trade concern at an SPS Committee meeting.<sup>87</sup> This trade concern

<sup>80</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat: Revision*, G/SPS/204/Rev.8, circulated on 27 March 2008, 6.

<sup>81</sup> The resolved trade concerns related to Korea's shelf life requirements and the EC's MRLs for aflatoxins in food. Resolved Issues*, G/SPS/GEN/204/Rev.8/Add.3, circulated on 27 March 2008, items 1 and 39. The remaining trade concerns raised by Australia related to the EC's BSE-related measures on cosmetics; Indonesia's restrictions on fresh fruit and vegetables; measures of Japan and Korea regarding living modified organisms; the EC's measures on live animals and animal products; and the EC's measures on certification requirements for live fish. Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, items 17, 21, 49, 50, 173 and 174.

<sup>82</sup> See the discussion on this point above, Part II, Sections 2.4.2.2, 2.2.2.4 and 2.3.

<sup>83</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Resolved Issues*, G/SPS/GEN/204/Rev.8/Add.3, circulated on 27 March 2008, items 4, 8, 45, 49, 86 and 194.

<sup>84</sup> *Ibid.*, item 194.

<sup>85</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.1, circulated on 27 March 2008, item 217. See further above, Part II, Section 2.4.2.4.

<sup>86</sup> Dispute Settlement Body, *Australia - Measures Affecting the Importation of Apples from New Zealand. Request for Consultations by New Zealand*, WT/DS367/1, G/L/825, G/SPS/GEN/796, circulated on 4 September 2007.

<sup>87</sup> This example is reported in Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges*

related to a Kenyan ban on the import of day-old chicks from Mauritius, due to concerns regarding avian encephalomyelitis. According to Mauritius, no risk assessment had been conducted, no testing had been done, and the measure was not notified to the WTO. The Mauritian authorities, in consultation with the Mauritian mission in Geneva, therefore considered raising a trade concern at the next meeting of the SPS Committee. The matter was however resolved bilaterally, and Kenya withdrew its ban.

Of the three Members discussed here, only Jamaica has supported trade concerns of other Members, which it has done on four occasions. In particular, it supported a concern raised by Brazil, with regard to the EC's new MRLs for dimetholate,<sup>88</sup> a chemical used in fruit production, which exceeded Codex standards.<sup>89</sup> Jamaica also supported a concern raised by Canada seeking clarifications regarding the EC's new Food and Feed Hygiene Rules,<sup>90</sup> and one raised by the US on the issue of the EC's deviation from the IPPC standard for wood packing material.<sup>91</sup> Finally, Jamaica supported the concern raised by St. Vincent and the Grenadines regarding EUREPGAP's private sector standards for fresh fruit and vegetables, required by UK supermarkets.<sup>92</sup> None of these trade concerns was reported resolved.

In general, however, the mechanism of specific trade concerns has been quite effective in resolving trade concerns. Of the 261 trade concerns raised, 75 have been reported resolved, two of which in 2007.<sup>93</sup> A partial solution has been reported to 18 trade concerns, meaning that market access may have been provided for selected products or by some of the importing Members imposing the relevant SPS measure. For the remaining 168 trade concerns, 152 of which are over a year old, no solutions have been reported.<sup>94</sup> However, as solutions are not always reported, some of these concerns may have been resolved already without the knowledge of the SPS Committee.<sup>95</sup> It is interesting to examine how successful Members at different income levels are in resolving disputes through the specific trade concern mechanism.

*for Developing Countries. Volume II: Procedures Followed by Selected International Standard-Setting Organisations and Country Reports on TBT and SPS* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2004, 151.

<sup>88</sup> These new MRLs were contained in Directive 2002/71/EC of 19 August 2002, notified in G/SPS/N/EEC/160.

<sup>89</sup> This new MRL, set at the level of analytical detection, was argued by the EC to be due to the fact that the existing MRL was inadequate to protect health. The EC noted that Codex had been asked to withdraw its MRL for dimethoate a number of years previously. The EC was at the time evaluating the safety of several hundred chemicals used in plant protection due to the fact that they were in use without having been properly evaluated. In the absence of toxicological data for a chemical, the EC would use the level of analytical detection as the MRL. See Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 144.

<sup>90</sup> In particular, clarification was sought on the traceability provisions of the new rules. The EC pointed to a document it had circulated explaining its new traceability requirements (G/SPS/GEN/539) and reported that a seminar would be held in Brussels to explain the new rules. *Ibid.*, item 208.

<sup>91</sup> *Ibid.*, item 199. The EC Directive required the debarking of wood in addition to the IPPC requirement of fumigation and heat treatment.

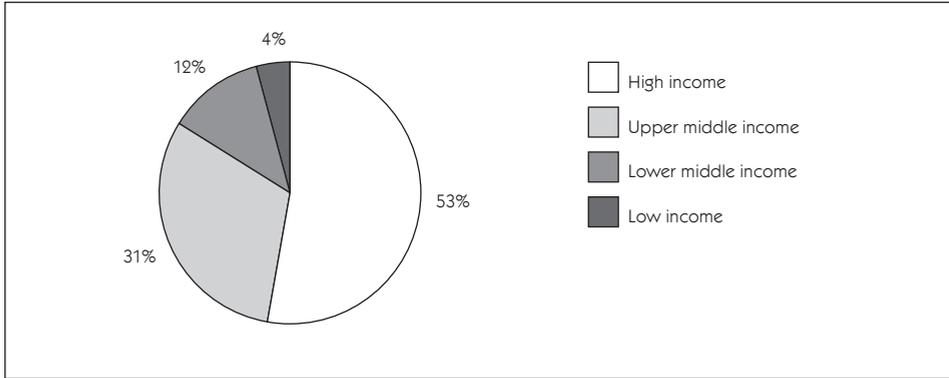

<sup>92</sup> *Ibid.*, item 219. This issue has been discussed above, Part III, Section 2.6.2.3.

<sup>93</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Revision*, G/SPS/GEN/204/Rev.8, circulated on 27 March 2008, para. 9.

<sup>94</sup> *Ibid.*

<sup>95</sup> *Ibid.*

**Graph 41: Resolved Specific Trade Concerns Raised by WTO Members by Income Level, 1995-2007**

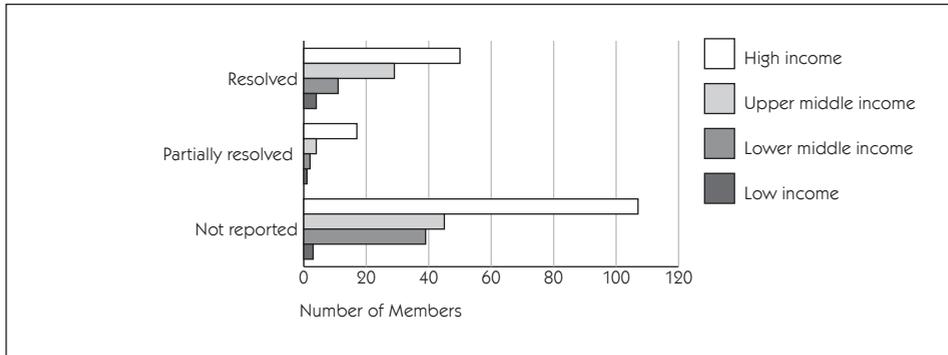

The 75 specific trade concerns that have been reported resolved were raised by 94 Members.<sup>96</sup> An examination of the income level of the Members raising the trade concerns that have been reported as resolved indicates that these are overwhelmingly high-income Members, and again concentrated in a limited number of different Members. More specifically, in 50 cases the Members raising the resolved concern were high-income Members (6 different Members), in 29 cases they were upper-middle-income Members (8 different Members), in 11 cases they were lower-middle-income Members (7 different Members) and in 4 cases they were low-income Members (3 different Members). It is interesting to note that in all cases where low-income Members were involved in raising a specific trade concern that was successfully resolved, the relevant trade concern was jointly raised with high-income or upper-middle-income Members.

An examination of the current status of all specific trade concerns raised thus far indicates that for all income categories of Members except low-income Members, the number of concerns not reported resolved exceeds those resolved or partially resolved.<sup>97</sup>

<sup>96</sup> Note, again, that this figure does not refer to 94 different Members. Instead it counts separately the number of times Members have been involved in raising trade concerns, even if the same Member was involved in raising several trade concerns.

<sup>97</sup> For low-income Members, four specific trade concerns raised by them are reported resolved, whereas one is partially resolved. For three of the concerns raised by low-income Members, no solution has been reported.

**Graph 42: Status of Specific Trade Concerns Raised by WTO Members by Income Level, 1995-2007**

The possibility of resolving a dispute through discussions at the SPS Committee, among technocrats, rather than through formal dispute settlement, has practical implications. As noted by Wolfe,

[E]xpertise is never neutral; every choice of forum privileges some set of actors. Trade lawyers displace microbiologists and regulators once a food problem moves from the SPS Committee to a dispute panel.<sup>98</sup>

The weak participation of some Members at lower levels of development in the specific trade concern mechanism does not seem to be due to flaws in the mechanism itself. In fact, the threshold for raising and supporting trade concerns is very low. The costs involved are minimal and there are almost no procedural requirements to be met, as set out above. It seems that the reason for the limited use of this mechanism by these Members lies rather in their national capacity constraints. Effective use of the mechanism is dependent on systematic monitoring of notified SPS measures in order to identify problems in a timely manner. It also requires good coordination with national export industries, which are best placed to pinpoint the problematic aspects of particular measures. Further, coordination between national ministries is important, to ensure that an effective strategy for raising the problem is developed. In addition, the attendance of SPS Committee meetings by at least one delegate with expertise in the relevant area is crucial. This is not only the case for the meeting where the Member involved wants to raise a trade concern, but for all meetings, so that the delegate is well-placed to see opportunities to support trade concerns raised by other Members where these are of importance to its own exports. Without assistance to build capacity in these areas, an improvement in the extent to which Members at lower levels of development use the specific trade concerns mechanism are unlikely.

As mentioned above, the specific trade concerns mechanism is not the only way in which the SPS Committee gives effect to its mandate under Article 12.2. The second way in which it does so, is by creating a forum for discussion of issues related to SPS matters of broader relevance, in SPS Committee meetings. Any Member may propose that the

<sup>98</sup> Robert Wolfe, 'See You in Geneva? Legal (Mis)Representations of the Trading System', *European Journal of International Relations* 11 (3), 2005, 339-364, 347.

SPS Committee consider, as part of its agenda, any specific SPS-related issue unrelated to a specific trade concern. A number of specific issues have been considered in this way, including implementation problems regarding certain provisions of the *SPS Agreement* (including those on equivalence, regionalisation, special and differential treatment and technical assistance). The discussions taking place through this mechanism have led in some cases to the decisions of the SPS Committee discussed above.<sup>99</sup> Other SPS issues discussed include those of private sector SPS standards, approaches to risk assessment, and the practice on setting pesticide limits.

No formal procedure has been adopted in this regard. In practice, a Member wishing to add a specific issue to the agenda of an SPS Committee meeting submits a proposal to the Committee, with an explanation of the reasons this request. The item will be added to the agenda for the next meeting.<sup>100</sup> Either the Member making the proposal or the Secretariat will normally prepare a background document on the matter in advance of the meeting where the issue will be discussed, to help focus the Committee's discussions.<sup>101</sup> Following the discussions, the SPS Committee decides what further steps, if any, it will take on the specific issue.<sup>102</sup>

The task of the SPS Committee under Article 12.2, as stated above, has also been understood to include a third mechanism. This mechanism entails the role of the Chairperson of the SPS Committee in providing good offices for the resolution of specific trade concerns raised under the *SPS Agreement*, also known as the 'good offices of the Chair'. This is provided for in the *Working Procedures* of the SPS Committee.<sup>103</sup> In 1998, the US reminded the SPS Committee of this mechanism of informal consultations between the Chairperson and Members involved in a trade concern.<sup>104</sup> It noted that these consultations are not necessarily a precursor to formal dispute settlement proceedings but could, in fact, be used by Members to avoid costly and lengthy dispute settlement. This issue was raised by New Zealand in the context of the second review of the *SPS Agreement*, where it suggested that the SPS Committee remind Members of the availability of this option and encourage them to make use thereof.<sup>105</sup> The WTO Secretariat invited the SPS Committee

---

<sup>99</sup> See above, Part IV, Sections 1.1.6 and 1.2.6 and Part V, Section 1.8.

<sup>100</sup> Committee on Sanitary and Phytosanitary Measures, *Ad Hoc Consultations and Resolution of Trade Concerns*, G/SPS/GEN/781, circulated on 15 June 2007, para. 14.

<sup>101</sup> *Ibid.*

<sup>102</sup> This approach is being used to discuss specific issues identified in the Second Review of the operation and implementation of the *SPS Agreement* (such as the use of *ad hoc* consultations and the relationship between the SPS Committee and Codex, IPPC and OIE).

<sup>103</sup> Committee on Sanitary and Phytosanitary Measures, *Working Procedures of the Committee - Adopted by the Committee at Its Meeting of 29-30 March 1995*, G/SPS/1, circulated on 4 April 1995, para. 6. This provision states: 'With respect to any matter which has been raised under the Agreement, the Chairperson may, at the request of the Members directly concerned, assist them in dealing with the matter in question. The Chairperson shall normally report to the Committee on the general outcome with respect to the matter in question.'

<sup>104</sup> See Committee on Sanitary and Phytosanitary Measures, *Facilitation of Informal Consultations on Specific SPS Issues: Submission by the United States*, G/SPS/GEN/74, circulated on 5 June 1998.

<sup>105</sup> Committee on Sanitary and Phytosanitary Measures, *The Second Review of the Operation and Implementation of the SPS Agreement. Further Elaboration of Issues for Consideration by New Zealand*, G/SPS/W/157, circulated on 12 October 2004, para. 12.

to consider whether more explicit guidance on the use of ‘good offices’ would be helpful, or whether other mechanisms for *ad hoc* consultations should be developed.<sup>106</sup>

In March 2008, Argentina noted the underutilisation of the possibility to make use of the ‘good offices’ of the Chairperson, which had then been used only three times.<sup>107</sup> Argentina expressed the view that the lack of detailed guidelines on access to and the operation of this mechanism contributed to its underutilisation and therefore it supported the suggestion of the WTO Secretariat that such guidelines be drafted.<sup>108</sup> In June 2008 the US similarly supported the Secretariat’s suggestion for the elaboration of guidelines on this process.<sup>109</sup> The proposals of Argentina and the US are similar overall but do have some important differences. An important difference is that while the Argentine proposal deals only with a procedure for the use of the ‘good offices’ of the Chairperson, the US proposal stresses that the best forum for addressing concerns on SPS measures and related technical issues is the SPS Committee, coupled with bilateral discussions.<sup>110</sup> It creates a procedure for consultations between Members, which includes the possibility to agree on using the ‘good offices’ of the Chairperson. The US said its proposal emphasises technical consultations rather than legal procedures. In the US proposal the Chairperson (or person designated by him/her) is prohibited from expressing an opinion about whether the measure under discussion is legal or not under WTO agreements.<sup>111</sup> Similarities in the proposals include the provision that participation in the consultations is voluntary and without prejudice to the rights and obligations of Members under WTO agreements or in further proceedings; the requirement that a written request for consultations be addressed to another Member identifying the measure at issue and the concerns that the requesting Member has with the measure;<sup>112</sup> the notification of the initiation and termination of the

<sup>106</sup> The Secretariat’s suggestion is contained in Job(07)/14, para. 30.

<sup>107</sup> The first use of the good offices of the Chairperson of the SPS Committee was in 1998 by Argentina, Chile, South Africa and Uruguay with regard to the EC’s measures with respect to citrus canker (see G/SPS/GEN/204/Rev.6/Add.3, item 27, paras 25-88). The second use of this mechanism was by the US with regard to Poland’s restrictions on wheat and oil seeds in November 1998 (see G/SPS/GEN/204/Rev.6/Add.2, item 25, paras 444-445). The third use of this mechanism was by Canada with regard to India’s restrictions on imports of bovine semen in March 2001 (see G/SPS/GEN/204/Rev.6/Add.2, item 61, paras 327-335).

<sup>108</sup> Argentina’s communication containing its proposal for guidelines for the operation of the mechanism of good offices of the Chairperson of the SPS Committee are contained in Committee on Sanitary and Phytosanitary Measures, *Good Offices of the Chairperson. Communication from Argentina*, G/SPS/W/219, circulated on 17 March 2008.

<sup>109</sup> Committee on Sanitary and Phytosanitary Measures, *Article 12.2 - Consultations. Proposal by the United States*, G/SPS/W/227, circulated on 23 June 2008, para. 7.

<sup>110</sup> The US calls this a ‘Committee first’ approach, which it has also taken in its informal response to a proposal with regard to non-tariff barriers in non-agricultural market access (NAMA) negotiations which includes the possibility of mediation by a facilitator. Negotiating Group on Market Access, *Market Access for Non-Agricultural Products. Ministerial Decision on Procedures for the Facilitation of Solutions to Non-Tariff Barriers. Proposal by the African Group, Canada, European Communities, LDC Group, NAMA-II, the Group of Developing Countries, New Zealand, Norway, Pakistan and Switzerland*, TN/MA/W/106, circulated on 9 May 2008. The Group of Developing Countries consists of Argentina, Bolivarian Republic of Venezuela, Brazil, Egypt, India, Indonesia, Namibia, Philippines, South Africa and Tunisia. SPS measures are one of the non-tariff barriers addressed in this proposal (to the extent that they apply to non-agricultural products such as processed food).

<sup>111</sup> Committee on Sanitary and Phytosanitary Measures, *Article 12.2 - Consultations. Proposal by the United States*, G/SPS/W/227, circulated on 23 June 2008, para. 20.

<sup>112</sup> While the US proposal refers only to the requesting Member’s questions and concerns regarding the measure, the Argentine proposal is more formal requiring an identification of the legal basis for the concerns with

proceedings to the WTO Secretariat; the possibility to request the participation of the secretariat of the CAC, OIE or IPPC where an international standard is at issue; the confidentiality of the proceedings; and the requirement that the Chairperson report back on the general outcome of the consultations to the SPS Committee. Argentina and the US have agreed to discuss combining their papers before the next meeting, in October 2008.<sup>113</sup>

### 2.1.3 Monitoring and promotion of international harmonisation

The SPS Committee is allocated various tasks regarding the process of international harmonisation of SPS standards by Article 12 of the *SPS Agreement*. According to Article 12.2 it must encourage the use of international standards, guidelines and recommendations by all Members, and sponsor technical consultation and study in this regard. As required by Article 12.3, it must also maintain close contact with the three main international standard-setting organisations in order to obtain the best possible scientific advice for the administration of the *SPS Agreement* and avoid duplication of effort. In the exercise of this function, the SPS Committee maintains close working relationships with the CAC, OIE and IPPC Secretariat and receives regular updates of their activities.

Further, Article 12.5 allows the SPS Committee to avoid unnecessary duplication by using information generated by the procedures, particularly those relating to notification, in place in the international organisations. In 2008, the IPPC reported to the SPS Committee that the CPM had initiated the development of a system to monitor the use of IPPC standards, under the responsibility of a standards implementation officer.<sup>114</sup> The OIE indicated that it has no monitoring mechanism in place for the implementation of its standards and no plans to develop such a mechanism.<sup>115</sup> The CAC acceptance procedure, whereby members notified the CAC of their intention to apply the CAC standard at issue,<sup>116</sup> was abolished in 2005.<sup>117</sup> The CAC currently has no procedure in place to

---

reference to the applicable Articles of the *SPS Agreement*.

<sup>113</sup> As the report of the discussion at the June 2008 meeting of the SPS Committee has not been circulated yet, this information is taken from the WTO News Item 'Members turn Attention to Improving SPS Mediation', available at: [http://www.wto.org/english/news\\_e/news08\\_e/sps\\_24june08\\_e.htm](http://www.wto.org/english/news_e/news08_e/sps_24june08_e.htm), visited on 26 June 2008.

<sup>114</sup> Committee on Sanitary and Phytosanitary Measures, *Decisions from the Third Session of the Commission on Phytosanitary Measures (Rome, 7-11 April 2008). Submission from the International Plant Protection Convention, G/SPS/GEN/849*, circulated on 18 June 2008. Under the new mechanism, a database will be created allowing the identification of the IPPC standards that are being used. The IPPC has noted that in some cases non-use of standards is due to the fact that they may not be relevant to the particular situation of an individual country.

<sup>115</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Tenth Annual Report Adopted by the Committee on 25 June 2008, G/SPS/49*, circulated on 14 July 2008, para. 8.

<sup>116</sup> Under the CAC acceptance procedure, members could indicate their acceptance of CAC standards in three different ways: (1) full acceptance, which entailed the obligation to ensure that conforming products could circulate freely and that non-conforming products could not bear the name or description set out in the standard; (2) acceptance with specific deviations, which obliged members to allow free circulation of conforming products, except under the derogations specified by the member and to ensure that products complied with the standard as qualified by the derogations; and (3) acceptance by means of a declaration of free distribution, which required that the member allow free circulation of conforming products within its territory. For a detailed explanation of the acceptance procedure, see Mariëlle Masson-Matthee, *The Codex Alimentarius Commission and Its Standards*, Doctoral Thesis, Maastricht University, Faculty of Law (T.M.C. Asser Press, Maastricht), 2007, 83-85.

<sup>117</sup> Codex Alimentarius Commission, *Report of the Twenty-Eighth Session*, ALINORM 05/28/41 (Joint FAO/

monitor the implementation of its standards.<sup>118</sup> Therefore, except in the case of phytosanitary standards once the proposed IPPC mechanism is in operation, the burden of gathering information on implementation of international standards remains squarely on the SPS Committee.

Article 12.4 of the *SPS Agreement* requires that the SPS Committee develop a procedure to monitor the process of international harmonisation and the use of international standards. This duty is also provided for in Article 3.5 of the *SPS Agreement*. To give effect to this obligation, a provisional procedure was established by the SPS Committee in 1997,<sup>119</sup> and extended three times.<sup>120</sup> In October 2004, the procedure was modified to facilitate the consideration of new issues at each meeting, by changing the deadline for identifying issues from 30 days to 10 days in advance of Committee meetings.<sup>121</sup> Finally, in 2006, the SPS Committee agreed to extend the provisional procedure indefinitely.<sup>122</sup>

The monitoring procedure currently applies only to the standards set by the CAC, OIE or IPPC, but if the need arises it may be extended to the standards of other relevant international organisations.<sup>123</sup> In terms of the monitoring procedure, only the use or non-use of international standards with a 'major trade impact' is monitored.<sup>124</sup> A standing agenda

---

WHO Food Standards Programme, Rome), 4 - 9 July 2005, para. 36, available at: <http://www.codexalimentarius.net/web/archives.jsp?year=05>, visited on 14 May 2008.

<sup>118</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Ninth Annual Report Adopted by the Committee on 28 June 2007*, G/SPS/45, circulated on 10 July 2007, para. 6. At the SPS Committee meeting of October 2006, the CAC representative informed the SPS Committee of the ongoing discussion in the CAC regarding the introduction of a mechanism to monitor the use of Codex standards. The CAC Secretariat had sent a questionnaire to all CAC members relating to: (1) the use of Codex standards and related texts at the national and regional level; (2) non-use of Codex standards and related texts; (3) any difficulties encountered by Codex members in using Codex standards and related texts; (4) relevance of Codex standards as a basis for harmonization; and (5) any other health and trade problems related to standardization. Committee on Sanitary and Phytosanitary Measures, *Submission to the 37th Meeting of the SPS Committee (Geneva, 11-13 October 2006). Information on Activities of the Codex Alimentarius Commission. Adopted by the Committee on 25 June 2003*, G/SPS/25, circulated on 1 July 2003.

<sup>121</sup> Committee on Sanitary and Phytosanitary Measures, *Revision of the Procedure to Monitor the Process of International Harmonisation. Decision of the Committee. Revision*, G/SPS/11/Rev.1, circulated on 15 November 2004.

<sup>122</sup> Committee on Sanitary and Phytosanitary Measures, *Decision to Modify and Extend the Provisional Procedure to Monitor the Process of International Harmonization. Adopted on 28 June 2006*, G/SPS/40, circulated on 5 July 2006.

<sup>123</sup> Recall here the possibility set out in Annex A.3(d) for other international organisations to be identified as relevant by the SPS Committee for matters not covered by the CAC, OIE or IPPC. See above, Part III, Section 4.1.1.

<sup>124</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization: Decision of the Committee*, G/SPS/11, circulated on 22 October 1997, para. 5. Trade impact is determined on the basis of the extent to which Members use the relevant standard and the frequency/

item for all SPS Committee meetings exists in this regard, allowing Members to raise problems with regard to international standards at any meeting. Members should do so in advance, indicating the nature of the trade problem. Members may submit comments with regard to trade problems resulting from the non-use of appropriate standards or the non-existence or inappropriateness of international standards.<sup>125</sup> On the basis of the submissions of Members and the discussion in the SPS Committee, a list of international standards with a major impact on trade is drawn up, and reviewed at each SPS Committee meeting. The SPS Committee may, on this basis, invite the relevant standard-setting body to consider reviewing the standard at issue or to provide information on the standard, including with regard to amendments or ongoing work. Members participating in the standard-setting bodies should take this into account in priority setting activities.<sup>126</sup> The SPS Committee adopts annual reports, drawn up by the Secretariat, based on information and comments from Members and international standard-setting organisations regarding the use of existing international standards, the need for new international standards and work on the adoption of such standards.<sup>127</sup> Ten annual reports have been adopted thus far.<sup>128</sup>

When used, this procedure can be effective in resolving concerns of Members in the area of harmonised standards. It allows for discussion of these concerns among WTO Members and may result in a recommendation by the SPS Committee, under Article 12.6 of the *SPS Agreement*, inviting the international standard-setting organisation involved to address the issue. More specifically, Article 12.6 allows the SPS Committee, on the

---

severity of trade problems experienced with regard to the products covered by the standard.

<sup>125</sup> For example, in 2001 South Africa requested the monitoring of the OIE standard for African horse sickness under this procedure, on the grounds that the standard was outdated in terms of the epidemiology of the disease and created an impediment to international trade in horses. Committee on Sanitary and Phytosanitary Measures, *Monitoring/Revision of an International Standard: African Horse Sickness - Request by South Africa*, G/SPS/GEN/289, Geneva, circulated on 29 October 2001.

<sup>126</sup> Committee on Sanitary and Phytosanitary Measures, *Revision of the Procedure to Monitor the Process of International Harmonisation. Decision of the Committee. Revision*, G/SPS/11/Rev.1, circulated on 15 November 2004, para. 10.

Eighth Annual Report Adopted by the Committee on 28 June 2006*, G/SPS/42, circulated on 4 August 2006; Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Ninth Annual Report Adopted by the Committee on 28 June 2007*, G/SPS/45, circulated on 10 July 2007; Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Tenth Annual Report Adopted by the Committee on 25 June 2008*, G/SPS/49, circulated on 14 July 2008.

initiative of one Member, to use appropriate channels to invite the relevant international organisations or their subsidiary bodies to examine specific matters relating to a particular standard, guideline or recommendation. Among these specific matters, the reasons for non-use of international standard provided by Members under Article 12.4 are expressly included.

By 2005, Members had raised 11 issues under this procedure and these concerns were promptly addressed by the standard-setting bodies.<sup>129</sup> Six new issues were raised between 2005 and 2006. In the context of the second periodic review of the *SPS Agreement*, New Zealand noted that this procedure was successfully used by the US to achieve the development of a definition and guidelines on the issue of ‘official control’ by the IPPC’s Interim Committee on Phytosanitary Measures.<sup>130</sup> In addition, this possibility was used to facilitate progress in the discussion in the SPS Committee on regionalisation, as proposed by New Zealand at the SPS Committee meeting of October 2004.<sup>131</sup> According to New Zealand, this could lead to the incorporation of the best available scientific and technical advice into the work of the SPS Committee on this matter, thereby avoiding unnecessary duplication of work. In accordance with Article 12.6 of the *SPS Agreement*, New Zealand requested the SPS Committee to invite OIE and IPPC Secretariats to examine the specific matters concerning regionalisation relevant to their international standards, guidelines or recommendations.<sup>132</sup> In particular, New Zealand proposed that the SPS Committee invite the OIE and IPPC to consider the appropriateness of developing administrative procedures for the recognition of pest- or disease-free areas or areas of low pest prevalence and including them in their international standards, recommendations or guidelines.<sup>133</sup>

The successful use of the possibilities provided by the procedure under Article 12.4 and 12.6 is best illustrated by the following example involving Sri Lanka. Sri Lanka has faced significant problems with regard to its exports of cinnamon due to the absence of a CAC standard setting an MRL for sulphur dioxide in cinnamon. In February 2006, Sri Lanka raised this concern under the SPS Committee’s procedure for monitoring harmonisation. The SPS Committee, in view of the importance of this matter for the exports of a devel-

---

<sup>129</sup> This was reported by the WTO Secretariat. Committee on Sanitary and Phytosanitary Measures, *Review of the Operation and Implementation of the SPS Agreement. Background Document. Note by the Secretariat. Revision*, G/SPS/GEN/510/Rev.1, circulated on 23 February 2005, para. 24.

<sup>130</sup> Committee on Sanitary and Phytosanitary Measures, *The Second Review of the Operation and Implementation of the SPS Agreement. Further Elaboration of Issues for Consideration by New Zealand*, G/SPS/W/157, circulated on 12 October 2004, para. 16.

<sup>131</sup> Committee on Sanitary and Phytosanitary Measures, *Monitoring of International Harmonization: Regionalization. Submission by New Zealand*, G/SPS/W/151, circulated on 29 September 2004.

<sup>132</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Seventh Annual Report Adopted by the Committee on 30 June 2005*, G/SPS/37, circulated on 19 July 2005, para. 5. Although New Zealand refers to the OIE Secretariat, it may be assumed that it means the OIE Bureau.

<sup>133</sup> In addition, New Zealand suggested that the CAC and OIE address the issue of the recognition of pest- or disease-free status, in particular the process for acceptance by members of OIE recognition of disease-free status; the question whether OIE recognition constitutes a determination under Article 6.2 of the *SPS Agreement*; and whether it would be feasible under the IPPC to provide recognition of pest or disease free status for a limited number of pests or diseases which have a significant impact on international trade of Members. Committee on Sanitary and Phytosanitary Measures, *Monitoring of International Harmonization: Regionalization. Submission by New Zealand*, G/SPS/W/151, circulated on 29 September 2004, para. 8.

oping-country Member, immediately brought the matter to the attention of the CAC.<sup>134</sup> In July 2006, the CAC informed the SPS Committee that, pursuant to the latter's request, a Codex standard had been adopted setting an MRL for sulphites in herbs and spices.<sup>135</sup> In his letter, the Chairperson of the CAC expressly noted that this rapid action on the part of the CAC 'would not have been possible without the proactive intervention made by the Delegation of Sri Lanka in the Codex Committee on Food Additives and Contaminants, and without the support of other Codex members on the proposal made by Sri Lanka.'<sup>136</sup>

Another example of the use of the procedure to monitor harmonisation, this time to report a problem in the implementation of an international standard, is the concern raised by Mauritius under this agenda item in 2005 before the SPS Committee with regard to the IPPC guidelines on wood packaging material (ISPM 15).<sup>137</sup> As noted above, Mauritius lacks the capacity to set up the heat-treatment plant for wood packaging material required by the relevant IPPC standard.<sup>138</sup> It therefore sought, through this procedure, a four-year moratorium for the implementation of this standard from the IPPC and from Members imposing the IPPC standard, while it developed the necessary capacity. Mauritius also requested Members to give positive consideration to recognising the equivalence of the use of phosphine fumigation treatment as a treatment for wood packaging materials in the interim period.<sup>139</sup>

A third example of the use of the Article 12.4 procedure is that by Argentina's at the SPS Committee meeting of June 2007. Argentina raised its concerns regarding the fact that several importing Members set MRLs for pesticides that are stricter than CAC MRLs without scientific justification.<sup>140</sup> As noted by Argentina, these Members set MRLs exceeding Codex standards based on studies conducted exclusively with national data. This causes problems in cases where a product is not grown in the importing Members or where the relevant pesticide is not used in that Member. In such cases, Members tend to automatically set MRLs at the 'limit of detection' level, creating significant compliance problems for developing-country Members.<sup>141</sup> Further, as noted by Argentina, Codex MRLs are

---

<sup>135</sup> Committee on Sanitary and Phytosanitary Measures, *Sulphur Dioxide in Cinnamon*, G/SPS/GEN/716, circulated on 25 July 2006. The standard was adopted at the 29<sup>th</sup> Session of the CAC, held on 3-7 July 2006. It sets a maximum level for use of 150 mg/kg for sulphites (including sulphur dioxide) in the food category 'herbs and spices' of the Codex General Standard for Food Additives (GSFA) Codex STAN 192-1995, Rev. 7 (2006) (available at [www.codexalimentarius.net/gsaonline/index.html](http://www.codexalimentarius.net/gsaonline/index.html), visited on 25 June 2007).

<sup>136</sup> *Ibid.*

<sup>137</sup> This example was mentioned above, Part II, Section 2.5.2.3.

<sup>138</sup> Committee on Sanitary and Phytosanitary Measures, *Implementation of International Standards. Communication by Mauritius*, G/SPS/GEN/547, circulated on 2 March 2005.

<sup>139</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Seventh Annual Report Adopted by the Committee on 30 June 2005*, G/SPS/37, circulated on 19 July 2005, para. 8.

<sup>140</sup> Committee on Sanitary and Phytosanitary Measures, *Maximum Residue Levels for Pesticides: Impact on Exports from Developing Countries. Communication from Argentina*, G/SPS/W/211, circulated on 26 June 2007. This concern was reported in Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Ninth Annual Report Adopted by the Committee on 28 June 2007*, G/SPS/45, circulated on 10 July 2007.

<sup>141</sup> Committee on Sanitary and Phytosanitary Measures, *Maximum Residue Levels for Pesticides: Impact on Exports from Developing Countries. Communication from Argentina*, G/SPS/W/211, circulated on 26 June

lacking for many of the products of export interest to developing-country Members. Of the 345 active substances registered to treat Argentina's various export crops, only 110 (31.8 percent) have Codex MRLs.<sup>142</sup> In addition, Argentina stated that some Members 'remove active substances from their national registries of permitted products not for scientific reasons but for purely commercial reasons.'<sup>143</sup> Argentina recognised that the scientific justification requirement for SPS measures not based on international standards aims to ensure objectivity. However, it stressed that, 'in the event of a dispute it implies an almost insurmountable restriction for developing countries, which do not have the necessary resources or scientific analyses to demonstrate the inconsistency of a measure that has been imposed on them unfairly.'<sup>144</sup>

Argentina proposed, *inter alia*, that the SPS Committee set up appropriate mechanisms to ensure that the CAC undertakes or hastens work on the establishment of MRLs for pesticides on products of interest to agricultural exporting Members, and that it urge Members to provide the scientific data at their disposal to facilitate this work.<sup>145</sup> Several Members supported Argentina's position. The CAC representative pointed out that Codex pesticide standards were established on the basis of the best available scientific data by the JMPR, but that this necessitated a commitment by members to generate the necessary data and to provide this to JMPR.<sup>146</sup> Further, the CAC representative stated that the issue raised by Argentina would be considered by the CAC at its July 2007 meeting, with a view to determining how to proceed.<sup>147</sup> At that meeting the CAC noted that the enforcement of CAC standards, including MRLs fell outside its mandate and could better be addressed in the SPS Committee.<sup>148</sup> In addition, the CAC noted that the lack of capacity of developing countries to generate scientific data, especially with regard to pesticide MRLs, had been discussed at the Fifty-Ninth Session of the CAC Executive Committee on the basis of a proposal made by the representative for the Latin American and the Caribbean region to include an activity in the draft CAC *Strategic Plan 2008-2013* to promote the strengthening of scientific advisory groups, with regard to their efficiency and necessary resources, particularly in the area of pesticide residues. However, the CAC Executive Committee stated that some of these concerns might best be addressed outside the CAC, including through international FAO/WHO workshops on pesticide residues.<sup>149</sup> The FAO representative, on behalf of the FAO and WHO, clarified that both organizations had assisted member states to enhance their capacity on data provision,<sup>150</sup> and expressed the

<sup>150</sup> One initiative mentioned was the FAO/WHO Meeting on Enhancing Developing Country Participation in Scientific Advice Activities, 12-15 November 2005, held in Belgrade, Serbia and Montenegro, which had led to several recommendations in this regard.

willingness of the FAO and WHO to continue efforts to fulfil their mandate by means of enhancing the provision scientific advice.<sup>151</sup>

Despite these examples of the possibilities provided by this monitoring procedure to raise awareness of specific issues relating to international standards and to create momentum for work to address these issues, to date, this possibility is generally poorly used and Members seldom provide information for the annual reports on harmonisation. In June 2008, a number of Members expressed their concern that the existing procedure was not providing for an effective monitoring of the use of international standards.<sup>152</sup> In addition, monitoring is currently limited to cases where international standards are lacking, inadequate, or not being used. In the abovementioned paper submitted by New Zealand, it proposed that the monitoring be extended to include also all new SPS measures that are based on international standards, to enable the SPS Committee to fully monitor harmonisation and the use of international standards.<sup>153</sup> Useful information may be provided if the recommendation in the recent revision of the transparency procedures that Members notify new or modified SPS measures that are based on international standards is given effect.<sup>154</sup>

#### 2.1.4 Periodic review of the SPS Agreement

The SPS Committee is obliged by Article 12.7 to review the operation and implementation of the *SPS Agreement* three years after its entry into force, and thereafter as the need arises. Where appropriate, the SPS Committee may make proposals to the Council for Trade in Goods regarding amendments to the *SPS Agreement*. The SPS Committee established a procedure for this review<sup>155</sup> and the first review was conducted in 1998, resulting in a report of the SPS Committee.<sup>156</sup> This report identified various problems with the implementation of the *SPS Agreement*. Among these were deficiencies in the operation of the transparency requirements, which the Committee stressed could be addressed by improvements in Members' compliance with the *Recommended Notification Procedures* as well as through revisions to these procedures to deal with new concerns. The need

<sup>151</sup> Executive Committee of the Codex Alimentarius Commission, *Report of the Fifty-Ninth Session*, ALINORM 07/30/3 (Joint FAO/WHO Food Standards Programme, Rome), 26-29 June 2007, para. 81.

<sup>152</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Tenth Annual Report Adopted by the Committee on 25 June 2008*, G/SPS/49, circulated on 14 July 2008, para. 6.

<sup>153</sup> Committee on Sanitary and Phytosanitary Measures, *The Second Review of the Operation and Implementation of the SPS Agreement. Further Elaboration of Issues for Consideration by New Zealand*, G/SPS/W/157, circulated on 12 October 2004, paras 8 and 10. New Zealand proposed that this should be done by means of amendments to the SPS Committee's *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7)*, (G/SPS/7/Rev.2), as was done with regard to transparency of the recognition of equivalence.

<sup>154</sup> This point was made by Members at the SPS Committee meeting of June 2008, where the procedure to monitor international harmonisation was discussed. Committee on Sanitary and Phytosanitary Measures, *Procedure to Monitor the Process of International Harmonization. Tenth Annual Report Adopted by the Committee on 25 June 2008*, G/SPS/49, circulated on 14 July 2008, para. 6.

<sup>155</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Review the Operation and Implementation of the Agreement*, G/SPS/10, circulated on 21 October 1997.

<sup>156</sup> Committee on Sanitary and Phytosanitary Measures, *Review of the Operation and Implementation of the Agreement on the Application of Sanitary and Phytosanitary Measures: Report of the Committee*, G/SPS/12, circulated on 11 March 1999.

for improvements in the provision of technical assistance and the lack of information on the extent to which SDT was accorded to developing-country Members was pointed to. The potential importance of the obligations on equivalence and regionalisation was noted and the contributions of the CAC, OIE and IPPC through their work in these areas was welcomed. However, no amendments were proposed as a result of this review. The SPS Committee noted that the review had not been comprehensive and recognised that Members could raise any issue for the consideration of the Committee at any time.<sup>157</sup>

In the *Decision on Implementation* adopted at the Doha Session of the Ministerial Conference in 2001, the SPS Committee is instructed to review the operation and implementation of the *SPS Agreement* at least once every four years.<sup>158</sup> The next review was required to result in a report for the Sixth Session of the Ministerial Conference. In order to meet this goal, the SPS Committee adopted a decision, at its meeting on 22-23 June 2004, setting out the procedure for the second review process.<sup>159</sup> On request of the Members, the WTO Secretariat prepared and revised a background document for purposes of the review.<sup>160</sup>

The outcome of the second review reflected a positive assessment by Members regarding the achievement of the *SPS Agreement* of its purpose, which was seen as benefiting both importing and exporting Members.<sup>161</sup> It also noted the importance of the SPS Committee in providing a regular forum for national officials to make contacts, engage in consultations and explore solutions to trade problems. However, it pointed to the fact that, despite improvements in participation, many developing-country Members and LDC Members still faced difficulties in participating effectively, including in adequate preparation for meetings and timely follow-up.<sup>162</sup> After commending the progress made on a number of issues by the SPS Committee through its decisions on transparency, consistency in appropriate level of protection, equivalence and monitoring of harmonisation, it was noted that more could be done by the SPS Committee to ensure the effective implementation of the *SPS Agreement*. The second review was completed in June 2005, and resulted in a 47-page report, including 40 recommendations and a programme for further work.<sup>163</sup> Many of the recommendations relate to maintaining as standing agenda items for SPS Committee meetings the various issues addressed in the review (including consistency, equivalence, regionalisation, transparency, monitoring of international standards, technical assistance, SDT and specific trade concerns) and continuing work on these issues. In

<sup>161</sup> Committee on Sanitary and Phytosanitary Measures, *Review of the Operation and Implementation of the Agreement on the Application of Sanitary and Phytosanitary Measures. Report Adopted by the Committee on 30 June 2005*, G/SPS/36, circulated on 11 July 2005, para. 8.

<sup>162</sup> *Ibid.*, para. 7.

<sup>163</sup> The report of the Second Review was adopted at the SPS Committee meeting of 29-30 June 2005. *Ibid.*

addition, the SPS Committee agreed to pursue work on new issues, based on information provided by Members regarding their experiences and on specific suggestions submitted by Members to the Committee. These new issues were the need to clarify the relationship between the SPS Committee and the CAC, OIE and IPPC; the need to clarify the relationship between the terms ‘SPS measures’ and ‘SPS regulations’ for purposes of the transparency provisions; the need to examine the relationship between Articles 2.1 and 5.6 of the *SPS Agreement*; the need to address undue delays in respect of various provisions of the *SPS Agreement* (including in respect of equivalence, regionalisation, risk assessments prior to granting market access, and the operation of control, inspection and approval systems); the need to develop guidelines on good regulatory practices; and the need to clarify ambiguities and develop common practices with regard to control and inspection procedures, in particular with regard to who should bear the costs of inspection visits.<sup>164</sup>

It is interesting to note that, despite the express option given to the SPS Committee under Article 12.7 of the *SPS Agreement* to submit proposals to the Council for Trade in Goods for amendments to the *SPS Agreement* where appropriate, having regard to the experience gained in the implementation of the Agreement, neither review proposed any amendments. No suggestion was made that the work of the Committee in developing procedural guidelines for the operationalisation of the provisions of the *SPS Agreement* be incorporated in the form of amendments. Instead, it is apparent that Members wish to continue the current successful *modus operandi* of working towards the resolution of implementation problems through decisions of the Committee, based on technical discussions and shared experiences, and reviewing these decisions as needed. As noted above, the weak legal status of decisions of the SPS Committee, as compared to the binding status of an amendment, makes it easier for Members to reach consensus on new norms.

## 2.2 Dispute settlement procedures

While the mechanism established by the SPS Committee to address specific trade concerns through multilateral discussions is very useful in facilitating cooperative solutions to SPS conflicts where bilateral initiatives have failed, Members do not always succeed in finding agreed solutions. In such cases, it is important to have a well-functioning, enforceable system for the settlement of disputes.

While a very small proportion of the conflicts between Members with regard to the rules of the *SPS Agreement* result in the initiation of dispute settlement proceedings, and even fewer actually proceed to adjudication, as set out below,<sup>165</sup> this does not mean that the dispute settlement system is of limited importance to SPS disputes. The very existence of the dispute settlement system creates an incentive for Members against whose SPS measures concerns are raised to address these concerns through negotiated solutions. In addition, the clarifications developed by panels and the Appellate Body with regard to the provisions of the *SPS Agreement* play a key role in establishing the normative framework

---

<sup>164</sup> *Ibid.*, paras 91, 93, 95, 97, 99, and 101.

<sup>165</sup> See the discussion of the use of the dispute settlement system to resolve SPS-related disputes, below, Part IV, Section 2.2.7.

within which Members address their SPS conflicts.<sup>166</sup> These clarifications are taken up in decisions of the SPS Committee that elaborate procedural guidelines for the operationalisation of provisions of the *SPS Agreement*. Equally importantly, they form the backdrop against which discussions between Members, bilaterally but even more so in the multi-lateral forum of the SPS Committee, take place to resolve trade concerns.<sup>167</sup> These have been referred to as ‘settlements negotiated in law’s shadow’.<sup>168</sup>

The manner in which panels and the Appellate Body have applied the disciplines of the *SPS Agreement* to the disputes before them has had important implications for the balance achieved by the Agreement between the competing objectives of health protection and trade liberalisation, and its effect on Members at different levels of development, as is seen from the discussion of the case law in this book.<sup>169</sup> The sensitive nature of this balance has meant that the disputes under the *SPS Agreement*, although few, ‘have been among the most closely watched and carefully critiqued’<sup>170</sup> of all WTO disputes to date. Much of the criticism relates not so much to the disciplines of the *SPS Agreement* as such, but rather to the way in which they have been clarified and applied in dispute settlement. While the substantive clarifications are discussed elsewhere in this book, a closer look at procedural aspects of the work of panels and the Appellate Body in disputes under the *SPS Agreement* is now called for. This work takes place within the framework of the WTO rules applicable to dispute settlement proceedings.

In order to enforce their rights under the *SPS Agreement*, Members can have recourse to the dispute settlement system of the WTO, as embodied in the *Dispute Settlement Understanding* (DSU).<sup>171</sup> In terms of Article 11.1 of the *SPS Agreement*, Articles XXII

<sup>166</sup> Victor Mosoti notes, with regard to the need for improving developing (and especially African) country participation in WTO dispute settlement, the importance of ensuring that these Members contribute to the evolving *corpus* of international trade law principles and jurisprudence arising from cases that ‘will govern multi-lateral trade relations for years to come.’ Victor Mosoti, ‘Does Africa Need the WTO Dispute Settlement System?’ in *Towards a Development-Supportive Dispute Settlement System in the WTO*, Gregory Shaffer, *et al.* (eds.) (International Centre for Trade and Sustainable Development, Geneva), 2003, 67-88, 73-74, available at: [www.ictsd.org/pubs/ictsd\\_series/resource\\_papers/DSU\\_2003.pdf](http://www.ictsd.org/pubs/ictsd_series/resource_papers/DSU_2003.pdf), visited on 30 June 2008.

<sup>167</sup> As noted by Wolfe, several authors have argued that the decisions of WTO adjudicatory bodies affect how Members bargain before they get to court, and that knowledge of what a court would do shapes the bargaining between Members. Here Wolfe refers, *inter alia*, to Richard H. Steinberg, ‘In the Shadow of Law or Power? Consensus-Based Bargaining and Outcomes in the GATT/WTO’, *International Organization* 56 (2), 2002, 339-374. However, Wolfe advocates a contrary understanding, which he calls ‘law in the shadow of bargaining’, arguing that law arises from human interaction rather than through dispute settlement outcomes. Robert Wolfe, ‘See You in Geneva? Legal (Mis)Representations of the Trading System’, *European Journal of International Relations* 11 (3), 2005, 339-364.

<sup>168</sup> Gregory Shaffer, ‘Recognising Public Goods in WTO Dispute Settlement: Who Participates? Who Decides? The Case of TRIPS and Pharmaceutical Patent Protection’, *Journal of International Economic Law* 7 (2), 2004, 459-482, 471. See also Gregory Shaffer, ‘Power, Governance, and the WTO: A Comparative Institutional Approach’, in *Power in Global Governance*, Michael Barnett and Raymond Duvall (eds.) (Cambridge University Press, Cambridge), 2005, 130-160, 136.

<sup>169</sup> The case law on specific substantive disciplines of the *SPS Agreement* is discussed in Part III above; that on the procedural arrangements under this Agreement in Chapter 1 of Part IV, above; and that on the special provisions for developing-country Members in Part V, below.

<sup>170</sup> Andrew T.F. Lang, *Provisional Measures under Article 5.7 of the WTO’s Agreement on Sanitary and Phytosanitary Measures: Some Criticisms of the Jurisprudence So Far*; LSE Legal Studies Working Paper No. 11/2008 (London School of Economics, London), 30 June 2008, 2, available at: <http://ssrn.com/abstract=1153660>, visited on 18 August 2008.

<sup>171</sup> ‘Understanding on the Rules and Procedures Governing the Settlement of Disputes’, in *The Results of the*

and XXIII of GATT 1994, as elaborated by the DSU apply to consultations and settlement of disputes under the *SPS Agreement*, unless otherwise provided in the Agreement.

This Chapter starts by briefly outlining the general rules on the WTO dispute settlement procedure. It proceeds to pay particular attention to certain aspects of these rules of special relevance to dispute settlement under the *SPS Agreement*, namely the question of which party bears the burden of proof, the standard of review to be applied by panels, and the role of international law in the interpretation of the Agreement.

In addition to the normal rules of the DSU, the *SPS Agreement* contains a special provision with regard to dispute settlement. This is contained in Article 11.2, dealing with the authority of panels to seek expert advice.<sup>172</sup> This Chapter therefore proceeds to examine the use of experts by panels when resolving disputes under the *SPS Agreement*.

Article 11.3 preserves the rights of Members under other international agreements, including the right to avail themselves of the good offices or dispute settlement mechanisms of other international organisations or created by any international agreement. Particularly relevant here are the dispute settlement mechanisms of the OIE and IPPC. These mechanisms are briefly outlined in this Chapter.

Finally, this Chapter examines the practice of dispute settlement under the *SPS Agreement* to date. Specific reference is made to the use made of the dispute settlement system by Members at different levels of development to resolve SPS disputes. An effort is made to identify some of the constraints faced by developing-country Members in participating in this system, and the implications their weak participation may have for the effect of the *SPS Agreement* on their trade/health interests. In addition, the implementation problems arising in respect of certain SPS disputes are addressed.

### 2.2.1 Overview of the WTO dispute settlement system

The DSU, negotiated in the Uruguay Round and seen as one of its main achievements, sets out the rules and procedures of the dispute settlement system of the WTO. The WTO dispute settlement system aims to provide security and predictability to the multilateral trading system.<sup>173</sup> It builds upon the dispute settlement practice that developed under the GATT 1947, and addresses the major shortcomings of that system. One of these shortcomings, as mentioned above, was the requirement of consensus for the establishment of a panel to hear a dispute and for the adoption of the report of this panel.<sup>174</sup> The consensus requirement for these decisions has been replaced by decision-making by reverse consensus (i.e. the decision is taken unless there is a consensus against it). In this way, there has

---

*Uruguay Round of Multilateral Trade Negotiations: The Legal Texts* (World Trade Organization, Geneva), 1994, 404-433.

<sup>172</sup> Article 11.2 of the *SPS Agreement*. Article 1.2 of the DSU provides that its rules and procedures apply subject to such additional rules and procedures on dispute settlement as are identified in Annex 2 to the DSU. Article 11.2 of the *SPS Agreement* is one of the provisions identified in Annex 2 of the DSU.

<sup>173</sup> Article 3.2 of the DSU.

<sup>174</sup> See the discussion of the shortcomings of the existing legal framework for the resolution of disputes concerning trade/health conflicts prior to the Uruguay Round, above Part III, Section 1.1.3.

been a movement away from a political/diplomatic system of resolving disputes towards a 'quasi-judicial' dispute settlement system.<sup>175</sup>

However, the preference for negotiated solutions to disputes, rather than adjudicated solutions, remains and is evident in several provisions of the DSU. Article 3.7 of the DSU declares the aim of the dispute settlement system to be 'to secure a positive solution to a dispute' and expresses the preference for 'a solution mutually acceptable to the parties to a dispute'. As a result, parties to a dispute are obliged to engage in consultations, normally for a minimum of 60 days, before resorting to adjudication.<sup>176</sup> Any agreed solution must be in accordance with the rights and obligations established by the covered agreements.<sup>177</sup> The possibility to make use of good offices, mediation and conciliation to resolve disputes is also provided for, in an attempt to increase the chances for a negotiated solution.<sup>178</sup>

Under Article 4.7 of the DSU, if attempts to resolve a dispute by means of consultations between the parties fail, a complaining party may request the Dispute Settlement Body to establish a panel to hear the dispute.<sup>179</sup> There is no standing panel body at the WTO, so a new panel must be established *ad hoc* for each dispute that proceeds to adjudication. A panel is normally composed of three persons, agreed upon by the parties to the dispute or, if no agreement can be reached within 20 days of the establishment of the panel, chosen by the WTO Director-General.<sup>180</sup> Where the dispute is between a developing-country Member and a developed-country Member, if the developing-country Member so requests at least one panellist shall be from a developing-country Member.<sup>181</sup> Article 10 makes provision for the participation, as a third party, of any Member having a substantial interest in the matter before a panel. This possibility is frequently used by Members that have a systemic interest in the dispute, for example with regard to the interpretation of the obligations in the relevant agreement, to have their views heard by the panel.

Panels have the right to seek information from any individual or body they deem appropriate and to consult experts to obtain their opinion on certain aspects of the matter before them.<sup>182</sup> During the panel process, the panel should continue to consult with the parties

<sup>175</sup> For a detailed discussion of the WTO dispute settlement system, see Peter Van den Bossche, *The Law and Policy of the World Trade Organization: Text, Cases and Materials*, 2<sup>nd</sup> ed. (Cambridge University Press, Cambridge), 2008, 168-311.

<sup>176</sup> Article 4.7 of the DSU provides a minimum 60-day period for consultations, unless both parties agree during the 60-day period that consultations have failed to settle the dispute. The consultation period may also be less than 60 days if the respondent does not reply to the request for consultations within 10 days of the request, or does not enter into consultations within 30 days. In both these situations, the complainant can proceed directly to request the establishment of a panel, under Article 4.3 of the DSU. The consultation period may also be shortened in cases of urgency, including those involving perishable goods, under Article 4.8 of the DSU.

<sup>177</sup> Article 3.4 of the DSU.

<sup>178</sup> Article 5 of the DSU.

<sup>179</sup> Article 4.7 provides that if consultations have failed, the complaining party may request the Dispute Settlement Body to establish a panel to hear the dispute. Article 6.1 of the DSU provides that the requested panel shall be established at the latest at the DSB meeting following that at which the request first appears on the agenda, unless there is a consensus in the DSB not to establish a panel (known as a 'reverse consensus'). Since the complaining party would logically never join such a reverse consensus, a panel is always established to hear a dispute.

<sup>180</sup> Article 8.5 and 8.7 of the DSU.

<sup>181</sup> Article 8.10 of the DSU.

<sup>182</sup> Article 13.1 and 13.2 of the DSU.

and give them an opportunity to develop a mutually agreed solution.<sup>183</sup> If no mutually agreed solution has been reached, the panel circulates its findings in the form of a written report, within a period that should not exceed nine months from the date of establishment of the panel.<sup>184</sup> In practice, this period is very often exceeded. The report of the panel, where one or more of the parties to a dispute is a developing-country Member, must indicate the form in which any SDT provisions raised have been taken into account.<sup>185</sup> The report of the panel is adopted by the DSB by reverse consensus within 60 days of its circulation, unless a party to the dispute notifies the DSB of its intention to appeal.<sup>186</sup>

Appeals are heard by the Appellate Body, which, unlike panels, is a permanent body. The Appellate Body is composed of seven members, who sit in divisions of three to hear appeals from panel reports.<sup>187</sup> Only issues of law and legal interpretations covered in the panel report may be appealed.<sup>188</sup> Appellate Body proceedings may not exceed 90 days.<sup>189</sup> In all but a few cases, the Appellate Body has managed to keep to this time limit.<sup>190</sup> The report of the Appellate Body is adopted by reverse consensus within 30 days of its circulation.<sup>191</sup>

Where a panel or the Appellate has found that a challenged measure is inconsistent with a WTO agreement, it must recommend that the Member concerned bring its measure into conformity with that agreement.<sup>192</sup> The first objective of the DSU, in such a case, is to secure the withdrawal of the inconsistent measure.<sup>193</sup> Prompt compliance with the recommendations and rulings of the DSB is preferred.<sup>194</sup> If this is impracticable, the respondent Member shall have a reasonable period of time to comply.<sup>195</sup> This period may be agreed to between the parties, or be determined through binding arbitration. If the recommendations and rulings of the DSB are not implemented within the reasonable period of time, the DSU provides for the temporary remedies of agreed compensation,<sup>196</sup> or as a last resort, authorised retaliation through the suspension by the complaining Member of concessions or other obligations towards the respondent Member of a level equivalent to the nullification or impairment of benefits suffered from non-compliance.<sup>197</sup> Members

<sup>188</sup> Article 17.6 of the DSU.

<sup>189</sup> Article 17.5 of the DSU.

<sup>190</sup> An example of a case where this time limit was exceeded is the appeal against the panel reports in *US – Continued Suspension* and *Canada – Continued Suspension*, which was initiated on 29 May 2008. The Appellate Body has indicated that, due to the numerous and complex issues it has to address and the increased burden on translation services, it is unable to meet the deadline, and expects to circulate its report in October 2008.

<sup>191</sup> Article 17.14 of the DSU.

<sup>192</sup> Article 19.1 of the DSU.

<sup>193</sup> Article 3.7 of the DSU.

<sup>194</sup> Article 21.1 of the DSU.

<sup>195</sup> Article 21.3 of the DSU.

<sup>196</sup> Article 22.2 of the DSU.

<sup>197</sup> Article 22.2 and 22.4 of the DSU. Authorisation to suspend concessions or other obligations must be requested from the DSU, which grants this request by reverse consensus. Disagreements as to the level of retaliation shall be referred to arbitration, by the original panel if possible, under Article 22.6 of the DSU.

may not unilaterally determine non-compliance with the recommendations and rulings of the DSB. If there is disagreement regarding the existence, or consistency with a covered agreement, of measures taken to comply, this dispute must be decided by recourse to the dispute settlement procedures of the DSU.<sup>198</sup> Where possible, resort is had to the original panel to hear this dispute.

The WTO dispute settlement system is characterised by the confidentiality of the proceedings. Consultations, and – as a rule – panel and Appellate Body proceedings take place behind closed doors,<sup>199</sup> and the submission of parties and third parties are confidential unless the party involved decides to make its own submission available to the public.<sup>200</sup> In view of the fact that disputes under the *SPS Agreement*, particularly those dealing with food safety issues such as the *EC – Hormones* dispute and *EC – Approval and Marketing of Biotech Products* dispute, have been the subject of much public concern, the confidential nature of dispute settlement proceedings has given rise to distrust in the manner in which disputes are addressed. In a surprising, and welcome, move, the Panels and the Appellate Body in the *US/Canada – Continued Suspension* disputes agreed to the parties' request to open the panel meetings with the parties and the Appellate Body's oral hearing to the public through a closed-circuit television broadcast.<sup>201</sup> This was also done by the Panel in the *Australia – Apples* dispute, in respect of its first substantive meeting with the parties and third parties.<sup>202</sup>

After this very brief overview of the dispute settlement process, it is necessary to look in more detail at certain aspects thereof that have an impact on the way in which the trade/health balance written into the provisions of the *SPS Agreement* plays out in disputes. Some of these aspects have a particular effect on the possibilities for Members at lower levels of development to participate effectively in the dispute settlement system.

<sup>198</sup> Article 21.5 of the DSU. A shorter time-frame (90 days) is laid down for compliance panel proceedings. Appeal from the report of an Article 21.5 panel is possible.

<sup>201</sup> Dispute Settlement Body, *United States-Continued Suspension of Obligations in the EC-Hormones Dispute (WT/DS320)*; *Canada-Continued Suspension of Obligations in the EC-Hormones Dispute (WT/DS321)*. *Communication from the Chairman of the Panels*, WT/DS320/8, WT/DS321/8, circulated on 2 August 2005. The WTO Secretariat was asked by the Panels to make the necessary arrangements for the broadcast. To ensure full transparency and non-discriminatory access to the broadcast by all, the Panels also requested the Secretariat to ensure that each Member has at least two seats available in the room where the broadcast would be shown. As the third parties in this case did not all agree to opening up proceedings to the public, meetings with third parties remained closed. The Appellate Body's decision to open its oral hearing to observation via simultaneous closed circuit broadcast was reported on the WTO website, available at: [http://www.wto.org/english/tratop\\_e/dispu\\_e/public\\_hearing\\_july08\\_e.htm](http://www.wto.org/english/tratop_e/dispu_e/public_hearing_july08_e.htm), visited on 15 July 2008. The hearing was held on 28-29 July 2008. Two other panels in non-SPS disputes have followed suit, by allowing public observation in different forms, namely through allowing actual presence of the public at the panel meeting in a public gallery (*EC – Bananas III (Article 21.5 – US)*) and through the broadcasting of an edited video tape of the panel meeting (*EC and Certain Member States – Large Civil Aircraft*).

<sup>202</sup> 'WTO Hearings on Apple Dispute Open to the Public' WTO News Item, 11 August 2008, available at: [http://www.wto.org/english/news\\_e/news08\\_e/hearing\\_11aug08\\_e.htm](http://www.wto.org/english/news_e/news08_e/hearing_11aug08_e.htm), visited on 11 August 2008. This meeting will take place on 2-3 September 2008.

### 2.2.2 Burden of proof

The allocation of the burden of proof in dispute settlement reflects a particular choice, which is of relevance to the balance struck between the competing interests at issue in disputes. It has been argued that it ‘serves to allocate of the risk of error between the disputing Members and to indicate the relative importance that is attached to the ultimate decision.’<sup>203</sup> The question of which party bears the burden of proof is particularly significant in the case of SPS disputes due to the difficult and intricate factual issues involved in this area. In *EC – Hormones* the Appellate Body emphasised the importance of the issue of burden of proof, in the light of the ‘multiple and complex issues of fact’ that may arise under the *SPS Agreement*.<sup>204</sup>

The Appellate Body first set out the burden of proof rules for WTO disputes in *US – Wool Shirts and Blouses*.<sup>205</sup> There it recognised that various international tribunals and most national jurisdictions apply the rule that the party who asserts a fact, whether plaintiff or respondent, must prove it. Once a party has adduced sufficient evidence to create a presumption that what is claimed is true, in other words established a *prima facie* case, the evidentiary burden shifts to the other party who must rebut the presumption or lose the case. In *EC – Hormones* the Appellate Body held that this rule applies equally to disputes under the *SPS Agreement*. It rejected the Panel’s finding that the *SPS Agreement* allocates the burden of proof to the Member imposing the SPS measure.<sup>206</sup> Instead, the Appellate Body allocated the burden of proof as follows:

The initial burden lies on the complaining party, which must establish a *prima facie* case of inconsistency with a particular provision of the *SPS Agreement* on the part of the defending party, or more precisely, of its SPS measure or measures complained about. When that *prima facie* case is made, the burden of proof moves to the defending party, which must in turn counter or refute the claimed inconsistency.<sup>207</sup>

This finding was reiterated by the Panels in *Australia – Salmon*,<sup>208</sup> *Japan – Agricultural Products II*<sup>209</sup> and *Australia – Salmon (Article 21.5 – Canada)*.<sup>210</sup> The importance of this approach to the burden of proof lies in its recognition of the difference in the regime

<sup>203</sup> Theofanis Christoforou, ‘Settlement of Science-Based Trade Disputes in the WTO: A Critical Review of the Developing Case Law in the Face of Scientific Uncertainty’, *New York University Environmental Law Journal* 8, 2000, 622-648, 641.

<sup>204</sup> Appellate Body Report, *EC – Hormones*, para. 97.

<sup>205</sup> Panel Report, *US – Wool Shirts and Blouses*, 14-16.

<sup>206</sup> The Appellate Body in *EC – Hormones* dealt with the grounds for the Panel’s finding in turn. Firstly, it rejected the Panel’s conclusion that the fact that many SPS provisions are worded ‘Members shall ensure that...’ has any logical connection to the allocation of the evidentiary burden. Secondly, it held that Article 5.8, under which Members may ask for an explanation of the reasons for an SPS measure from another Member and the latter is obliged to comply with the request, does not purport to address burden of proof issues, contrary to the Panel’s finding. Instead this Article is most likely to be used in pre-dispute situations in order to enable a Member to acquire information which it could later use to meet its burden of proof in dispute settlement proceedings. Appellate Body Report, *EC – Hormones*, paras 102-105

<sup>207</sup> Appellate Body Report, *EC – Hormones*, para. 98.

<sup>208</sup> Panel Report, *Australia – Salmon*, para. 8.40.

created by the *SPS Agreement* to balance trade and health objectives, from the regime applicable to health measures under the GATT 1994. As discussed above, the GATT approach was premised on the idea that health protection measures were exceptional, and therefore once a complainant Member had shown a violation of one of the GATT disciplines by the health measure at issue, the burden of justifying the measure under the relevant exception of Article XX(b) of the GATT was on the Member imposing the measure.<sup>211</sup> The new approach of the *SPS Agreement* is to recognise that Members have the right to regulate to the extent necessary to address SPS risks, but to subject such regulation to disciplines to minimise its trade effects and the possibilities for disguised protectionism. It is therefore for the complaining Member to prove, *prima facie*, that the SPS measure complained of violates the disciplines of the *SPS Agreement*.

In *EC – Hormones*, the Appellate Body clarified what is meant by a ‘*prima facie* case’, stating:

[A] *prima facie* case is one which, in the absence of effective refutation by the defending party, requires a panel, as a matter of law, to rule in favour of the complaining party presenting the *prima facie* case.<sup>212</sup>

A complicating issue regarding the burden of proof under the *SPS Agreement* has to do with the question whether, in view of the scientific requirements in the Agreement, a complaining Member is required to prove the *absence* of scientific evidence to back the challenged measure. This issue arose in *Japan – Agricultural Products II*.<sup>213</sup> In this case, the Panel had found that Japan’s varietal testing requirement was maintained without ‘sufficient scientific evidence’ contrary to Article 2.2, with regard to apples, cherries, nectarines and walnuts.<sup>214</sup> However, it did not consider that there was sufficient evidence before it to extend this finding to apricots, pears, plums and quince. This was due to the fact that the parties had not submitted any evidence for the latter products. The Panel had also asked the experts advising it whether their statements with regard to the former group of products applied to the latter as well. The experts affirmed this but did not elaborate at all. Thus the Panel found that the US had not adduced sufficient evidence to raise a presumption (i.e. make a *prima facie* case) that the measure was maintained without sufficient scientific evidence with regard to apricots, pears, plums and quince.

The US appealed this ruling, arguing that the Panel’s interpretation imposed on it an impossible burden of proof, requiring it to prove a negative (namely that there were no relevant studies or reports supporting Japan’s measure). The US contended that the Panel’s finding amounted to holding that because there was insufficient evidence of the existence or relevance of varietal differences, it could not find that there was insufficient evidence to support the measure.<sup>215</sup> The Appellate Body rejected this argument, finding that the US was not being required to prove a negative, but merely to raise a presumption that there were no relevant studies or reports. According to the Appellate Body, this is not an

---

<sup>211</sup> See the discussion of the relevant GATT rules above, Part III, Section 1.1.1.

<sup>212</sup> Appellate Body Report, *EC – Hormones*, para. 104, referring to Appellate Body Report, *US – Wool Shirts and Blouses*, 14.

<sup>213</sup> Appellate Body Report, *Japan – Agricultural Products II*, paras 132-139.

<sup>214</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.45.

<sup>215</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 38.

impossible burden. The US could have requested Japan, under Article 5.8,<sup>216</sup> to provide an ‘explanation of the reasons’ for its measure as it related to the products at issue. The failure of Japan to do so would have amounted to a strong indication that such studies or reports did not exist. Further, the US could have questioned the Panel’s experts or submitted an opinion of its own experts on the question whether such reports exist. Instead, the US submitted no evidence on the point. Therefore, the Appellate Body agreed with the Panel’s refusal to find a violation of Article 2.2 with regard to the products at issue.

This decision is significant as it establishes clearly that it is the complaining Member’s duty to make a *prima facie* case for the absence of scientific evidence in support of the SPS measure. Only once this has occurred does the defending Member have to submit evidence to rebut this presumption. A mere contention that scientific evidence is lacking without the submission of any evidence in support of this claim is insufficient to create a duty of rebuttal. It would be too onerous to require Members to have to defend their many SPS measures on the basis of scientific evidence, without any indication having to be shown that the measures violate the *SPS Agreement* in the first place. Complaining Members are assisted in their task by the possibility created in Article 5.8 of the *SPS Agreement* to request information on the SPS measures of other Members.

The allocation of the burden of proof on the complaining Member to make a *prima facie* case of violation of the *SPS Agreement*, does not absolve the respondent Member from proving its case. In *Japan – Apples*, the Appellate Body clarified its finding in *EC – Hormones* as follows:

[T]he Appellate Body statement in *EC – Hormones* does not imply that the complaining party is responsible for providing proof of all facts raised in relation to the issue of determining whether a measure is consistent with a given provision of a covered agreement. In other words, although the complaining party bears the burden of proving its case, the responding party must prove the case it seeks to make in response.<sup>217</sup>

The issue of the burden of proof of the respondent Member arose also in *Japan – Apples*. In that case, the US had argued that there was insufficient scientific evidence, for purposes of Article 2.2, that mature, symptomless apples could form a transmission pathway for fire blight. To counter these arguments, Japan averred that, due to failures in export control systems, infected or immature apples could be exported, and these apples could serve as a pathway for fire blight. The US limited its arguments to the issue of mature, symptomless apples. On the basis of the scientific evidence presented to it, the Panel agreed with the US that Japan’s measure, as it applied to mature, symptomless apples, was maintained without sufficient scientific evidence and concluded that it had not been established with sufficient scientific evidence that infected or immature apples could serve as a pathway for the transmission of fire blight.<sup>218</sup> On appeal, Japan argued that the

<sup>216</sup> See the discussion of the transparency obligation contained in Article 5.8 of the *SPS Agreement*, above, Part IV, Section 1.3.3.

<sup>217</sup> Appellate Body Report, *Japan – Apples*, para. 154. This finding was referred to by the Panel in *US – Continued Suspension*, para. 7.329; *Canada – Continued Suspension*, para. 7.329.

<sup>218</sup> This was due to the fact that Japan did not present sufficient scientific evidence that the last stage of the transmission pathway of fire blight from the infected imported apple to the host plant, was likely to be completed.

Panel had erred in shifting the burden of proof to Japan in respect of infected or immature apples before the US had made a *prima facie* case in that regard. The Appellate Body rejected Japan's contention, holding:

It is important to distinguish, on the one hand, the principle that the complainant must establish a *prima facie* case of inconsistency with a provision of a covered agreement from, on the other hand, the principle that the party that asserts a fact is responsible for providing proof thereof. In fact, the two principles are distinct. In the present case, the burden of demonstrating a *prima facie* case that Japan's measure is maintained without sufficient scientific evidence, rested on the United States. Japan sought to counter the case put forward by the United States by putting arguments in respect of apples other than mature, symptomless apples being exported to Japan as a result of errors of handling or illegal actions. It was thus for Japan to substantiate those allegations; it was not for the United States to provide proof of the facts asserted by Japan. Thus, we disagree with Japan's assertion that "the shift of the burden of proof to Japan was made prematurely *before* the demonstration of a *prima facie* case by the United States." There was no "shift of the burden of proof" with respect to allegations of fact relating to apples other than mature, symptomless apples, for Japan was solely responsible for providing proof of the facts it had asserted. Moreover, it was only after the United States had established a *prima facie* case that Japan's measure is maintained without sufficient scientific evidence, that the Panel had to turn to Japan's attempts to counter that case.<sup>219</sup>

This finding is useful in clarifying the issue of the burden of proof in cases where there are several hypotheses regarding the alleged risks underlying an SPS measure. It is not necessary for the complainant to address all possible hypotheses and establish that there is insufficient evidence of risk for each.<sup>220</sup> According to the Appellate Body in *Japan – Apples*, the Panel had evidently found it sufficient for the US to address whether mature symptomless apples could serve as a transmission pathway for fire blight. It noted, referring to its previous finding in *US – Wool Shirts and Blouses* that "the nature and scope of evidence required to establish a *prima facie* case "will necessarily vary from measure to measure, provision to provision, and case to case."<sup>221</sup> Once a *prima facie* case is established, the respondent will bear the burden of proving the assertions it makes to refute the complainant's case.

The difficulty of finding the scientific evidence necessary to prove a case under the *SPS Agreement* has raised questions regarding whether the availability of the necessary information should affect the allocation of the burden of proof. In *Japan – Apples*, Japan argued that the US, as the exporting country affected by the disease, would naturally have more information regarding the fire blight bacterium. Therefore it should bear a greater burden of proof. The Panel disagreed, noting that it did not see the greater expertise of the

---

Panel Report, *Japan – Apples*, para. 8.168.

<sup>219</sup> Appellate Body Report, *Japan – Apples*, para. 157.

<sup>220</sup> This was argued by Japan but rejected by the Appellate Body. *Ibid.*, para. 159.

<sup>221</sup> Appellate Body Report, *Japan – Apples*, para. 160. In footnote, the Appellate Body referred to Appellate Body Report, *US – Wool Shirts and Blouses*, 335.

exporting Member as a factor automatically justifying a different allocation of the burden of proof or the imposition of a heavier burden on one party.<sup>222</sup> While acknowledging that certain pieces of scientific evidence may be more readily available in some Members than others (for example, a disease-free Member may have less-developed evidence on that disease than a Member with direct exposure to the disease), the Panel did not see this as relevant to the burden of proof issue, noting the possibility for Japan to commission research in third countries. It pointed out that, in fact, many developing-country Members affected by a pest or disease may not have the resources to gather information on that pest or disease and may have to rely on information gathered in other countries.<sup>223</sup> However, the Panel noted that all Members have the duty to cooperate in the dispute settlement proceedings including with respect to the gathering of information relevant to the Panel's assessment.<sup>224</sup> While the Panel's finding on the allocation of the burden of proof seems correct, it does highlight the difficulty encountered by Members in accessing the necessary scientific data to prove their cases. If Japan, a high-income Member, faced difficulties in this regard, how much more so will less-developed Members. These Members may not have the resources to commission third country research and will therefore depend on the chance that there are already existing studies of relevance to their situation. It can be doubted whether the duty to cooperate in dispute settlement proceedings will lead Members, in an adversarial system, to provide data supporting of the position of the opposing party.

Aside from the issue of the burden of proof under the *SPS Agreement* generally, two provisions of the Agreement, namely Articles 3 and 5.7, present interesting specific burden of proof issues. The question of the allocation of the burden of proof under the harmonisation provision contained in Article 3 of the *SPS Agreement* arose in the *EC – Hormones* dispute. The Appellate Body's ruling on this issue is particularly important in the light of the problematic aspects, discussed above, of standard-setting by international bodies.<sup>225</sup> In *EC – Hormones* the Panel had derived, from the presumption in favour of a measure that conforms to an international standard in Article 3.2 and from its finding of a rule/exception relationship between Articles 3.1 and 3.3, a burden of proof for the respondent Member whose SPS measure deviates from the relevant international standard.<sup>226</sup> The Appellate Body rejected this finding as having no textual basis. It denied that Article 3.3 embodies an exception to the general rule contained in Article 3.1, finding that the relationship between Articles 3.1, 3.2 and 3.3 is qualitatively different from that between Articles I or III (non-discrimination obligations) and Article XX (exceptions) of the GATT 1994. Instead, it held that Article 3.1 of the *SPS Agreement* merely excludes from its scope situations falling under Article 3.3. Article 3.3 contains an autonomous option available to Members and it is for the challenging Member to prove non-compliance with the conditions laid down in this Article for SPS measures not based on international standards.<sup>227</sup> To hold otherwise would result in penalising a Member who chooses a higher level of protection than that aimed at by the international standard, a right expressly

<sup>222</sup> Panel Report, *Japan – Apples*, para. 8.44.

<sup>223</sup> Panel Report, *Japan – Apples*, para. 8.45.

<sup>224</sup> *Ibid.*, para. 8.48.

<sup>225</sup> See above, Part II, Sections 3.2.1.4, 3.2.2.4 and 3.2.3.4.

<sup>226</sup> Panel Report, *EC – Hormones (US)*, para. 8.54.; Panel Report, *EC – Hormones (Canada)*, para. 8.57.

<sup>227</sup> Appellate Body Report, *EC – Hormones*, para. 104.

recognised in the Preamble to the *SPS Agreement*.<sup>228</sup> The Appellate Body held as following in respect of the presumption in Article 3.2:

The presumption of consistency with relevant provisions of the *SPS Agreement* that arises under Article 3.2 in respect of measures that conform to international standards may well be an *incentive* for Members so to conform their SPS measures with such standards. It is clear, however, that a decision of a Member not to conform a particular measure with an international standard does not authorize imposition of a special or generalized burden of proof upon that Member, which may, more often than not, amount to a *penalty*.<sup>229</sup>

While it is not likely that developing-country Members will often choose a level of protection higher than that reflected in international standards, the problems of participation they face in international standard setting procedures means that the adopted standards are often technically inappropriate for them or do not take into account scientific data on the risk at issue as it occurs in their particular circumstances. This may lead a developing-country Member to adopt a different SPS measure than that embodied in an international standard, as done by Mauritius in adopting a fumigation treatment for wood packaging material rather than the heat treatment laid down in the relevant IPPC standard, ISPM 15. If a Member would wish to challenge Mauritius's measure, that Member would bear the burden of proof to show a violation of the requirements of Article 3.3 of the *SPS Agreement*.

A second question raised by Article 3 is that of the consequences of the presumption of consistency with the *SPS Agreement* and GATT 1994, for measures that conform to the relevant international standards, contained in Article 3.2. Clearly, this provision is intended to encourage Members to adopt international standards, thus resulting in increasing harmonisation of SPS measures and promoting free trade. However, in *EC – Hormones*, the Appellate Body held this presumption to be rebuttable.<sup>230</sup> One could question the practical benefit of a rebuttable presumption for the defending Member, since in any case the burden of proving a violation of the *SPS Agreement* and GATT 1994 rests on the challenging Member, even in the absence of this presumption. Thus the efficacy of this presumption in promoting harmonisation around international standards would seem questionable. It would seem preferable to view the Article 3.2 presumption as irrebuttable.

In any case, as suggested above,<sup>231</sup> a Member whose measure conforms to an international standard under Article 3.2, just as one whose measure is based on such a standard under Article 3.1, would arguably be immune to challenges on grounds of violation of the obligation to conduct a risk assessment under Articles 5.1-5.3 of the *SPS Agreement*, since the international standard-setting procedure of all three of the relevant international bodies is founded on risk assessments by scientific expert groups. Bearing in mind the difficulties

<sup>228</sup> Para. 6 of the Preamble to the *SPS Agreement* provides: 'Desiring to further the use of sanitary and phytosanitary measures between Members, on the basis of international standards, guidelines and recommendations developed by international organisations ... without requiring Members to change their appropriate level of protection of human, animal or plant life or health.'

<sup>229</sup> Appellate Body Report, *EC – Hormones*, para. 102.

<sup>230</sup> *Ibid.*, para. 170.

<sup>231</sup> See above, Part III, Sections 4.2.1 and 4.2.2.

of proving that the requirements for a risk assessment have been met, particularly for developing-country Members which often lack the necessary expertise, this would constitute a considerable advantage and thus a strong incentive to adopt international standards.

The question of the burden of proof under Article 5.7 of the *SPS Agreement* was first addressed in *Japan – Apples*,<sup>232</sup> where the Panel held that the burden of proof under Article 5.7 is on the respondent.<sup>233</sup> This finding, as expressly pointed out by the Appellate Body, was not appealed.<sup>234</sup> When the issue arose again in *EC – Approval and Marketing of Biotech Products*, the Panel took this remark by the Appellate Body as expressing the Appellate Body's reservations with regard to this allocation of the burden of proof.<sup>235</sup> In *EC – Approval and Marketing of Biotech Products*, the EC argued that its Member States' safeguard measures banning biotech products that had already been approved at EC level, fell to be assessed under Article 5.7 rather than under Articles 2.2 and 5.1 of the *SPS Agreement*. As discussed above,<sup>236</sup> the Panel agreed with the EC that Article 5.7 is an autonomous right, and not merely an exception from the scientific obligations under Articles 2.2 and 5.1.<sup>237</sup> Thus, the Panel held that a measure falling under Article 5.7 is excluded from the scope of application of the scientific obligations in Article 2.2 and Article 5.1, in the same way that a measure falling under Article 3.3 is excluded from the scope of application of Article 3.1.<sup>238</sup> The Panel pointed out the implications of this finding for the burden of proof, namely that the party claiming a violation of Articles 2.2 or 5.1 bears the burden of proving that the challenged measure is inconsistent with at least one of the four requirements set out in Article 5.7.<sup>239</sup> Only then will the measure fall within the scope of application of Articles 2.2 and 5.1.

The result for the burden of proof of viewing Article 5.7 as an autonomous right rather than as an exception to Articles 2.2 and 5.1 reflects the leeway, to take into account scientific realities, provided to regulating Members by the Appellate Body in its interpretation of the *SPS Agreement*. By allocating the burden of proof to the complaining Member, the Appellate Body ensures that the policy space left to Members by the *SPS Agreement* is not undermined by an unrealistic application of its scientific disciplines in the face of insufficiencies in science.

An issue repeatedly raised regarding the burden of proof is that of the relationship between the burden of proof on a Member to show a *prima facie* case and the investigative authority of a panel. Regarding the role of panels (in this case with regard to the determination whether an SPS measure is based on a risk assessment), the Panel in *EC – Hormones* stated as follows:

---

<sup>232</sup> The burden of proof under Article 5.7 was also relevant in *Japan – Agricultural Products II*, the first case in which Article 5.7 was at issue. However, the Panel did not expressly address the burden of proof under this Article but merely referred back to its general statement on the allocation of the burden of proof as set out in *EC – Hormones*. Panel Report, *Japan – Agricultural Products II*, para. 59.

<sup>233</sup> Panel Report, *Japan – Apples*, para. 8.212. Here, Japan had invoked Article 5.7 to justify its measure, which explains the Panel's approach.

<sup>234</sup> Appellate Body Report, *Japan – Apples*, para. 175 and footnote 316.

<sup>235</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.2979.

<sup>236</sup> See above, Part III, Section 5.2.5.

<sup>237</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.2969 and 7.3004.

<sup>238</sup> *Ibid.*, paras 7.2969 and 7.3007.

<sup>239</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.2976 and 7.3007.

It is for the European Communities to submit evidence before the Panel that its measures are based on a risk assessment; it is not for the Panel itself to conduct its own risk assessment on the basis of scientific evidence gathered by the Panel or submitted by the parties during the Panel proceedings.<sup>240</sup>

This issue is closely related to the issue of the standard of review to be applied by a panel in evaluating the evidence before it, and the question of the role of the experts advising the panel. These issues are discussed further below.<sup>241</sup>

### 2.2.3 Standard of review

The issue of the appropriate standard of review to be applied in dispute settlement proceedings is an important one, as it has a significant role to play in the allocation of authority to make policy choices balancing competing trade and health interests. The particular standard of review applied determines the extent to which the WTO adjudicatory bodies are entitled to interfere in Members' regulatory determinations. On either end of the spectrum of possible standards of review are deference to national regulatory decisions and *de novo* review, allowing the adjudicator to replace national regulatory decisions with its own assessment. The question of where on this spectrum the appropriate standard of review lies in SPS disputes is crucial to the limits of policing national regulatory choices in favour of trade liberalisation, and therefore to the trade/health balance achieved in the implementation of the rules of the *SPS Agreement*.

As noted by Shaffer, through its determination of the applicable standard of review, the 'Appellate Body can effectively allocate decision making over policy matters brought before it to alternative decision-making processes, each of which favours different actors to varying extents.'<sup>242</sup> A deferential approach effectively allocates the competence to balance the competing interests of trade liberalisation and health protection to national authorities. This has the advantage of giving greater policy space to domestic regulators, enabling them to give effect to democratically determined preferences.<sup>243</sup> In view of the wide divergences between Members at different levels of development in respect of priorities, consumer preferences and regulatory capacity, such respect for policy space seems wise. However, this approach also holds dangers. It allows for regulatory capture by powerful domestic industry lobbies.<sup>244</sup> It also neglects the fact that the interests of foreign stakeholders, including producers and exporters, are not taken into account in the balancing of interests that underlies national regulation. The application of a *de novo* standard of review would instead allocate the balancing competence to the adjudicatory

<sup>240</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.104.; Panel Report, *EC – Hormones (US)*, para. 8.101.

<sup>241</sup> See below, Part IV, Sections 2.2.3 and 2.2.5.

<sup>242</sup> Gregory Shaffer, 'Power, Governance, and the WTO: A Comparative Institutional Approach', in *Power in Global Governance*, Michael Barnett and Raymond Duvall (eds.) (Cambridge University Press, Cambridge), 2005, 130-160, 159. Shaffer analyses the *US – Shrimp* dispute and identifies five different options for the standard of review that could have been applied. These overlap to some extent with some of the discussion below.

<sup>243</sup> Shaffer notes that participation in democratic decision-making is of a higher quality at national level than at international level due to the closer relation between the citizen and the state, the sense of a common identity and communal cohesiveness, and the reduced costs of organisation and participation. *Ibid.*, 143.

<sup>244</sup> See the discussion of private interest capture of national SPS regulation, above, Part II, Section 1.2.

body itself, replacing the regulatory choices of the national regulator with its own. While this has the benefit of incorporating the trade interests of the exporting Member, as reflected in WTO disciplines, in the balancing exercise, it creates legitimacy problems.<sup>245</sup> There are many subjective elements to the risk analysis process, in particular with regard to the evaluation of scientific evidence and the choice amongst equally plausible alternative risk assessments, that are best left to democratic decision-making processes. In addition, due to the imbalance in effective participation in WTO dispute settlement by Members at different levels of development,<sup>246</sup> *de novo* review may skew the outcome of judicial review in favour of developed-country Members that have the resources to bring convincing scientific evidence and persuasive legal arguments in support of their positions.<sup>247</sup> It would therefore seem that neither complete deference nor *de novo* review is the appropriate standard of review to be applied by WTO adjudicators. Some have suggested that, instead, a process-based review would be best, limited to establishing whether the procedural requirements have been complied with.<sup>248</sup> As the *SPS Agreement* does not lay down procedures for the conduct of a risk assessment or the establishment of sufficient scientific evidence, such a limited review seems inappropriate.<sup>249</sup> Instead, it is proposed here that a panel should limit its examination to the question whether the regulatory disciplines of the *SPS Agreement* have been complied with, including that requiring that an SPS measure be based on a risk assessment as defined in the Agreement, stopping short of assessing quality and weight of the scientific evidence itself. In other words, panels should apply a strict standard of review to legal questions, but should show more defer-

---

<sup>245</sup> In respect of the *US – Shrimp* dispute, involving a conflict between trade and environmental objectives, Shaffer notes that the Appellate Body was ‘reluctant to allocate substantive decision-making authority to itself’ due to the realisation that ‘it lacked the legitimacy to engage in a delicate balancing of the priorities of constituencies from countries of widely disparate levels of development under open-ended standards. Although, as any court, WTO judicial bodies are not elected, they are even more subject to legitimacy challenges than domestic courts because of the more fragile social acceptance of their decisions.’ Gregory Shaffer, ‘Power, Governance, and the WTO: A Comparative Institutional Approach’, in *Power in Global Governance*, Michael Barnett and Raymond Duvall (eds.) (Cambridge University Press, Cambridge), 2005, 130-160, 153.

<sup>246</sup> See below, Part IV, Section 2.2.7.

<sup>247</sup> Shaffer notes that participation in dispute settlement ‘is far from neutral’. He points out that in contrast to developed countries that are repeat players in WTO dispute settlement and thus are able to mobilise legal resources cost-effectively, developing countries (such as Malaysia in the *US – Shrimp (Article 21.5 – Malaysia)* dispute) may fail to bring convincing factual and legal arguments in their WTO challenges. Gregory Shaffer, ‘Power, Governance, and the WTO: A Comparative Institutional Approach’, in *Power in Global Governance*, Michael Barnett and Raymond Duvall (eds.) (Cambridge University Press, Cambridge), 2005, 130-160, 152.

<sup>248</sup> Rosie Cooney and Andrew T.F. Lang, ‘Taking Uncertainty Seriously: Adaptive Governance and International Trade’, *European Journal of International Law* 18 (3), 2007, 523-551, 544. Cooney and Lang advocate procedural rather than substantive review, not primarily to ensure against interference with democratic decisions at national level but rather in order to use the trade regime in a positive way to facilitate and encourage appropriate governance frameworks on national level by promoting transparent, accountable and reasoned use of science and risk assessment.

<sup>249</sup> Claus-Dieter Ehlermann and Nicolas Lockhart, ‘Standard of Review in WTO Law’, in *A True European: Essays for Judge David Edwards*, Mark Hoskins and William Robinson (eds.) (Hart Publishing, Portland), 2003, 267-296, 291. These authors note that while the *SPS Agreement* identifies the substantive issues to be considered in a risk assessment, it does not lay down procedures for how the risk assessment is to be conducted. There is no requirement to carry out an investigation, engage in formal fact-finding or publish a report explaining the justification for the SPS measure adopted. See further on this point Catherine Button, *The Power to Protect. Trade, Health and Uncertainty in the WTO* (Hart Publishing, Oxford and Portland, Oregon), 2004, 182-185.

ence to national regulatory authorities in factual determinations.<sup>250</sup> Such a review ensures that the regulating Member respects the balance struck in the rules of the *SPS Agreement* between its health concerns and the trade interests of other Members, but the review does not intrude too far into the regulatory competence of Members by interfering in their assessment of scientific evidence. Considering the fact that SPS disputes largely turn on determinations regarding the scientific disciplines of the Agreement, the importance of ensuring that the standard of review applied reflects the balance aimed at by the Agreement cannot be overstated. The proposed type of review would also reduce the disadvantage at which Members that lack scientific capacity find themselves in challenging or defending measures under the *SPS Agreement*.

Despite its importance, the standard of review to be applied by panels is not explicitly addressed in the *SPS Agreement* or in the DSU. It has therefore been elaborated in the case law. In *EC – Hormones*,<sup>251</sup> the question of the appropriate standard of review for SPS disputes was first dealt with. The EC argued that the Panel had failed to apply the appropriate standard of review, which it asserted to be a ‘deferential reasonableness standard’, as exists for the WTO *Anti-Dumping Agreement*.<sup>252</sup> Under such a standard, the Panel should not interfere in the investigation conducted on national level which led to the establishment of the measure. If the Member has properly established the facts and conducted an objective, unbiased examination thereof, its conclusions should be deferred to by the Panel, even if it would have come to a different conclusion on the facts. Instead, the EC argued that the Panel had undertaken a *de novo* standard of review, under which it has complete freedom to examine the factual and procedural validity of the decision and to come to a different conclusion.

The Appellate Body rejected the proposed extension of the standard of review set in the *Anti-Dumping Agreement* to the *SPS Agreement*,<sup>253</sup> holding that this standard is textually specific to the former Agreement and there is no evidence of an intention to adopt it in the latter Agreement.<sup>254</sup> It stated:

In so far as legal questions are concerned - that is, consistency or inconsistency of a Member's measure with the provisions of the applicable agreement - a standard not found in the text of the *SPS Agreement* itself cannot absolve a panel (or the Appellate Body) from the duty to apply the customary rules of interpretation of public international law ... Nevertheless, it is appropriate to stress that here

---

<sup>250</sup> Catherine Button criticises the Appellate Body's articulation of the standard of review to be applied under the *SPS Agreement* for disregarding the distinction between issues of fact and issues of law. Catherine Button, *The Power to Protect. Trade, Health and Uncertainty in the WTO* (Hart Publishing, Oxford and Portland, Oregon), 2004, 179-181.

<sup>251</sup> Appellate Body Report, *EC – Hormones*, para. 133.

<sup>252</sup> Agreement on Implementation of Article VI of the General Agreement on Tariffs and Trade 1994, (reprinted in *The Results of the Uruguay Round of Multilateral Trade Negotiations: The Legal Texts* (1994) GATT Secretariat, Geneva at 168-196) [hereinafter referred to as the *Anti-Dumping Agreement*] at Article 17.6(i).

<sup>253</sup> This refusal to extend the standard of review laid down in the *Anti-Dumping Agreement* to other WTO agreements was affirmed in Appellate Body Report *US – Lead and Bismuth II*, para. 51, where the Appellate Body held that Article 11 of the DSU sets the standard of review for disputes under the *Agreement on Subsidies and Countervailing Measures*.

<sup>254</sup> Further, this standard applies only to the factual assessment of the matter and not to the legal analysis applied thereto.

again Article 11 of the DSU is directly on point, requiring a panel to “make an objective assessment of the matter before it, including an objective assessment of the facts of the case and the applicability of and conformity with the relevant covered agreements ...”<sup>255</sup>

Thus, instead of adopting the deferential standard proposed by the EC, the Appellate Body focused on the need to maintain the balance between the competences WTO Members retain and those they transferred to the WTO, as reflected in the *SPS Agreement* itself. The Appellate Body stated as follows:

The standard of review appropriately applicable in proceedings under the *SPS Agreement*, of course, must reflect the balance established in that Agreement between the jurisdictional competences conceded by the Members to the WTO and the jurisdictional competences retained by the Members for themselves. To adopt a standard of review not clearly rooted in the text of the *SPS Agreement* itself, may well amount to changing that finely drawn balance; and neither a panel nor the Appellate Body is authorized to do that.<sup>256</sup>

The Appellate Body then expressed its view that the standard of review applicable to ‘both the ascertainment of facts and the legal characterization of such facts’ in disputes under the *SPS Agreement* is to be found in Article 11 of the DSU. According to the Appellate Body, this provision ‘articulates with great succinctness but with sufficient clarity the appropriate standard of review’.<sup>257</sup> Article 11 of the DSU provides that ‘a panel should make an objective assessment of the matter before it, including an objective assessment of the facts of the case and the applicability of and conformity with the relevant covered agreements.’<sup>258</sup> Examining this provision, the Appellate Body held:

So far as fact-finding by panels is concerned, their activities are always constrained by the mandate of Article 11 of the DSU: the applicable standard is neither *de novo* review as such, nor ‘total deference’, but rather the ‘objective assessment of the facts’. Many panels have in the past refused to undertake *de novo* review, wisely, since under current practice and systems, they are in any case poorly suited to engage in such a review. On the other hand, ‘total deference to the findings of the national authorities’, it has been well said, ‘could not ensure an ‘objective assessment’ as foreseen by Article 11 of the DSU’.<sup>259</sup>

<sup>255</sup> Appellate Body Report, *EC – Hormones*, para. 118.

<sup>256</sup> *Ibid.*, para. 115.

<sup>257</sup> *Ibid.*

<sup>258</sup> The utility of this ‘objective assessment’ standard has been criticised on the grounds that it far from clarifies the required standard of review. See Axel G. Desmedt, ‘Hormones: “Objective Assessment” And (or as) Standard of Review’, *Journal of International Economic Law* 1 (4), 1998, 695-698, 698. See also David Palmeter, ‘The WTO Standard of Review in Health and Safety’, in *Trade and Human Health and Safety*, George A. Bermann and Petros C. Mavroidis (eds.) (Cambridge University Press, Cambridge), 2006, 224-234, 229.

<sup>259</sup> Appellate Body Report, *EC – Hormones*, para. 117. A footnote to this sentence refers to Panel Report on *US – Underwear*, para. 7.10.

The Appellate Body's finding that neither a panel nor the Appellate Body is authorised to change the balance of jurisdictional competences agreed to by the Members and embodied in the *SPS Agreement* is undoubtedly correct. However, it could be argued that where this balance lies is not always made explicit in the *SPS Agreement* and there is thus room for interpretation. It is precisely here that the panel's role lies, and its approach to the standard of review will have important consequences for the allocation of the authority to make policy choices balancing competing trade and health interests.<sup>260</sup> The extent to which a panel may examine the substantive choices made by a Member, including in its assessment of scientific evidence, is crucial in establishing the nature of this balance. The possibility of limiting a panel's authority to conducting a purely procedural review is excluded by the terms of the provisions of the *SPS Agreement*, many of which contain enforceable obligations of a substantive nature. According to the Appellate Body in *EC – Hormones*, the question whether a panel's analysis is purely procedural or also substantive depends on the specific provision at issue.<sup>261</sup> Where the provision in question contains substantive elements, a panel must conduct a substantive analysis. For example, in addressing a claim under the requirement in Article 5.1 that an SPS measure be 'based on' a risk assessment, a panel does not only look at the procedural requirements for a risk assessment, but also determines substantively whether a risk assessment is 'rationally related to' or 'reasonably supports' the measure. However, this should not amount to a panel conducting its own risk assessment, which would amount to a *de novo* review. An examination of panel practice is called for in this regard.

As noted above, the Panel in *EC – Hormones*, in its determination of whether the SPS measure at issue was based on a risk assessment, noted that 'it is not for the Panel itself to conduct its own risk assessment on the basis of scientific evidence gathered by the Panel or submitted by the parties during the Panel proceedings.'<sup>262</sup> In *Japan – Agricultural Products II*, in examining the claim under Article 2.2, the Panel made a similar finding, noting that it needed to refer to the opinions of experts advising the Panel regarding the evidence submitted by the parties, but stating: 'We are not empowered, nor are the experts advising the Panel, to conduct our own risk assessment.'<sup>263</sup> The Panel in *Australia – Salmon* similarly stressed: '[I]n examining this case we did not attempt (nor are we, in our view, allowed) to conduct our own risk assessment or to impose any scientific opinion on Australia.'<sup>264</sup> The Panel in this case further stated, in respect of Australia's contention that

<sup>260</sup> Natalie McNelis argues that regardless of the expressed terminology for the standard of review to be applied by an adjudicator, the real standard of review is determined by the relationship between the adjudicator and the actor that is judged (as reflected by the different standards of review applied when WTO adjudicators judge the acts of WTO Members, when the ECJ judges an act of a European institution, and when the ECJ judges an act of an EU Member State). She cautions that as the WTO adjudicators do not have the same legitimacy with regard to WTO Members as the ECJ has with regard to EU Member States, WTO adjudicators should be less interventionist in reviewing health measures or will risk strident opposition from citizens. Natalie McNelis, 'The Role of the Judge in the EU and WTO: Lessons from the BSE and Hormones Cases', in *The Role of the Judge in International Trade Regulation: Experience and Lessons for the WTO*, T. Cottier and P.C. Mavroidis (eds.) (University of Michigan Press: Ann Arbor, Michigan), 2003, 225-246, 234 and 237-239.

<sup>261</sup> Hurst, David R., 'Hormones: European Communities - Measures Affecting Meat and Meat Products', *European Journal of International Law* 9 (1), 1998, 27.

<sup>262</sup> Panel Report, *EC – Hormones (Canada)*, para. 8.104.; Panel Report, *EC – Hormones (US)*, para. 8.101.

<sup>263</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.32.

<sup>264</sup> Panel Report, *Australia – Salmon*, para. 8.41. The Panel further stated: 'We only examined and evaluated

for ‘different situations’ to be compared under Article 5.5, a risk assessment in respect of each situation must have been carried out:

We cannot conduct our own risk assessment. Nor do we attempt to do so in this report. ... Our mandate is different. We are not asked to make a scientific risk comparison nor to state with scientific certainty that one product is riskier than the other. We can only weigh the evidence put before us and, on the basis of the rules of burden of proof we adopted, including the use of factual presumptions, decide whether sufficient evidence is before us - evidence which has not been rebutted - in order to state that it can be presumed that one product is riskier than the other.<sup>265</sup>

In the same line, the Panels in *US/Canada – Continued Suspension*, recalled that:

[I]t is not the appropriate role of the Panel to conduct its own risk assessment based on scientific evidence gathered by the Panel or submitted by the parties during the Panel proceedings. Similarly, the Panel believes that it is not its role to impose any scientific opinion on the European Communities. The Panel must objectively measure the Opinions against the relevant standard for whether a risk assessment has been conducted, which can be found in the texts of Articles 5.1 (including an examination of Article 5.2) as well as Annex A(4) of the *SPS Agreement*.<sup>266</sup>

From this line of case law it appears that panels are well-aware of the limits to their competence in respect of the standard of review to be applied in assessing the scientific evidence before them. This assessment, they recognise, cannot extend to undertaking a risk assessment themselves, and imposing their evaluation of the risk at issue on the respondent Member. However, a close examination of what panels actually do indicates that, despite their statements to the contrary cited above, panels increasingly assess the scientific evidence before them, relying on the opinions of the panel experts, to determine for themselves the likelihood or potential of the adverse effects materialising. In effect, therefore, they go ever further along the path to conducting their own risk assessments, and often impose the scientific views of the panel experts on the respondent Member.

The relevant scientific disciplines of the *SPS Agreement*, namely Articles 2.2 and 5.1, as interpreted in the case law, are limited to requiring a ‘rational relationship’ between an SPS measure and the scientific evidence, as discussed above,<sup>267</sup> implying some space for regulatory autonomy in the assessment of the evidence.<sup>268</sup> This more deferential approach is illustrated by the manner in which the Panel in *Australia – Salmon (Article 21.5 – Canada)* addressed the question of whether the new risk assessment submitted by

---

the evidence - including the information we received from the experts advising the Panel - and arguments put before us in light of the relevant WTO provisions and, following the rules on burden of proof set out above, based our findings on this evidence and these arguments.’ *Ibid*.

<sup>265</sup> Panel Report, *Australia – Salmon*, para. 8.126.

<sup>266</sup> Panel Report, *US – Continued Suspension*, para. 7.443; Panel Report, *Canada – Continued Suspension*, para. 7.432.

<sup>267</sup> See above, Part III, Sections 3.2.3.1 and 5.1.5.

<sup>268</sup> M. Gregg Bloche, ‘WTO Deference to National Health Policy: Toward an Interpretative Principle’, *Journal of International Economic Law* 5 (4), 2002, 825-848, 837.

Australia, the 1999 IRA, met the requirements for a risk assessment. The Panel stated that what it was looking for was a level of objectivity in the risk assessment such that ‘one can have reasonable confidence in the evaluation made, in particular, in the levels of risk assigned.’<sup>269</sup> Although Canada and one of the panel experts, Dr. Wooldridge, pointed out certain methodological flaws and alleged inconsistencies in the 1999 IRA, arguing that it did not fully take into account all information available, and that a possible bias might arise due to the way the information was presented, the Panel did not regard these flaws as serious enough to call into question the validity of the risk assessment. It held that although the alleged flaws, if absent, ‘*might have led* to a lower level of assessed risk, [it had] not been convinced that this *would be so*, at least not to such an extent that [it] would no longer have reasonable confidence in the levels of risk currently assigned in the 1999 IRA.’<sup>270</sup> The Panel thus seemed reluctant to interfere in the choices of methodology and presentation of information made by Australia in conducting its risk assessment, in the absence of proof that these had undermined the objectivity of the assessment in a manner preventing reasonable confidence in its results.

However, most panels have gone considerably further than this and adopted a rather intrusive approach.<sup>271</sup> They consider themselves mandated to ‘examine and weigh’<sup>272</sup> all the evidence submitted to them and to come to their own conclusions regarding the risk at issue. This approach has relied upon the finding by the Appellate Body that the ‘rational relationship’ test that is part of Articles 2.2 and 5.1 depends, *inter alia*, on ‘the quality and quantity of the scientific evidence’.<sup>273</sup> This reading of the ‘rational relationship’ requirement entailed by the scientific disciplines of the Agreement opens the door for an intrusive review.<sup>274</sup>

The most glaring example of the assessment of scientific evidence by a panel in a manner constituting a risk assessment is to be found in the *Japan – Apples* case.<sup>275</sup> In this case the Panel had to address whether Japan’s cumulative requirements on apple imports for the prevention of the introduction of fire blight were maintained without ‘sufficient scientific evidence’ under Article 2.2 of the *SPS Agreement*. As discussed above,<sup>276</sup> the Panel in

<sup>269</sup> Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 7.51.

<sup>270</sup> *Ibid.*, para. 7.57.

<sup>272</sup> Panel Report, *Japan – Agricultural Products II*, para. 7.10.

<sup>273</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 84.

<sup>274</sup> Alberto Alemanno, *Trade in Food: Regulatory and Judicial Approaches in the EC and WTO* (Cameron May, London), 2007, 339. Alberto Alemanno argues that there is greater scope for an intrusive review in cases decided under Article 2.2 than those under Article 5.1 due to the former provision’s lack of specific guidance for how a panel should verify whether a measure is based on scientific principles (or maintained without sufficient scientific evidence). *Ibid.*, 341.

<sup>275</sup> Button states with regard to the Panel’s approach to the ‘sufficient scientific evidence’ requirement in the *Japan – Apples* dispute: ‘It is difficult to discern in the panel’s consideration of these and other scientific questions any point at which the panel did *not* conduct a *de novo* assessment. In evaluating these scientific questions, the panel engaged closely with the studies cited (going as far as to point out flaws in a study’s methodology), relied heavily on the panel-appointed experts’ views, engaged in interpretation of the results and implications of the studies, and arrived at its own conclusions on specific scientific questions.’ Catherine Button, ‘The WTO’s ‘Objective Assessment’ Standard of Review and Panel Review of Health Measures’, in *Challenges and Prospects for the WTO*, Andrew D. Mitchell (ed.) (Cameron May, London), 2005, 99.

<sup>276</sup> The Panel’s findings on this point are discussed in more detail above, Part III, Section 3.2.3.1.

*Japan – Apples* considered that the ‘sufficiency’ requirement entailed not only a rational relationship between the scientific evidence and the SPS measure, but also between the evidence and the risk at issue. In so finding, the Panel allocated to itself the competence to assess the available scientific evidence to determine whether it convincingly established the risk addressed by Japan’s measure. In coming to its decision, the Panel disassembled the sequence of events on the transmission pathway of the fire blight bacterium. It then assessed the divergent scientific evidence brought by the parties with regard to whether each step of the transmission pathway could be completed, and relying on the advice of the panel experts it came to its own conclusion on the likelihood of the risk of transmission.<sup>277</sup> Although it was of the view that ‘some slight risk of contamination cannot be totally excluded’ it relied on the opinion of the panel experts that all the risks were ‘negligible’ to find that Japan’s measure was maintained without ‘sufficient scientific evidence’ contrary to Article 2.2.<sup>278</sup>

Not only in an analysis under Article 2.2, but also under Article 5.1, panels have appropriated to themselves, with the assistance of the panel experts, the task of reassessing the scientific evidence that forms the basis of the risk assessment at issue, to determine the existence of a risk and the likelihood or potential of the risk occurring. In other words, they have conducted a risk assessment. This is shown, for example, in the report of the Panel in *Japan – Apples (Article 21.5 – US)*, where it examined Japan’s revised 2004 Pest Risk Assessment, which assessed the probability of infection of US apple fruit and the question whether fire blight could survive handling, storage, shipment and finally complete the transmission pathway. The Panel referred to the opinions of its experts that the studies relied upon in the 2004 Pest Risk Assessment did not support the conclusion that mature symptomless apples can be latently affected, since they did not address real orchard conditions and actual commercial practice.<sup>279</sup> Consequently the Panel found the new studies relied upon by Japan not to support the conclusions in the 2004 Pest Risk Assessment. Therefore, despite the confirmation by the panel experts that Japan’s Pest Risk Assessment closely followed the steps set out in the IPPC’s standard for pest risk analysis (ISPM 11), the Panel found that it did not constitute a ‘risk assessment’ because, in the Panel’s view, its conclusions were not supported by the scientific evidence relied upon therein.<sup>280</sup>

A similar approach was subsequently followed by the Panels in the *US/Canada – Continued Suspension* disputes when addressing the question whether Article 5.1 was violated by the EC’s measure. They did not stop at determining whether the Opinions of

---

<sup>277</sup> For example, in respect of the question whether mature, symptomless apples could host endophytic bacterial, Japan relied on a 1990 study by Van der Zwet *et al.*, confirmed in 1998 by Roberts *et al.*, which recorded fire blight on harvested fruit, but did not specify if this fruit was mature or symptomless. The US pointed to other studies which found that endophytic bacteria do not occur in mature, symptomless apple fruit. The panel experts indicated that they were not convinced by the evidence in papers describing the presence of endophytic bacteria. The Panel followed the views of the experts and concluded that there was not sufficient scientific evidence to conclude that mature symptomless apples could harbour endophytic populations of bacteria. Panel Report, *Japan – Apples*, paras 8.123-8.128.

<sup>278</sup> On the additional problem of the strong proportionality requirement read into Article 2.2 of the *SPS Agreement* by this finding, see above, Part III, Section 3.2.3.1.

<sup>279</sup> Panel Report, *Japan – Apples (Article 21.5 - US)*, paras 8.140-8.144. These same studies had been examined under the Article 2.2 claim and found to be insufficient to support the measure.

<sup>280</sup> *Ibid.*, paras 8.147.

the SCVPH relied upon by the EC constituted a risk assessment within the meaning of Annex A.4, and whether the EC's measure was based on these Opinions, but proceeded to address the question whether the conclusions arrived at in these risk assessments were sufficiently supported by the scientific evidence referred to therein.<sup>281</sup> In so doing they examined the divergent scientific evidence brought by the US and Canada on the one hand and that contained in the EC's Opinions on the other regarding the genotoxicity of oestradiol-17 $\beta$ . Recognising that they were not in a position to evaluate the scientific data reviews by the SCVPH, the Panels consulted the panel experts and asked them to evaluate the Opinions and the underlying science.<sup>282</sup> It is significant that one panel expert, Dr. Cogliano, noted with respect to a particular divergence in views between the EC and Canada and the US regarding threshold in genotoxic potential, that neither was scientifically demonstrated but rather reflected different assumptions used by the parties in the interpretation of the available evidence.<sup>283</sup> Nevertheless, in response to direct questioning, the panel experts expressed the view that while a zero risk could not be guaranteed, the level of risk of cancer was so small as to not be calculable. The Panels consequently stated:

The Panel's evaluation of the expert views and the plain language of the Opinions themselves leads the Panel to conclude that the scientific evidence referred to in the Opinions does not support the European Communities' conclusion that for oestradiol-17 $\beta$  genotoxicity had already been demonstrated explicitly, nor does it support the conclusion that the presence of residues of oestradiol-17 $\beta$  in meat and meat products as a result of the cattle being treated with the hormone for growth promotion purposes leads to an increased cancer risk.<sup>284</sup>

As can be seen from these examples, in practice most panels do not merely police the trade/health balance as established by the rules of the *SPS Agreement*, including its requirements for a rational relationship between the SPS measure and sufficient scientific evidence and a risk assessment, but instead they appropriate one of the aspects of this balance left by the Agreement in the competence of Members, namely the competence to evaluate the scientific evidence in a way that reflects the science policy choices of that Member, provided that the requirements set out in the Agreement are met.<sup>285</sup> Instead of reviewing Member's science-based risk assessments for compliance with the requirements of the *SPS Agreement*, panels directly review the basis in science of a Members' SPS measures.<sup>286</sup> In doing so, the relevant panels have gone further than allowed by the

<sup>281</sup> Panel Report, *US – Continued Suspension*, para. 7.538; Panel Report, *Canada – Continued Suspension*, para. 7.510.

<sup>282</sup> Panel Report, *US – Continued Suspension*, para. 7.553; Panel Report, *Canada – Continued Suspension*, para. 7.521. The Panel expressly noted that the experts were asked not to make their own scientific conclusions but rather to evaluate the Opinions to assess whether the evidence relied on by the SCVPH supports the conclusions in the Opinions.

<sup>283</sup> Panel Report, *US – Continued Suspension*, para. 7.559; Panel Report, *Canada – Continued Suspension*, para. 7.527.

<sup>284</sup> Panel Report, *US – Continued Suspension*, para. 7.572; Panel Report, *Canada – Continued Suspension*, para. 7.499.

<sup>285</sup> On the subjective elements inherent to a risk assessment that reflect science policy choices, see above, Part II, Section 1.5.

<sup>286</sup> Jacqueline Peel, *Risk Regulation under the WTO SPS Agreement: Science as an International Normative*

‘objective assessment’ standard of review, and have allocated to themselves the competence to conduct a risk assessment by evaluating the scientific evidence and determining the likelihood or potential of the risk at issue.

As the failure to conduct an objective assessment under Article 11 of the DSU is an issue of law, it is subject to appeal. Not surprisingly, all appeals from panel reports in SPS disputes have included claims of violation of Article 11 of the DSU, due to the failure of the relevant panel to properly assess, interpret or take into account the scientific evidence provided by the parties.

However, the Appellate Body has set a very high threshold for a finding that a panel has failed to make an objective assessment of the matter, thereby limiting the impact of the discipline of Article 11 of the DSU.<sup>287</sup> In *EC – Hormones*, in addressing a claim that the Panel had failed to make an objective assessment, the Appellate Body held:

[N]ot every error in the appreciation of the evidence (although it may give rise to a question of law) may be characterized as a failure to make an objective assessment of the facts ... The duty to make an objective assessment of the facts is, among other things, an obligation to consider the evidence presented to a panel and to make factual findings on the basis of that evidence. The deliberate disregard of, or refusal to consider, the evidence submitted to a panel is incompatible with a panel’s duty to make an objective assessment of the facts. The wilful distortion or misrepresentation of the evidence put before a panel is similarly inconsistent with an objective assessment of the facts. “Disregard” and “distortion” and “misrepresentation” of the evidence, in their ordinary signification in judicial and quasi-judicial processes, imply not simply an error of judgment in the appreciation of evidence but rather an egregious error that calls into question the good faith of a panel.<sup>288</sup>

Only this type of egregious error will prompt the Appellate Body to find that a panel has exceeded the bounds of its discretion as a trier of facts. The narrow interpretation by the Appellate Body of what is meant by a failure to make an objective assessment has meant that in no case has the overreaching of panels in the cases decided under the *SPS Agreement* been corrected. The problematic consequences can be seen by looking at the Appellate Body’s rulings on this issue in the SPS disputes where the standard of review applied by panels has been challenged.

---

*Yardstick?*, Jean Monnet Working Paper 02/04 (NYU School of Law, New York), June 2004, 19, available at: [www.jeanmonnetprogram.org/papers/04/040201.pdf](http://www.jeanmonnetprogram.org/papers/04/040201.pdf), visited on 14 September 2004.

<sup>287</sup> The reason for this very high threshold lies in the Appellate Body’s view that an allegation that a panel has failed to conduct an objective assessment is very serious and ‘goes to the very core of the integrity of the WTO dispute settlement process itself.’ Appellate Body Report, *EC – Poultry*, para. 133. In addition, as explained by the Appellate Body in *US – Carbon Steel*, its deference to panels’ evaluation of the evidence is motivated by its recognition of the distinction in the respective roles of the Appellate Body and panels. In the WTO dispute settlement process it is the panel that is the trier of facts, and the appreciation of evidence therefore falls within the bounds of its discretion. The Appellate Body will thus not find a violation of Article 11 merely because it would have reached a different factual finding from that reached by the panel. Appellate Body Report, *US – Carbon Steel*, para. 142.

<sup>288</sup> Appellate Body Report, *EC – Hormones*, para. 133.

In *EC – Hormones*, the Appellate Body found that although the Panel had misquoted and misinterpreted the evidence, including the statements of its own expert advisors, its actions had not been deliberate or grossly negligent and there had thus been no failure to make an objective assessment of the facts.<sup>289</sup> This trend continued in *Australia – Salmon*<sup>290</sup>, *Japan – Agricultural Products II*,<sup>291</sup> and *Japan – Apples*<sup>292</sup> where errors of the Panels in the appreciation of evidence were not characterised by the Appellate Body as failures to make an objective assessment of the facts, due to their lack of an egregious nature.<sup>293</sup> It thus seems that the only limitation on the powers of review of a panel is its obligation not to make mistakes so serious that they call into question its good faith.

<sup>289</sup> The Appellate Body in *EC – Hormones*, agreed with the EC that the Panel had misquoted the evidence of an EC expert, Dr. Lucien but it held that this mistake did not constitute ‘a *deliberate* disregard of evidence or *gross* negligence amounting to bad faith.’ Appellate Body Report, *EC – Hormones*, para. 138. Further, in response to the EC’s contention that the Panel had distorted the views of a panel expert, Dr. André, by stating that they supported those of the other panel experts when, in fact, they rather supported the views of EC scientists, the Appellate Body stated: ‘Whether or not the views of Dr. André support the statements made by the other Panel experts or the opinions expressed by the EC scientists may be an issue of fact; it does require some technical expertise to deal with it. However, even if the Panel has interpreted the views of Dr. André incorrectly, we see no reason, and no reason was advanced, to consider this mistake as a *deliberate disregard* or *distortion* of evidence.’ Appellate Body Report, *EC – Hormones*, para. 139. A similar finding was made in respect of the Panel’s inaccurate representation of the statements of the panel experts on the potential for abuse in a regime where the use of hormones was allowed, as compared to a regime where they were banned. *Ibid.*, para. 144. It would appear that the Appellate Body gives a certain leeway for the lack of ‘technical expertise’ of the panel to deal with scientific evidence, provided the mistake is not deliberate. When one bears in mind that cases under the *SPS Agreement* often turn on scientific evidence, this is a worrying approach.

<sup>290</sup> In *Australia – Salmon*, Australia claimed on appeal that the Panel had ‘partially or wholly ignored the relevant evidence placed before it, or misrepresented the evidence in a way that went beyond a mere question of the weight attributed to it, but constituted an egregious error amounting to an error of law’ and had ‘failed to accord due deference to matters of fact put forward by the parties.’ Appellate Body Report, *Australia – Salmon*, para. 262. The Appellate Body dealt very shortly with this claim, finding only that the Panel had not deliberately disregarded, refused to consider, wilfully distorted or misrepresented the evidence, nor had Australia proved an ‘egregious error that calls into question the good faith’ of the Panel. It added that panels are not required to accord the same meaning or weight to factual evidence as do the parties. Consequently, no violation of Article 11 was found. Appellate Body Report, *Australia – Salmon*, paras 266-267.

<sup>291</sup> Similarly, the Appellate Body in *Japan – Agricultural Products II* responded to Japan’s claim that the Panel had not properly examined the evidence, had cited the views of the experts in an arbitrary manner and had evaluated the evidence in a contradictory way, by stressing the egregious nature of the errors required for a finding of violation of Article 11 of the DSU, and holding that Japan had not demonstrated errors of that gravity. Appellate Body Report, *Japan – Agricultural Products II*, paras 140-142.

<sup>292</sup> In *Japan – Apples*, Japan argued before the Appellate Body, *inter alia*, that the Panel had made a material factual error in characterising the experimental evidence underlying its conclusion that fire blight was unlikely to complete the transmission pathway to infect apple fruit. The Appellate Body found no violation of Article 11 of the DSU in this respect as the Panel had relied on factual evidence in addition to that allegedly mischaracterised for its findings. Further, Japan claimed that the Panel’s conclusion covered infected apple fruit although the evidence before it centred on mature symptomless apple fruit, leading to a lack of connection between the evidence considered and the findings of the Panel, in violation of Article 11. The Appellate Body, instead, found that the Panel had simply been unclear in its findings in this respect. In addition, Japan argued that the Panel’s conclusion regarding the likelihood of the completion of the transmission pathway was inconsistent with its recognition that the risk identified by the experts was not merely a theoretical risk. In response, the Appellate Body found that the Panels finding that the risk from infected fruit, identified in the scientific prudence expressed by the experts, was ‘real’ did not contradict its finding that the risk of transmission was ‘negligible’. As a result, no violation of Article 11 of the DSU was found. Appellate Body Report, *Japan – Apples* paras. 218-242.

<sup>293</sup> Appellate Body Report, *Australia – Salmon*, para. 266 and Appellate Body Report, *Japan – Agricultural Products II*, para. 142.

Further, it seems that a panel is free to substitute its own judgement, even if its appreciation of the scientific evidence before it is incorrect, for that of the Member government without any real limits beyond that of not committing an egregious error. One wonders whether this was the ‘balance’ in competences intended by the Members to be embodied in the *SPS Agreement*.

Due to the limited interpretation given by the Appellate Body to the obligation to conduct an objective assessment, it is clear that the parties are to a large degree at the mercy of the relevant panel when it comes to its review of the evidence before it. This is problematic when one bears in mind the composition of panels and their lack of expertise in scientific matters. Despite a lack of bad faith or gross negligence on the part of the panel, it could still (and does) sometimes substantially misunderstand or mischaracterise evidence before it. This is not surprising, when one sees the extremely technical and complex nature of the evidence submitted in SPS disputes. This complexity and the difference of opinions that often exists in the scientific arena mean that the panel’s possibility to consult experts does not constitute a real safeguard against the possibility of mistakes. While the discretion of panels as the triers of fact to decide on the meaning and weight to be given to the factual evidence before them is not disputed, this should not extend to allowing panels to evaluate for themselves the scientific evidence that forms part of a Member’s risk assessment and make their own conclusions as to the likelihood or potential of the risk, in effect conducting their own risk assessments. Otherwise the likelihood of panels ‘getting the science wrong’ is greatly increased.<sup>294</sup>

In sum, the current case law on the standard of review has two problematic aspects. Firstly, the decision that the applicable standard of review is an ‘objective assessment’ of the factual and legal aspects of the case, without a precise definition of what this standard entails, gives cause for concern.<sup>295</sup> While this was held to mean neither complete deference nor *de novo* review, what it does entail is not clear aside from the fact that a panel must not commit egregious errors such that its good faith is called into question. While expressly recognising that their task is not to conduct their own risk assessments or impose a particular scientific view on the respondent Member, it appears that panels in practice do substitute their judgements for that of the respondent Member in the evaluation of scientific evidence, despite their lack of ‘technical expertise’ in reviewing such evidence and their possible miscomprehension of the advice of the panel experts. This could lead to

---

<sup>294</sup> Jacqueline Peel, *Risk Regulation under the WTO SPS Agreement: Science as an International Normative Yardstick?*, Jean Monnet Working Paper 02/04 (NYU School of Law, New York), June 2004, 19, available at: [www.jeanmonnetprogram.org/papers/04/040201.pdf](http://www.jeanmonnetprogram.org/papers/04/040201.pdf), visited on 14 September 2004. It is interesting to note that similar difficulties confront judicial organs at national level when faced with the task of reviewing risk regulation. As noted by Jacqueline Peel in her analysis of the case law of the EC and the US in this regard, despite different rhetoric, there are striking similarities in the approaches of adjudicators in both Members to this issue. In particular, both bodies of jurisprudence feature deference to the judgement of regulators to select the appropriate risk management policies on the basis of the scientific evidence. *Ibid.*, 50.

<sup>295</sup> Claus-Dieter Ehlermann and Nicolas Lockhart, ‘Standard of Review in WTO Law’, in *A True European: Essays for Judge David Edwards*, Mark Hoskins and William Robinson (eds.) (Hart Publishing, Portland), 2003, 267-296, 271. Ehlermann and Lockhart point out that the ‘objective assessment’ standard of review ‘is couched in rather broad terms that do little to provide substantive guidance on the nature and intensity of the review which panels should apply to national measures.’ They note that ‘the requirement for an “objective assessment” must function with another, more detailed, underlying standard of review’ and they suggest that the scope and intensity of review differs for different issues in dispute.

arbitrary results when one bears in mind the complexity of scientific evidence in the area of health and the conflicting opinions that often exist. Secondly, since only ‘wilful distortion’ or ‘deliberate disregard’ of evidence will constitute a failure to make an ‘objective assessment’ of the facts, the situation could arise that a case is incorrectly decided on the basis of a good faith misunderstanding of scientific evidence by a panel, without this mistake constituting a ground for overturning the panel decision. This is problematic since the disciplines of the *SPS Agreement* are primarily science-based, and thus cases decided under its provisions will most likely turn on the evaluation of scientific evidence. Since the Appellate Body may not review issues of fact on appeal, an appeal will not be able to correct this situation but will instead be decided on the basis of this mistaken understanding of the facts. Also, a panel that does go as far as undertaking a *de novo* evaluation of the scientific evidence, in disregard of the scientific choices made by national authorities, will not have its finding overruled on the basis of a failure to conduct an ‘objective assessment’ since this action does not fall within the narrow definition given by the Appellate Body to the failure to conduct an objective assessment.

In order to avoid this unacceptable situation, it seems imperative that the question of the appropriate standard of review under the *SPS Agreement* be reassessed to allow for some deference to national decisions regarding the quality and weight of scientific evidence in conducting a risk assessment. This does not imply that a panel should conduct a purely procedural review.<sup>296</sup> Neither does it mean that a panel must respect a national authority’s assessment of the evidence, no matter what. Instead, it requires that the panel start with ‘the Member’s evaluations and approach by asking whether they are reasonable.’<sup>297</sup> This means that provided that the scientific support for a measure is plausible and a Member has met all the requirements of the *SPS Agreement* relating to the conduct of a risk assessment and has based its measure on this risk assessment, a panel should refrain from evaluating the risk on the basis of the scientific evidence itself, a task for which it is demonstrably poorly suited. Ensuring that panels stay within the bounds of the proposed standard of review not only ensures that the balance of competences written into the *SPS Agreement* is respected, but also makes room for the diversity of priorities, consumer preferences and regulatory capacity between Members at different levels of development to be reflected in the science policy choices incorporated into national risk assessments. The Appellate Body, while respecting the role of panels as the triers of facts, should be willing to shoulder its responsibility to keep watch over the standard of review applied by panels.

---

<sup>296</sup> An alternative approach, suggested by Joost Pauwelyn, is to set out explicitly the procedural steps that national authorities have to take when conducting a risk assessment (the factors to be examined, the type and source of scientific evidence to be considered etc) and to limit review by panels to the question whether the Member concerned has followed the required steps and made an unbiased and objective evaluation of the facts (in line with the deferential approach followed under the *Anti-Dumping Agreement*). Joost Pauwelyn, ‘Does the WTO Stand for ‘Defence to’ or ‘Interference with’ National Health Authorities When Applying the Agreement on Sanitary and Phytosanitary Measures (*SPS Agreement*)?’ in *The Role of the Judge in International Trade Regulation: Experience and Lessons for the WTO*, T. Cottier and P.C. Mavroidis (eds.) (University of Michigan Press: Ann Arbor, Michigan), 2003, 175-192, 186.

<sup>297</sup> Catherine Button, *The Power to Protect. Trade, Health and Uncertainty in the WTO* (Hart Publishing, Oxford and Portland, Oregon), 2004, 112. Button calls this the ‘reasonable regulator’ standard of review.

An additional issue which arises with regard to the standard of review to be applied is whether the precautionary principle should guide a panel's evaluation of the evidence before it. This issue arose in *Japan – Apples*. Japan argued, on appeal, that the Panel had failed to adequately take into account the precautionary principle in its evaluation of the evidence, leading to a violation of Article 11 of the DSU. The panel experts in this case had recognized the need for caution with respect to the elimination of the phytosanitary measures protecting Japan from fire blight. According to Japan, this fact should have been given greater weight by the Panel in considering the evidence regarding the completion of the transmission pathway for fire blight.<sup>298</sup> The Appellate Body noted that Japan did not argue that the precautionary principle should have been applied as distinct from the provisions of the *SPS Agreement*, nor did it argue that the Panel should have used the precautionary principle as part of its interpretative analysis of the Agreement. Instead, it understood Japan to argue that the principle was embodied in the cautionary opinions of the experts and *should have been given greater weight* in the Panel's conclusions on the completion of the pathway. The Appellate Body then noted that it is established case law that the credibility and weight to be properly ascribed to a particular piece of evidence is in the discretion of a panel as the trier of facts. This discretion is limited only by a panel's duty to make an 'objective assessment' of the facts. Since Japan made no argument challenging the objectivity of the Panel's assessment, it failed to establish a violation of Article 11.<sup>299</sup>

This finding of the Panel reinforces the conclusion that the possible relevance of the precautionary principle for purposes of the *SPS Agreement* is limited to the particular formulation it has been given in Article 5.7.<sup>300</sup> Outside this Article, the precautionary principle plays no role, according to the case law, in guiding the interpretation of the *SPS Agreement* or the evaluation of the evidence. The standard of review to be applied by panels remains an 'objective assessment' of the matter, even in cases of scientific uncertainty. Once again, it is argued here that the assessment of scientific evidence, including the weight to be given to particular scientific opinions, is best left to the Member imposing the SPS measure. This would allow the Member to take a precautionary approach in the science policy choices incorporated in its risk assessment. The assessment of the scientific evidence by a panel should be limited to establishing whether the risk assessment meets the conditions of the *SPS Agreement*, and its conclusions are plausible.

#### 2.2.4 Role of international law in interpretation

It is also interesting to examine the approach taken in WTO case law to the role of international law in the interpretation of the *SPS Agreement*. This will determine the scope for taking into account development-oriented norms of the international legal order in the interpretation of the *SPS Agreement*.<sup>301</sup> It also establishes the possibility for consideration of

<sup>298</sup> This evidence was considered for purposes of the Panel's finding under Article 2.2 of the *SPS Agreement*.

<sup>299</sup> Appellate Body Report, *Japan – Apples*, para. 283.

<sup>300</sup> See further on this issue, above, Part III, Section 5.2.5.1.

<sup>301</sup> Asif H. Qureshi, 'Interpreting World Trade Organization Agreements for the Development Objective', *Journal of World Trade* 37 (5), 2003, 847-882, 301. Qureshi points out that international law norms that could be of relevance to the interpretation of WTO agreements are not limited to environmental or human rights norms, as feared by some developing-country Members. Instead they include development-oriented norms, since '[d]evelopment is an imperative of the international economic order.' *Ibid.*

international law norms on the protection of human life and health and the environment in addressing the rights and obligations laid down in the *SPS Agreement*. Such consideration of the international law context within which the *SPS Agreement* functions, could operate to provide the much-needed normative framework to guide WTO adjudicators in striking a balance between the competing goals of trade liberalisation and health protection.<sup>302</sup>

Article 3.2 of the DSU requires provides that the dispute settlement system of the WTO serves, *inter alia*, to clarify the provisions of WTO agreements ‘in accordance with customary rules of interpretation of public international law’. However, in doing so panels and the Appellate Body may not ‘add to or diminish the rights and obligations provided in the covered agreements.’<sup>303</sup>

As acknowledged in previous WTO case law, the customary rules of interpretation, referred to in Article 3.2 of the DSU, are reflected in Articles 31 and 32 of the *Vienna Convention on the Law of Treaties*.<sup>304</sup> Article 31.3(c) deals with the relevance of other international law rules for the interpretation of a treaty. It provides:

There shall be taken into account, together with the context:

...(c) any relevant rules of international law applicable in the relations between the parties.

Further, as held by the Panel in *Korea – Procurement*:

Article 3.2 of the DSU requires that we seek within the context of a particular dispute to clarify the existing provisions of the WTO agreements in accordance with customary rules of interpretation of public international law. However, the relationship of the WTO Agreements to customary international law is broader than this. Customary international law applies generally to the economic relations between the WTO Members. Such international law applies to the extent that the WTO agreements do not ‘contract out’ from it. To put it another way, to the extent there is no conflict or inconsistency, or an expression in a covered WTO agreement that implies differently, we are of the view that the customary rules of international law apply to the WTO treaties and to the process of treaty formation under the WTO.<sup>305</sup>

---

<sup>302</sup> Jacqueline Peel identifies the absence of a normative framework for this balancing as the reason why WTO adjudicators, different from adjudicators in the US and EC, when reviewing SPS regulations conduct such a rigorous review of the scientific basis. Jacqueline Peel, *Risk Regulation under the WTO SPS Agreement: Science as an International Normative Yardstick?*, Jean Monnet Working Paper 02/04 (NYU School of Law, New York), June 2004, 3, available at: [www.jeanmonnetprogram.org/papers/04/040201.pdf](http://www.jeanmonnetprogram.org/papers/04/040201.pdf), visited on 14 September 2004.

<sup>303</sup> Article 19.2 of the DSU. Similarly, Article 3.2 of the DSU provides that the recommendations and rulings of the SDB cannot add to or diminish the rights and obligations provided in the covered agreements. The term ‘covered agreements’ refers to all the WTO agreements that are covered by the dispute settlement mechanism set out in the DSU, as listed in Appendix 1 to the DSU. This includes all the multilateral agreements on trade in goods, of which the *SPS Agreement* is one.

<sup>304</sup> Appellate Body Report, *US – Gasoline*, 16 (in respect of Article 31 of the *Vienna Convention on the Law of Treaties*); and Appellate Body Report, *Japan – Alcoholic Beverages II*, 104 (in respect of Article 32 of the *Vienna Convention on the Law of Treaties*).

<sup>305</sup> Panel Report, *Korea – Procurement*, para. 7.96. This panel report was not appealed.

Considerable debate has arisen regarding the question of the extent to which international law must be had regard to by WTO panels and the Appellate Body in adjudicating claims under the WTO agreements. While there is widespread support for the idea that, in line with the presumption against conflicts in international law, WTO agreements should as far as possible be interpreted in conformity with other international law rules,<sup>306</sup> disagreement persists with regard to situations of irreconcilable conflict between a rule of WTO law and another international law rule. The debate centres on the question of what WTO adjudicators should do when faced with such a conflict. Should they necessarily give precedence to WTO law rules, due to the prohibition on adding to or diminishing the rights or obligations contained in WTO agreements that is part of their mandate?<sup>307</sup> Or can WTO adjudicators refuse to apply a WTO law rule that conflicts with a non-WTO rule of international law that has precedence due to the application of the rules on conflicts of laws?<sup>308</sup> Irreconcilable conflicts are, however, rare and the question most often before a panel is to what extent non-WTO law should inform the interpretation of WTO provisions rather than whether it should override the express terms of WTO law.<sup>309</sup>

This issue of the role of other international law norms in the interpretation of the *SPS Agreement* arose already in the first SPS dispute, *EC – Hormones*. As discussed above,<sup>310</sup> in this case the EC relied on the ‘precautionary principle’ which it argued had attained the status of customary international law, or at least of a general principle of law, to guide the interpretation of Article 5.1 of the *SPS Agreement*. The Appellate Body found it unnecessary to decide whether the precautionary principle now forms part of general customary international law.<sup>311</sup> However, it held that even if this were the case, the specific agreement on rules for cases of scientific uncertainty in Article 5.7 of the *SPS Agreement* overrides any such general principle.<sup>312</sup> This approach was also followed by the Appellate

<sup>306</sup> Gabrielle Marceau, ‘Conflicts of Norms and Conflicts of Jurisdictions. The Relationship between the WTO Agreement and MEAs and Other Treaties’, *Journal of World Trade* 35 (6), 2001, 1081-1131, 1086-1090; Joost Pauwelyn, ‘The Role of Public International Law in the WTO: How Far Can We Go?’, *The American Journal of International Law* 95, 2001, 535-578, 542.

<sup>307</sup> Gabrielle Marceau supports this view, arguing that the applicable law in WTO disputes is limited to the covered agreements and the institutional actions pursuant to these agreements. She states that it is difficult to imagine a situation where a provision of other international law, such as a human rights provision, would supersede a WTO provision without, in effect, adding to or diminishing the rights or obligations of the two disputing Members under the covered agreements. Gabrielle Marceau, ‘WTO Dispute Settlement and Human Rights’, *European Journal of International Law* 13 (4), 2002, 753-814.

<sup>308</sup> Joost Pauwelyn is the main proponent of this view, arguing that although the jurisdiction of WTO adjudicators is limited to claims brought under WTO agreements, the law applicable in deciding such claims is not limited to WTO law, but includes other rules of international law. Therefore, international law rules that bind both parties to a dispute may be invoked in dispute settlement proceedings with regard to a claim of violation of WTO law. Joost Pauwelyn, ‘The Role of Public International Law in the WTO: How Far Can We Go?’, *The American Journal of International Law* 95, 2001, 535-578, 560-561 and 566.

<sup>309</sup> On the narrow interpretation of the concept of ‘conflict’ in WTO law (referring to situations where compliance with one obligation necessarily entails violation of the other), see above, Part III, Section 2.4.2. Note, however, that Pauwelyn advocates a broader interpretation of ‘conflict’ to include situations where one norm permits something which the other norm prohibits. Joost Pauwelyn, *Conflict of Norms in Public International Law: The Example of the World Trade Organization: Internal Hierarchy and How WTO Law Relates to Other Rules of International Law*, Doctoral Thesis, Faculté de Droit (Université de Neuchâtel, Neuchâtel), 2001, 107-110.

<sup>310</sup> See above, Part III, Section 5.2.5.1.

<sup>311</sup> Appellate Body Report, *EC – Hormones*, para. 123.

<sup>312</sup> *Ibid.*, para. 125.

Body in *Japan – Agricultural Products II* when addressing the role of the precautionary principle in the interpretation of Article 2.2 of the *SPS Agreement*.<sup>313</sup> This view seems rather limited. The question of the relationship between a norm of international law and a WTO provision is not limited to which one prevails, but instead, as mentioned above, is most often a question of whether a harmonious interpretation is possible that would avoid a conflict. In this light it would seem appropriate for the Appellate Body to have addressed the question whether the precautionary principle has attained the status of a rule of customary international law or a general principle of law, in order to ascertain its relevance in *interpreting* the scientific disciplines of the *SPS Agreement*. As was discussed above, there are various aspects of the scientific disciplines, including the meaning of the ‘rational relationship’ requirement read into Articles 2.2 and 5.1, that could usefully be informed by reference to the precautionary principle, should it have achieved this status.<sup>314</sup>

In *EC – Approval and Marketing of Biotech Products*, the EC raised the question of the relevance of other rules of international law to the interpretation of the applicable WTO agreements in this dispute, including the *SPS Agreement*. It relied on Article 31.3(c) of the *Vienna Convention on the Law of Treaties* requiring a treaty interpreter to take account of relevant rules of international law. In particular, the EC referred to the precautionary principle and relevant multilateral environmental agreements (MEAs), especially the *Convention on Biological Diversity* (CBD) of 1992 and the *Cartagena Protocol on Biosafety* of 2000,<sup>315</sup> as international law rules to which the Panel must have regard. It further made reference in some of its arguments to definitions of terms developed by international standard-setting bodies.<sup>316</sup>

The Panel noted that Article 3.2 of the DSU requires it to interpret WTO agreements ‘in accordance with customary rules of interpretation of public international law’ which are reflected in Articles 31 and 32 of the *Vienna Convention on the Law of Treaties*. The Panel focused on Article 31.3(c) of the *Vienna Convention on the Law of Treaties*, cited above. It noted that the use of the word ‘shall’ indicates that Article 31.3(c) *mandates* a treaty interpreter to take account of other international law rules, rather than merely gives

<sup>313</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 81.

<sup>314</sup> For an example of the recognition of the possibility to make room for a ‘precautionary approach’ in applying the requirement of Article 5.1 to base an SPS measure on a risk assessment, see Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.3065. This finding is discussed above, Part III, Section 5.2.5.1.

<sup>315</sup> The *Cartagena Protocol on Biosafety* is a protocol to the UN *Convention on Biological Diversity*. It deals with transboundary movement of living modified organisms. It contains provisions dealing with approval procedures, laying down a time line and addressing factors that could cause delays in such procedures (in Articles 9–11 thereof). It contains provisions on risk assessment (in Article 15 and Annex III) and the precautionary approach (Articles 1, 10.6 and 11.8 and Annex III). It currently has 147 contracting parties (as of 30 June 2008). The EC argued that the *Cartagena Protocol* and the *SPS Agreement* should be interpreted and applied consistently as far as possible. It claimed that there are no *a priori* inconsistencies between the two treaties, and that the *Cartagena Protocol*’s provisions on risk assessment and the precautionary principle inform the meaning and effect of the relevant provisions in the *SPS Agreement*. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.55.

<sup>316</sup> The EC pointed to the strong relationship between the *SPS Agreement* and these international bodies, which are expressly referred to in Annex A.3 of the *SPS Agreement* as the relevant standard-setting bodies for purposes of the harmonisation obligations in Article 3. Further, it noted that Article 12.3 of the *SPS Agreement* refers to the objective of securing from the relevant international organisations the best available scientific and technical advice for the administration of the *SPS Agreement* (by the SPS Committee). Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 4.749.

the interpreter the option of doing so.<sup>317</sup> Thereby, this Article enhances the consistency of international law rules applicable to the relevant States parties and contributes to avoiding conflicts between those rules.<sup>318</sup>

The Panel examined the term ‘rules of international law’ in Article 31.3(c) and noted that it is broad enough to encompass ‘all generally accepted sources of public international law’ including treaties and customary international law rules.<sup>319</sup> Further, it noted that in *US – Shrimp*, the Appellate Body had made clear that general principles of international law also fall under Article 31.3(c).<sup>320</sup> Thus, if the precautionary principle is a general principle of public international law, it could also be considered to fall under this provision.<sup>321</sup>

However, the Panel pointed out that Article 31.3(c) of the *Vienna Convention on the Law of Treaties* contains an important limitation, namely that only those rules of international law ‘applicable in the relations between the parties’ are to be taken into account.<sup>322</sup> The Panel held ‘the parties’ to mean those states that have consented to be bound by the treaty being interpreted (i.e. *all* WTO Members).<sup>323</sup> After examining the MEAs at issue, the Panel found that while the EC, Argentina and Canada are parties to the CBD (having signed and ratified it), the US is not.<sup>324</sup> Further, the *Cartagena Protocol* has been signed and ratified by the EC only. Argentina and Canada have signed but not ratified it, and the US has neither signed nor ratified it.<sup>325</sup> Thus, according to the Panel, these two treaties cannot be regarded as falling within the scope of 31.3(c) of the *Vienna Convention on the Law of Treaties*. This finding would seem to practically exclude the possibility of a Panel being obliged to have regard to other treaties in the interpretation of WTO agreements, since it is improbable that all 153 WTO Members would be parties to another treaty. As is stated in the report of the Study Group set up by the United Nations International Law

---

<sup>317</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.69. The Panel pointed out that although this obligation is limited to taking account of other international law rules and no particular outcome is prescribed, the principle of good faith would require that where more than one interpretation is possible, the treaty interpreter applying Article 31.3(c) of the VCLT must choose the alternative that is more in accord with the other rules of international law.

<sup>318</sup> *Ibid.*, para. 7.70.

<sup>319</sup> *Ibid.*, para. 7.67.

<sup>320</sup> The Panel here referred to the finding in Appellate Body Report, *US – Shrimp*, para.158 and note 157.

<sup>321</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.67.

<sup>322</sup> *Ibid.*, para. 7.68.

<sup>323</sup> *Ibid.*, para. 7.67. To support its finding, the Panel noted that Article 31.3(c) does not refer to ‘one or more parties’ or ‘the parties to the dispute’. Further, it pointed to the definition of ‘party’ in Article 2.1(g) of the *Vienna Convention on the Law of Treaties* as ‘a State that has consented to be bound by the treaty and for which the treaty is in force’ and derived from this definition the conclusion that ‘parties’ in Article 31.3(c) refers to states which have consented to be bound by the treaty that is being interpreted and for which that treaty is in force.

<sup>324</sup> The US signed the CBD in 1993 but never ratified it. Note, however, that Article 18 of the *Vienna Convention on the Law of Treaties* establishes the obligation on states that have signed but not yet ratified a treaty to refrain from acts that would defeat the object and purpose of the treaty.

<sup>325</sup> Although the Panel limited its examination to the four Parties to this dispute, this should not give the impression that it had departed from its view that the other rules of international law must be applicable to *all* WTO Members. Instead, the Panel stated that if a rule of international law is not applicable to one of the four Parties to this dispute, it is not applicable to the relations between all WTO Members. Thus, although the Panel declined to take a position on this, it appears that even if the relevant international law rules raised in this dispute had been applicable to all four Parties, but had not been applicable to another WTO Member, they would still not have to be taken into account by the Panel under Article 31.3(c) of the *Vienna Convention on the Law of Treaties*. Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.71–7.72.

Commission (ILC) to address the issue of the fragmentation of international law (expressly criticising this finding by the Panel in *EC – Approval and Marketing of Biotech Products*).<sup>326</sup>

Bearing in mind the unlikelihood of a precise congruence in the membership of most important multilateral conventions, it would become unlikely that *any* use of conventional international law could be made in the interpretation of such conventions. This would have the ironic effect that the more the membership of a multilateral treaty such as the WTO covered agreements expanded, the more those treaties would be cut off from the rest of international law. In practice, the result would be the isolation of multilateral agreements as “islands” permitting no references *inter se* in their application.<sup>327</sup>

The ILC Study Group finds it a better solution to permit reference to another treaty under Article 31.3(c), provided that the *parties in dispute* are also parties to that other treaty.<sup>328</sup> The resulting possibly divergent interpretations would respect party will, which is inherently divergent according to the Study Group. Further, it advocates taking into account the extent to which the other treaty can be regarded as implicitly accepted or tolerated by other parties in the sense that it can be considered to reflect the common understanding of Members as to the meaning of the relevant term.<sup>329</sup> In the same vein, in the conclusions of the Study Group, the particular relevance of other treaty-based rules to the interpretation of a treaty under Article 31.3(c) of the *Vienna Convention on the Law of Treaties* is noted, *inter alia* where ‘they provide evidence of the common understanding of the parties as to the object and purpose of a treaty under interpretation or as to the meaning of a particular term.’<sup>330</sup>

<sup>326</sup> International Law Commission, 58th Session, *Fragmentation of International Law: Difficulties Arising from the Diversification and Expansion of International Law*, Report of the Study Group of the International Law Commission, finalised by Martti Koskenniemi, A/CN.4/L.682, 13 April 2006. This report contains an analytical study finalised by the Chairman of the ILC Study Group. A set of 42 conclusions adopted by the Study Group is published separately as an appendix. The ILC took note of the conclusions and commended them to the UN General Assembly. The Study Group emphasised that conclusions are based on the analytical study and must be read together with it. It is interesting that this report expressly addresses the findings of the Panel in *EC – Approval and Marketing of Biotech Products* although at that stage only the interim Panel reports had been issued and were officially confidential.

<sup>327</sup> International Law Commission, 58th Session, *Fragmentation of International Law: Difficulties Arising from the Diversification and Expansion of International Law*, Report of the Study Group of the International Law Commission, finalised by Martti Koskenniemi, A/CN.4/L.682, 13 April 2006, para. 471.

<sup>328</sup> *Ibid.*, para. 472. This approach to the meaning of ‘the parties’ is also taken by David Palmeter and Petros Mavroidis, ‘The WTO Legal System: Sources of Law’, *The American Journal of International Law* 92, 1998, 398-413, 411. *Contra*, see Michael Lennard, ‘Navigation by the Stars: Interpreting the WTO Agreements’, *Journal of International Economic Law* 5 (1), 2002, 17-89, 35-39.

<sup>329</sup> International Law Commission, 58th Session, *Fragmentation of International Law: Difficulties Arising from the Diversification and Expansion of International Law*, Report of the Study Group of the International Law Commission, finalised by Martti Koskenniemi, A/CN.4/L.682, 13 April 2006, para. 472. Here the ILC refers to the approach taken in Appellate Body Report, *US – Shrimp*, para. 130.

<sup>330</sup> These conclusions are contained in the following document: International Law Commission, 58th Session, *Fragmentation of International Law: Difficulties Arising from the Diversification and Expansion of International Law*, Report of the Study Group of the International Law Commission, A/CN.4/L.702, 18 July 2006, para. 21.

The Panel's finding in *EC – Approval and Marketing of Biotech Products* seems to be a step backwards from the progressive approach of the Appellate Body in *US – Shrimp*. In that case, the Appellate Body reaffirmed that WTO law is not to be read 'in clinical isolation from public international law'.<sup>331</sup> It followed an evolutionary interpretation of the relevant treaty terms, taking into account the 'contemporary concerns of the community of nations'<sup>332</sup> as reflected in other treaties. In so doing, it relied on treaties that were not binding on all the parties to the dispute, let alone all WTO Members.<sup>333</sup> However, the Panel in *EC – Approval and Marketing of Biotech Products* considered that its approach was consistent with that followed by the Appellate Body in *US – Shrimp*. According to the Panel, the Appellate Body in the latter case 'drew on other rules of international law because it considered that they were informative and aided it in establishing the meaning and scope of the term...' <sup>334</sup> rather than because it was obliged to refer to these other rules under Article 31.3(c) of the *Vienna Convention on the Law of Treaties*.

The Panel pointed out that under Article 31.1 of the *Vienna Convention on the Law of Treaties*, a treaty must be interpreted in accordance with the ordinary meaning of its terms, in their context and in the light of its object and purpose. It regarded, in addition to dictionaries, other relevant rules of international law as aids for a treaty interpreter to establish the ordinary meaning of words in their context. Thus, the treaty interpreter may rely on such other rules when he/she considers them informative, but need not do so, particularly if the ordinary meaning of the treaty terms can be otherwise ascertained.<sup>335</sup> In this case, the Panel apparently did not regard the CBD or *Cartagena Protocol* to be 'informative' for the interpretation of the *SPS Agreement*.<sup>336</sup>

With regard to the precautionary principle, as discussed above, the Panel rejected the EC's argument that it has 'now become a fully-fledged and general principle of international law'.<sup>337</sup> It referred to the Appellate Body's finding in January 1998, in the *EC – Hormones* case, that the status of the precautionary principle was still subject to debate, and that it was 'unnecessary and probably imprudent' for the Appellate Body to take a position on that question.<sup>338</sup> The Panel noted that this legal debate is still ongoing and that, despite its incorporation in numerous international conventions and declarations, mainly in the area of the environment, its precise definition, content and legal status remains an open question. Due to considerations of prudence, the Panel declined to resolve this complex issue, noting further that it was unnecessary to do so.<sup>339</sup>

<sup>331</sup> This finding reiterates that of the Appellate Body in *US – Gasoline*, 16.

<sup>332</sup> The Appellate Body was interpreting the term 'exhaustible natural resources', which it regarded as by definition evolutionary, necessitating regard to modern environmental treaties. Appellate Body Report, *US – Shrimp*, paras 129–130.

<sup>333</sup> It is interesting that in *US – Shrimp*, the Appellate Body referred to the CBD in support of the arguments of the US, which had itself neither signed nor ratified that convention.

<sup>334</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.94.

<sup>335</sup> *Ibid.*, para. 7.92–7.93.

<sup>336</sup> *Ibid.*, para. 7.95. The Panel stated that it 'did not find it necessary or appropriate' to rely on the CBD or Cartagena Protocol in interpreting the WTO agreements at issue.

<sup>337</sup> The EC pointed to several international instruments incorporating the precautionary principle and noted that the approval systems in many countries are based on the need to take precautionary action. *Ibid.*, para. 7.78.

<sup>338</sup> Appellate Body Report, *EC-Hormones*, para. 121, cited in Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.87.

<sup>339</sup> According to the Panel, it was not necessary for it to take a position on the question of whether the

While one can understand the Panel's reluctance to rule upon this controversial issue, it is difficult to see how it could be regarded as 'unnecessary' in this dispute. As pointed out by the Panel itself, if the precautionary principle has become a general principle of law, or a rule of customary international law, it *must* be taken into account in the interpretation of the *SPS Agreement* under Article 31.3(c) of the *Vienna Convention on the Law of Treaties*. It therefore seems imperative for the Panel to decide whether the precautionary principle has achieved this status, in order for it to know whether it is obliged to have regard to this principle.

It is also interesting to examine the approach of the Panel in *EC – Approval and Marketing of Biotech Products* to internationally agreed-upon definitions of terms used in the *SPS Agreement*. The Panel itself had invited several international organisations to identify appropriate standard references (such as technical dictionaries, glossaries, standards and guidelines) which might be useful to it in determining the meaning of terms in the *SPS Agreement*.<sup>340</sup> In its arguments regarding the scope of application of the *SPS Agreement*, the EC repeatedly relied on definitions of terms used in Annex A(1), which have been developed by the international standard-setting bodies expressly referred to in the *SPS Agreement*, namely the CAC, OIE and IPPC.

For example, the EC argued that the definition of a 'pest' in the IPPC of 1997 as a 'plant, animal or pathogenic agent injurious to plants or plant products' provides a context for the interpretation of the term in the *SPS Agreement*, requiring that a pest be a living organism and that it cause injury to a plant.<sup>341</sup> Similarly, it relied on the definition of 'additives' of the Codex, which refers to a substance intentionally added to food in the manufacture thereof for a technological purpose, for its argument that the substance must be added to food and not to a plant that may later find its way into food.<sup>342</sup> It also pointed to the Codex definition of 'contaminants' as 'any substance not intentionally added to food, which is present in the food as a result of the production...of such food...' to argue that as GMOs and the proteins they produce will be intentionally present in food, they cannot be contaminants.<sup>343</sup> The OIE definition of a 'disease' as 'the clinical and/or pathological manifestation of infection' was further pointed to by the EC in support of its contention that a GMO is not a disease.<sup>344</sup>

The Panel found that while these internationally agreed upon definitions are informative,<sup>345</sup> they are not dispositive of the meaning of the relevant terms in the *SPS Agreement* since the international standard-setting bodies are not referred to in Annex A.1. It therefore felt

---

precautionary principle 'is a recognized principle of general or customary international law', in order for it to dispose of the legal claims before it. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.89.

<sup>340</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.19 and 7.31. The Panel consulted the Parties on the choice of organisations and decided to seek information from the secretariats of the CBD, Codex, FAO, IPPC, OIE, UNEP and WHO.

<sup>341</sup> *Ibid.*, para. 7.241.

<sup>342</sup> *Ibid.*, para. 7.295.

<sup>343</sup> *Ibid.*, para. 7.314.

<sup>344</sup> *Ibid.*, para. 7.276.

<sup>345</sup> The Panel, in its findings on the relevance of other international law as evidence of the ordinary meaning of terms used in a treaty, noted that the reference materials obtained from the relevant international organisations had been 'taken into account by [the Panel] as appropriate.' *Ibid.*, para. 7.96.

free to deviate from these definitions and come to a more expansive interpretation of the relevant terms.<sup>346</sup> The Panel appeared to prefer to rely on definitions in the *New Shorter Oxford English Dictionary* to determine the ‘ordinary meaning’ of the terms used in the *SPS Agreement*.<sup>347</sup> This approach does not seem in line with the *SPS Agreement*’s reliance on the work of the relevant international standard-setting bodies as establishing standards and guidelines that Members are encouraged to adopt.<sup>348</sup> It seems strange to promote the use of these international standards by Members, while the Panel can freely disregard them in applying the provisions of the *SPS Agreement*.

The narrow view of the Panel in *EC – Approval and Marketing of Biotech Products* regarding the role of other international law in the interpretation of WTO agreements is lamentable. The Panel fruitfully could have had recourse to relevant multilateral environmental agreements, general principles of international law (if found to exist) and internationally agreed definitions of terms to inform certain terms in the *SPS Agreement*, such as ‘pests’, ‘contaminants’, ‘undue delay’ and ‘insufficient scientific evidence’. In this way, the Panel would have promoted the coherence of the international law system, in line with the progressive approach of the Appellate Body in *US – Shrimp*.<sup>349</sup> The concern may be voiced that, as developed countries can afford higher levels of regulatory protection, and may prioritise these above economic goals, some MEAs negotiated by these Members would not be appropriate to refer to in the interpretation of the *SPS Agreement* in disputes involving developing-country Members not party to the particular MEA. This danger is averted by the very terms of Article 31.3(c) of the *Vienna Convention on the Law of Treaties*, which even under the proposed wider interpretation limits the international agreements that may be used in the interpretation of WTO agreements to those between the parties to the dispute.

---

<sup>346</sup> On this expansive interpretation and its impact on the scope of application of the *SPS Agreement*, see above, Part III, Section 2.1.1.

<sup>347</sup> For example, the Panel noted that the IPPC definition did not support part of its interpretation of the term ‘pest’ but as it did not regard the IPPC’s definition as dispositive, it did not regard it as detracting from the Panel’s view that plants may be considered pests even if they are not injurious to other plants. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.241. Likewise, the Panel, while noting that the word ‘manufacture’ in the Codex definition of ‘additives’ does not fit well with the situation where GM plants are grown for food purposes and the gene is added in the development of the seeds, preferred to rely on the dictionary definition of this term. It thus held that genes intentionally added to food for a technological purpose are to be considered ‘additives in food’. *Ibid.*, para. 7.301. Further, the Panel preferred to make use of the wider definition of ‘disease’ in the *New Shorter Oxford English Dictionary* rather than rely on that of the OIE, although it refrained from finding that GMOs are themselves diseases. *Ibid.*, para. 7.277. Similarly, with regard to ‘contaminants’, after examining the *New Shorter Oxford English Dictionary*, the Panel agreed that intentionally added genes and the proteins produced by GM plants that are intended, are not contaminants. However, it regarded proteins that are an unintended expression of the intentionally added genes as contaminants if they infect or pollute the food product. *Ibid.*, para. 7.313.

<sup>348</sup> Many of the definitions at issue are contained in actual ‘standards’ developed by the relevant standard-setting bodies. As discussed above, Part III, Section 4.2, while Article 3 of the *SPS Agreement* does not oblige Members to adopt international standards, guidelines or recommendations, it provides a strong incentive for doing so by providing a presumption of conformity with the *SPS Agreement* and GATT 1994 for measures conforming to international standards and requiring that deviation be justified by means of a risk assessment.

<sup>349</sup> For an in-depth critique of the findings on this issue by the Panel in *EC – Approval and Marketing of Biotech Products*, see Margaret A. Young, ‘The WTO’s Use of Relevant Rules of International Law: An Analysis of the *Biotech Case*’, *International & Comparative Law Quarterly* 56 (4), 2007, 907-930.

The limited interpretative approach applied by the Panel in *EC – Approval and Marketing of Biotech Products* does not only have effects on the possibility to interpret the *SPS Agreement* in a manner coherent with the obligations of Members under international environmental law. It also does not bode well for the possibilities to interpret the *SPS Agreement* in light of the normative framework that is provided by international human rights law. The various human rights conventions and customary international law rules regarding the protection of the rights to life, health and safe food clearly have relevance for the way that the regulatory disciplines of the *SPS Agreement* should be interpreted, so as not to undermine the protection of these rights.<sup>350</sup> Due regard by panels, policing the regulatory disciplines of the *SPS Agreement*, for the duties of states under international human rights law would ensure that the flexibilities inherent in the Agreement, for example in the requirement of a ‘rational relationship’ between an SPS measure and the scientific evidence, are applied in a way that is supportive of the protection of these rights.

In addition, the emerging recognition of a ‘right to development’ as reflected in the *UN Declaration on the Right to Development of 1986* and the *Vienna Declaration and Programme of Action of 1993* may arguably be seen as reflecting a customary international law principle. This principle recognises the link between economic growth and human rights as inherent parts of development, and establishes the responsibility of states and international organisations that are part of the international trade regime to act in a way that is supportive of development.<sup>351</sup> This principle, if found to have attained the status of customary international law, could inform the interpretation of the *SPS Agreement*, and especially the trade/health balance it aims to achieve. Such an interpretative tool would set the limits for the interpretation of the *SPS Agreement* in that its promotion of economic growth through trade cannot come at the cost of the ability of an importing Member to protect human life and health in its territory. Panels would be called upon to use the flexibilities inherent in the *SPS Agreement*, such as the requirement of a risk assessment ‘as appropriate to the circumstances’, to take account of the particular situation of Members at different levels of development in order to ensure that the regulatory disciplines of the Agreement do not operate to undermine health protection in less-developed Members. Reliance on the right to development as an interpretative tool would also be useful in redressing the currently weak interpretation of SDT under the *SPS Agreement*.<sup>352</sup>

However, for this to be possible, a panel faced with this issue would have to be willing to rule on whether the right to development has emerged as a customary international law

---

<sup>350</sup> For a brief discussion of the relevant human rights framework, see above Part I, Section 1.1 and Part II, Section 1.1. No attempt is made in this book to analyse the question of whether all these human rights obligations have attained the status of customary international law rules, or to set out their content in precise terms. Instead, only the aspects of these rights, as set out by authoritative bodies, that are of particular relevance to the *SPS Agreement* are highlighted above. The argument here is limited to the idea that WTO adjudicators in interpreting the *SPS Agreement* should examine whether the relevant international law norms, either as customary international law rules or as treaty obligations binding on the parties to the dispute, are among those rules which they are required to take into account together with the context of the SPS provision under interpretation. If so, these international human rights norms should inform the meaning of the relevant provisions, thereby contributing to the achievement of an appropriate trade/health balance by the *SPS Agreement*.

<sup>351</sup> See the discussion of the relevance of the right to development for the world trading system above, Part I, Section 1.1.

<sup>352</sup> The interpretation of the only one of these provisions that has been raised in dispute settlement to date (Article 10.1) is discussed below, Part V, Section 1.1.

principle, and to use it in its interpretation of the relevant provisions of the Agreement. Similarly, a panel would have to be willing to have regard to international human rights treaties where the parties to the dispute, even if not all WTO Members, are parties to the relevant treaties. In addition, it would need to consider whether the human rights to life, health and safe food have developed into customary international law rights, and if so, to inform its interpretation of the regulatory disciplines of the *SPS Agreement* with reference to these rights. This would be a salutary development, providing a clear normative basis for the trade/health balance pursued in the interpretation of the rules of the *SPS Agreement*.

As argued by Jacqueline Peel, the ‘normative vacuum’ in which the *SPS Agreement* is currently interpreted, has led panels to rely heavily on science as a default criterion.<sup>353</sup> Science provides a seemingly universal and objective benchmark against which to judge Member’s SPS measures. However, in reality this benchmark is far from neutral and the increasingly intrusive review of the scientific assessments underlying Members’ regulatory choices simply allows adjudicators to replace Member’s policy choices in the assessment of evidence with their own. If, instead, WTO adjudicators were to acknowledge the relevance of international law norms, particularly those relating to the rights to life, health, safe food and development, in their interpretation of the *SPS Agreement*, this normative backdrop for interpretation would enable panels to achieve a more appropriate balance between recognising the policy space left in the Agreement for Members to regulate and policing the disciplines on this space to promote trade liberalisation and economic growth. They may then be less inclined to adopt an invasive approach to the review of the scientific basis for Member’s SPS measures. In other words, in applying the scientific disciplines of the *SPS Agreement*, reliance on international human rights law to provide a normative framework for interpretation would operate to moderate panels’ dependence on the supposed neutrality of science as the arbiter of the legitimacy of SPS measures.

### 2.2.5 Expertise of panellists and the use of panel experts

As noted above, there is no permanent panel body in the WTO dispute settlement system. Instead, panels are created *ad hoc* for each dispute. Panels must be composed of well-qualified governmental or non-governmental individuals according to Article 8.1 of the DSU. No further specification is given regarding *what* these individuals must be well qualified in, aside from an illustrative list of possible panellists. Specifically, the DSU includes the following among possible panellists: persons who have previously served on a panel, persons who have presented a case before a panel, persons who have represented their governments at the GATT or the WTO or in any Council or Committee of a covered agreement or in the Secretariat, persons who served as senior trade policy officials of Members and finally persons who have taught or published in the area of international trade law or policy.<sup>354</sup>

---

<sup>353</sup> Jacqueline Peel, *Risk Regulation under the WTO SPS Agreement: Science as an International Normative Yardstick?*, Jean Monnet Working Paper 02/04 (NYU School of Law, New York), June 2004, 9, available at: [www.jeanmonnetprogram.org/papers/04/040201.pdf](http://www.jeanmonnetprogram.org/papers/04/040201.pdf), visited on 14 September 2004.

<sup>354</sup> An indicative list is kept by the WTO Secretariat, with the names of persons suggested by Member governments who meet the requirements of Article 8.1 of the DSU. Members may suggest new persons for inclusion on this list, providing information on their expertise in the area of international trade and the subject matter

Although this list is not exclusive, it seems that the primary focus of this provision is on the trade expertise of panellists. No express reference is made to persons with non-trade fields of expertise that are nonetheless relevant to disputes under WTO rules, such as experts in the fields of phytosanitary protection, animal health or food safety. However, the reference in Article 8.1 of the DSU to persons who have represented a Member in a WTO committee leaves open the possibility that representatives at the SPS Committee could be called upon to act as panellists. A recent example of this is the composition of the Panel to hear the latest SPS dispute, namely *Australia – Apples*.<sup>355</sup> The Chairperson of this Panel is Attie Swart, Chief Programmes Officer at the South African National Department of Agriculture, formerly South Africa's delegate to the SPS Committee in 1996-2000 and later Chairperson of the SPS Committee.

Nevertheless, it is clear that panellists are primarily trade experts. Although it is possible that persons with additional knowledge in the area of SPS protection may be included among them, there is no requirement that panels hearing cases on health measures include such persons. Bearing in mind the often complex scientific issues that are involved in health regulation, it seems likely that persons without scientific expertise in this area would experience difficulty in making judgements evaluating the often-conflicting scientific evidence before them.<sup>356</sup> This seems particularly problematic when one has regard to the vague limits on the standard of review applied by panels to the regulatory determinations of Member governments, as discussed above.<sup>357</sup>

An attempt to deal with the lack of scientific expertise of panellists is reflected generally in Article 13 of the DSU and for disputes under the *SPS Agreement* more specifically in Article 11.2 of the *SPS Agreement*. Article 13.1 of the DSU authorises panels to seek information and technical advice from any individual or body. Article 13.2 of the DSU allows panels to seek information from any source and to consult experts or request advisory reports from expert review.<sup>358</sup> Article 11.2 of the *SPS Agreement* states:

In a dispute under this Agreement involving scientific or technical issues, a panel should seek advice from experts chosen by the panel in consultation with the parties to the dispute. To this end, the panel may, when it deems it appropriate, establish an advisory technical experts group, or consult the relevant international organizations, at the request of either party to the dispute or on its own initiative.

The views of panel experts are not binding on a panel, but are purely advisory. In all disputes under the *SPS Agreement* to date, panels have chosen to consult experts in their individual capacities, rather than establish an expert review group.<sup>359</sup> This choice is partly

---

of the covered agreements. Article 8.4 of the DSU.

<sup>355</sup> Dispute Settlement Body, *Australia – Measures Affecting the Importation of Apples from New Zealand. Request for Consultations by New Zealand*, WT/DS367/1, G/L/825, G/SPS/GEN/796, circulated on 4 September 2007.

<sup>356</sup> There have been calls for reform in this area. It has been argued that the primary focus on the trade expertise of panellists leads to a definite slant towards free trade goals in panel decisions, which results in inadequate attention being paid to the equally important aim of the protection of health against SPS risks. It has been suggested that a more balanced composition of panels, including experts in both trade and health, is needed.

<sup>357</sup> See above, Part IV, Section 2.2.3.

<sup>358</sup> These groups are set up in terms of Appendix 4 of the *Dispute Settlement Understanding*.

<sup>359</sup> Panel Report, *EC – Hormones*, para. 6.10 (the same experts were appointed for both Panels); Panel Report,

motivated by the panels' wish to hear all scientific views on the matter at hand, rather than only the consensus position arrived at by an expert review group. As noted by Joost Pauwelyn, the fact that an expert review group must produce a report under Appendix 6.4 of the DSU 'may be perceived as transforming the expert group into a form of "tribunal within a tribunal"'.<sup>360</sup> By questioning independent experts, a panel has the flexibility obtain a range of individual opinions rather than a consensus view.<sup>361</sup> In *EC – Hormones*, the Panel stressed that it had 'made clear to the experts advising the Panel that [it was] not seeking a consensus position among the experts but wanted to hear all views.'<sup>362</sup>

The Appellate Body in *EC – Hormones* affirmed the right of panels to appoint individual experts rather than expert review groups.<sup>363</sup> It held that:

in disputes involving scientific or technical issues, neither Article 11.2 of the *SPS Agreement*, nor Article 13 of the DSU prevents panels from consulting with individual experts. Rather, both the *SPS Agreement* and the DSU leave to the sound discretion of a panel the determination of whether the establishment of an expert review group is necessary or appropriate.<sup>364</sup>

The same approach was followed by all the other panels hearing disputes under the *SPS Agreement*. In *US – Continued Suspension*,<sup>365</sup> the Panel addressed the EC's argument that Article 13.2 and Appendix 4 of the DSU, Article 11.2 of the *SPS Agreement* and Article 14.2 of the *TBT Agreement* all refer to the possibility to establish expert review groups, and that this 'normal procedure' was clearly preferred by the drafters of the WTO agreements. According to the EC, establishing an expert review group would reduce<sup>366</sup> the risk of the Panel having to decide between competing scientific views among the experts. The Panel disagreed, holding that neither Article 13.2 of the DSU nor Article 11.2 of the *SPS Agreement* sets a preference for expert review groups, but instead they mention consultation of expert review groups as only one option. It stressed that Article 13.2 of the DSU only says that panels 'may' request an advisory report from expert review groups,

---

*Australia – Salmon*, para. 6.6; Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 6.5 (where all but one of the experts appointed were different to those in the original dispute); Panel Report, *Japan – Agricultural Products II*, para. 6.4; Panel Report, *Japan – Apples*, para. 6.4; Panel Report, *Japan – Apples (Article 21.5 – US)*, para. 6.2 (appointing the same experts as in the original dispute); Panel Reports, *EC – Approval and Marketing on Biotech Products*, para. 7.25; Panel Report, *US – Continued Suspension*, paras 7.86 and 7.88; Panel Report, *Canada – Continued Suspension*, paras 7.84 and 7.86 (the same experts were appointed by the latter two Panels).

<sup>360</sup> Joost Pauwelyn, 'The Use of Experts in WTO Dispute Settlement', *International and Comparative Law Quarterly* 51 (2), 2002, 325-364, 328.

<sup>361</sup> Pauwelyn notes that while the report of an expert review group is advisory only, it may be harder for a panel to overrule a consensus position of such a group than it is to disregard the views of single experts. *Ibid.*

<sup>362</sup> Panel Report, *EC – Hormones (Canada)*, 8.9.; Panel Report, *EC – Hormones (US)*, 8.9.

<sup>363</sup> Appellate Body Report, *EC – Hormones*, para. 147.

<sup>364</sup> *Ibid.*, para. 142.

<sup>365</sup> Although this dispute was not strictly speaking a dispute under the *SPS Agreement* since the terms of reference of the Panel did not refer to the *SPS Agreement*. However, the Panel was of the view that since, in order to address the EC's claim of violation of Article 22.8 of the DSU, it had to examine whether the EC had complied with its obligations under the *SPS Agreement*, the dispute was 'at least indirectly "under [the SPS] Agreement"'. Panel Report, *US – Continued Suspension*, para. 7.63; Panel Report, *Canada – Continued Suspension*, para. 7.61.

<sup>366</sup> Panel Report, *US – Continued Suspension*, para. 7.66; Panel Report, *Canada – Continued Suspension*, para. 7.64.

and that Article 11.2 of the *SPS Agreement* states that a panel ‘may, when it deems it appropriate’ establish an advisory technical experts group. The Panel read these provisions as leaving a wide margin of discretion to the Panel.<sup>367</sup>

Explaining its choice to consult experts in their individual capacity rather than as part of an expert review group, the Panel in *US – Continued Suspension* gave the following two reasons:

Firstly, the fields of competence proposed by the parties were quite varied, rendering it difficult to find individual experts with competence in most or all of these fields to serve in an expert review group. The fact that no expert would have a comprehensive knowledge of all the relevant subjects made it even more important for the Panel to seek advice from the experts on an individual basis on their respective fields of expertise. Secondly, the Panel wished to hear any dissenting or minority views among the experts rather than receiving a consensus text from an expert review group. The Panel did not consider that the risk that experts may have diverging opinions would generate difficulties as serious as those alleged by the European Communities. The Panel rather saw the risk that an expert review group would only agree on a minimum common position, thus depriving the Panel of a full picture of the problems. It was also worth noting that so far, all WTO panels had preferred to consult scientific and/or technical experts on an individual basis.<sup>368</sup>

Referring to the consequence of its choice to consult experts individually rather than as an expert review group, the Panel in *US – Continued Suspension* recognised that sometimes diverging views were expressed by the experts. It considered this situation to be similar to that addressed by the Appellate Body in *EC – Hormones* when the Appellate Body considered that both mainstream and divergent views may be set out in a risk assessment.<sup>369</sup> Recognising that it was not carrying out its own risk assessment, the Panel in *US – Continued Suspension* nevertheless felt that:

...it may benefit from hearing the full spectrum of experts’ views and thus obtain a more complete picture both of the mainstream scientific opinion and of any divergent views.<sup>370</sup>

However, once it has the full spectrum of divergent views before it, problems may arise with regard to the way in which a panel deals with the various viewpoints. In *US – Continued Suspension*, the Panel explained its approach as follows

While, on some occasions, we followed the majority of experts expressing concurrent views, in some others the divergence of views were such that we could not follow that approach and decided to accept the position(s) which appeared,

<sup>367</sup> Panel Report, *US – Continued Suspension*, paras 7.72-7.75; Panel Report, *Canada – Continued Suspension*, paras 7.70 – 7.73.

<sup>368</sup> Panel Report, *US – Continued Suspension*, para. 7.71 and Panel Report, *Canada – Continued Suspension*, para. 7.69.

<sup>369</sup> Appellate Body Report, *EC – Hormones*, para. 194, discussed further above, Part III, Section 5.1.5.1.

<sup>370</sup> Panel Report, *US – Continued Suspension*, para. 7.418 and Panel Report, *Canada – Continued Suspension*, para. 7.409.

in our view, to be the most specific in relation to the question at issue and to be best supported by arguments and evidence. As we have told the parties and the experts during these proceedings, this Panel is not composed of scientists.<sup>371</sup>

This seems a perilous approach.<sup>372</sup> The difference between the role of a panel in assessing whether an SPS measure has a rational relationship with the scientific evidence, including diverging scientific opinions, and the role of a regulatory authority in assessing the, also sometimes diverging, scientific evidence before it should be borne in mind. While it is the responsibility of a regulatory agency to make policy choices with regard to which of the diverging scientific opinions it will follow, a task for which it has both the mandate and the expertise, it is not the task of a WTO panel to make such policy choices. Instead, a panel is tasked with assessing whether a Member's measure is in conformity with the relevant provisions of the *SPS Agreement*, *inter alia* by determining whether the scientific evidence on which the measure is based meets the requirements of Articles 2.2 and 5.1. It is here that the experts play a role, in assisting the panel to understand the scientific evidence before it.

In this regard, contrary to the view of the Panel, it has been argued that scientists consulted individually are unlikely to provide a clear picture of the state of scientific knowledge on an issue. Scientists' views reflect the scientific tradition of which they are part.<sup>373</sup> Individual scientists may therefore offer a range of possibly competing opinions, leaving it to the panel to decide between them. As stated by Pauwelyn, this 'would exceed [panels'] competence and stain the legitimacy that is traditionally linked to science-based outcomes. It increases the risk of panels "getting it wrong" ...'.<sup>374</sup> In addition, reliance on individual opinions enables a panel to attach undue weight to a single expert's opinion.<sup>375</sup> An expert review group is regarded as more conducive to understanding the range of possible interpretations of scientific data. An expert review group is not obliged to come to a monolithic conclusion, but could present the various possible views in a more authoritative way since these would no longer be purely individual opinions but rather the alternative views on the scientific evidence that the expert group regards as plausible.

---

<sup>371</sup> Panel Report, *US – Continued Suspension*, para. 7.420 and Panel Report, *Canada – Continued Suspension*, para. 7.411.

<sup>372</sup> For a strong view that it would be preferable for panels to appoint expert review groups and thus avoid the situation that 'untrained and inexperienced panelists' have to assess competing scientific opinions by different panel experts, see Theofanis Christoforou, 'Settlement of Science-Based Trade Disputes in the WTO: A Critical Review of the Developing Case Law in the Face of Scientific Uncertainty', *New York University Environmental Law Journal* 8, 2000, 622-648, 638.

<sup>373</sup> According to Atik, scientists are more likely to recognise a scientific justification for a measure where the scientific assertion is accepted in the scientific community to which they belong. Jeffery Atik, 'Symposium - Institutions for International Economic Integration: Science and International Regulatory Convergence', *Journal of International Law and Business* 17, 1997, 736-758, 757.

<sup>374</sup> Joost Pauwelyn, 'The Use of Experts in WTO Dispute Settlement', *International and Comparative Law Quarterly* 51 (2), 2002, 325-364, 329.

<sup>375</sup> Alberto Alemanno, *Trade in Food: Regulatory and Judicial Approaches in the EC and WTO* (Cameron May, London), 2007, 355-356. Alemanno gives the example in *EC – Hormones*, where the Panel dismissed the argument of the EC that no alternative existed to Carbadox with the same therapeutic effect, by relying on the opinion of a single expert who stated that Oxytetracycline was a readily available alternative. Panel Report, *EC – Hormones*, para. 8.234.

In addition, an expert group, through discussions, could find common ground between scientific views that may at first appear contradictory.<sup>376</sup>

In respect of the nomination of panel experts, it should be noted that both Article 13.2 and Appendix 4 of the DSU and Article 11.2 of the *SPS Agreement* require the Panel to consult the parties to the dispute in the selection of experts. No further rules are provided for the selection of individual experts. However, with regard to expert groups, Appendix 4 of the DSU requires that experts be ‘persons of professional standing and experience in the field in question’<sup>377</sup> and that they serve in their individual capacities and not as government representatives.<sup>378</sup> Citizens of parties to the dispute may not be selected as expert group members except in exceptional circumstances.<sup>379</sup> These guidelines could be applied, by analogy, to the selection of individual experts. However, in *EC – Hormones* the Appellate Body held:

The rules and procedures set forth in Appendix 4 of the DSU apply in situations in which expert review groups have been established. However, this is not the situation in this particular case. Consequently, once the panel has decided to request the opinion of individual scientific experts, there is no legal obstacle to the panel drawing up, in consultation with the parties to the dispute, *ad hoc* rules for those particular proceedings.<sup>380</sup>

In *EC – Hormones*, the Panels gave the parties the right to nominate one scientific expert each, and the Panel selected three additional experts (from a list drawn up for it by the CAC and the International Agency for Cancer Research (IARC)), taking into account the comments of the parties.<sup>381</sup> Among the experts chosen were nationals of the parties to the dispute. However, since these experts were chosen in terms of procedures agreed upon by the parties, the Appellate Body in *EC – Hormones* found that the Panel had not acted inconsistently with Articles 11, 13.2 and Appendix 4 of the DSU and Article 11.2 of the *SPS Agreement*.<sup>382</sup>

In contrast, in *Australia – Salmon*, the panel did not give the parties the right to nominate experts, although it did invite them, together with the OIE, to submit names of individuals with expertise on the matter before the Panel. Parties were given the opportunity to comment on the suggested experts and to raise compelling objections if any.<sup>383</sup> This practice was followed in later cases.<sup>384</sup> An example of the complexity of the expert

<sup>376</sup> Joost Pauwelyn, ‘The Use of Experts in WTO Dispute Settlement’, *International and Comparative Law Quarterly* 51 (2), 2002, 325-364, 329.

<sup>377</sup> Appendix 4.2 of the DSU.

<sup>378</sup> Appendix 4.3 of the DSU.

<sup>379</sup> Appendix 4.3 of the DSU. The exceptional circumstance referred to is where the panel considers that the need for specialised scientific expertise cannot otherwise be fulfilled. An example suggested by Pauwelyn is where expertise is needed on a very country-specific disease. Joost Pauwelyn, ‘The Use of Experts in WTO Dispute Settlement’, *International and Comparative Law Quarterly* 51 (2), 2002, 325-364, 340.

<sup>380</sup> Panel Report, *EC – Hormones (Canada)*, 148.

<sup>381</sup> Appellate Body Report, *EC – Hormones*, para. 148.

<sup>382</sup> *Ibid.*

<sup>383</sup> Panel Report, *Australia – Salmon*, paras 6.2-6.3. Parties were given the opportunity to comment on the potential experts and state any compelling objections before the Panel selected four individuals from the list of persons proposed.

<sup>384</sup> See Panel Report, *Japan – Agricultural Products II*, para.6.2. Here the Panel set out a procedure for the

selection process is provided by the *US – Continued Suspension* and *Canada – Continued Suspension* disputes. Here the Panel requested the Secretariats of the CAC, JECFA and the IARC to recommend names of candidate experts in the relevant fields.<sup>385</sup> Of the 22 suggested experts, 11 were available and willing to participate. However, as the positions of parties to the disputes differed significantly on these experts, the Panel requested the parties to suggest additional names of experts.<sup>386</sup> An additional 49 experts were suggested by the parties. Of all the experts proposed, all but one was objected to by at least one party.<sup>387</sup> Finally the Panel selected six experts, on the following basis:

The Panel excluded experts with close links with governmental authorities directly involved in policy-making regarding the six hormones and experts with close links to pharmaceutical companies or involved in public advocacy activities. The Panel chose not to exclude *a priori* experts who had participated in the preparation and drafting of JECFA's risk assessments because this would deprive the Panel and the parties of the benefit of the contribution of internationally recognized specialists and because the Panel was of the opinion that experts familiar with the JECFA reports would be well-placed to assist the Panel in understanding the work of JECFA extensively referred to by the parties in their submissions, in particular by the European Communities. Moreover, the Panel, who was fully aware of the fields of competence of these experts, considered that they would be competent to answer questions with respect to risk assessment regarding the hormones at issue. The Panel also decided not to exclude *a priori* all experts who were current or past governmental employees unless a potential conflict of interests could reasonably be assumed from their official functions. In selecting the experts, the Panel also had in mind the need to choose experts with expertise to cover all the fields identified as at issue in the dispute.<sup>388</sup>

---

selection and questioning of experts, indicating that it would request suggestions from the IPPC and the parties and allow parties to comment or raise compelling objections to suggested experts. The Panel indicated that it did not intend to appoint nationals of the parties unless the need for specialised scientific expertise could otherwise not be fulfilled. See also Panel Report, *Australia – Salmon (Article 21.5 – Canada)*, para. 6.2. Although the Panel in this case initially considered appointing two of the four experts appointed in the original dispute and a third expert specialised in the application of sanitary measures, after the parties had the opportunity to comment on this proposal the Panel decided to appoint only one of the experts in the original dispute and two others. A similar procedure was set out in Panel Report, *Japan – Apples*, para. 6.2. See further Panel Reports, *EC – Approval and Marketing of Biotech Products*, paras 7.21-7.30. Here the Panel noted that it would request suggestions from the CBD, CAC, FAO, WHO, IPPC and OIE as well as from the parties to identify appropriate experts. Parties were invited to comment and raise compelling objections to the suggestions, which they did in many cases. The Panel then selected four experts. As two issues were identified on which the selected experts were unlikely to be able to provide advice, the parties were invited to submit names of experts on these issues. After allowing for comments and compelling objections, the Panel selected two additional experts.

<sup>385</sup> Panel Report, *US – Continued Suspension*, para. 7.79 and Panel Report, *Canada – Continued Suspension*, para. 7.77.

<sup>386</sup> Panel Report, *US – Continued Suspension*, para. 7.80 and Panel Report, *Canada – Continued Suspension*, para. 7.78.

<sup>387</sup> Objections were made on the grounds that a proposed expert either lacked scientific expertise in the relevant areas; was affiliated with a government of a party to the dispute; was affiliated with JECFA; had received funding from the pharmaceutical industry; or had been involved in the regulatory approval of one or more of the six hormones at issue. Panel Report, *US – Continued Suspension*, para. 7.84 and Panel Report, *Canada – Continued Suspension*, para. 7.82.

<sup>388</sup> Panel Report, *US – Continued Suspension*, para. 7.85 and Panel Report, *Canada – Continued Suspension*,

In addition to authorising panels to seek information from selected experts, Article 11.2 of the *SPS Agreement* allows a panel to consult relevant international organisations.<sup>389</sup> In *EC – Approval and Marketing of Biotech Products*, the Panel, after consulting the parties, decided to seek information from the secretariats of the CBD, CAC, FAO, IPPC, OIE, UNEP and WHO. These organisations were invited to identify standard references that could assist the Panel in determining the meaning of certain terms and concepts.<sup>390</sup> In *US – Continued Suspension* and *Canada – Continued Suspension*, the Panel sought information from three international organisations, the CAC, JECFA and the IACR, particularly with regard to institutional and procedural issues, and definitions relevant to the dispute.<sup>391</sup>

The procedures used to obtain scientific advice from experts are also described in the panel reports.<sup>392</sup> In general, in parallel to the expert selection procedure, a panel draws up a list of written questions and submits them to the parties for comment. Then the panel finalises the questions and sends them, together with the submissions and scientific evidence, to the experts with the request that they address the questions that are within their competence. Parties have the opportunity to comment in writing on the experts' answers. A joint meeting is then held with the parties and the experts, where discussion takes place on the views of the experts, and the panel can ask additional questions and allows questions by the parties. A transcript of the hearing is attached to the panel report. As noted by Pauwelyn, the publication of the experts' answers in this way is of great importance as '[i]t ensures peer pressure which, in turn, constitutes an incentive for experts to be neutral and truthful...'<sup>393</sup>

---

para. 7.83. Footnote omitted.

<sup>389</sup> The reliance on the international standard-setting organisations to suggest relevant experts and to provide information to the panels has been criticised by Theofanis Christoforou. According to this author, scientists coming from these organisations may be 'unfairly biased in favour of maintaining their organizations standards and recommendations. Theofanis Christoforou, 'Settlement of Science-Based Trade Disputes in the WTO: A Critical Review of the Developing Case Law in the Face of Scientific Uncertainty', *New York University Environmental Law Journal* 8, 2000, 622-648, 630. On the other hand, Pauwelyn notes that the relevant international organisations bring together the best scientists in the world in working groups and committees. In addition, the names they provide are often those of independent scientists working at universities, research institutes or public authorities, rather than their own staff. Peer pressure operates to prevent these persons from expressing 'bogus positions.' Joost Pauwelyn, 'The Use of Experts in WTO Dispute Settlement', *International and Comparative Law Quarterly* 51 (2), 2002, 325-364, 343.

<sup>390</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.31.

<sup>391</sup> Panel Report, *US – Continued Suspension*, para. 7.79; and Panel Report, *Canada – Continued Suspension*, para. 7.77. See also *Working Procedures for Consultations with Scientific and/or Technical Experts* in Annex A-5 to each of these Panel Reports, and the letter from the Panel to parties on 25 November 2005, in Annex A-5 to each of these Panel Reports. At its meeting with the experts in the presence of the parties, the Panel met with six experts and four representatives from the three international organisations mentioned above. One of these persons served as both an individual scientific expert and as the representative of the IARC. Panel Report, *US – Continued Suspension*, para. 7.98; and Panel Report, *Canada – Continued Suspension*, para. 7.95.

<sup>393</sup> Joost Pauwelyn, 'The Use of Experts in WTO Dispute Settlement', *International and Comparative Law Quarterly* 51 (2), 2002, 325-364, 347.

A panel can also make use of scientific reports as part of its mandate to seek information from any source. In *Australia – Salmon*, the Panel noted that ‘for purposes of our examination the scientific and technical content of ... reports and studies is relevant, not their administrative status (i.e., whether they are official government reports or not)’.<sup>394</sup> When examining certain reports under Article 5.5, it further stated:

We note that these reports do not form part of Australia’s formal risk assessment nor represent Australia’s official government policy. However, to the extent they constitute relevant available scientific information which was submitted to the Panel, we consider it our task to take this evidence into account. We consider that, for purposes of our examination, the scientific and technical content of these reports and studies is relevant, not their administrative status (i.e., whether they are official government reports or not).

... Whether or not this evidence is part of official Australian government policy does not, in our mind, change the scientific weight to be given to it.<sup>395</sup>

In respect of the use of the various sources of scientific advice and information available to panels, it is very important to set the limits. These limits lie in the interaction between the obligation of a party to prove a *prima facie* case of inconsistency and the investigative authority of a panel. This issue was examined by the Appellate Body in *Japan – Agricultural Products II*.<sup>396</sup> In this case, the US had argued that Japan’s varietal testing requirement was more trade restrictive than required to meet Japan’s appropriate level of protection, contrary to Article 5.6 of the *SPS Agreement*. It claimed that testing by product was an alternative measure, meeting the Article 5.6 requirements. The Panel found that this measure would not meet Japan’s appropriate level of protection. However, it went on to deduce another alternative measure, neither claimed nor argued by the US, from the opinions given by the panel experts.<sup>397</sup> Although the Panel acknowledged that the US had not argued that this measure, the determination of sorption levels, met any of the three requirements of Article 5.6, it held that it could be presumed that the requirements were met and that the US had offered views consistent with this.

This finding was appealed and the Appellate Body found that the US was obliged to establish a *prima facie* case that an alternative measure exists meeting all three requirements of Article 5.6. As the US had not even claimed that determination of sorption levels was such a measure, it did not comply with this obligation. The Appellate Body stated as follows:

Article 13 of the DSU and Article 11.2 of the *SPS Agreement* suggest that panels have a significant investigative authority. However, this authority cannot be used by a panel to rule in favour of a complaining party which has not established a *prima facie* case of inconsistency based on specific legal claims asserted by it. A panel is entitled to seek information and advice from experts and from any other relevant source it chooses, pursuant to Article 13 of the DSU and, in an SPS

<sup>394</sup> Panel Report, *Australia – Salmon*, para. 7.5.

<sup>395</sup> *Ibid.*, paras. 8.136-8.137.

<sup>396</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 121-131.

<sup>397</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.74.

case, Article 11.2 of the *SPS Agreement*, to help it to understand and evaluate the evidence submitted and the arguments made by the parties, but not to make the case for a complaining party.<sup>398</sup>

This makes clear that the expert advice sought by a panel is intended to help it understand and evaluate the evidence submitted and arguments made by the parties, not to make the complaining party's case for it.

In *Japan – Apples*, Japan referred to this finding by the Appellate Body to challenge on appeal the Panel's use of experts. Japan argued that the US had not made claims or submitted evidence in respect of the risk of transmission of fire blight by apples other than mature symptomless apples, yet the Panel had made findings of fact with regard to these 'other' apples. Japan claimed that the Panel had thus exceeded the bounds of its investigative authority.<sup>399</sup> The Appellate Body rejected Japan's argument, finding that the Panel had acted within the limits of its investigative authority, as 'it did nothing more than assess the relevant allegations of fact asserted by Japan, in the light of the evidence submitted by the parties and the opinions of the experts.'<sup>400</sup> It thus clarified that a panel may use the evidence of its experts to assist it in assessing not only the claims of the complaining Member, but also the allegations of the responding Member. In doing so, it cannot be said to be exceeding its authority under Article 11.2.

These findings are important in clarifying the respective roles of the panel, its experts and the parties before it in the proceedings. It establishes that the panel procedure is adversarial, with the panel acting as an impartial arbiter, rather than inquisitorial, where the panel would have a more active role in the investigation of the facts and establishment of a case. The panel's investigative authority, including its reliance on panel experts, is meant only to help its own understanding and evaluation of the factual case presented by each of the parties before it.

However, panels have not always stayed within these boundaries in their use of panel experts. In some cases, they have put questions to the experts that entail analysis that is not purely scientific but rather falls within the role of the panel in applying WTO law to the facts before it. For example, in *Japan – Agricultural Products II*, the Panel asked its experts whether 'in their expert opinion, there is a rational or objective relationship between, on the one hand, the varietal testing requirement imposed by Japan, and, on the other hand, any evidence submitted by the parties.'<sup>401</sup> The concept of a 'rational relationship' has a particular legal significance in the context of the *SPS Agreement*. The question thus addresses an issue of law that is for the panel, as the arbitrator, to determine. A similar legal question was put to the panel experts in *Japan – Apples*, namely whether Japan's 1999 Report was a proper risk assessment.<sup>402</sup> Once again, what is a proper 'risk assessment' for purposes of the *SPS Agreement* is legally defined. It is beyond the competence of panel experts to address this question. Instead, their role should be strictly limited to assisting the panel in understanding the scientific evidence brought by the parties. In other

---

<sup>398</sup> Appellate Body Report, *Japan – Agricultural Products II*, para. 129.

<sup>399</sup> Appellate Body Report, *Japan – Apples*, para. 158.

<sup>400</sup> *Ibid.*

<sup>401</sup> Panel Report, *Japan – Agricultural Products II*, para. 8.35.

<sup>402</sup> Panel Report, *Japan – Apples*, para. 6.27, question 2.

cases, the questions put to the panel experts were not related to their scientific expertise but required a personal opinion. For example, in *EC – Hormones*, the Panel asked the experts whether the conditions imposed by the EC for the therapeutic or zootechnical use of hormones could ‘achieve its aim of avoiding any potential adverse effects on human health’ arising from their residues in meat. One of the experts, Dr André, responded that this question was ‘not related to a scientific expertise’ and that he could therefore only give a personal opinion.<sup>403</sup> In addition, the experts in this case were asked about the feasibility of labelling with respect to hormone-treated meat. As pointed out by Dr. André, this is again not a question related to scientific expertise, but requires rather a ‘political decision’.<sup>404</sup> Dr. Ritter, another of the panel experts, noted that labelling is an issue subject to intense public debate and to which there was no easy resolution.<sup>405</sup>

While the use of panel experts is to be welcomed as it assists panels to understand the highly complex factual evidence before them, and thereby lends scientific authority to the decision, the prevailing use of panel experts clearly leaves much to be desired. Reliance on panel experts should avoid the assessment and choice between competing scientific views by a panel. However, the practice of reliance on individual experts rather than expert groups has the effect of adding to the competing scientific opinions before a panel. It allows a panel to pick and choose between the various opinions,<sup>406</sup> which is troubling in view of the lack of scientific expertise of panellists to undertake this task. It is recommended that panels make use of expert review groups, in order to ensure that the scientific basis for their decisions is authoritative. In addition, the fact that there are no standard guidelines for the process of nomination of individual panel experts, or for the procedures by which expert advice is sought, is problematic. While the current practice in this regard is converging, established guidelines, such as those contained in Appendix 4 of the DSU, lend transparency and legitimacy to the process while allowing sufficient flexibility to take account of the different circumstances of the cases at issue. It is also recommended that these guidelines be amended by providing that, in cases involving a developing-country Member, an expert from a developing-country Member be included in the review group. As experts’ views reflect the scientific traditions of which they are part, this step is necessary to ensure that the assessments provided by the group incorporate developing-country realities. Finally, it is important that panels take more seriously the distinction between the respective roles of the panel, its experts and the parties before it in the proceedings. While the temptation is there to expand the role of the experts to providing the evidence in support of the position of one of the parties, or, even more so, to addressing the legal questions before the panel that require a basis in scientific assessments, such use of experts undermines the legitimacy of the outcome of dispute settlement.

<sup>403</sup> Panel Report, *EC – Hormones (US)*, para. 6.189.

<sup>404</sup> Panel Report, *EC – Hormones (US)*, para. 6.234.

<sup>405</sup> *Ibid.*, para. 6.238.

<sup>406</sup> Alberto Alemanno, *Trade in Food: Regulatory and Judicial Approaches in the EC and WTO* (Cameron May, London), 2007, 356. Alemanno points out that the practice of consulting individual experts entrusts panels ‘with an even more demanding task: to assess the merits of the expert opinions formulated on the plausibility of the scientific evidence brought by the parties and to verify whether there exists common ground among the diverging opinions of individual experts, thus legitimising and even more complex involvement in scientific matters.’ *Ibid.*

### 2.2.6 Resort to other dispute resolution mechanisms

While the jurisdiction to hear disputes under the *SPS Agreement* lies exclusively with the WTO's adjudicatory bodies, disputes regarding other SPS-related matters may be properly addressed through resort to other mechanisms for the resolution of disputes. The *SPS Agreement* makes provision for this possibility, in Article 11.3, which states:

Nothing in this Agreement shall impair the rights of Members under other international agreements, including the right to resort to the good offices or dispute settlement mechanisms of other international organizations or established under any international agreement.

Of particular relevance here are the non-binding mechanisms in place in the OIE and IPPC to resolve disputes between their members or contracting parties.<sup>407</sup> Both these mechanisms focus on finding technical solutions to sanitary or phytosanitary issues.

The OIE has a voluntary dispute settlement system in place.<sup>408</sup> It takes the form of the possibility for disputing countries to request Director-General of the OIE to arrange for mediation by a panel of scientific experts.<sup>409</sup> The experts are recommended by the Director-General of the OIE, usually from the relevant OIE Reference Laboratories, and agreed upon by the parties. The discussions by the panel experts take place on a technical basis.<sup>410</sup> This procedure has been argued to have certain advantages as compared to WTO dispute settlement in that it is less resource-intensive and allows for face-saving solutions, for example by finding technical measures to resolve the disputes that had not yet considered.<sup>411</sup> The recommendations of the OIE panel are communicated by the Director-General to both parties, and are non-binding. Although the OIE dispute settlement process is confidential, the documentation from this mediation and the experts conducting the

---

<sup>407</sup> For a description of mandate, institutional structure and procedures of the OIE and IPPC, see above, Part II, Sections 3.2.2 and 3.2.3.

<sup>408</sup> This mechanism is provided for in Article 1.3.1.3 of the *Animal Health Code* (2006 Edition). The *Aquatic Animal Health Code* has contained similar provisions since its creation in 1995 (in Article 1.4.1.3 of the 2006 Edition).

<sup>409</sup> The agreement of both parties is required to initiate the process and the outcomes are not legally binding unless both parties agree to this in advance. The parties must also agree on the terms of reference and the work program. Committee on Sanitary and Phytosanitary Measures, *OIE Dispute Mediation Process. Communication from the World Organization for Animal Health (OIE)*, G/SPS/GEN/731, circulated on 12 October 2006, para 5.

<sup>410</sup> *Ibid.*, para 4. This communication stresses the fact that the 'role of the OIE is to help the parties find a resolution of their differences strictly based on scientific elements and with facilitation by OIE experts'. It contrasts this with the WTO dispute settlement system which is based on the application of legal provisions.

<sup>411</sup> Alex B. Thiermann, *The Role of Animal Health and Zoonoses Standards on Disease Control and Trade* (OIE, Paris), February 2003, available at: [http://www.oie.int/eng/edito/en\\_thiermann.htm](http://www.oie.int/eng/edito/en_thiermann.htm), visited on 6 February 2008. Thiermann is the president of the Animal Health Code Commission. See also on this point Committee on Sanitary and Phytosanitary Measures, *Implementing the Standards of the OIE. Communication from the OIE*, G/SPS/GEN/437, circulated on 28 October 2003, paras 33-34.

mediation are available to WTO panels should the dispute eventually result in a formal case at the WTO.<sup>412</sup> The OIE dispute settlement mechanism has been used twice to date.<sup>413</sup>

The IPPC also has dispute settlement procedures in place,<sup>414</sup> under the authority of the SBDS. The seven members of the SBDS are phytosanitary experts from each of the FAO regions.<sup>415</sup> Under the IPPC dispute settlement mechanism, measures prohibiting or restricting imports of plants or plant products may be challenged as unjustified.<sup>416</sup> The contracting parties concerned are required to engage in consultations to resolve the dispute.<sup>417</sup> If these are unsuccessful, the parties concerned may request the Director-General of the FAO to establish a committee of experts to consider the issue in dispute, in terms of the rules and procedures established by the CPM and administered by the SBDS.<sup>418</sup> The dis-

---

<sup>412</sup> Thiermann further compares the OIE dispute settlement procedure to the possibilities provided under Article 12.2 of the *SPS Agreement* to resolve disputes through discussions in the SPS Committee. He notes, 'While this is simple and does not require extensive legal preparation and it encourages parties to examine options which may have not been fully considered, it has the disadvantage that it does not focus as much on the technical aspects of the dispute, as it lacks the technical experts in the panel.' See Alex B. Thiermann, *The Role of Animal Health and Zoonoses Standards on Disease Control and Trade* (OIE, Paris), February 2003, available at: [http://www.oie.int/eng/edito/en\\_thiermann.htm](http://www.oie.int/eng/edito/en_thiermann.htm), visited on 6 February 2008. The possibilities under Article 12.2 of the *SPS Agreement* are discussed above, Part IV, Section 2.1.2.

<sup>413</sup> The first dispute in 2002, between Japan and the US, related to avian influenza. The second dispute was rather atypical, in that the EC and the US jointly requested the OIE's assistance in facilitating bilateral consultations on the interpretation and implementation of the BSE provisions in the *Terrestrial Animal Health Code*. In both cases, the mechanism was effective in facilitating technical discussions that significantly narrowed initial differences and provided a basis for the disputing parties to better understand their respective positions. Committee on Sanitary and Phytosanitary Measures, *OIE Dispute Mediation Process. Communication from the World Organization for Animal Health (OIE)*, G/SPS/GEN/731, circulated on 12 October 2006, paras 7-9.

<sup>414</sup> The original IPPC of 1951 included an article on the settlement of disputes (providing for a conciliation mechanism whereby contracting parties could request the FAO Director-General to establish a committee to consider issues in dispute). This was unchanged by the 1979 amendments to the IPPC. The 1997 *New Revised Text* of the IPPC expanded on this mechanism to include consultation requirements before establishing an IPPC dispute settlement committee. The conciliation mechanism was maintained in revised form. The revised dispute settlement mechanism of the IPPC is set out in Article XIII of the *New Revised Text* of 1997.

<sup>415</sup> The *Terms of Reference and Rules of Procedure for the Subsidiary Body on Dispute Settlement* are to be found in International Plant Protection Convention, *Report of the First Session of the Commission on Phytosanitary Measures*, CPM-1 (2006)/Report (Food and Agriculture Organization, Rome), 3-7 April 2006, Appendix V, available at: [https://www.ippc.int/servlet/BinaryDownloaderServlet/133571\\_CPM\\_1\\_report\\_2006.pdf?filename=1151505665852\\_CPM\\_1\\_report.pdf&refID=133571](https://www.ippc.int/servlet/BinaryDownloaderServlet/133571_CPM_1_report_2006.pdf?filename=1151505665852_CPM_1_report.pdf&refID=133571), visited on 28 July 2006. The SBDS replaces the interim Subsidiary Body on Dispute Settlement that was in place pending the entry into force of the *New Revised Text* of the IPPC. The composition of the SBDS was described above Part II, Section 3.2.3.2.

<sup>416</sup> The dispute settlement mechanism of the IPPC under Article XIII of the *New Revised Text* of the IPPC may be relied upon if there is any dispute regarding the interpretation or application of the *New Revised Text* of the IPPC or if a contracting party considers that any action by another contracting party is in conflict with its obligations under Articles V and VII of the *New Revised Text*. These obligations relate to phytosanitary certification and requirements in relation to imports. Committee on Sanitary and Phytosanitary Measures, *IPPC Dispute Settlement Manual. Submission by the Secretariat of the International Plant Protection Convention (IPPC)*, G/SPS/GEN/787, circulated on 22 June 2007.

<sup>417</sup> Article XIII.1 of the *New Revised Text* of the IPPC.

<sup>418</sup> Article XIII.2 of the *New Revised Text* of the IPPC. The CPM was instructed to develop rules and procedures for the settlement of disputes, as well as rules and procedures for IPPC expert committees and their reports established under the dispute settlement system (Articles XI.2(c) and XIII of the *New Revised Text*). For details on the rules and procedures for IPPC dispute settlement, see Committee on Sanitary and Phytosanitary Measures, *IPPC Dispute Settlement Manual. Submission by the Secretariat of the International Plant Protection Convention (IPPC)*, G/SPS/GEN/787, circulated on 22 June 2007. The Subsidiary Body on Dispute Settlement (SBDS) was established by the Third Session of the ICPM in 2001 and its first members

pute settlement process under the IPPC offers an alternative for examining controversial issues at a technical level. The dispute settlement process in the IPPC is non-binding, but forms the basis for renewed consideration by the parties of the matter at issue.<sup>419</sup> The results of the process can be expected to have an influence in disputes that may be raised at the WTO level under the *SPS Agreement*. The possibility of providing WTO panels or the Appellate Body with the report of the SBDS is expressly stated in Article XIII.3 of the *New Revised Text*.<sup>420</sup> To date, there have been only two requests under the IPPC dispute settlement procedure, both in 2007.<sup>421</sup>

### 2.2.7 Use of the dispute settlement mechanism

The question whether Members at lower levels of development have been able to use the WTO dispute settlement system to enforce their rights under the *SPS Agreement* requires attention. Several studies have examined the participation of developing-country Members in WTO dispute settlement in general,<sup>422</sup> and have proposed various explanations for the low level of participation found to exist.<sup>423</sup> Among the reasons for the

---

confirmed by the Fourth Session of the ICPM in 2002.

<sup>419</sup> Article XIII.4 of the *New Revised Text* of the IPPC provides: 'The contracting parties agree that the recommendations of such a committee, while not binding in character, will become the basis for renewed consideration by the contracting parties concerned of the matter out of which the disagreement arose.'

<sup>420</sup> Article XIII.3 of the *New Revised Text* of the IPPC provides that the report of the committee hearing the dispute 'may also be submitted, upon its request, to the competent body of the international organization responsible for resolving trade disputes.' This is clearly a reference to the WTO.

<sup>421</sup> One request was dropped and in the second discussions are still ongoing. Committee on Sanitary and Phytosanitary Measures, *Summary of the Work of the International Plant Protection Convention (IPPC) October 2007-February 2008. Communication from the IPPC Secretariat*, G/SPS/GEN/833, circulated on 26 March 2008, para. 13.

<sup>422</sup> It is beyond the scope of this book to examine in detail the issue of developing-country participation in WTO dispute settlement. A wealth of literature exists on this important issue. See for example Victor Mosoti, 'Does Africa Need the WTO Dispute Settlement System?' in *Towards a Development-Supportive Dispute Settlement System in the WTO*, Gregory Shaffer, et al. (eds.) (International Centre for Trade and Sustainable Development, Geneva), 2003, 67-88, available at: [www.ictsd.org/pubs/ictsd\\_series/resource\\_papers/DSU\\_2003.pdf](http://www.ictsd.org/pubs/ictsd_series/resource_papers/DSU_2003.pdf), visited on 30 June 2008; Chad P. Bown and Bernard M. Hoekman, 'WTO Dispute Settlement and the Missing Developing Country Cases: Engaging the Private Sector', *Journal of International Economic Law* 8 (4), 2005, 861-890; Chad P. Bown, 'Developing Countries as Plaintiffs and Defendants in GATT/WTO Trade Disputes', *The World Economy* 27 (1), 2004, 59-80; James Smith, 'Inequality in International Trade? Developing Countries and Institutional Change in WTO Dispute Settlement', *Review of International Political Economy* 11 (3), 2004, 542-573; Mary E. Footer, 'Developing Country Practice in the Matter of WTO Dispute Settlement', *Journal of World Trade* 35 (1), 2001, 55-98; Chakravarthi Raghavan, *The World Trade Organization and Its Dispute Settlement System: Tilting the Balance against the South*, Trade and Development Series no. 9 (Third World Network, Geneva), 2002, available at: [www.twinside.org.sg/title/tilting-cn.htm](http://www.twinside.org.sg/title/tilting-cn.htm), visited on 6 June 2003; Valentina Delich, 'Developing Countries and the WTO Dispute Settlement System', in *Development, Trade and the WTO: A Handbook*, Philip English, et al. (eds.) (World Bank, Washington D.C.), 2002, 71-80, available at: [http://publications.worldbank.org/catalog/product-detail?product\\_id=1525978&](http://publications.worldbank.org/catalog/product-detail?product_id=1525978&), visited on 5 June 2003; Robert E. Hudec, 'The Adequacy of WTO Dispute Settlement Remedies. A Developing Country Perspective', in *Development, Trade and the WTO: A Handbook*, Philip English, et al. (eds.) (World Bank, Washington D.C.), 2002, 81-91, available at: [http://publications.worldbank.org/catalog/product-detail?product\\_id=1525978&](http://publications.worldbank.org/catalog/product-detail?product_id=1525978&), visited on 5 June 2003; Gregory Shaffer, 'How to Make the WTO Dispute Settlement System Work for Developing Countries: Some Proactive Developing Country Strategies', in *Towards a Development-Supportive Dispute Settlement System in the WTO*, Gregory Shaffer, et al. (eds.) (International Centre for Trade and Sustainable Development, Geneva), 2003, 1-65, available at: <http://ictsd.net/i/dsu/11342/>, visited on 30 June 2008.

<sup>423</sup> Chad Brown and Bernard Hoekman report that between 1995 and 2006, of the 352 disputes brought in

relatively few complaints initiated by developing-country Members are financial hurdles due to the high costs of WTO litigation;<sup>424</sup> the small trade volumes in the affected developing-country exports,<sup>425</sup> which lower the absolute benefits from participation in dispute settlement;<sup>426</sup> and the absence of partnerships with private sector actors that have the resources and incentives to support Members in bringing disputes at the WTO.<sup>427</sup> Also, the reliance of developing-country Members on development assistance or preferential market access from the potential respondent Members makes them hesitant to risk these benefits by bringing a challenge against these respondents.<sup>428</sup> In addition, lack of legal expertise in WTO law often means that less-developed Members are unaware of potential claims they could bring against the measures of their trading partners, or of how to use the procedural mechanisms available for them to do so. Of relevance to SPS-related disputes

---

that period by 380 complainants, 235 were brought by high-income Members, 59 by upper-middle-income Members, 65 by lower-middle-income Members (22 of which by Brazil and 12 by Thailand), and 21 by low-income Members (17 of which by India). Chad P. Bown and Bernard M. Hoekman, 'Developing Countries and Enforcement of the Trade Agreements: Why Dispute Settlement is Not Enough', *Journal of World Trade* 42 (1), 2008, 177-203, Table 1.

<sup>424</sup> Chad P. Bown and Bernard M. Hoekman, 'WTO Dispute Settlement and the Missing Developing Country Cases: Engaging the Private Sector', *Journal of International Economic Law* 8 (4), 2005, 861-890, 863. See also Gregory Shaffer, 'How to Make the WTO Dispute Settlement System Work for Developing Countries: Some Proactive Developing Country Strategies', in *Towards a Development-Supportive Dispute Settlement System in the WTO*, Gregory Shaffer, et al. (eds.) (International Centre for Trade and Sustainable Development, Geneva), 2003, 1-65, 9-10, available at: <http://ictsd.net/i/dsu/11342/>, visited on 30 June 2008. Shaffer points out that the greater legalisation of the WTO dispute settlement system, and the rapid increase in case law has led to a skyrocketing of the human resource demands of dispute settlement. He states: 'Just to read through and understand the hundreds of WTO panel and Appellate Body decisions is an immense task, even for specialised academics. Actually deploying the legal system to defend a country's interests through marshalling facts and legal arguments that take account of WTO case law is a daunting enterprise. If developing countries are unable to mobilize the requisite legal resources, they do not stand a chance.' Gregory Shaffer, 'How to Make the WTO Dispute Settlement System Work for Developing Countries: Some Proactive Developing Country Strategies', in *Towards a Development-Supportive Dispute Settlement System in the WTO*, Gregory Shaffer, et al. (eds.) (International Centre for Trade and Sustainable Development, Geneva), 2003, 1-65, 10, available at: <http://ictsd.net/i/dsu/11342/>, visited on 30 June 2008.

<sup>425</sup> Shaffer notes, in addition, that although developing countries' stakes in trade disputes are often higher than those of the EC or US, relative to the small size of their economies, their aggregate stakes in the trading system are smaller. As a result they are less likely to be repeat players who benefit from economies of scale in bringing disputes. Gregory Shaffer, 'Power, Governance, and the WTO: A Comparative Institutional Approach', in *Power in Global Governance*, Michael Barnett and Raymond Duvall (eds.) (Cambridge University Press, Cambridge), 2005, 130-160, 137.

<sup>426</sup> Chad P. Bown and Bernard M. Hoekman, 'WTO Dispute Settlement and the Missing Developing Country Cases: Engaging the Private Sector', *Journal of International Economic Law* 8 (4), 2005, 861-890, 863.

<sup>427</sup> Gregory Shaffer, 'Power, Governance, and the WTO: A Comparative Institutional Approach', in *Power in Global Governance*, Michael Barnett and Raymond Duvall (eds.) (Cambridge University Press, Cambridge), 2005, 130-160, 136. Shaffer points out that multinational corporations are the world's largest traders, and thus have the greatest stake in the 'interpretative nuances of WTO rules'. They have the necessary resources to dedicate to supporting Members in WTO litigation, and are willing to do so due to the stakes involved. As a result, they engage in partnerships with US or EC authorities and hire economists and lawyers to work on the dispute.

<sup>428</sup> Chad P. Bown and Bernard M. Hoekman, 'WTO Dispute Settlement and the Missing Developing Country Cases: Engaging the Private Sector', *Journal of International Economic Law* 8 (4), 2005, 861-890, 863. See also Victor Mosoti, 'Does Africa Need the WTO Dispute Settlement System?' in *Towards a Development-Supportive Dispute Settlement System in the WTO*, Gregory Shaffer, et al. (eds.) (International Centre for Trade and Sustainable Development, Geneva), 2003, 67-88, 80, available at: [www.ictsd.org/pubs/ictsd\\_series/resource\\_papers/DSU\\_2003.pdf](http://www.ictsd.org/pubs/ictsd_series/resource_papers/DSU_2003.pdf), visited on 30 June 2008.

is the lack of the necessary SPS regulatory capacity to analyse the SPS measures of other Members for compliance with the disciplines of the *SPS Agreement*, particularly those relating to the scientific basis of a measure.

Aside from these constraints to bringing disputes, the inability of Members with small economies to use the retaliation mechanism to induce compliance by larger Members with the outcome of dispute settlement has been identified as a disincentive to participation.<sup>429</sup> Chad Bown points out that while the Uruguay Round reforms to the mechanism for resolving trade disputes may have reduced many barriers to the initiation of disputes by developing-country Members,<sup>430</sup> problems with enforcement of compliance by economically stronger respondents with the outcome of dispute settlement remain deterrents to the use of the system. In this light, the increasing participation of developing-country Members as complainants in dispute settlement proceedings can be explained by examining the respondents against which they bring disputes. As reported by Bown, the evidence suggests that developing-country Members increasingly initiate disputes against respondents against which they can make credible retaliatory threats.<sup>431</sup>

As pointed out above, another way for Members to make their views heard in dispute settlement proceedings is by acting as third parties in a dispute between other Members. Any Member having a 'substantial interest' in a dispute may participate as a third party, by notifying its interest to do so to the DSB. This is a low-cost way to participate in a dispute, as it enables 'piggy-backing' on the efforts of the parties to the dispute, in what have been dubbed 'me too' cases.<sup>432</sup> Third parties have the opportunity to make written submissions to a panel and to be heard by the panel, and their submissions must be reflected in the panel report.<sup>433</sup> In addition to the advantages of participation for advancing a Member's interests in a particular dispute, third party participation enables a Member to gain experience with the workings of dispute settlement system. This familiarity with the system will stand them in good stead by lowering the threshold for future participation as parties in dispute settlement. While some developing-country Members make use of this possibility, in practice the EC and US are the most frequent participants as third parties in disputes between other Members.<sup>434</sup> They use this opportunity to defend their systemic interests in the interpretation of WTO rules through the case law.

<sup>429</sup> Chad P. Bown and Bernard M. Hoekman, 'WTO Dispute Settlement and the Missing Developing Country Cases: Engaging the Private Sector', *Journal of International Economic Law* 8 (4), 2005, 861-890, 863. An empirical analysis of the way in which the retaliation capacity of the complaining Member affects the market access outcome of a dispute is presented in Chad P. Bown, 'Developing Countries as Plaintiffs and Defendants in GATT/WTO Trade Disputes', *The World Economy* 27 (1), 2004, 59-80, 68-73.

<sup>430</sup> As discussed above, these reforms include the elimination of the possibility for respondents to prevent the establishment of a panel to hear a dispute or the adoption of the resulting panel report (and possibly Appellate Body report).

<sup>431</sup> Chad P. Bown, 'Developing Countries as Plaintiffs and Defendants in GATT/WTO Trade Disputes', *The World Economy* 27 (1), 2004, 59-80, 78.

<sup>432</sup> Gregory Shaffer, 'Recognising Public Goods in WTO Dispute Settlement: Who Participates? Who Decides? The Case of TRIPS and Pharmaceutical Patent Protection', *Journal of International Economic Law* 7 (2), 2004, 459-482, 472.

<sup>433</sup> Article 10.2 of the DSU. In practice third parties are invited to present their views to the panel in a special session of the first substantive meeting of the panel with the parties.

<sup>434</sup> Shaffer reports that by 2003, among developing-country Members, only India, Brazil and Mexico had participated as third parties in more than 8 of the 273 disputes raised by them. In contrast, Japan had done so 42 times, the EC 41 times and the US 32 times. Gregory Shaffer, 'How to Make the WTO Dispute Settlement

The capacity constraints of developing-country Members in bringing disputes at the WTO were the impetus for the creation, in 2001, of the Advisory Centre on WTO Law (ACWL).<sup>435</sup> The ACWL is an independent organisation, created to help developing countries improve their participation in the multilateral trading system. It, *inter alia*,<sup>436</sup> provides direct support in WTO dispute settlement proceedings at low-cost to its developing-country members and to LDCs that are Members of the WTO or in the process of accession.<sup>437</sup> It is funded by its members, with membership fees determined on the basis of share in world trade and per capita income.<sup>438</sup> The dispute settlement support provided by the ACWL is of a very high quality, but its resource constraints limit the number of cases that it can take on.<sup>439</sup> The ACWL has a staff of only eight lawyers, two junior lawyers under a secondment programme and three administrative officers. By the end of 2007, the ACWL had provided support to developing countries and LDCs in 29 WTO dispute settlement proceedings. In 22 of these cases, the support was provided to the complainant,<sup>440</sup> in 11 of these cases against a developing-country respondent.<sup>441</sup>

A Technical Expertise Fund has been created for ACWL members that are developing countries, customs territories or economies in transition to bear some of the costs of the technical expertise needed to prepare the information required in fact-intensive dispute settlement proceedings, including those under the *SPS Agreement*.<sup>442</sup> To date, Denmark,

---

System Work for Developing Countries: Some Proactive Developing Country Strategies', in *Towards a Development-Supportive Dispute Settlement System in the WTO*, Gregory Shaffer, *et al.* (eds.) (International Centre for Trade and Sustainable Development, Geneva), 2003, 1-65, 14, available at: <http://ictsd.net/i/dsu/11342/>, visited on 30 June 2008.

<sup>435</sup> At the Seattle Session of the WTO Ministerial Conference in 1999, 29 Members signed the *Agreement establishing the Advisory Centre on WTO Law*, which entered into force on 15 July 2001. Membership of the ACWL is open to all WTO Members and any state or separate customs territory in the process of acceding to the WTO. The ACWL is administered by its developing-country Members, LDCs and by the developed countries that fund its activities. Its administrative and financial roles are separate from its legal services to ensure the independence of its legal advice and services.

<sup>436</sup> In addition the ACWL provides free legal advice on all substantive and procedural aspects of WTO law, not limited to cases where dispute settlement is contemplated, as well as training services.

<sup>437</sup> The fees payable by developing-country Members are CHF324 per hour for Category A members, CHF243 per hour for Category B members, and CHF162 per hour for Category C members. LDCs pay CHF40 per hour. LDCs do not have to be members of the ACWL to benefit from its free legal assistance. Currently 27 developing-country members and 42 LDCs are entitled to the services of the ACWL.

<sup>438</sup> Each of the developed-country members of the ACWL (Canada, Denmark, Finland, Ireland, Italy, the Netherlands, Norway, Sweden, Switzerland and the UK) has contributed US\$1 million or more to the Endowment Fund and/or has committed to pay US\$1,250,000 in multiyear contributions to finance expenditures in the first five years. It is notable that the US is not among these members and neither is the EC in its own name. Developing-country members are divided into three categories according to their share of world trade and income per capita, according to which their contributions are determined (CHF486,000 for Category A members, CHF162,000 for Category B members and CHF81,000 for Category C members). LDCs are not required to contribute. They have priority in the provision of the ACWL's services.

<sup>439</sup> Bown and Hoekman note that the reluctance of certain high-income Members, such as the US, Japan, France, Germany and the EC, to fund the ACWL may be due to the fact that the ACWL provides litigation assistance to Members that may be used in direct challenges to the measures of the donor Members. Chad P. Bown and Bernard M. Hoekman, 'WTO Dispute Settlement and the Missing Developing Country Cases: Engaging the Private Sector', *Journal of International Economic Law* 8 (4), 2005, 861-890, 875.

<sup>440</sup> In the remaining 7 cases the ACWL provided support to the respondent or a third party.

<sup>441</sup> Advisory Centre on WTO Law, *Report on Operations 2007*, available at: [http://www.acwl.ch/pdf/Oper\\_2007.pdf](http://www.acwl.ch/pdf/Oper_2007.pdf), visited on 30 June 2008.

<sup>442</sup> This information is provided on the ACWL's website, available at: [http://www.acwl.ch/e/dispute/technical\\_e](http://www.acwl.ch/e/dispute/technical_e).

Norway and the Netherlands have contributed or pledged contributions to this fund.<sup>443</sup> The fund has been used in two disputes involving claims under the *SPS Agreement*.<sup>444</sup>

Not only does the level of participation of Members as *complainants* in dispute settlement vary with their level of development, but a similar pattern can be seen with regard to the participation of Members as *respondents*. Much fewer cases are brought against developing-country Members than against developed-country Members.<sup>445</sup> Several reasons have been suggested for this, among which is the fact that the small market size of many Members at lower levels of development means that the potential gains in terms of increased market access to be obtained from winning a case may be too small to compensate for the costs of litigation. Also, politically, high-income Members may be hesitant to 'be seen as picking on a poor country for WTO violations.'<sup>446</sup>

As the WTO dispute settlement system is a Member-to-Member system, depending on the initiative of Members for the enforcement of the rules, the limited number of disputes brought against Members at lower levels of development results in weak incentives for compliance with their commitments.<sup>447</sup> With regard to WTO disciplines on domestic regulation, as contained in the *SPS Agreement*, this may be seen as creating the advantage of securing for these Members additional *de facto* policy space, to take measures supportive of their development objectives, even if these are WTO-inconsistent. This is particularly the case where the relevant rules are not appropriate for Members at lower levels of development. However, as pointed out by Bown and Hoekman, the appropriate remedy for badly designed rules or commitments is 'to renegotiate the rules or seek waivers, and not to rely on the low probability of being confronted with a dispute.'<sup>448</sup> Reliance on non-enforcement creates uncertainty and unpredictability with regard to the limits of the policy space available to the relevant Members, and leaves them vulnerable to pressure

---

aspx, visited on 30 June 2008.

<sup>443</sup> Their contributions total over CHF 1 million.

<sup>444</sup> Advisory Centre on WTO Law, *The ACWL after Four Years. A Progress Report by the Management Board*, ACWL/GA/2005/1, ACWL/MB/2005/1, 5 October 2005, 18, available at: [www.acwl.ch/misc/getfile.aspx?id=008b453f-b440-4995-be50-1e536f5f8477](http://www.acwl.ch/misc/getfile.aspx?id=008b453f-b440-4995-be50-1e536f5f8477), visited on 30 June 2008.

<sup>445</sup> Bown and Hoekman report that between 1995 and 2006, of the 352 disputes brought, 217 were brought against high-income Members, 69 against upper-middle-income Members, 46 against lower-middle-income Members 913 of which against Brazil) and 20 against low income Members (18 of which against India and the remaining 2 against Pakistan). Chad P. Bown and Bernard M. Hoekman, 'Developing Countries and Enforcement of the Trade Agreements: Why Dispute Settlement is Not Enough', *Journal of World Trade* 42 (1), 2008, 177-203, Table 1.

<sup>446</sup> *Ibid.*, 179. Other reasons for the low level of challenges against developing-country Members mentioned by Bown and Hoekman, which are less relevant to disputes under the *SPS Agreement*, are the fact that Members at lower levels of development have made fewer market access commitments, thereby creating fewer possibilities for challenges. In addition, developing countries can invoke SDT provisions in some cases with regard to the application of specific rules.

<sup>447</sup> With respect to basic trade disciplines, such as tariff concessions, the prohibition on quotas and the rules on non-discrimination, implementation of commitments is welfare enhancing for Members at all levels of development. In these cases, as argued by Bown and Hoekman, weak enforcement of compliance reduces the economic gains from WTO membership due to: 'welfare economic losses due to continued import protection within developing economies; diminished incentives for the country to take on additional WTO commitments such as reducing tariff bindings to meaningful levels ...; as well as externality costs to other developing countries.' *Ibid.* These economic losses from non-compliance are not equally present with regard to WTO disciplines on behind-the-border areas of regulatory policy, as discussed above, Part I, Section 1.6.

<sup>448</sup> *Ibid.*, 180.

from threats of dispute settlement action. In some cases, this pressure may lead the non-complying Member to accept unfavourable settlements in respect of trade concerns they have with regard to the measures of other Members. To avoid this undesirable situation, it is important to ensure that in cases where the regulatory disciplines laid down in the *SPS Agreement* are beyond the capacity of certain less-developed Members to comply with, and the disciplines themselves cannot be amended without tilting the delicate trade/health balance sought by the Agreement, an effective mechanism is in place to allow for temporary waivers from specific disciplines in response to the development needs of the relevant Member.<sup>449</sup> In addition, an effective mechanism for the delivery of technical assistance in order to build the capacity of the Member to comply with the obligations at issue is essential.<sup>450</sup>

It is now useful to examine the practice of dispute settlement under the *SPS Agreement*. This analysis aims to establish the extent to which the dispute settlement system is used by Members to resolve their SPS-related conflicts. It pays particular attention to the participation of Members at different levels of development in this dispute settlement practice to determine whether, and to what extent, the factors mentioned above have played a role in inhibiting developing-country Members' participation in the system. An overview of the disputes involving claims under the *SPS Agreement* that have been initiated to date, the Members participating and the status of the disputes, is provided in table form in the Appendix to this book.<sup>451</sup>

---

<sup>449</sup> For a discussion of the waiver mechanism in Article 10.3 of the *SPS Agreement*, see below, Part V, Section 1.5.

<sup>450</sup> On technical assistance and capacity building, see below, Part V, Section 2.1.

<sup>451</sup> See below, Appendix.

To date, there have been 31 formal disputes<sup>452</sup> under the *SPS Agreement* regarding 27 sep-

<sup>452</sup> Dispute Settlement Body, *Korea – Measures Concerning the Testing and Inspection of Agricultural Products. Request for Consultations by the United States*, WT/DS3/1, circulated on 6 April 1995; Dispute Settlement Body, *Korea – Measures Concerning the Shelf-Life of Products - Request for Consultations by the United States*, WT/DS5/1, circulated on 5 May 1995; Dispute Settlement Body, *Australia – Measures Affecting Importation of Salmon. Request for Consultations by Canada*, WT/DS18/1, G/L/28, G/SPS/W/29, circulated on 11 October 1998; Dispute Settlement Body, *Korea – Measures Concerning Bottled Water. Request for Consultations by Canada*, WT/DS20/1, G/L/33, G/SPS/W/35, G/TBT/D/4, G/MA/3, G/AG/W/14, circulated on 22 November 1995; Dispute Settlement Body, *Australia – Measures Affecting the Importation of Salmonids. Request for Consultations by the United States*, WT/DS21/1, G/L/39, G/SPS/W/40, circulated on 23 November 1995; Dispute Settlement Body; Dispute Settlement Body; Dispute Settlement Body, *Japan – Measures Affecting Agricultural Products. Request for Consultations by the US*, WT/DS76/1, G/L/167, G/SPS/GN/15, G/SG/GEN/1, circulated on 9 April 1997; Dispute Settlement Body, *India – Quantitative Restrictions on Imports of Agricultural, Textile and Industrial Products. Request for Consultations by the European Communities*, WT/DS96/1, G/L/178, G/AG/GEN/10, G/LIC/D/11, G/SPS/GEN/25, circulated on 24 July 1997; Dispute Settlement Body, *United States – Measures Affecting Imports of Poultry Products. Request for Consultations by the EC*, WT/DS100/1, G/SPS/GEN/28, G/TBT/D/14, circulated on 25 August 1997; Dispute Settlement Body, *Slovak Republic – Measures Concerning the Importation of Dairy Products and the Transit of Cattle. Request for Consultations by Switzerland*, WT/DS133/1, G/L/243, G/SPS/GEN/71, G/LIC/D/22, circulated on 18 May 1998; Dispute Settlement Body, *European Communities – Restrictions on Certain Import Duties on Rice. Request for Consultations by India*, WT/DS134/1, G/L/245, G/VAL/D/1, G/LIC/D/23, G/AG/GEN/24, G/TBT/D/16, G/SPS/GEN/73, circulated on 8 June 1998; Dispute Settlement Body, *EC – Measures Affecting Asbestos and Products Containing Asbestos: Request for Consultations by Canada*, WT/DS135/1, G/SPS/GEN/72, G/TBT/D/15, circulated on 3 June 1998; Dispute Settlement Body, *EC – Measures Affecting Imports of Wood of Conifers from Canada: Request for Consultations by Canada*, WT/DS137/1, G/L/246, G/SPS/GEN/84, G/TBT/D/17, circulated on 24 June 1998; Dispute Settlement Body, *United States – Certain Measures Affecting the Import of Cattle, Swine and Grain from Canada. Request for Consultations from Canada*, WT/DS144/1, G/L/260, G/SPS/W/90, G/TBT/D/18, G/AG/GEN/27, circulated on 29 September 1998; Dispute Settlement Body, *Mexico – Measures Affecting Trade in Live Swine. Request for Consultations by the United States*, WT/DS203/1, G/L/389, G/ADP/D25/1, G/SPS/GEN/196, G/AG/GEN/43, G/TBT/D/20, circulated on 13 July 2000; Dispute Settlement Body, *Egypt – Import Prohibition on Canned Tuna with Soybean Oil. Request for Consultations by Thailand*, WT/DS205/1, G/L/392, G/SPS/GEN/203, circulated on 27 September 2000; Dispute Settlement Body, *Turkey – Certain Import Procedures for Fresh Fruit. Request for Consultations by Ecuador*, WT/DS237/1, G/L/472, G/SPS/GEN/276, G/LIC/D/33, G/AG/GEN/48, S/L/101, circulated on 10 September 2001; Dispute Settlement Body, *Japan – Measures Affecting the Importation of Apples: Request for Consultations by the US*, WT/DS245/1, G/L/520, G/SPS/GEN/299, G/AG/GEN/50, circulated on 6 March 2002; Dispute Settlement Body, *Turkey – Import Ban on Pet Food from Hungary. Request for Consultations by Hungary*, WT/DS256/1, G/L/538, G/SPS/GEN/316, G/AG/GEN/51, circulated on 7 May 2002; Dispute Settlement Body, *Australia – Certain Measures Affecting the Importation of Fresh Fruit and Vegetables. Request for Consultations by the Philippines*, WT/DS270/1, G/L/575, G/SPS/GEN/345, G/LIC/D/34, circulated on 23 October 2002; Dispute Settlement Body, *Australia – Certain Measures Affecting the Importation of Fresh Pineapple. Request for Consultations by the Philippines*, WT/DS271/1, G/L/576, G/SPS/GEN/346, circulated on 23 October 2002; Dispute Settlement Body, *India – Import Restrictions Maintained under the Export and Import Policy 2002-2007. Request for Consultations by the EC*, WT/DS279/1, G/L/600, G/AG/GEN/57, G/LIC/D/36, G/SPS/GEN/367, G/TBT/D/26, circulated on 9 January 2003; Dispute Settlement Body, *Australia – Quarantine Regime for Imports. Request for Consultations by the European Communities*, WT/DS287/1, G/L/618, G/SPS/GEN/384, circulated on 9 April 2003; Dispute Settlement Body, *European Communities – Measures Affecting the Approval and Marketing of Biotech Products. Request for Consultations by the United States*, WT/DS291/1, G/L/627, G/SPS/GEN/397, G/AG/GEN/60, G/TBT/D/28, circulated on 20 May 2003; Dispute Settlement Body, *European Communities – Measures Affecting the Approval and Marketing of Biotech Products. Request for Consultations by Canada*, WT/DS292/1, G/L/628, G/SPS/GEN/398, G/AG/GEN/61, G/TBT/D/29, circulated on 20 May 2003; Dispute Settlement Body, *European Communities – Measures Affecting the Approval and Marketing of Biotech Products. Request for Consultations by Argentina*, WT/DS293/1, G/L/629, G/SPS/GEN/399, G/AG/GEN/62, G/TBT/D/30, circulated on 21 May 2003; Dispute Settlement Body, *Croatia – Measure Affecting Imports of Live Animals and Meat Products. Request for*

arate issues. Five of the 31 complaints only involved minor SPS issues.<sup>453</sup> Consultations are still pending with regard to ten complaints.<sup>454</sup> A mutually agreed solution has been reached in 14 cases, eight of which before a panel was established,<sup>455</sup> three after a panel

---

*Consultations by Hungary*, WT/DS297/1, G/L/636, G/SPS/GEN/411, circulated on 14 July 2003; Dispute Settlement Body, *Mexico – Certain Measures Preventing the Importation of Black Beans from Nicaragua*, WT/DS284/1, G/L/614, G/LIC/D/37, G/SPS/GEN/375, circulated on 20 March 2003.

<sup>453</sup> Dispute Settlement Body, *India – Quantitative Restrictions on Imports of Agricultural, Textile and Industrial Products. Request for Consultations by the European Communities*, WT/DS96/1, G/L/178, G/AG/GEN/10, G/LIC/D/11, G/SPS/GEN/25, circulated on 24 July 1997; Dispute Settlement Body, *European Communities – Restrictions on Certain Import Duties on Rice. Request for Consultations by India*, WT/DS134/1, G/L/245, G/VAL/D/1, G/LIC/D/23, G/AG/GEN/24, G/TBT/D/16, G/SPS/GEN/73, circulated on 8 June 1998; Dispute Settlement Body, *EC – Measures Affecting Asbestos and Products Containing Asbestos: Request for Consultations by Canada*, WT/DS135/1, G/SPS/GEN/72, G/TBT/D/15, circulated on 3 June 1998; Dispute Settlement Body, *Mexico – Measures Affecting Trade in Live Swine. Request for Consultations by the United States*, WT/DS203/1, G/L/389, G/ADP/D25/1, G/SPS/GEN/196, G/AG/GEN/43, G/TBT/D/20, circulated on 13 July 2000; Dispute Settlement Body, *India – Import Restrictions Maintained under the Export and Import Policy 2002-2007. Request for Consultations by the EC*, WT/DS279/1, G/L/600, G/AG/GEN/57, G/LIC/D/36, G/SPS/GEN/367, G/TBT/D/26, circulated on 9 January 2003.

<sup>454</sup> Dispute Settlement Body, *United States – Measures Affecting Imports of Poultry Products. Request for Consultations by the EC*, WT/DS100/1, G/SPS/GEN/28, G/TBT/D/14, circulated on 25 August 1997; Dispute Settlement Body, *European Communities – Restrictions on Certain Import Duties on Rice. Request for Consultations by India*, WT/DS134/1, G/L/245, G/VAL/D/1, G/LIC/D/23, G/AG/GEN/24, G/TBT/D/16, G/SPS/GEN/73, circulated on 8 June 1998; Dispute Settlement Body, *EC – Measures Affecting Imports of Wood of Conifers from Canada: Request for Consultations by Canada*, WT/DS137/1, G/L/246, G/SPS/GEN/84, G/TBT/D/17, circulated on 24 June 1998; Dispute Settlement Body, *United States – Certain Measures Affecting the Import of Cattle, Swine and Grain from Canada. Request for Consultations from Canada*, WT/DS144/1, G/L/260, G/SPS/W/90, G/TBT/D/18, G/AG/GEN/27, circulated on 29 September 1998; Dispute Settlement Body, *Mexico – Measures Affecting Trade in Live Swine. Request for Consultations by the United States*, WT/DS203/1, G/L/389, G/ADP/D25/1, G/SPS/GEN/196, G/AG/GEN/43, G/TBT/D/20, circulated on 13 July 2000; Dispute Settlement Body, *Egypt – Import Prohibition on Canned Tuna with Soybean Oil. Request for Consultations by Thailand*, WT/DS205/1, G/L/392, G/SPS/GEN/203, circulated on 27 September 2000; Dispute Settlement Body, *Australia – Certain Measures Affecting the Importation of Fresh Fruit and Vegetables. Request for Consultations by the Philippines*, WT/DS270/1, G/L/575, G/SPS/GEN/345, G/LIC/D/34, circulated on 23 October 2002; Dispute Settlement Body, *Australia – Certain Measures Affecting the Importation of Fresh Pineapple. Request for Consultations by the Philippines*, WT/DS271/1, G/L/576, G/SPS/GEN/346, circulated on 23 October 2002; Dispute Settlement Body, *India – Import Restrictions Maintained under the Export and Import Policy 2002-2007. Request for Consultations by the EC*, WT/DS279/1, G/L/600, G/AG/GEN/57, G/LIC/D/36, G/SPS/GEN/367, G/TBT/D/26, circulated on 9 January 2003; and Dispute Settlement Body, *Croatia – Measure Affecting Imports of Live Animals and Meat Products. Request for Consultations by Hungary*, WT/DS297/1, G/L/636, G/SPS/GEN/411, circulated on 14 July 2003.

<sup>455</sup> Four mutually agreed solutions were notified to the DSB, namely Dispute Settlement Body, *Korea – Measures Concerning the Shelf-Life of Products. Notification of Mutually Agreed Solution*, WT/DS5/5, G/SPS/W/27, G/TBT/D/3, G/AG/W/8, circulated on 31 July 1995; Dispute Settlement Body, *Korea – Measures Concerning Bottled Water. Notification of Mutually Agreed Solution*, WT/DS20/6, G/L/33/Add.1, G/SPS/W/35/Add.1, G/TBT/D/4/Add.1, G/MA/3/Add.1, G/AG/W/14/Add.1, circulated on 6 May 1996; Dispute Settlement Body, *India – Quantitative Restrictions on Imports of Agricultural, Textiles and Industrial Products. Notification of Mutually Agreed Solution*, WT/DS96/8, G/L/234, G/AG/GEN/23, G/LIC/D/21, G/SPS/GEN/70, circulated on 6 May 1998; Dispute Settlement Body, *Mexico – Certain Measures Preventing the Importation of Black Beans from Nicaragua. Communication from Nicaragua*, WT/DS284/4, circulated on 11 March 2005. The remaining four mutually agreed solutions were reported to the SPS Committee but not notified to the DSB. They concerned the following disputes: *Turkey – Import Ban on Pet Food From Hungary*, WT/DS256; *Slovak Republic – Measures Concerning the Importation of Dairy Products and the Transit of Cattle*, WT/DS133; *Korea – Measures Concerning Inspection of Agricultural Products. Request for Consultations by the United States*, WT/DS41/1; *Korea – Measures Concerning Inspection of Agricultural Products*, WT/DS4; and *Korea – Measures Concerning the Testing and Inspection of Agricultural Products*, WT/DS3.

had been established but before it had adjudicated the dispute,<sup>456</sup> and three of which with regard to implementation of the outcome of adjudication of the dispute.<sup>457</sup> Thirteen complaints resulted in the establishment of a panel.<sup>458</sup> Nine complaints,<sup>459</sup> regarding five separate issues, were actually (or are currently being) adjudicated by a panel under the *SPS Agreement* and eight panel reports have thus far been issued.<sup>460</sup> All these panel reports,

---

See Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Resolved Issues*, G/SPS/GEN/204/Rev.8/Add.3, circulated on 27 March 2008, items 1 and 4.

<sup>456</sup> Dispute Settlement Body, *Australia – Measures Affecting the Importation of Salmonids. Notification of Mutually Agreed Solution*, WT/DS21/10, G/L/39/Add.1, G/SPS/W/40/Add.1, circulated on 1 November 2000; Dispute Settlement Body, *Turkey – Certain Import Procedures for Fresh Fruit. Notification of Mutually Agreed Solution*, WT/DS237/4, circulated on 29 November 2002 and Dispute Settlement Body, *Australia – Quarantine Regime for Imports. Notification of Mutually Agreed Solution*, WT/DS287/8, G/L/618/Add.1, G/SPS/GEN/384/Add.1, circulated on 13 March 2007.

<sup>457</sup> Dispute Settlement Body, *Japan – Measures Affecting Agricultural Products. Communication from Japan and the United States*, WT/DS76/12, circulated on 30 August 2001; Dispute Settlement Body, *Japan – Measures Affecting the Importation of Apples. Notification of Mutually Agreed Solution*, WT/DS245/21; G/L/520/Add.1; G/SPS/GEN/299/Add.1; G/AG/GEN/50/Add.1, circulated on 2 September 2005. At the DSB meeting of 18 May 2000, Australia and Canada reported that they had reached a mutually agreed solution on the implementation by Australia of the conclusions and recommendations adopted by the DSB in the case *Australia – Salmon*. However, the details of this solution have not yet been formally notified to the DSB.

<sup>458</sup> Not all of these thirteen Panels actually adjudicated the relevant dispute, or did not do so under the *SPS Agreement*. One of these Panels, namely the Panel in *Australia – Measures Affecting the Importation of Salmonids (Complaint by the United States)*, WT/DS21, did not adjudicate the dispute before it as it was instructed to suspend its work by the US, the complainant in the case, pending the outcome of the Article 21.5 Panel Report in the related case *Australia – Salmon (Article 21.5 – Canada)*, and consultations between the US and Australia. A mutually agreed solution was notified in November 2000. Dispute Settlement Body, *Australia – Measures Affecting the Importation of Salmonids. Notification of Mutually Agreed Solution*, WT/DS21/10, G/L/39/Add.1, G/SPS/W/40/Add.1, circulated on 1 November 2000. Further, two separate Panels were established with regard to each of the disputes *Australia – Certain Measures Affecting the Importation of Fresh Fruit and Vegetables (Complaint by the Philippines)* (WT/DS270) and *Australia – Quarantine Regime for Imports (Complaint by the European Communities)* (WT/DS287), on 29 August 2003 and 7 November 2003 respectively. See Dispute Settlement Body, *Minutes of Meeting Held in Centre William Rappard on 29 August 2003*, WT/DSB/M/155, circulated on 7 November 2003, para. 26; Dispute Settlement Body, *Minutes of Meeting Held in the Centre William Rappard on 7 November 2003*, WT/DSB/M/157, circulated on 18 December 2003, para. 40. The disputes deal with the same matter, so it was expected that (in terms of Article 9.3 of the DSU) the two panels would be composed of the same panellists and follow a harmonised timetable. However, the panels were not composed as the parties suspended discussions on the composition of the panels. In 2007 a mutually agreed solution was notified in the second of these disputes. Dispute Settlement Body, *Australia – Quarantine Regime for Imports. Notification of Mutually Agreed Solution*, WT/DS287/8, G/L/618/Add.1, G/SPS/GEN/384/Add.1, circulated on 13 March 2007. The dispute in *EC – Asbestos* also proceeded to adjudication by a Panel and the Appellate Body, but the claims under the *SPS Agreement* were not pursued in the adjudication process.

<sup>459</sup> These nine complaints are the separate complaints by the US and Canada in *EC – Hormones* that were heard by separate panels, composed of the same panellists, which issued separate but largely identical reports; the complaint by the US in *Japan – Agricultural Products II*; the complaint by Canada in *Australia – Salmon*; the complaint by the US in *Japan – Apples*; the separate complaints by the US, Canada and Argentina in *EC – Approval and Marketing of Biotech Products* which were heard by a single Panel that issued three reports in a single document; and the complaint by New Zealand against Australia in *Australia – Apples* which is currently before a Panel.

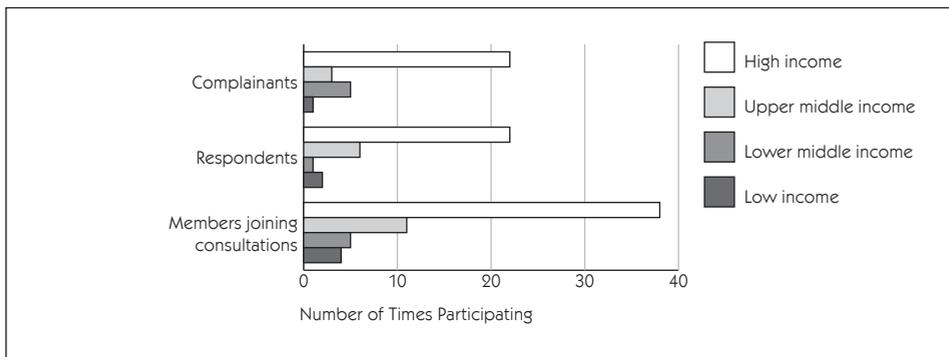

<sup>460</sup> Panel Report, *EC – Hormones (Canada)*; Panel Report, *EC – Hormones (US)*; Panel Report, *Australia – Salmon*; Panel Report, *Japan – Agricultural Products II*; Panel Report, *Japan – Apples*; Panel Reports, *EC – Approval and Marketing of Biotech Products*. The findings in these cases were discussed in previous chapters where relevant.

except the three reports of the Panel in *EC – Approval and Marketing of Biotech Products*, have been appealed, resulting in four Appellate Body reports.<sup>461</sup>

Aside from the cases decided under the *SPS Agreement*, the *SPS Agreement* has also been addressed in the *Canada – Continued Suspension* and *US – Continued Suspension* disputes, brought by the EC. These disputes concern the refusal of Canada and the US to lift their retaliatory measures against EC exports imposed due to the EC's non-compliance with the recommendations and rulings of the DSB in the *EC – Hormones* dispute. The EC's claim that the continued suspension of concessions against it was inconsistent with the DSU was based on its argument that it had brought its measure into conformity with the *SPS Agreement*. Therefore, the Panel had to examine the EC measure against the relevant provisions of the *SPS Agreement*, although its findings were limited to the claims under the DSU.<sup>462</sup> This Panel report was appealed, but at time of writing was still before the Appellate Body.<sup>463</sup>

The varying levels of participation of Members at different levels of development in these disputes is now examined.

**Graph 43: Participation in Initiating SPS-related Dispute Settlement Proceedings: WTO Members by Income Level, 1995-2008**

No African country or LDC has initiated a complaint under the *SPS Agreement*. India is the only low-income country to have done so, in one complaint against the EC on import duties on rice, involving a minor SPS claim.<sup>464</sup> Upper-middle-income Members have been complainants in three of the dispute settlement proceedings initiated under

<sup>461</sup> Appellate Body Report, *EC – Hormones*; Appellate Body Report, *Australia – Salmon*; Appellate Body Report, *Japan – Agricultural Products II*; Appellate Body Report, *Japan – Apples*. The appeals against the panel reports in *EC – Hormones (US)* and *EC – Hormones (Canada)* were heard together and a single Appellate Body report was issued.

<sup>462</sup> Panel Report, *US – Continued Suspension*, paras 7.375-7.379; Panel Report, *Canada – Continued Suspension*, para. 7.372-7.376.

<sup>463</sup> Consequently, the Appellate Body's rulings in this case are not addressed in this book.

<sup>464</sup> *EC – Restrictions on Certain Import Duties on Rice (Complaint by India)*, WT/DS134. The only SPS claim in this dispute was of a violation of Article 2.2 of the *SPS Agreement*.

the *SPS Agreement*,<sup>465</sup> and lower-middle-income Members in five.<sup>466</sup> This is in marked contrast to the involvement of high-income Members, which have been complainants in the remaining 22 disputes. Five of the disputes brought by upper- and lower-middle-income Members, have involved other upper- and lower-middle-income respondents, which seems to support Bown's view regarding the role of a credible retaliation possibility in decisions to bring disputes. Of the four disputes brought by middle- or low-income complainants against high-income respondents, three were brought in parallel to high-income Member complaints on the same or a similar issue. It is interesting to note that in four cases, the disputes brought by non-high-income Members were supported by the ACWL.<sup>467</sup>

By far the greatest number of complaints under the *SPS Agreement* has been brought against high-income Members, accounting for 22 of the respondents. Upper-middle-income Members have been respondents in six disputes,<sup>468</sup> a lower-middle-income Member in one dispute<sup>469</sup> and a low-income Member in two disputes.<sup>470</sup>

It is also interesting to examine the participation of Members at different levels of development in dispute settlement proceedings by joining consultations in disputes brought by other Members under the *SPS Agreement*. Of the 58 times that Members have joined consultations in the 31 disputes relating to the *SPS Agreement*, 65 percent (38) were joiners by high-income Members, 19 percent (11) by upper-middle-income Members, 8.5 percent (5) by lower-middle income Members and 7.5 percent (4) by a low-income Member. This form of participation is, however, concentrated in a limited number of Members, namely seven high-income Members, four upper-middle-income Members, four lower-middle income Members and one low-income Member.<sup>471</sup>

<sup>465</sup> *Croatia – Measure Affecting Imports of Live Animals and Meat Products (Complaint by Hungary)*, WT/DS297; *European Communities – Measures Affecting the Approval and Marketing of Biotech Products (Complaint by Argentina)*, WT/DS293; and *Turkey – Import Ban on Pet Food from Hungary (Complaint by Hungary)*, WT/DS256.

<sup>466</sup> *Mexico – Certain Measures Preventing the Importation of Black Beans from Nicaragua (Complaint by Nicaragua)*, WT/DS284; *Australia – Certain Measures Affecting the Importation of Fresh Pineapple (Complaint by the Philippines)*, WT/DS271; *Australia – Certain Measures Affecting the Importation of Fresh Fruit and Vegetables (Complaint by the Philippines)*, WT/DS270; *Turkey – Certain Import Procedures for Fresh Fruit (Complaint by Ecuador)*, WT/DS237; and *Egypt – Import Prohibition on Canned Tuna with Soybean Oil (Complaint by Thailand)*, WT/DS205.

<sup>467</sup> These were the following four disputes: *Mexico – Certain Measures Preventing the Importation of Black Beans from Nicaragua (Complaint by Nicaragua)*, WT/DS284; *Australia – Certain Measures Affecting the Importation of Fresh Pineapple (Complaint by the Philippines)*, WT/DS271; *Australia – Certain Measures Affecting the Importation of Fresh Fruit and Vegetables (Complaint by the Philippines)*, WT/DS270; and *Turkey – Certain Import Procedures for Fresh Fruit (Complaint by Ecuador)*, WT/DS237. The ACWL is discussed above, Part IV, Section 2.2.7.

<sup>468</sup> *Croatia – Measures Affecting Imports of Live Animals and Meat Products (Complaint by Hungary)*, WT/DS297; *Mexico – Certain Measures Preventing the Importation of Black Beans from Nicaragua (Complaint by Nicaragua)*, WT/DS284; *Turkey – Import Ban on Pet Food from Hungary (Complaint by Hungary)*, WT/DS256; *Turkey – Certain Import Procedures for Fresh Fruit (Complaint by Ecuador)*, WT/DS237; *Mexico – Measures Affecting Trade in Live Swine (Complaint by the United States)*, WT/DS203; and *Slovak Republic – Measures Concerning the Importation of Dairy Products and the Transit of Cattle (Complaint by Switzerland)*, WT/DS133.

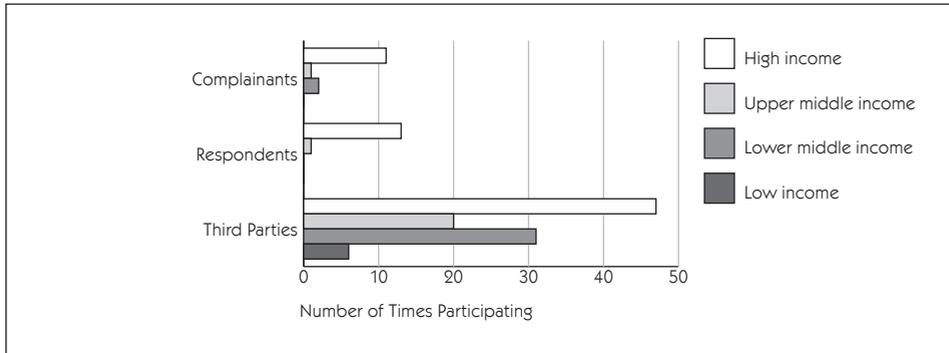

<sup>469</sup> *Egypt – Import Prohibition on Canned Tuna with Soy Oil (Complaint by Thailand)*, WT/DS205.

<sup>470</sup> *India – Import Restrictions Maintained Under the Export and Import Policy 2002-2007 (Complaint by the European Communities)*, WT/DS279; and *India – Quantitative Restrictions on Imports of Agricultural, Textile and Industrial Imports (Complaint by the European Communities)*, WT/DS96.

<sup>471</sup> The 7 high-income Members that have joined consultations in these disputes are the US (9 times), Canada (8

The extent to which Members at different levels of development have participated in the 13 disputes that proceeded to the establishment of a panel, is also useful to examine.

**Graph 44: Participation in SPS-related Dispute Settlement Proceedings in which a Panel was Established: WTO Members by Income Level, 1995-2008**

The complainants in 10 of these 13 disputes were high-income Members. In addition, one upper-middle-income Member and two lower-middle-income Members were complainants in the remaining three disputes. In only one of the disputes involving a non-high-income Member as complainant has the dispute actually been heard by a panel, namely *EC – Approval and Marketing of Biotech Products* where Argentina was one of the complainants, together with the US and Canada.<sup>472</sup> In all but one case the disputes that proceeded to the establishment of a panel were brought against high-income respondents.<sup>473</sup> In these disputes, of the 104 times that Members joined as third parties in panel proceedings, high-income Members accounted for 45 percent (47); upper-middle-income Members for 19 percent (20); lower-middle-income Members for 30 percent (31) and low-income Members 6 percent (6).<sup>474</sup>

times), Australia (6 times), New Zealand (6 times), the EC (5 times), Japan (3 times) and Switzerland (once). The 4 upper-middle-income Members that have done so are Brazil (4 times), Mexico (3 times), Argentina (twice), and Chile (twice). The 4 lower-middle-income Members that have joined consultations are Thailand (twice), Colombia (once), the Philippines (once) and Peru (once). The only low-income Member to have joined consultations is India (4 times).

<sup>472</sup> In the two other cases involving non-high-income complainants, panels were requested (and in one of these cases actually established). In *Turkey – Certain Import Procedures for Fresh Fruit (Complaint by Ecuador)*, WT/DS237, a panel request was submitted by Ecuador on 14 June 2002, but a mutually agreed solution was subsequently reached. In *Australia – Certain Measures Affecting the Importation of Fresh Fruit and Vegetables (Complaint by the Philippines)*, WT/DS270, the Philippines' first panel request, on 10 July 2003, was blocked by Australia. The Philippines's second panel request led to the establishment of a panel on 29 August 2003. However, as mentioned above, this panel was never composed as parties suspended discussions on the composition of the panel.

<sup>473</sup> The only exception is *Turkey – Certain Import Procedures for Fresh Fruit (Complaint by Ecuador)*, WT/DS237.

<sup>474</sup> The 10 high income Members that have joined as third parties in these disputes are the US (9 times), the EC and Norway (7 times each), New Zealand and Australia (6 times each), Canada (5 times), Chinese Taipei (4 times) and Hong Kong, China, Iceland and Japan (once each). The 6 upper-middle-income Members that have done so are Brazil (6 times), Chile (5 times), Mexico and Uruguay (3 times each), Argentina (twice), and Hungary (once). The 9 lower-middle-income Members that have done so are China (7 times), Thailand (6 times), Colombia (5 times), El Salvador, Honduras, Paraguay and Peru (3 times each), and the Philippines

The significance of the weak participation of Members at lower levels of development in SPS-related dispute settlement should not be underestimated. The constraints these Members face in enforcing their rights through dispute settlement proceedings affects their ability to pursue their interests successfully through negotiated solutions. As pointed out by Gregory Shaffer:

WTO law casts a weaker shadow over settlement negotiations for countries that lack lawyers conversant in WTO law. When developing countries are unable to mobilize legal resources cost-effectively, their threats to invoke WTO legal procedures lack credibility. They thus wield less bargaining leverage in WTO law's shadow.<sup>475</sup>

### 2.3 Conclusion

The proper implementation and operation of the *SPS Agreement* is ensured through two institutional and procedural avenues, that provided by the bargaining forum of the SPS Committee and that provided by the adjudicatory mechanism of the dispute settlement system.

The question of whether Members' trade concerns with respect to the SPS measures of other Members are dealt with through multilateral discussions at SPS Committee meetings or through formal adjudication is not without significance. It is highly relevant for the manner in which the trade/health balance is struck, which is closely tied to the questions of who participates in framing the issues under discussion and who decides on the outcome of the dispute. These questions are particularly pertinent when one bears in mind the differences in opportunities for effective participation available to Members at different levels of development under each of the two alternatives. As stated by Shaffer:

Balancing concerns over competing public goods and defining the means of production of these goods involve tradeoffs over preferences and priorities that vary in a world of divergent levels of development and limited public finances. The dynamics of participation in national, regional and international decision-making over the production of public goods thus becomes decisive.<sup>476</sup>

The discussion of the role and functioning of the SPS Committee has shown much greater possibilities for participation of Members at lower levels of development than exist currently in the dispute settlement system. The specific trade concern mechanism of the SPS Committee has proved very effective in providing opportunities for Members to address the problems they face regarding the SPS measures of their trading partners

---

and Ecuador (once each). The low-income Members that have participated as third parties are India (4 times) and Pakistan and Zimbabwe (once each).

<sup>475</sup> Gregory Shaffer, 'Power, Governance, and the WTO: A Comparative Institutional Approach', in *Power in Global Governance*, Michael Barnett and Raymond Duvall (eds.) (Cambridge University Press, Cambridge), 2005, 130-160, 137.

<sup>476</sup> Gregory Shaffer, 'Recognising Public Goods in WTO Dispute Settlement: Who Participates? Who Decides? The Case of TRIPS and Pharmaceutical Patent Protection', *Journal of International Economic Law* 7 (2), 2004, 459-482, 464.

in an inexpensive and constructive way. Most often, bilateral discussions on trade concerns placed on the agenda are held in the margins of SPS Committee meetings, and may resolve the matter. If not, discussions are held in the multilateral forum of the SPS Committee, which enables other Members to comment on the issue and support the trade concern raised. This could lead to the revision of the notified measure or to further bilateral consultations between the Members involved. It may also facilitate compliance by the Member raising the concern with the SPS measure at issue, through increased clarity on the requirements and ways to meet them, and in some cases by means of the provision of technical or financial assistance by the importing Member. In this way disputes can be resolved without recourse to the expensive, time-consuming and confrontational process of formal dispute settlement. Indirect benefits of the specific trade concerns mechanism also exist, including increased familiarity of Members with each other's regulatory systems due to the regular contact and sharing of experiences between Members' officials. Members may gain confidence in the regulatory capacity of the alternative SPS regimes maintained by other Members. This confidence has an impact on issues such as the recognition of equivalence and of pest- or disease free areas.

As shown by the examination of participation by Members at different levels of development in the specific trade concerns mechanism, while developing countries have featured strongly, both as initiators or supporters of issues raised, and as subjects of concerns raised, the number of *different* developing countries participating to date has been limited. The statistics reflect the fact that a relatively small number of (larger) developing countries, particularly Cairns Group members as well as China and India, has been quite active in raising and supporting specific trade concerns. While participation in the specific trade concerns mechanism is certainly broader than in dispute settlement, there is still room for improvement. The constraints to the use of this mechanism seem to lie, not in the mechanism itself but rather in the capacity of Members at lower levels of development to keep track of notified measures, consult with their export industries to identify specific trade concerns arising from these measures, understand the extent to which these concerns can be addressed under the rules of the *SPS Agreement*, and send a national expert to the meetings of the SPS Committee to raise the concern. This is an area where capacity building is sorely needed. Efforts such as IICA's SPS Initiative for the Americas are to be applauded. It not only funds participation in SPS Committee meetings by capital-based experts but also promotes the establishment of offices at national level to follow the activities of SPS-related international bodies, particularly the SPS Committee. As the support provided by this initiative is being phased out, new and more broadly-applicable efforts along the same lines are essential.

The SPS Committee not only provides a forum for the discussion and resolution of specific trade concerns, but it also promotes regulatory learning and creates possibilities for building professional networks. It provides a mechanism for the monitoring of harmonisation that allows concerns regarding the lack of international standards or problems with existing standards to be raised and forwarded to the relevant international standard setting body. In addition, it plays a crucial role in addressing broader SPS concerns by promoting the implementation of particular disciplines in the *SPS Agreement* through developing and adopting procedural guidelines. The disciplines addressed, such as those on equivalence, regionalisation, SDT and transparency, are particularly important for developing-country

Members in that they hold great potential for market access gains while fully respecting the level of protection chosen by importing Members.

Attendance and effective participation by Members at different levels of development in meetings of the SPS Committee varies greatly. As illustrated by the four Members used as examples in this book, high-income Members tend to participate actively and effectively in SPS Committee meetings and are represented by experts from their relevant ministries. However, some Members at lower levels of development do not have the resources to send an SPS expert from their capital, and are represented in meetings of the SPS Committee by diplomats from their missions in Geneva, lacking in the necessary technical knowledge. There are also some Members that are unable to send any representative to most SPS Committee meetings.

The problems this situation creates for effective participation by Members at lower levels of development in the decisions of the SPS Committee are ameliorated by two practices of the Committee. The first is its practice to canvass all Members, by means of questionnaires, to submit their practical experiences with regard to the issue under discussion and to compile these experiences as the basis for the development of the new guidelines. The second practice that addresses participation problems is that of *ad referendum* decision making. This entails that a decision is only provisionally adopted at a meeting of the SPS Committee, and a period is provided for Members to raise objections to the provisional decision. This enables Members that were not present at the relevant meeting, or those that were represented by delegates lacking the necessary expertise to evaluate the impact of the provisional decision, to have the decision examined by their ministry officials and to raise objections if necessary. Objections are addressed and the agreement of the objecting Member is obtained before the provisional decision is finally adopted. This practice ensures broad participation in the decisions of the SPS Committee, increasing their legitimacy and the 'ownership' of the decision by Members. This is important in view of the fact that decisions of the SPS Committee are not directly enforceable in dispute settlement proceedings. Implementation of decisions of the SPS Committee therefore relies upon the willingness of Members to follow the procedural guidelines set out therein.

The dispute settlement mechanism of the WTO, through which non-compliance with the obligations of the *SPS Agreement* can be challenged by Members, is a great improvement above that existing under the GATT 1947. While a very small proportion of the SPS-related conflicts between Members result in the initiation of WTO dispute settlement proceedings, and even fewer actually proceed to adjudication, the importance of the dispute settlement system to SPS disputes should not be underestimated. The very existence of the dispute settlement system creates an incentive for Members against whose SPS measures concerns are raised to address these concerns through negotiated solutions. In addition, the clarifications developed by panels and the Appellate Body with regard to the provisions of the *SPS Agreement* are essential in establishing the normative framework within which Members address their SPS conflicts. These clarifications are taken up in decisions of the SPS Committee that elaborate procedural guidelines for the operationalisation of provisions of the *SPS Agreement*. Equally importantly, they inform discussions between Members, bilaterally but even more so in the multilateral forum of the SPS

Committee, to resolve trade concerns. As noted above, these have been referred to as ‘settlements negotiated in law’s shadow’.<sup>477</sup>

The question of which party bears the burden of proof in dispute settlement proceedings is particularly significant in the case of SPS disputes due to the difficult and intricate factual issues involved in this area. The approach to the burden of proof in complaints under the *SPS Agreement*, as clarified by the Appellate Body, reflects the difference in the regime created by the *SPS Agreement* to balance trade and health objectives, from the regime applicable to health measures under the GATT 1994, where health measures were seen as exceptional and needing justification. The new approach of the *SPS Agreement*, is to recognise that Members have the right to regulate to the extent necessary to address SPS risks, but to subject such regulation to disciplines. It is for the complaining Member to bring a *prima facie* case to show that the SPS measure complained of violates the disciplines of the *SPS Agreement*. Complaining Members are assisted in their task by the possibility created in Article 5.8 of the *SPS Agreement* to request information on the SPS measures of other Members. The Appellate Body’s view of Articles 3.3 and Article 5.7 of the *SPS Agreement* as autonomous rights rather than as exceptions to the harmonisation discipline in Article 3.1 and the scientific disciplines in Articles 2.2 and 5.1, respectively, results in maintaining the burden of proof firmly on the complaining Member. This reflects the leeway provided to regulating Members by the Appellate Body in order to ensure that the policy space left to Members by the *SPS Agreement* is not undermined.

Many developing-country Members may not have the resources to gather the scientific information necessary to bring a challenge under the *SPS Agreement*, or to defend their measures. High-income Members have faced serious difficulties in this regard in the SPS disputes heard thus far. For less-developed Members the hurdle seems almost insurmountable. These Members may not have the resources to commission the necessary research and will therefore depend on the chance that there are already existing studies of relevance. The duty to cooperate in dispute settlement proceedings, identified by the Panel in *Japan – Apples*, is unlikely to lead Members, in an adversarial system, to provide data supportive of the position of the opposing party.

The issue of the burden of proof on Members in dispute settlement proceedings is closely linked with the question of the investigative authority of a panel, the standard of review it applies when assessing the facts before it and the question of the appropriate role of experts advising the Panel.

The question of the appropriate standard of review to be applied in dispute settlement proceedings plays a significant role in the allocation of authority to make policy choices balancing competing trade and health interests. The particular standard of review applied determines the extent to which the WTO adjudicatory bodies are entitled to interfere in Members’ regulatory determinations. Currently, while panels customarily state that they will not conduct their own risk assessment or impose a particular scientific view on the regulating Member in reviewing the scientific evidence, in practice this is increasingly what they do. This is in part due to the interpretation given to the ‘rational relationship’ requirement entailed by the scientific disciplines of the Agreement as involving an

---

<sup>477</sup> *Ibid.*, 471.

assessment of the quality and weight of the scientific evidence, which opens the door for an intrusive review. It is proposed here that a panel should limit its examination to the question whether the regulatory disciplines of the *SPS Agreement*, including that an SPS measure is based on a risk assessment as defined in the Agreement, have been complied with, stopping short of reassessing the scientific evidence itself to determine the existence and extent of a risk. Limiting the factual assessment to the question whether the regulatory determination by the Member is plausible on the scientific evidence before it, allows some deference to national authorities' scientific determinations. Such a review ensures that the regulating Member respects the balance struck in the rules of the *SPS Agreement* between its health concerns and the trade interests of other Members, but the review does not intrude too far into the regulatory competence of Members by interfering in their assessment of scientific evidence. This would make room for the diversity of priorities, consumer preferences and regulatory capacity between Members at different levels of development to be reflected in the science policy choices incorporated into national risk assessments. This type of review would also reduce the disadvantage at which Members that lack scientific capacity find themselves in challenging or defending measures under the *SPS Agreement*. The current intrusive approach may skew the outcome of judicial review in favour of developed-country Members that have the resources to bring convincing scientific evidence and persuasive legal arguments in support of their positions.

The standard of review currently applied by panels is made even more problematic by the practice with regard to the consultation of experts by panels. While the use of panel experts is essential in assisting panels, which are usually composed of trade specialists rather than SPS experts, to understand the highly complex scientific evidence before them, it is important to ensure that appropriate regard is had to the role of experts in dispute settlement. The use of panel experts aims to ensure that the assessment and choice between the competing scientific views presented by the parties is not made by a panel on its own, but rather that the panel is advised on this by persons with the necessary expertise. The prevailing practice of panels of appointing individual experts rather than expert groups has the contrary effect, adding to the competing scientific opinions before a panel. It allows a panel to pick and choose between the various opinions, which is troubling in view of the lack of scientific expertise of panellists to undertake this task. It is recommended that panels make use of expert review groups, in order to ensure that the scientific basis for their decisions is authoritative. In cases involving a developing-country Member, the expert review group should include at least one expert from a developing-country Member to ensure that the assessments provided by the group incorporate developing-country realities. In addition, it is important that panels respect the distinction between the respective roles of the panel, its experts and the parties before it in the proceedings. They should resist the temptation to expand the role of the experts to providing the evidence in support of the position of one of the parties, or to address the legal questions before the panel that require a basis in scientific assessments. Such inappropriate use of experts undermines the legitimacy of the outcome of dispute settlement.

It has been argued that the 'normative vacuum' in which the *SPS Agreement* is currently interpreted has led to the strong focus on science, and the concomitant heavy reliance on the opinions of panel experts in assessing the science, by panels in reviewing the SPS measures of Members. Science is seen as providing a neutral and universal benchmark

against which SPS measures can be tested to distinguish SPS protection from disguised protectionism. It is submitted here that consideration of the international law context within which the *SPS Agreement* functions, in particular international human rights norms relating to the rights to life, health, safe food and development, in addressing the rights and obligations laid down in the *SPS Agreement* could operate to provide the urgently needed normative framework to guide WTO adjudicators in striking a more appropriate balance between the competing goals of trade liberalisation and health protection. The recognition of this normative basis for interpretation, on which they can rely to enhance the legitimacy of their decisions, may make panels less inclined to continue their current invasive approach to the review of the scientific basis for Member's SPS measures. It may also make them more willing to use the flexibilities in the *SPS Agreement* to allow for the consideration of developing-country Members' constraints in the application of the scientific disciplines on regulation, to ensure that the *SPS Agreement* does not operate to undermine the protection of health in these Members.

The weak use of the dispute settlement system by Members at lower levels of development attests to high political and financial costs of dispute settlement for these Members and the limited chance of success they foresee. The ACWL is a welcome development in providing much-needed assistance in dispute settlement. However, without concerted efforts to build SPS capacity in developing countries, these Members are unlikely to overcome the remaining hurdles to participation in dispute settlement and thereby to influence the normative framework within which negotiations to address SPS issues occur.

## Conclusion to Part IV

The difficulties and failures with reliance by less-developed Members on formal dispute settlement procedures to ensure compliance with the *SPS Agreement* ‘imply a need to reconsider alternative mechanisms that induce compliance with [its] obligations. ... Greater transparency is critical to prevent capture of policies by interest groups, to make policies contestable, and to give both winners and losers a greater voice in policy formation.’<sup>1</sup>

The discussion in this Part makes it abundantly clear that currently ‘alternative mechanisms’ to dispute settlement represent the best way forward in ensuring that developing-country Members benefit as fully as possible from the benefits offered by the disciplines of the *SPS Agreement*. This is recognised by the concerted efforts of the SPS Committee in this regard.

First and foremost, from the earliest days of the *SPS Agreement*, the SPS Committee has worked to promote the implementation of the transparency provisions of the *SPS Agreement*, by drafting the *Recommended Notification Procedures* and by revising and extending them to cover all aspects of the transparency rules. These procedural guidelines have been successful in increasing the number of SPS measures being notified, and improving greatly the content of notifications. It is impossible to determine how many potential trade disputes have been resolved to date through informal bilateral consultations following the notification of draft measures, or by making use of the other transparency mechanisms created by the *SPS Agreement*, such as the possibility to request information from the national Enquiry Point. However, it seems likely that the majority of SPS issues between trading partners are addressed in this way, with greater or lesser degrees of success.

The transparency provisions are essential for the functioning of the specific trade concerns mechanism of the SPS Committee. This mechanism can be regarded as second in order of importance for the resolution of problems between trading partners with regard to SPS measures. Members can engage in discussions on these concerns both in the multilateral forum of the SPS Committee and bilaterally on the margins of meetings in an effort to find a mutually acceptable solution in a constructive manner. The current work to strengthen the role for the Chair of the SPS Committee in providing good offices for the resolution of specific trade concerns raised under the *SPS Agreement* is aimed at increasing the possibilities for agreed solutions to SPS-related trade concerns. The statistics presented in this Part indicate the importance of non-adjudicatory methods of resolving SPS conflicts, and therefore also of the value of transparency as an instrument to facilitate these processes.

The ‘alternative mechanisms’ to promote compliance with the *SPS Agreement*, however, are not limited to tools to address specific trade concerns. More mundane and prone to be underestimated, is the mechanism provided by the SPS Committee, in the fulfilment of

---

<sup>1</sup> This statement is made by Bown and Hoekman with regard to the use of dispute settlement procedures to enforce developing-country compliance with WTO rules. However, in the context of the *SPS Agreement* it applies more broadly to mechanisms to induce compliance with the *SPS Agreement* by all Members. Chad P. Bown and Bernard M. Hoekman, ‘Developing Countries and Enforcement of the Trade Agreements: Why Dispute Settlement is Not Enough’, *Journal of World Trade* 42 (1), 2008, 177-203, 194.

its mandate to further the implementation of the *SPS Agreement* and the attainment of its objectives, by creating a forum for discussion on SPS matters of broader relevance to the implementation of specific provisions of the Agreement. A number of issues have been considered in this way, including implementation problems regarding provisions of the *SPS Agreement* that hold great potential benefits for developing-country Members, such as those on equivalence, regionalisation and special and differential treatment. In addition, specific issues of particular importance to developing-country Members, including the issues of private sector standards, approaches to risk assessment and pesticide MRLs, have received attention. The discussions taking place through this mechanism have led in some cases to decisions of the SPS Committee laying down procedural guidelines to further the implementation of the provision at issue. The inclusive nature of the process leading up to the elaboration of these guidelines, based on the collection of practical experiences of Members with the issue under discussion and discussions in formal and informal sessions of the Committee, is crucial to the value of the resulting guidelines. In addition, the practice of *ad referendum* decision-making of the SPS Committee is to be applauded for its effort to ensure the broadest participation possible. While clearly far from all implementation problems have been removed by the procedural guidelines developed by the SPS Committee, these guidelines are ‘works in progress’ and make provision for periodic reassessment and review.

The positive light in which Members view this role of the SPS Committee is evinced by the outcome of the second review of the *SPS Agreement*. Many of the recommendations coming out of this review relate to maintaining as standing agenda items for SPS Committee meetings the various issues currently addressed by the Committee (such as equivalence, regionalisation, transparency, monitoring of international standards, technical assistance, SDT and specific trade concerns) and continuing work on these issues. In addition, the second review mandates the SPS Committee to pursue work on new issues, based on information provided by Members regarding their experiences and on specific suggestions submitted by Members to the Committee. None of the recommendations suggest that proposals for amendments to the *SPS Agreement* be submitted to the Council for Trade in Goods, as allowed by Article 12.7 of the *SPS Agreement*. This despite the fact that it would be possible to give the procedural guidelines developed by the SPS Committee binding force in this way. It is apparent that Members wish to continue the current successful *modus operandi* of working towards the resolution of implementation problems through decisions of the Committee, based on technical discussions and shared experiences, and reviewing these decisions as needed.

In view of the current problems with the use of the dispute settlement system faced by Members at lower levels of development that lack the scientific capacity essential to mounting an effective challenge, there is little to be gained by converting the procedural guidelines of the SPS Committee into enforceable rules, and much to be lost. As noted above, the weak legal status of decisions of the SPS Committee, as compared to the binding status of an amendment, makes it easier for Members to reach consensus on new norms. In addition, the flexibility to respond to new problems and to improve the existing procedures that is provided by their ‘soft law’ nature is highly valued by Members.

It is nevertheless necessary to address the hurdles faced by less-developed Members in using the dispute settlement system to enforce their rights under the *SPS Agreement*. As

emphasised above, the bargaining that takes place at the SPS Committee, both with regard to specific trade concerns and with regard to broader implementation issues, takes place ‘in the shadow’ of dispute settlement. This brings us once again to the need for effective initiatives to build the capacity of Members at lower levels of development to make use of the dispute settlement system to resolve their SPS disputes. An essential component of the capacity needed in this regard relates to the SPS regulatory systems and scientific competence in these Members.

## Part V

---

### **Special provisions for developing countries in the SPS Agreement**

---

## Introduction to Part V

WTO agreements creating disciplines for behind-the border regulatory regimes, such as the *SPS Agreement*, necessitate the recognition of differences in SPS capacity of Members across different levels of development. As noted in Part I of this book, the expansion of trade rules beyond issues of tariffs and quotas into areas of regulatory activity, brings with it new problems. The ability of countries to comply with, and benefit from, such rules depends on their ‘starting position.’<sup>1</sup> In other words, the existing situation in a country, such as the strength of its regulatory system, its infrastructure and its human and financial resources will affect the impact of regulatory disciplines on that Member, and its ability to use those disciplines against other Members to gain market access.<sup>2</sup>

It is therefore necessary to find ways to ensure that WTO agreements laying down regulatory disciplines, such as the *SPS Agreement*, are development friendly.<sup>3</sup> To meet this objective, they should leave sufficient space for countries to pursue their development policies through national regulation, while at the same time create clear and workable rules that developing countries can use to gain market access. This difficult balance is not only achieved in the substantive and procedural disciplines, but is contributed to by provisions in WTO agreements providing special treatment for developing-country Members.

In the current discussion on SDT in the WTO, there is wide recognition of the fact that ‘one size does not fit all’ when it comes to regulatory disciplines in trade rules.<sup>4</sup> Stevens sees the primary purpose of SDT as being:

to provide a framework for development in cases where it is not possible to agree a standard rule, applicable to all Members, that achieves this objective.<sup>5</sup>

---

<sup>1</sup> Hoekman notes that the adjustment burden of resource-intensive WTO agreements containing regulatory disciplines falls mostly on developing countries, since the rules in such agreements mostly reflect best practices in developed countries. Bernard Hoekman, ‘Operationalizing the Concept of Policy Space in the WTO: Beyond Special and Differential Treatment’, *Journal of International Economic Law* 8 (2), 2005, 405-424.

<sup>2</sup> Low reports that 24 WTO Members have no representation in Geneva, and many others have too few staff to deal adequately with all the issues on the agenda at the WTO. Patrick Low, ‘Is the WTO Doing Enough for Developing Countries?’ in *WTO Law and Developing Countries*, George A. Bermann and Petros C. Mavroidis (eds.) (Cambridge University Press, Cambridge), 2007, 324-358, 339.

<sup>3</sup> Stevens argues that this is particularly the case now that the improved dispute settlement system has eliminated much of the flexibility that characterized the GATT. As a result, ‘in order to avoid adverse, unintended consequences from dispute settlement (or the threat thereof), the WTO needs new mechanisms to balance precise rules and appropriate flexibility...’ See Christopher Stevens, ‘Recognising Reality: Balancing Precision and Flexibility in WTO Rules’, presented at the *Joint ICTSD – GP International Dialogue: Making Special & Differential Treatment More Effective and Responsive to Development Needs* (International Centre for Trade and Sustainable Development, Chavannes-de-Bogis, Switzerland) 6 and 7 May 2003, 3, available at: [www.ictsd.org/dlogue/2003-05-06/STEVENS\\_S&DT\\_final.pdf](http://www.ictsd.org/dlogue/2003-05-06/STEVENS_S&DT_final.pdf), visited on 6 July 2003.

<sup>4</sup> Hamwey notes that: ‘... the playing field resulting from international trade agreements that have ostensibly equivalent rules for all contracting parties, may provide a much smaller policy space for developing than developed countries because of differences in initial conditions and national policy implementation capacities’. Robert M. Hamwey, *Expanding National Policy Space for Development: Why the Multilateral Trading System Must Change*, T.R.A.D.E. Working Paper 25 (South Centre, Geneva), September 2005, i, available at: <http://129.3.20.41/eps/dev/papers/0511/0511005.pdf>, visited on 6 June 2008.

<sup>5</sup> Christopher Stevens, ‘Recognising Reality: Balancing Precision and Flexibility in WTO Rules’, presented at the *Joint ICTSD – GP International Dialogue: Making Special & Differential Treatment More Effective and Responsive to Development Needs* (International Centre for Trade and Sustainable Development, Chavannes-de-Bogis, Switzerland) 6 and 7 May 2003, 3 (emphasis omitted), available at: [www.ictsd.org/](http://www.ictsd.org/)

These general observations are particularly on point with regard to the *SPS Agreement*. WTO Members at lower levels of development face particular problems with regard to the *SPS Agreement*, as has become clear from preceding Parts of this book.

Broadly speaking, these problems relate to two main areas. The first concerns the disciplines of the *SPS Agreement* itself, which are the tools it uses to achieve a balance between trade and health. In particular, some less developed Members experience difficulties with compliance with the resource-intensive obligations of the *SPS Agreement*. The fact that this non-compliance is infrequently challenged does not ameliorate the situation.<sup>6</sup> As argued by Low, there is no substitute for viable rules and legal certainty.<sup>7</sup> Further, many developing-country Members lack the capacity to enforce their rights under the *SPS Agreement* to gain market access for their exports. The problem area relating to the disciplines of the *SPS Agreement* encompasses also many developing-country Members' frustration at their inability to participate effectively in international standard setting and thereby influence the content of the benchmark standards created in this process. The second problem area goes beyond the *SPS Agreement* and relates to the constraints on the ability of less developed Members to meet the SPS requirements of their trading partners, even when these are consistent with the *SPS Agreement*.<sup>8</sup> Both these areas need to be addressed.

It is important to ensure that developing-country Members are in a position to reap the benefits of the *SPS Agreement* without these benefits being outweighed by its significant implementation costs. At the same time, many developing-country Members need assistance in overcoming their supply-side constraints in respect of the ability to meet the SPS requirements imposed on their export markets.<sup>9</sup> It is important to ensure that the

---

dlogue/2003-05-06/STEVENS\_S&DT\_final.pdf, visited on 6 July 2003.

<sup>6</sup> As reported above, Part IV, Section 2.2.7, there have been only nine challenges to developing-country Members alleged non-compliance with the *SPS Agreement* to date in dispute settlement proceedings, none of which have led to adjudication by a panel. More often, the 'specific trade concerns' mechanism of the SPS Committee is used to address problems with non-implementation by developing-country Members of their obligations under the *SPS Agreement*.

<sup>7</sup> Low points out that while many instances of non-compliance with their obligations under the *SPS Agreement* by developing-country Members are not challenged by other Members as this non-compliance is not regarded as sufficiently serious to warrant a dispute settlement procedure, this cannot be seen as a mechanism to redefine the *de facto* obligations of Members. It has systemic implications in that it opens the door to arbitrariness or directed pressure that would render some countries unduly vulnerable. Low emphasises that there is no substitute for viable rules and legal certainty. Patrick Low, 'Is the WTO Doing Enough for Developing Countries?' in *WTO Law and Developing Countries*, George A. Bermann and Petros C. Mavroidis (eds.) (Cambridge University Press, Cambridge), 2007, 324-358, 338.

<sup>8</sup> Patrick Low, 'Is the WTO Doing Enough for Developing Countries?' in *WTO Law and Developing Countries*, George A. Bermann and Petros C. Mavroidis (eds.) (Cambridge University Press, Cambridge), 2007, 324-358, 334. Low points out that these concerns of developing countries, while undoubtedly legitimate, 'are poorly addressed by seeking an exemption from the application of the standards regime.'

<sup>9</sup> Supply-side constraints are those that limit the ability of a country to take advantage of market access opportunities. Special treatment of developing countries in this area would be aimed at enabling them to implement active policies to take advantage of market access, for example by taking measures to ensure their exports meet the SPS requirements of their trading partners. For the distinction between demand-side SDT and supply-side SDT, see Werner Corrales-Leal *et al.*, "'Spaces for Development Policy': Revisiting Special and Differential Treatment', presented at the *Joint ICTSD – GP International Dialogue: Making Special & Differential Treatment More Effective and Responsive to Development Needs*, Chavannes-de-Bogis, Switzerland) 6-7 May 2003, available at: [www.ictsd.org/dlogue/2003-05-06/ICTSD\\_SDT\\_wkgdraft-16-May.pdf](http://www.ictsd.org/dlogue/2003-05-06/ICTSD_SDT_wkgdraft-16-May.pdf), visited on 6 June

regulatory disciplines of the *SPS Agreement* do not have the effect of forcing developing-country Members to divert resources from other areas of public spending which may be more crucial to their development needs, such as the provision of health and education services. For this reason, special consideration is needed with regard to the compliance obligations of developing countries. The extent to which this is provided for in the *SPS Agreement*, whether in the form of special flexibilities in the rules for developing-country Members or in the form of provisions on technical assistance to support developing-country Members' compliance efforts, bears examination.

At the same time, despite some proposals to the contrary, it is widely recognised by WTO Members that any mechanisms to deal with developing-country concerns should not jeopardise the right of a Member to impose scientifically-justified measures necessary to prevent risks to human, plant or animal life or health that they consider unacceptable.<sup>10</sup> To do so would not only lead to risks of harmful effects on human health and agricultural production, contrary to the obligations of governments, but would also be counterproductive. It would fuel consumer fears, leading to a decrease in demand for products originating in developing countries, and harm the reputation of such exporting countries by casting doubts on their regulatory capacities.<sup>11</sup> Similarly, difficulties with implementation of the regulatory disciplines of the Agreement should not be dealt with by means of wholesale relaxation of the rules. Creating loopholes through which measures that are disguised forms of protectionism can slip, would undermine the market access gains achieved by the *SPS Agreement*. Thus, it is important to find ways of helping developing countries to overcome their constraints without weakening legitimate SPS measures or watering down the disciplines of the Agreement. The extent to which the *SPS Agreement* achieves this difficult objective needs to be examined.

The general disciplines on SPS measures contained in the *SPS Agreement* apply equally to developed and developing countries. However, the *SPS Agreement* does recognise the financial and technical resource constraints that developing countries face. This consideration finds its first reflection in the Preamble to the *SPS Agreement*, which recognises that:

... developing country Members may encounter special difficulties in complying with sanitary and phytosanitary measures of importing Members, and as a consequence in access to markets, and also in the formulation and application of sanitary and phytosanitary measures in their own territories, and desiring to assist them in their endeavors in this regard;<sup>12</sup>

The degree to which this recognition is given effect in the operational provisions of the *SPS Agreement* is examined in this Part.

Although in general WTO-parlance, the term 'special and differential treatment' is understood to mean all special provisions in favour of developing countries, and covers both additional flexibilities in the rules and the provision of technical assistance, the

---

2008.

<sup>10</sup> Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment. Adopted by the Committee on 30 June 2005*, G/SPS/35, circulated on 7 July 2005, para. 5.

<sup>11</sup> *Ibid.*

<sup>12</sup> See the 7<sup>th</sup> preambular recital of the *SPS Agreement*.

*SPS Agreement* deals with SDT and technical assistance in separate Articles. The SPS Committee also regards them as separate agenda items in its meetings. For that reason, a distinction will be made in this Part between SDT in the form of additional flexibilities for developing countries, and provisions regarding technical assistance to comply with the obligations of the *SPS Agreement* or the SPS measures of other Members. Only the former category will be termed ‘SDT’ in this book.<sup>13</sup>

The analysis in this Part therefore proceeds as follows. In Chapter 1, those provisions in the *SPS Agreement* allowing additional flexibility for developing-country Members through SDT are addressed. Chapter 2 examines the provisions in the *SPS Agreement* relating to technical assistance. In both these Chapters, first the relevant provisions are set out and analysed. Then, each Chapter identifies some of the problems with the implementation of the SDT or technical assistance provisions discussed. Finally, each Chapter discusses the ongoing work and progress made in finding solutions to those problems in the context of the Doha Round negotiations and elsewhere, and examines the possibilities for operationalising SDT and technical assistance provisions. With regard to technical assistance, a few selected examples of actual initiatives in place to provide technical assistance to developing countries, on bilateral and multilateral level, are briefly set out and evaluated. The Conclusion to Part V evaluates the current role and potential of the rules on special treatment and technical assistance for developing-country Members in the *SPS Agreement* as a mechanism to make the Agreement workable for these Members without disturbing the careful balance achieved by its disciplines.

---

<sup>13</sup> This approach is also followed in the current Doha Round negotiations, where SDT is treated separately from technical assistance. Ministerial Conference, *Doha Ministerial Declaration*. Adopted on 14 November 2001, WT/MIN(01)/DEC/1, circulated on 20 November 2001, paras 38-41 and 44.

## CHAPTER 1

### Special and differential treatment of developing-country Members

Specific provisions exist in the *SPS Agreement* to take into account the special constraints of developing-country Members by providing them with some flexibility with regard to both their implementation of the obligations of the *SPS Agreement* and their compliance with the SPS measures of other Members. These SDT provisions can be found not only in Article 10 of the *SPS Agreement*, entitled ‘Special and Differential Treatment’, but also in Article 14 and in Annex B.2 and 8.

It should be noted that, as discussed in Part III above, some of the substantive disciplines in the *SPS Agreement* also contain elements of flexibility that can be used to the benefit of developing-country Members.<sup>1</sup> However, as these flexibilities are available to all Members, they cannot be regarded as a form of SDT in the strict sense and will consequently not be discussed in this Chapter.

#### 1.1 Consideration of the special needs of developing-country Members

Developing countries, especially those at lower levels of development, with weaker regulatory systems and lower levels of health protection, find it hard to meet the SPS requirements of their trading partners. A new or stricter SPS measure affecting a product of export interest to such countries can therefore have a significant economic effect on them. This is even more the case where the SPS measure does not prescribe the characteristics of the final product, something which could be achieved in a variety of ways, but instead sets requirements for the production process. For example, the application of HACCP requirements by the EC and US to the entire production chain in the fisheries sector,<sup>2</sup> has created huge compliance problems for Kenya and Costa Rica, whose fisheries industries are largely composed of artisanal fishermen.<sup>3</sup>

<sup>1</sup> For example, Article 5.1 requires a risk assessment ‘as appropriate to the circumstances’ and Article 5.6 allows technical and economic feasibility to be taken into account in assessing the existence of a less-trade-restrictive alternative SPS measure. These flexibilities have been discussed above, Part III, Sections 5.1.2 and 5.2.4.1.

<sup>2</sup> The EC legislation applying HACCP to fish products is *Council Directive Laying down the Health Conditions for the Production and the Placing on the Market of Fishery Products*, No. 91/493/EEC (22 July 1991). The basic US legislation making mandatory the HACCP system for fish and fishery products is US Food and Drug Administration, 21 Code of Federal Regulations Parts 123 and 1240 *Procedures for the Safe and Sanitary Processing and Importing of Fish and Fishery Products: Final Rule*. US Fed. Regist. 61, 65096-65202 (18 December 1995).

<sup>3</sup> Max Valverde, *Sanitary and Environmental Trade Barriers in Costa Rican Fisheries*, Project on Standards and Trade, Strengthening Developing Countries’ Capacity to Respond to Health Sanitary and Environmental Requirements (UNCTAD and IDRC, Geneva), 16-17 May 2001, para. 96 and 106, available at: [http://r0.unctad.org/trade\\_env/test1/meetings/standards/mariacostarica1.doc](http://r0.unctad.org/trade_env/test1/meetings/standards/mariacostarica1.doc), visited on 10 June 2008; Food and Agriculture Organization, *Fortalecimiento De Los Comites Nacionales Del Codex y Aplicacion De Las Normas Del Codex Alimentarius*, Project TCP/RLA/0065 (FAO, San Jose, Costa Rica), 24 September – 5 October 2001; Richard O. Abila, *Food Safety in Food Security and Food Trade. Case Study: Kenyan Fish Exports* (International Food Policy Research Institute, Washington D.C.), September 2003. Henson *et al* note that in Kenya this has had significant consequences for persons, mainly women, whose livelihoods depend on processing the skeletons and other waste products produced by processing plants. Spencer Henson *et al.*, ‘Food Safety Requirements and Food Exports from Developing Countries: The Case of Fish Exports from Kenya to the European Union’,

Similarly, the way in which an SPS requirement is *applied* by an importing country may create particular difficulties for countries at lower levels of development. Some countries may not have the resources or institutional structures in place to deal with strict or inflexible implementation mechanisms. For example, the authorisation procedure for importation of plant products that may be hosts of pests may require lengthy and complex pest risk assessments that, while routine for more developed Members, are beyond some developing countries' capabilities. Another example is the application of rigid mandatory testing requirements, such as the US requirement that two histamine tests be carried out per ton of fish, which creates prohibitive costs for Costa Rica.<sup>4</sup>

Very often, the regulatory process in importing countries through which SPS measures are prepared, does not involve consideration of the effect of proposed measures on developing-country exporters. Neither are developing-country constraints commonly taken into account in the application of the resulting SPS measures. This despite the fact that active consideration of developing-country circumstances could lead to the framing of measures and the application thereof in ways that facilitate compliance by developing countries, without endangering the level of SPS protection sought.

For this reason, Article 10.1 of the *SPS Agreement* provides:

In the preparation and application of sanitary or phytosanitary measures, Members shall take account of the special needs of developing country Members, and in particular of the least-developed country Members.

This is the only SDT provision in Article 10 of the *SPS Agreement* that is couched in mandatory terms, and would seem to create an obligation for Members.<sup>5</sup>

However, the strength of this obligation, as interpreted in dispute settlement, leaves much to be desired. It was raised as a challenge for the first time ever by Argentina in the *EC – Approval and Marketing of Biotech Products* dispute.<sup>6</sup> In support of its reliance on this provision, Argentina claimed that the general moratorium had important implications for its economic development, due to the fact that Argentina is highly dependent on agricultural exports. Argentina pointed out that it is the world's second-largest producer of biotech products and is the world's leading developing-country producer of biotech products. It further noted that it has a great interest in the integrated EC market. Therefore, it argued, the EC was obliged to take into account Argentina's special needs in

<sup>5</sup> In the WTO Secretariat's review of SDT provisions in WTO agreements for purposes of the discussions in the Committee on Trade and Development on strengthening SDT, this Article is classified as a mandatory provision, creating an 'obligation of conduct', in that it does not prescribe a particular result. Committee on Trade and Development, *Implementation of Special and Differential Treatment Provisions in WTO Agreements and Decisions. A Review of Mandatory Special and Differential Treatment Provisions. Note by the Secretariat. Addendum*, WT/COMTD/W/77/Rev.1/Add.2, circulated on 21 December 2001, 9.

<sup>6</sup> Much of the following discussion is taken from a previously published article, namely Denise Prévost, 'Opening Pandora's Box: The Panel's Findings in the EC-Biotech Products Dispute', *Legal Issues of Economic Integration* 34 (1), 2007, 67-101, 93-97.

the preparation and application of its SPS measure.<sup>7</sup> Argentina emphasised the mandatory nature of Article 10.1 and claimed that it requires more than mere attention to developing-country problems. Instead, it requires ‘positive action’, in this case ‘preferential market access’ for developing-country products or implementation of the Member’s obligations in a manner that is ‘beneficial, or less detrimental, to the interests of developing country Members.’<sup>8</sup> According to Argentina, the EC failed to comply with this obligation.

The EC countered these arguments by stating that it does ‘bear [SDT provisions] in mind when developing and applying its legislation, including, where relevant, its GMO legislation’.<sup>9</sup> It further argued that Argentina’s claim amounted to ‘nothing more than saying that since the European Communities has violated other provisions of the agreements and this affects Argentina, a developing country, it has consequently also failed to comply with its obligations of special and differential treatment towards developing countries.’<sup>10</sup> Finally, the EC disputed the factual assertion that developing-country exports were restricted by its measure, but averred that trade statistics showed that its imports from developing countries that have widely adopted biotechnology in agriculture have increased since 1995/1996.<sup>11</sup> In response, Argentina disputed the EC’s view, implicit in its arguments, that Article 10.1 is discretionary and a Member can thus have regard to developing-country needs when it deems it ‘relevant’.<sup>12</sup> Secondly, Argentina pointed out that the obligation contained in Article 10.1 is separate, and not consequential on the violation of other provisions of the *SPS Agreement*.<sup>13</sup> Finally, Argentina questioned how data on trade flows can be an indication that developing-country needs have been taken into account.<sup>14</sup>

The Panel took a conservative approach to the interpretation of Article 10.1, in keeping with previous case law on SDT provisions in other WTO agreements.<sup>15</sup> It held that the

---

<sup>7</sup> The Panel considered that it seemed that Argentina intended to claim that the general *de facto* moratorium constituted the SPS measure at issue for purposes of its Article 10.1 claim. As the Panel regarded the general moratorium not to be an SPS measure but rather the application of an SPS measure, it did not find Article 10.1 of the *SPS Agreement* applicable to it (otherwise Article 10.1 would impose an obligation with regard to the ‘application’ of the application of an SPS measure, which would be illogical and contrary to the obligation on a treaty interpreter to give effect to all the terms of a treaty provision). However, while the Panel regarded Argentina’s claim as less than precisely clear, in light of its status as a developing country, the Panel was willing to consider the alternative possibility that Argentina regarded the EC legislation as the SPS measure at issue. Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1611.

<sup>8</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1607.

<sup>13</sup> *Ibid.*, para. 117.

<sup>14</sup> *Ibid.*, para. 122.

<sup>15</sup> For example, in *EC – Bed Linen*, the Panel addressed a claim of violation of the SDT provision contained in Article 15 of the *Anti-Dumping Agreement*, which like Article 10.1 of the *SPS Agreement*, is framed in mandatory terms. Article 15 of the *Anti-Dumping Agreement* provides: ‘It is recognized that *special regard must be given* by developed country Members to the special situation of developing country Members when considering the application of anti-dumping measures under this Agreement. Possibilities of constructive remedies

obligation to ‘take account’ of developing-country needs merely requires Members ‘to consider along with other factors before reaching a decision’<sup>16</sup> the needs of developing countries. This obligation, according to the Panel, does not prescribe a particular result to be achieved, and notably does not provide that the importing Member must invariably accord SDT where a measure may lead to a decrease, or slower increase, in developing-country imports.<sup>17</sup> In fact, it is conceivable, according to the Panel, that the EC did take account of Argentina’s needs, but at the same time took account of other legitimate interests (such as those of its consumers and environment) and gave priority to the latter.<sup>18</sup>

This finding, like that in case law on SDT in other WTO agreements, leads to the conclusion that, to be effective, SDT provisions must not only be framed in mandatory language, but must also specify the action required of Members.<sup>19</sup> This result is particularly problematic when one takes into account the purpose of SDT, which is to provide the *flexibility* to respond to the *special needs* of developing countries.<sup>20</sup> What the needs of particular developing countries are varies from case to case. As has been highlighted several times in previous Chapters, developing countries are not a homogenous group. Instead, there are vast differences in their levels of economic and human development, export

---

provided for by this Agreement *shall be explored* before applying antidumping duties where they would affect the essential interests of developing country Members.’ (Emphasis added). The Panel in *EC – Bed Linen* noted that both parties in that dispute, the EC and India, had agreed that the first sentence of Article 15 imposes *no legal obligations* on developed-country Members. Thus, the Panel expressed no views on this matter. Focusing on the second sentence, the Panel held that it creates an obligation to consider actively, with an open mind, the possibility of constructive remedies before imposing an anti-dumping duty that would affect the essential interests of a developing-country Member. Panel Report, *EC – Bed Linen*, para. 6.233. This issue was not appealed. Subsequently, with regard to the same provision, the Panel in *US – Steel Plate* held, ‘Members cannot be expected to comply with an obligation whose parameters are entirely undefined. In our view, the first sentence of Article 15 imposes no specific or general obligation on Members to undertake any particular action.’ Panel Report, *US – Steel Plate*, para. 7.110. This Panel Report was not appealed. Similarly, on the same issue, the Panel in *EC – Tube or Pipe Fittings* held, ‘...even assuming that the first sentence of Article 15 imposes a general obligation on Members, it clearly contains no operational language delineating the precise extent or nature of that obligation or requiring a developed country Member to undertake any specific action.’ Panel Report, *EC – Tube or Pipe Fittings*, para. 7.68. This finding was not appealed. It appears from these cases that the use of mandatory language in SDT provisions is not sufficient to make them enforceable. Such SDT provisions must additionally contain specific obligations to undertake a particular action before a claim of violation can succeed. The discussion in this footnote is taken from Denise Prévost, ‘Operationalising’ Special and Differential Treatment in the *SPS Agreement*, *South African Yearbook of International Law* 30, 2005, 82-111.

<sup>16</sup> This finding was based on the definition of the expression ‘take account’ in the Concise Oxford Dictionary.

<sup>17</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1620.

<sup>18</sup> *Ibid.*, para. 7.1621.

<sup>19</sup> An example of such a specific obligation in an SDT provision is that in Article 9.1 of the *Safeguards Agreement* which sets a *de minimis* threshold below which Members shall not impose safeguard measures on imports from developing-country Members. In *US – Line Pipe*, both the Panel and the Appellate Body found this provision to be legally enforceable. Panel Report, *US – Line Pipe*, paras 7.180-7.181 and Appellate Body Report, *US – Line Pipe*, para. 133.

<sup>20</sup> An example of a request by a developing-country Member for the application of Article 10.1 of the *SPS Agreement* to provide additional flexibility in particular circumstances is the following. In 2005, Sri Lanka requested that the EC suspend its ban on Sri Lankan cinnamon containing sulphur dioxide, and establish instead a maximum residue level of 150 parts per million, pending the development of an international standard. The EC’s ban was in place not because it held the view that all sulphur dioxide residues in cinnamon are harmful, but because it had not yet evaluated the risks of sulphur dioxide in cinnamon. According to Sri Lanka, the proposed provisional MRL would satisfy the EC’s obligations under Article 10.1. Committee on Sanitary and Phytosanitary Measures, *Trade Difficulties Encountered in the Export of Sri Lankan Cinnamon to the European Communities. Communication by Sri Lanka*, G/SPS/GEN/597, circulated on 10 October 2005.

diversification, ability to absorb costs from trade restrictive measures and to adapt to new economic circumstances, and therefore also in their ‘special situation’. To require that an SDT provision, to be effective, must specify the required action to be taken in response to developing-country needs undermines the very flexibility that characterises SDT.

Even if one were to accept the Panel’s restrictive view of the nature of the obligation in Article 10.1, one might take issue with its approach to the burden of proof on this issue. In keeping with the normal rules on burden of proof followed in WTO disputes,<sup>21</sup> the Panel found that it was incumbent on Argentina as the Complainant to adduce *prima facie* evidence that the EC failed to take account of Argentina’s needs, in violation of Article 10.1.<sup>22</sup> However, the Panel made it very difficult for Argentina to meet this burden. Argentina had argued that there is no reference in the EC approval legislation to the special needs of developing countries. Neither could any evidence be found in the entire period of application of the general moratorium that the EC had taken account of Argentina’s special needs. Further, the EC had not provided any evidence that it had taken account of Argentina’s needs as a developing-country Member. The Panel found these arguments insufficient. According to the Panel, the absence of reference to developing-country needs in the approval legislation does not demonstrate a failure to take account of those needs in the adoption or application of that legislation.<sup>23</sup> Further, the Panel found the absence of evidence supporting the conclusion that the EC took Argentina’s needs into account insufficient to indicate that Argentina had met its burden of proof. The Panel noted that Article 10.1 does not require a Member to document how it has complied with this Article.<sup>24</sup> In addition, the Panel stated that Argentina had noted the absence of relevant evidence without specifying what efforts it had made to collect such evidence.<sup>25</sup> While recognising that Argentina may not have ready access to information regarding whether and to what extent the EC took its special needs as a developing country into account, the Panel found no evidence to show that Argentina had approached the EC for such information.<sup>26</sup> Consequently, the Panel did not consider that Argentina had met its burden of proof and thus found that a violation of Article 10.1 had not been shown.

It is unclear from these findings what a developing country would have to do to meet its burden of proof under Article 10.1. Aside from seeming to require that the Complainant set out what steps it has taken to collect evidence regarding whether its needs as a developing country have been considered, and approach the opposing party for such information, the Panel does not provide guidance as to how a developing country can make a *prima facie* case under Article 10.1. Given the absence of an obligation on Members to

<sup>21</sup> The first WTO case dealing with the issue of burden of proof was *US – Wool Shirts and Blouses* where the Appellate Body held it is a generally-accepted rule applied by international courts and tribunals as well as in civil law, common law and most jurisdictions, ‘...that the burden of proof rests upon the party, whether complaining or defending, who asserts the affirmative of a particular claim or defence. If that party adduces evidence sufficient to raise a presumption that what is claimed is true, the burden then shifts to the other party, who will fail unless it adduces sufficient evidence to rebut the presumption.’ Appellate Body Report, *US – Wool Shirts and Blouses*, 14. The issue of burden of proof is discussed above, Part IV, Section 2.2.2.

<sup>22</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1622.

<sup>23</sup> *Ibid.*, para. 7.1623.

<sup>24</sup> Panel Reports, *EC – Approval and Marketing of Biotech Products*, para. 7.1624.

<sup>25</sup> *Ibid.*, para. 7.1624.

<sup>26</sup> *Ibid.*, para. 7.1625. The Panel explained that it did not mean to suggest that there is a duty on developing countries to specifically request that their needs as developing countries are considered.

document how developing-country needs have been taken into account, it seems particularly difficult for a developing country to meet its burden of proof regarding a claim of violation of Article 10.1. A request for information from the Member imposing the measure could be met by the mere assertion that due regard was had to developing-country needs. This finding makes ineffectual the SDT obligation in Article 10.1 of the *SPS Agreement*. This is an unfortunate outcome.<sup>27</sup>

On a more hopeful note, it should be recalled that the SPS Committee in 2004 adopted a decision amending the *Recommended Transparency Procedures* for SPS measures in order to improve the transparency of SDT, as discussed above.<sup>28</sup> New steps have been added to the notification procedure, requiring a Member that has notified a new or revised SPS measure to submit an addendum to its notification in the case that SDT is requested. This addendum must set out what SDT was requested and specify the SDT that was provided, or if none was provided, it must give reasons why not. Although this procedure has rarely been used to date, in the future it may assist developing countries in meeting their burden of proof under Article 10.1. The lack of submission of an addendum on SDT in cases where SDT was requested might be taken to indicate an absence of consideration of developing-country needs. However, since the procedure only applies where a developing country has requested SDT from a notifying Member, it will not fully cover the situations where a developing-country complainant may seek to rely upon the obligation in Article 10.1.<sup>29</sup>

If the approach taken by the Panel in *EC – Approval and Marketing of Biotech Products* to the interpretation of Article 10.1 of the *SPS Agreement* and its evidentiary requirements is not rejected by the Appellate Body in later cases, the risk exists that Article 10.1 may turn out to be, for practical purposes, a dead letter. Militating against this result is the principle of effective treaty interpretation, which requires that effect be given to all provisions of a treaty. In *US – Gasoline*, the Appellate Body held:

One of the corollaries of the ‘general rule of interpretation’ in the *Vienna Convention* is that interpretation must give meaning and effect to all the terms of a treaty. An interpreter is not free to adopt a reading that would result in reducing whole clauses or paragraphs of a treaty to redundancy or inutility.<sup>58</sup>

This principle has been consistently followed in subsequent cases. It is therefore likely that the Appellate Body, when interpreting Article 10.1 will consider itself bound to give some effect thereto, even if the provision itself is not regarded as enforceable. One way of

---

<sup>27</sup> Scott proposes that Article 10.1 of the *SPS Agreement* should be interpreted to encompass a procedural obligation to maintain a record of how developing-country interests have been taken into account, against which later claims can be assessed. In the alternative she suggests a reversal of the burden of proof with respect to Article 10.1. This seems to imply that a developed-country Member that prepares or applies an SPS measure that is challenged by a developing-country Member will have to show that it took account of developing-country needs in order for its measures to be in conformity with the *SPS Agreement*. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 286-287.

<sup>28</sup> This notification procedure for SDT is discussed below, Part V, Section 1.8.

<sup>29</sup> This obligation requires Members to take developing-country needs into account regardless of whether SDT has been requested or not, and applies not only to the development of (new or amended) measures, but also to the application of existing measures.

doing so, appears to be by seeing it as reflecting the ‘general policy’ with regard to SDT in the *SPS Agreement*, and therefore using it to inform related provisions, which give its general exhortation more concrete effect. Such an approach has been taken in the case law under Article 15 of the *Anti-Dumping Agreement*, which like Article 10.1 of the *SPS Agreement*, is couched in mandatory terms.<sup>30</sup> It provides in its first sentence that special regard ‘must’ be given to the special situation of developing countries when considering the application of anti-dumping duties and in its second sentence that the possibilities of constructive remedies ‘shall’ be explored where essential interests of developing countries are at stake. In *EC – Tube or Pipe Fittings*, Brazil argued that the first sentence of Article 15 of the *Anti-Dumping Agreement* contains ‘a general obligation to pay particular attention to the special situation of developing Members, while the second sentence concerns one possible way of fulfilling this obligation’.<sup>31</sup> The Panel in this case found that:

even assuming that the first sentence of Article 15 imposes a general obligation on Members, it clearly contains no operational language delineating the precise extent or nature of that obligation or requiring a developed country Member to undertake any specific action. The second sentence serves to provide operational indications as to the nature of the specific action required.<sup>32</sup>

Thus, according to the Panel, compliance with the obligations in the second sentence would necessarily ‘constitute fulfilment of any general obligation that might arguably be contained in the first sentence’.<sup>33</sup> The Panel’s interpretation of Article 15 was not appealed. In *EC – Bed Linen*, the Panel examined the second sentence of Article 15 of the *Anti-Dumping Agreement* and held that despite the difficulty in determining the precise parameters of this obligation, and the fact that no particular outcome is required by its provisions, ‘taken in its context and in the light of the object and purpose of Article 15’<sup>34</sup> the second sentence imposes an obligation to actively consider, with an open mind, the possibility of a constructive remedy. Therefore, it appears that effect can be given to a mandatory SDT provision that does not itself contain operational language by regarding it as reflecting the ‘general policy’ with regard to SDT in the relevant agreement, and therefore using it to inform related provisions, which give it concrete effect.

It is now necessary to examine the remaining SDT provisions in the *SPS Agreement* to determine if they can be regarded as giving effect to the obligation contained in Article 10.1, in the same way that the second paragraph of Article 15 of the *Anti-Dumping Agreement*, ‘operationalises’ the first paragraph. However, in doing so it is necessary to keep in mind that while both the first and second sentences of Article 15 of the *Anti-Dumping Agreement* contain mandatory language, the remaining SDT provisions of the *SPS Agreement* do not.

---

<sup>30</sup> Article 15 of the *Anti-Dumping Agreement* is quoted above, in this Section, note 15.

<sup>31</sup> Brazil’s claim was based on the argument that the EC had not had regard to the special situation of Brazil as a developing-country Member (in particular the specificity of the Brazilian tax rebate system which is unlike the sophisticated VAT systems in developed countries and the devaluation of the Brazilian currency) and conducted itself in the same way as it would have done when dealing with a developed-country Member. Panel Report, *EC – Tube or Pipe Fittings*, para. 7.57.

<sup>32</sup> *Ibid.*, para. 7.68.

<sup>33</sup> *Ibid.*

<sup>34</sup> Panel Report, *EC – Bed Linen*, para. 6.233.

## 1.2 Longer time frames for compliance for developing-country Members

As already mentioned, compliance with new SPS measures, especially those drafted and applied without regard to developing-country constraints, often entails considerable changes to production and processing systems. Particularly where the existing domestic SPS regime is very different from the new requirements on foreign markets, and supporting public services and infrastructure are weak, compliance may require substantial efforts and investments. Thus, time is needed to find the necessary resources and to make the required changes. If exports from developing countries are immediately subject to the new SPS measures, they risk being excluded from their export markets while producers are adapting to the new measure. This would result not only in loss of export revenue, but possibly also in loss of market share.

To address this problem, Article 10.2 of the *SPS Agreement* makes provision for the phased introduction of new SPS measures. It provides:

Where the appropriate level of sanitary or phytosanitary protection allows scope for the phased introduction of new sanitary or phytosanitary measures, longer time-frames for compliance should be accorded on products of interest to developing country Members so as to maintain opportunities for their exports

This provision is aimed at allowing developing countries to maintain their export opportunities while adjusting to the new measures, in cases where this would not undermine the SPS protection sought by the importing Member. However, it would appear from the hortatory wording of this provision, that it encourages, rather than obliges, Members to grant developing countries extended compliance periods.<sup>35</sup>

The legal effect of Article 10.2 of the *SPS Agreement* has not yet been established in the case law. Therefore, once again, guidance may be sought from the interpretation of similarly worded SDT provisions in other WTO agreements. The Panel in *EC – Bed Linen (Article 21.5 – India)* was faced with the question whether there was a violation of Article 21.2 of the DSU, which provides that special attention ‘should’ be applied to matters affecting developing-country Members with respect to measures that have been the subject of dispute settlement. It found that this Article contains no obligation to take any particular action, noting the use of the hortatory word ‘should’ and the fact that Article 21.2 does not set out any specific action.<sup>36</sup> However, the Panel stated that Article 21.2 is not devoid

<sup>35</sup> In its review of SDT provisions conducted for the Committee on Trade and Development, the WTO Secretariat categorised this provision as a non-mandatory provision. It noted that the provision could be made mandatory by replacing the word ‘should’ with ‘shall’. Alternatively it suggested that an authoritative interpretation of this provision could be adopted (pursuant to Article IX:2 of the WTO Agreement) clarifying that ‘should’ in Article 10.2 must be read to express a duty rather than an exhortation. Committee on Trade and Development, *Non-Mandatory Special and Differential Treatment Provisions in WTO Agreements and Decisions. Note by the Secretariat. Addendum*, WT/COMTD/W/77/Rev.1/Add.3, circulated on 4 February 2002, 6.

<sup>36</sup> The Panel held, ‘[W]e find nothing in that provision which explicitly requires a Member to take any particular action in any case. Nor has India pointed to any contextual element which would suggest that the hortatory word “should” must nonetheless be understood, in Article 21.2 of the DSU, to have the mandatory meaning of “shall”. ... In addition, the fact that there is no specific action set out in Article 21.2 makes it unlikely that Members intended the provision to be mandatory – the lack of specificity in this regard implies rather a hortatory use of should.’ Panel Report, *EC – Bed Linen (Article 21.5 – India)*, para. 2.667.

of meaning but ‘clearly reflects the concern of Members with ensuring that appropriate attention is given the interests of developing Members, and thus states an important general policy.’<sup>37</sup> It thus found it appropriate that the Arbitrator in another case had found guidance in this provision in his interpretation of Article 21.3 of the DSU with regard to the determination of a reasonable period of time to comply with the recommendations and rulings of the DSB.<sup>38</sup> It further held:

There may be any number of ways in which the policy set forth in Article 21.2 might be effectuated. However, nothing in that provision obliges any Member actually to effectuate that general policy, or to do so in any particular way in any particular case.<sup>39</sup>

By contrast, outside the context of SDT provisions, the Appellate Body in *Canada – Aircraft* has been prepared to interpret the word ‘should’ in Article 13.1 of the DSU<sup>40</sup> as implying an obligation. It held:

Although the word “should” is often used colloquially to imply an exhortation, or to state a preference, it is not always used in those ways. It can also be used “to express a duty [or] obligation”.<sup>41</sup>

It justified this finding by reference to the context of the provision, and the consequences of denying obligatory effect to this provision. The Appellate Body noted the fact that Article 13.1 gives panels a right to seek information, which right would be rendered illusory if parties had no duty to respond to requests for information. Further, Members would be free to prevent a panel from carrying out its duties and thereby undermine the negotiated dispute settlement procedures.<sup>42</sup> To avoid these far-reaching consequences, the Appellate Body saw fit to interpret the word ‘should’ as creating an obligation.<sup>43</sup>

<sup>37</sup> *Ibid.*, para. 2.669.

<sup>38</sup> Award of the Arbitrator, *Indonesia – Autos (Article 21.3(c))*, para. 24. In this award, relating to the period of time to be granted to Indonesia to implement the recommendations and ruling of the DSB, the Arbitrator noted that the language of Article 21.2 of the DSU ‘is rather general and does not provide a great deal of guidance’. However, the Arbitrator held: ‘Indonesia is not only a developing country; it is a developing country that is currently in a dire economic and financial situation. Indonesia itself states that its economy is “near collapse”. In these very particular circumstances, I consider it appropriate to give full weight to matters affecting the interests of Indonesia as a developing country pursuant to the provisions of Article 21.2 of the DSU.’ Therefore the Arbitrator granted Indonesia an additional period of six months, over and above the six-month period needed for its domestic rule-making process to be completed, for implementation of the recommendations and rulings of the DSB. *Ibid.*

<sup>39</sup> Panel Report, *EC – Bed Linen (Article 21.5 – India)*, para. 2.669. This issue was not appealed.

<sup>40</sup> Article 13.1 of the DSU, with regard to the right of a panel to seek information, provides, ‘A Member *should* respond promptly and fully to any request by a panel for such information as the panel considers necessary and appropriate.’ (Emphasis added.)

<sup>41</sup> Appellate Body Report, *Canada – Aircraft*, para. 187.

<sup>42</sup> In this regard, the Appellate Body stated, ‘So to rule would be to reduce to an illusion and a vanity the fundamental right of Members to have disputes arising between them resolved through the system and proceedings for which they bargained in concluding the DSU. We are bound to reject an interpretation that promises such consequences.’ *Ibid.*, para. 189.

<sup>43</sup> Another example of where the Appellate Body gave binding force to a provision in which ‘should’ rather than ‘shall’ is used, is Article 11 of the DSU which provides that, ‘...a panel should make an objective assessment of the matter before it....’ While it did not expressly address the issue of the use of the word ‘should’ in this Article, the Appellate Body referred several times to the ‘duty’ of a panel to make an objective assessment,

What guidance can we find in these cases for the interpretation of Article 10.2 of the *SPS Agreement*? It appears that in certain specific cases the Appellate Body is willing to interpret a provision containing the word ‘should’ as mandatory. However, this seems limited to cases where the context of the provision indicates that an obligation was intended, without which negotiated rights would be made illusory. In other cases, panels would seem reluctant to give binding force to a provision containing the word ‘should’, particularly if it does not set out any specific action. Article 10.2 of the *SPS Agreement* would seem to fall closer to the first than the second situation. Its context includes Article 10.1, which is framed in mandatory terms. While the lack of operational language delineating the precise extent or nature of the obligation in Article 10.1 means that it is unlikely to be interpreted as requiring a developed-country Member to do anything besides ‘consider alongside other factors’ developing-country needs, it cannot be ‘devoid of meaning.’ It would seem logical that it should be seen as reflecting ‘the concern of Members with ensuring that appropriate attention is given the interests of developing Members, and thus [as stating] an important general policy.’<sup>44</sup> As a result, it should guide the interpretation of the rest of Article 10,<sup>45</sup> including Article 10.2. Otherwise, the right of developing-country Members to rely on this negotiated obligation would be illusory.

Unlike Article 10.1, and contrary to the situation in *Canada – Aircraft*, Article 10.2 does set out specific actions to give effect to its provisions. It concretely calls on Members to allow longer time frames for compliance with new SPS measures on products of interest to developing-country Members, where the level of SPS protection allows. Thus, Article 10.2, it is argued here, should be interpreted as providing the operational indications for compliance with the obligation in Article 10.1; in much the same way as Article 15.2 of the *Anti-Dumping Agreement* is regarded as setting out obligations operationalising the provisions of Article 15.1 of that Agreement.<sup>46</sup> It therefore lays down an *obligation* on Members to provide longer compliance periods to developing countries so as to maintain their export opportunities, in all cases where such phased introduction of new SPS measures would not threaten the level of protection sought by the importing Member.

Concerns regarding the lack of implementation of this provision were raised in the run-up to the Doha Ministerial Conference.<sup>47</sup> As a result of discussions on this issue, agreement was reached to include a provision in the *Doha Implementation Decision* specifying that:

---

and called this an ‘obligation’. Appellate Body Report, *EC – Hormones*, para. 133.

<sup>44</sup> As set out above, this finding was made with regard to Article 21.2 of the DSU, which also does not set out concrete action, and further contains the word ‘should’ rather than ‘shall’. Panel Report, *EC – Bed Linen (Article 21.5 – India)*, para. 2.669.

<sup>45</sup> This includes Article 10.4 of the *SPS Agreement*, which is discussed below, Part V, Section 2.4.

<sup>46</sup> The argument here goes one step further than the approach followed with respect to Article 15 of the *Anti-Dumping Agreement* in that, unlike Article 15.2, Article 10.2 of the *SPS Agreement* is not couched in mandatory terms. However, in light of the fact that non-mandatory language is not seen by the Appellate Body as an impediment to the creation of obligations in cases where the context so demands, it would seem that such an interpretation is a logical extension of this line of reasoning.

<sup>47</sup> A group of developing countries (Cuba, the Dominican Republic, Egypt, El Salvador, Honduras, India, Indonesia, Malaysia, Nigeria, Pakistan, Sri Lanka and Uganda) proposed that Article 10.2 of the *SPS Agreement* be modified to include a mandatory period of at least twelve months between the date of notification of the measure and its entry into force for products from developing countries. Committee on Sanitary and Phytosanitary Measures, *Special and Differential Treatment: Note by the Secretariat*, G/SPS/W/105, circulated on 9 May 2000, para. 7.

... the phrase ‘longer time-frame for compliance’ referred to in Article 10.2 [of the *SPS Agreement*], shall be understood to mean normally a period of not less than 6 months. Where the appropriate level of sanitary and phytosanitary protection does not allow scope for the phased introduction of a new measure, but specific problems are identified by a Member, the Member applying the measure shall upon request enter into consultations with the country with a view to finding a mutually satisfactory solution to the problem while continuing to achieve the importing Member’s appropriate level of protection.<sup>48</sup>

While not directly enforceable in dispute settlement, it may be expected that this provision in the *Implementation Decision* will be taken into account by panels and the Appellate Body in interpreting the term ‘longer time frame for compliance’ in Article 10.2 of the *SPS Agreement* as a ‘subsequent agreement between the parties regarding the interpretation of the treaty or the application of its provisions’ under Article 31.3(a) of the *Vienna Convention on the Law of Treaties*. It serves the purpose of setting a guideline of 6 months for the additional compliance period, and adding a procedural obligation of consultations for cases where no phased introduction of the measure is possible.

The currently poor implementation of Article 10.2 is illustrated by China’s request, in 2005, that Japan provide a two-year additional period for compliance to developing-country Members in respect of its MRL for pesticides. This MRL sets a standard limit of 0.1ppm for over 700 different pesticides.<sup>49</sup> In November 2005, Japan indicated that a six-month transition period would be granted to all Members before the new MRL would be officially enforced. China argued that developing-country Members needed an additional two years to adjust their application of agricultural chemicals, train farmers and prepare their laboratories for the necessary tests. In addition, two years would be needed in order to allow pesticide residue levels in the soil and air to decline after their use had ceased. China noted that in view of the large number of pesticides affected by the new MRL, a phased introduction of the measure was called for. However, Japan considered that a six-month implementation period was sufficient for all Members.<sup>50</sup>

### 1.3 Reasonable adaptation period

Another provision in the *SPS Agreement* that aims to allow sufficient time for producers to adapt to new SPS measures can be found in paragraph 2 of Annex B. It provides:

Except in urgent circumstances, Members shall allow a reasonable interval between the publication of a sanitary or phytosanitary regulation and its entry into force in order to allow time for producers in exporting Members, and particularly in developing country

<sup>48</sup> Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001, para. 3.1.

<sup>49</sup> Committee on Sanitary and Phytosanitary Measures, *Specific Trade Concerns. Note by the Secretariat. Addendum. Issues Not Considered in 2007*, G/SPS/GEN/204/Rev.8/Add.2, circulated on 27 March 2008, item 212.

<sup>50</sup> *Ibid.*, item 212 para. 361.

Members, to adapt their products and methods of production to the requirements of the importing Member.

This provision differs from Article 10.2 of the *SPS Agreement* in three main respects. First, its binding nature is beyond doubt, as it is both worded in a mandatory fashion and specifically identifies the action required.<sup>51</sup> Second, it provides for delaying the entry into force of an SPS measure, rather than just extending the period of time for compliance therewith. Third, as the reasonable adaptation period must be granted equally to both developed and developing-country exporting Members, this provision is not an SDT provision in the strict sense of the term.

However, this provision does hold particular advantages for developing countries. As developing countries often face more difficulties in adapting to new SPS measures than do their developed counterparts, the provision makes *specific reference* to developing countries. This implies that in determining the reasonable adaptation period to be provided for compliance with new SPS measures, a Member should have particular regard to the time needed by the affected developing-country Members to adapt to the new requirements. For this reason, it can be seen as an SDT provision in the broader sense of the term.<sup>52</sup>

Despite the strong indications of the enforceability of the requirement of a reasonable adaptation period, lack of implementation of this provision has persisted. Concerns in this regard led developing-country Members to raise this as an implementation issue to be addressed before launching the Doha Round of negotiations. Following discussions in this regard, the reasonable adaptation period, for purposes of Annex B.2, was specified in the Doha *Implementation Decision* to mean normally a period of not less than six months. However, in each specific case, regard must be had to the circumstances of the measure and actions necessary for its implementation. The *Implementation Decision* further notes that the entry into force of trade liberalising measures should not be unnecessarily delayed.<sup>53</sup> This takes into account the fact that some new SPS measures may establish lower or easier requirements than existing ones. Despite the six-month specification in the *Implementation Decision*, statistics for 2002<sup>54</sup> show that only 3.7 percent of routine notifications<sup>55</sup> provided for an adaptation period of at least six months. A further 34.2 percent of notifications provided an adaptation period shorter than six months, and 62.1 percent did not state the date of adoption and/or entry into force. This situation showed

<sup>51</sup> In its review of SDT provisions, the WTO Secretariat classifies this provision as a mandatory provision containing an ‘obligation of result’. Committee on Trade and Development, *Implementation of Special and Differential Treatment Provisions in WTO Agreements and Decisions. A Review of Mandatory Special and Differential Treatment Provisions. Note by the Secretariat. Addendum*, WT/COMTD/W/77/Rev.1/Add.2, circulated on 21 December 2001, 10.

<sup>52</sup> An indication that Annex B.2 is regarded as an SDT provision is the fact that it is included in the WTO Secretariat’s review of SDT provisions, conducted for purposes of the Doha Round negotiations on SDT. *Ibid.*, 9-10.

<sup>53</sup> Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001, para. 3.2.

<sup>54</sup> These statistics were developed by China, on the basis of an analysis of all notifications submitted

<sup>in</sup> 2002. Committee on Sanitary and Phytosanitary Measures, *Report of the Analysis on SPS Notifications in 2002. Submission by China*, G/SPS/GEN/378, circulated on 31 March 2003, para. 13.

<sup>55</sup> As discussed above, routine notifications are those that are not ‘emergency notifications’, which have a different notification format. Emergency notifications relate to measures adopted in situations of urgency, for which a reasonable adaptation period is not required. See further above, Part IV, Section 1.3.2.2.

only slight improvement in 2003.<sup>56</sup> The frequent failures to comply with Annex B.2 have never been challenged in dispute settlement proceedings, notwithstanding its apparently binding and enforceable nature. This may be due to the fact that the enforcement thereof is hindered by a loophole, namely the proviso that a reasonable adaptation period need not be granted in ‘urgent circumstances’.

There is no further clarification of what types of situation would be deemed urgent.<sup>57</sup> The risk therefore exists that Members may interpret urgency broadly and thus be disinclined to grant the required adaptation period. In the absence of any criteria for the determination of urgency, developing-country Members may be reluctant to incur the costs of challenging a refusal to grant an adaptation period before a panel due to the uncertainty regarding what a panel might regard as ‘urgent’. There is a risk that a panel will readily find that urgency exists in most cases where SPS measures comply with the remaining requirements of the *SPS Agreement*, since such measures address scientifically proven risks to human, plant or animal life or health. A panel may be hesitant to interfere with the determination by the importing Member in such a sensitive policy area. This may result in an overly broad interpretation of ‘urgency’, which would diminish the utility of the provision for reasonable adaptation periods in Annex B.2.

Instead, it is recommended that panels, if and when such an issue is raised before them, shoulder their responsibility to interpret and apply this provision, in order to guard the negotiated balance reflected in the *SPS Agreement* between the right of Members to protect health in their territories, and the goal of increasing market access for food and agricultural products, including through SDT of developing countries. While this task is not an easy one, it is nevertheless one which panels are obliged to carry out under Article 11 of the DSU. As discussed above, this Article requires that panels carry out an ‘objective assessment’ of the matter before them, which has been interpreted to mean neither *de novo* review of the matter, nor complete deference to the determination of a Member.<sup>58</sup> Therefore, when addressing claims under Annex B.2, a panel must not simply defer to the determination by a member that the situation was urgent, but must objectively examine the facts and the applicability of the legal requirements of this provision to such facts.<sup>59</sup>

<sup>56</sup> On analysis of all notifications submitted in 2003, China calculated that 9.2 % of routine notifications provided at least 6 months adaptation period, 41.4 % provided a period of less than 6 months, and 49.4 % did not specify the date of adoption and/or entry into force of the measure. Committee on Sanitary and Phytosanitary Measures, *Report of the Analysis on SPS Notifications in 2003. Submission by China*, G/SPS/GEN/498, circulated on 18 June 2004, para. 15.

<sup>57</sup> The concept of ‘urgency’ is also found in article 4.8 and 4.9 of the DSU, which allow for shorter consultation periods and the acceleration of dispute settlement proceedings in cases of urgency, including those concerning perishable goods. This issue came before a Panel in *Canada-Patent Term* where the US requested expedited consideration of the dispute under Article 4.9 of the DSU on the grounds that premature expiration of patents during the dispute settlement procedure caused irreparable harm to the patent owners. The Panel did not examine the requirement of urgency, but noted that due to other demands on panellists’ time, it could not accelerate the timetable prior to the first substantive meeting. It then fixed its timetable according to the minimum periods of the proposed timetable provided in Working Procedures in Appendix 3 to the DSU, since Canada did not object to such a timetable. Panel Report, *Canada – Patent Term*, para. 1.5.

<sup>58</sup> Appellate Body Report, *EC – Hormones*, para. 116.

<sup>59</sup> It is useful to recall here that between total deference and *de novo* review is a wide spectrum of possibilities. The lack of guidance for panels in this respect gives cause for concern in a field such as that of SPS regulation, where disputes turn on the evaluation of complex scientific facts. The issue of the ‘objective assessment’ standard of review is discussed further above, Part IV, Section 2.2.3.

Such policing of compliance with this provision, including the urgency requirement justifying deviation, would encourage members to take the obligation to provide a reasonable adaptation period seriously.

#### 1.4 Delayed compliance with the SPS Agreement

Not only is compliance with SPS measures imposed by importing Members a problem for many developing-country-Members, also the implementation of the obligations contained in the *SPS Agreement* may be costly and burdensome for them.

As discussed above, many of the disciplines of the *SPS Agreement* reflect the ‘best practices’ of developed countries with regard to SPS regulation. For example, currently in developed countries scientific risk assessments are an inherent part of the regulatory process. Similarly, it is common practice in these countries to invite public comments on regulatory proposals and to publish new regulations promptly. While often the adoption of such regulatory practices by developing countries has long-term benefits, they lack the resources to do so immediately.

A certain level of regulatory capacity, infrastructure and skilled human resources is necessary in order to meet the requirements of the *SPS Agreement*. In countries in which well-functioning SPS regulatory systems are not in place, administrative systems are poor, or sufficient scientific capacity, both in the form of properly equipped laboratories and trained scientific staff, is lacking, complying with the *SPS Agreement* requires significant adjustments. For this reason, such countries need additional time for the implementation of their obligations under the *SPS Agreement*.

The *SPS Agreement*, in Article 14, makes provision for delayed implementation of the obligations under the Agreement for developing and least-developed-country Members. Least-developed-country Members were granted a five-year transitional period, from the entry into force of the WTO Agreement on 1 January 1995, for delayed implementation of all their obligations. Other developing Members were given a two-year transitional period, where lack of technical expertise, infrastructure or resources prevented immediate implementation of their obligations.<sup>60</sup> However, this possibility did not extend to their notification and information obligations under Articles 5.8 and 7 of the *SPS Agreement*. This cut-out can be attributed to the fact that transparency of SPS measures is crucial to the operation of the SPS Committee as a forum for consultations on SPS issues. It is also of key importance for exporting firms, as it creates a predictable trading environment. Therefore, developing-country Members, unlike least-developed-country Members, were, in principle, obliged to comply immediately with the transparency provisions in the *SPS Agreement*.

The transitional period expired in January 2000 for least-developed-country Members and in January 1997 for other developing-country Members. As one might expect, not all

---

<sup>60</sup> An example of the use of this possibility can be found in the notification of Honduras to the SPS Committee, in March 1995, of its decision to reserve the right to make use of the two-year transitional period. See Committee on Sanitary and Phytosanitary Measures, *Communication from the Republic of Honduras*, G/SPS/W/2, circulated on 24 March 1995.

developing-, and least-developed-country Members have been able to comply fully with their obligations under the *SPS Agreement* within the transition periods. Some obligations, such as those relating to risk assessments, may require far-reaching reforms and institutional capacity. In addition, such reforms are often not a priority for government spending in countries with more urgent development needs. Further, although the transitional period for developing-country Members does not apply to the transparency obligations, it can be envisioned that immediate compliance would be impossible for some of these Members.

An example of an LDC for which the transition periods were not sufficient is Bangladesh.<sup>61</sup> As set out in Part II above, Bangladesh is currently not in a position to comply with its notification obligations, and despite having set up its required National Notification Authority and Enquiry Point, it has never notified an SPS measure.

Therefore, although the transitional periods in Article 14 represented one of the most operational forms of SDT since their application was automatic and did not depend on implementation by other Members, they were not sufficient to address fully developing-country constraints with regard to meeting their obligations under the *SPS Agreement*. An indefinite exemption for developing-country Members from obligations under the *SPS Agreement* is clearly not the answer, as it would reintroduce the unfavourable situation that existed under the Tokyo Round *Standards Code*, where most developing countries opted out of the Code. As around two-thirds of WTO Members are currently developing-country Members, exempting them from the obligations of the *SPS Agreement* would leave this area largely undisciplined, to the detriment of trade not only between developed- and developing-country Members, but also between developing-country Members themselves. Instead, the constraints faced by developing-country Members in meeting their obligations under the *SPS Agreement* must be addressed in a constructive fashion that entails flexibility but not exemption.

### 1.5 Time-limited exemptions from specific obligations

To create additional flexibility for developing-country Members that have difficulties with compliance with their obligations under the *SPS Agreement* after the lapse of the transitional periods, Article 10.3 of the *SPS Agreement* provides:

With a view to ensuring that developing country Members are able to comply with the provisions of this Agreement, the Committee is enabled to grant to such countries, upon request, specified, time-limited exceptions in whole or in part from obligations under this Agreement, taking into account their financial, trade and development needs.

This provision aims to enable developing-country Members to comply with their obligations by giving them extra time to adjust to their new obligations, where necessitated by their financial, trade and development needs.

---

<sup>61</sup> Trade Policy Review Body, *Trade Policy Review: Bangladesh – Report by the Secretariat*, WT/TPR/S/68, circulated on 3 April 2000, Part II para. 25 and Table II.23.

While the SPS Committee is enabled to grant requested exemptions, it has no obligation to do so.<sup>62</sup> Neither are concrete criteria laid down according to which the SPS Committee should evaluate developing-country requests under Article 10.3. The only guidance for the Committee in this Article is the provision that the Committee is enabled to grant such requests from developing countries ‘taking into account their financial, trade and development needs.’ While the introduction of criteria based on the specific needs of the requesting Member, rather than purely its self-selected developing-country status, allows for differentiated decisions tailored to the concrete situation of a specific developing-country Member, the provision leaves very broad discretion to the SPS Committee in this regard.<sup>63</sup> As decisions of the SPS Committee, as discussed above, are taken by consensus according to Article 12.1 if the *SPS Agreement*, any exemptions requested under Article 10.3 would need at minimum the tacit approval of all Members.

It is difficult to determine whether Members within the SPS Committee would be disposed to grant requests under Article 10.3 easily or instead be reluctant to do so, as to date no developing-country or LDC Member has requested such an exemption. This despite the fact that some remain in breach of certain obligations under the *SPS Agreement*, such as the obligation to establish a National Notification Authority and Enquiry Point, to publish and notify all new SPS measures, or to base their SPS measures on either an international standard or a risk assessment. It seems possible that the hesitation of developing-country Members to make use of this exemption possibility is due to their uncertainty regarding the likelihood that their requests will be granted, given the broad discretion of the SPS Committee in this regard coupled with the consensus requirement, and their unwillingness to draw attention to their non-compliance in the face of this uncertainty. If the SPS Committee were to refuse to grant an exemption, the requesting country has exposed itself to the risk of challenges for violation of the *SPS Agreement*, either through the specific trade concerns mechanism of the SPS Committee or in dispute settlement proceedings.<sup>64</sup>

Some developing countries have proposed that Article 10.3 of the *SPS Agreement* be amended to oblige the SPS Committee to grant requests for time-limited exemptions for developing countries. However, this would have the effect of creating an automatic waiver, excusing developing-country Members from any of the obligations under the *SPS Agreement*, upon request. When one bears in mind that intra-developing-country trade in food and agricultural products is significant, the creation of such a loophole in the obligations would be to the detriment of developing-country Members themselves by reducing

---

<sup>62</sup> It is useful to bear in mind, as noted above, that there is no possibility to challenge the action of a WTO organ in dispute settlement proceedings, as these are limited to disputes between members. Thus the issue of enforceability of Article 10.3 of the *SPS Agreement* does not arise.

<sup>63</sup> The actions of WTO Members acting within the SPS Committee under Article 10.3 of the *SPS Agreement* are not guided by the general policy contained in Article 10.1 requiring consideration of the needs of developing-country Members, as exemptions cannot be regarded as covered by its reference to the ‘preparation and application’ of SPS measures by Members.

<sup>64</sup> While the risk of dispute settlement challenges to non-compliance of less developed Members is very small, in view of the limited interest in access to their markets, as discussed in Part IV of this book, weak enforcement does not obviate the need to ensure that there is sufficient flexibility in WTO obligations to accommodate the constraints of LDC Members and developing-country Members. Instead, it merely creates an undesirable lack of certainty and predictability and makes the non-complying Member vulnerable to pressure from other Members. See further above, Part IV, Sections 2.2.7 and 2.3.

their possibilities to enforce the market access achievements of the *SPS Agreement* against other developing-country Members making use of such a waiver. Instead, the creation of clear and concrete criteria to determine when the ‘financial, trade and development needs’ of developing countries preclude immediate compliance with specific obligations may be more useful. It would give guidance to the SPS Committee in taking decisions on exemptions, providing a degree of security and predictability for Members. The development of criteria would require Members to accept the possibility of differentiation between developing countries, on the basis of their specific needs, in the provision of this form of SDT.

### 1.6 Special provisions in the notification obligations

As stated above, compliance with the transparency obligations of the *SPS Agreement* can be particularly costly and onerous for developing-country Members. Nevertheless, due to their fundamental importance to the functioning of the *SPS Agreement*, immediate compliance therewith is required, except by LDC Members. However, some aspects of the transparency obligations are less crucial than others to the operation of the Agreement and may create an unnecessary burden for developing-country Members.

One such obligation is that contained in paragraph 8 of Annex B, with regard to documentation for notified measures. This provision contains an obligation to provide, upon request, copies of the documents, or in case of lengthy documents, summaries of the documents covered by a specific notification in one of the official languages of the WTO. Developing-country Members are exempt from these obligations of translation and summarising. This is clearly an attempt to reduce the burden on developing countries that results from compliance with some of the transparency provisions. Once again, as was the case with the transitional periods, this SDT provision is automatic in its application and requires no implementation. It can thus be regarded as an effective, albeit very limited, form of SDT.

Developing countries do not only have difficulties in complying with certain transparency obligations. They also face constraints in fully benefiting from increased transparency if they do not have the skilled human resources to monitor the notifications and identify those of interest to them. For this reason, under paragraph 9 of Annex B, the WTO Secretariat is obliged to draw the attention of developing countries to any notifications relating to products of interest to them. This aims to enable developing countries to take full advantage of the increased transparency resulting from the disciplines of the *SPS Agreement* despite the fact that they may lack the resources to keep track of all notifications.

The question of enforceability of this provision through dispute settlement does not arise, as the WTO dispute settlement system is limited to disputes between Members. Thus, claims can only be brought by a WTO Member against measures taken by another Member and not against acts or omissions of the WTO Secretariat. Nevertheless, the Secretariat takes its task under Annex B.9 seriously and has made every effort to give effect to this provision.

In practice, it is difficult to determine which notifications may be of interest to each developing-country Member. This was particularly the case initially when notifications were rudimentary and provided little information. The Secretariat thus revised the notification format to be used by Members, to include a box on which countries are most likely to be affected by the notification.<sup>65</sup> In addition, the Secretariat decided to implement its obligation under Article B.9 by circulating lists of all notified SPS measures to all WTO Members. Initially these periodic lists contained merely the official document number of the notification and the date in which it was issued,<sup>66</sup> and were therefore not very useful for developing-country Members. Following consultations with Members on this issue, the Secretariat decided, in 1999, to draw up a monthly document identifying all notifications received that month, with a short summary of the products covered by each notification, the countries or regions identified in the notification as likely to be affected, the nature of the measure, and the deadline for the submission of comments.<sup>67</sup> This additional information facilitates the monitoring of relevant notifications by developing-country authorities. The summary document is sent by electronic mail to each Member's Enquiry Point, and in paper form to all Members' permanent missions to the WTO. The actual notifications received are transmitted to all Members in the same way.<sup>68</sup>

These efforts indicate that this SDT provision, addressed to the WTO Secretariat, is implemented effectively, within the limits of what is possible given the information provided by Members in their notifications of SPS measures.<sup>69</sup>

## 1.7 Work on improving implementation of SDT provisions

The weakness of the SDT provisions in the *SPS Agreement* and the consequent inadequate implementation thereof has been the subject of much criticism by developing-country Members. In its review of the utilisation of SDT provisions in WTO agreements, the WTO Secretariat reported that no information was available on the extent to which the special and differential treatment provided for in Articles 10.1 and 10.2 had been accorded to developing-country Members, nor on the extent to which developing-country Members had made use of any special and differential treatment accorded to them.<sup>70</sup>

<sup>65</sup> The notifications received by the WTO Secretariat are transmitted by electronic mail to each Member's enquiry point, and in paper form to all Members' permanent missions to the WTO. The Secretariat sends all SPS-related documents to Members in English as well as the other WTO working languages of their choice (French or Spanish). The WTO Secretariat has created a self-subscribing e-mail list to receive SPS notifications and other non-restricted SPS documents. WTO Members and interested public can subscribe to this list.

<sup>66</sup> See for example, Committee on Sanitary and Phytosanitary Measures, *List of Notifications – Note by the Secretariat*, G/SPS/W/19, circulated on 19 June 1995.

<sup>67</sup> Committee on Sanitary and Phytosanitary Measures, *Electronic Transmission of Notifications to National Enquiry Points. Note by the Secretariat*, G/SPS/GEN/136, circulated on 9 August 1999. These lists can be found in the series G/SPS/GEN/\* by searching under the keyword 'notifications'.

<sup>68</sup> The Secretariat sends all SPS-related documents to Members in English as well as the other WTO working language of their choice (French or Spanish).

<sup>69</sup> The work done to improve the content and timeliness of notifications by Members has been discussed above, Part IV, Section 1.3.7.

<sup>70</sup> Committee on Trade and Development, *Information on the Utilisation of Special and Differential Treatment Provisions. Note by the Secretariat. Addendum*, WT/COMTD/W/77/Rev.1/Add.4, circulated on 7 February 2002, Section D.

While some developed-country Members have used this lack of information as a basis for the claim that strengthening SDT provisions is not useful since developing-country Members do not utilise the available SDT in any case,<sup>71</sup> this superficial argument has been effectively countered. As noted by Mexico and Uganda, the under-utilisation of the SDT provisions can be ascribed to their vague and weak terms and it is precisely this that needs to be addressed.<sup>72</sup> Further, as pointed out by Egypt and Uganda, the lack of reported use of the SDT provisions does not mean they are not utilised. In fact, they are often relied upon informally on a bilateral basis.<sup>73</sup>

Concerns regarding poor implementation of SDT are not limited to the *SPS Agreement*. They form part of the broader discussion on implementation of the WTO agreements, which as discussed above, has been going on since the Seattle Ministerial Conference and, in a more concrete fashion, during the preparations for the Doha Ministerial Conference and ever since.<sup>74</sup> Developing-country Members regard SDT as the *quid pro quo* for the extensive obligations they undertook in the Uruguay Round, and therefore regard the inadequate implementation thereof as cause for concern. As part of the effort to bring developing-country Members back on board after the failed Seattle Ministerial Conference in 1999, these implementation concerns received increased attention, resulting in the adoption of the *Implementation Decision* at the Doha Ministerial Conference in 2001.<sup>75</sup>

The *Implementation Decision* represents a step towards the strengthening of the provisions in the *SPS Agreement* in favour of developing-country Members. As stated above, this decision set out guidelines for the adaptation period and additional compliance period for developing-country Members provided for in Article 10.2 and Annex B.8 of the *SPS Agreement*.<sup>76</sup> However, much remains to be done if the SDT provisions are to be fully operationalised. For this reason, the *Implementation Decision* sets out a work programme on SDT. The Doha Ministerial Declaration, adopted at the same time as the *Implementation Decision*, recognises that SDT provisions are ‘an integral part of the WTO Agreements’

<sup>71</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members. Decision by the Committee of 27 October 2004*, G/SPS/33, circulated on 2 November 2004, para. 15.

<sup>72</sup> *Ibid.*, paras 18 and 26.

<sup>73</sup> *Ibid.*, paras 19 and 26. Egypt pointed to Pakistan’s comments on its unsuccessful attempts to rely on SDT as well as to the discussion in the SPS Committee on SDT with regard to the EC aflatoxin standards.

<sup>74</sup> See the discussion above, Part I, Sections 1.7 and 1.8.

<sup>75</sup> Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001. This Decision was adopted having regard to Articles IV:1, IV:5 and IX of the *WTO Agreement*. The *Implementation Decision* does not only address the *SPS Agreement*, but embodies decisions to address the concerns of developing-country Members regarding the implementation of various provisions in the WTO agreements, including those providing SDT, and sets out a work programme on SDT.

<sup>76</sup> Aside from the issue of SDT, it is useful to recall that the *Implementation Decision* also contains other provisions of relevance to the *SPS Agreement*, which have been referred to above where relevant. In particular, it took note of the *Equivalence Decision* and mandated the SPS Committee to expeditiously develop its work programme on that issue. It also instructed the SPS Committee to review the operation of the *SPS Agreement* every 4 years. Further, it took note of the Director-General’s efforts to facilitate the increased participation of Members at different levels of development in international standard setting organizations and to coordinate with these organizations and financial institutions in identifying SPS-related technical assistance needs and how best to address them; and it urged him to continue these efforts. Finally it urged Members to provide to the extent possible, technical and financial assistance to LDC Members to help them to comply with new SPS measures and to implement the *SPS Agreement*. *Ibid.*, paras 3.1-3.6.

and mandates the review of SDT provisions, ‘...with a view to strengthening them and making them more precise, effective and operational.’<sup>77</sup> The Doha Ministerial Declaration endorses the Work Programme on special and differential treatment set out in the *Implementation Decision*.

Work is ongoing in the Special Session of the Committee on Trade and Development with respect to the identification of ways to make the special and differential treatment provisions in WTO agreements more effective.<sup>78</sup> Proposals in this regard have addressed both agreement-specific SDT provisions and cross-cutting issues, including questions of eligibility criteria and differentiation between developing countries.

As noted above, some developing countries have opposed negotiations on cross-cutting issues, before agreement-specific issues have been resolved.<sup>79</sup> However, at the meeting of 28 October 2004, the polarisation between developed and developing countries reportedly diminished and some progress was made regarding the process for negotiations in the Special Session of the CTD.<sup>80</sup> It was decided that it was necessary to address the underlying development challenges when examining the agreement-specific proposals (other than those forwarded to other WTO bodies) in the Committee.<sup>81</sup>

As discussed above, 88 agreement-specific proposals have been made by Members.<sup>82</sup> It is useful to recall that these proposals were informally divided into three categories. Category I is composed of those proposals on which agreement is likely in the short-term, including those 28 proposals which were agreed upon in principle before the Cancun Ministerial. Category II consists of those 38 proposals that were forwarded to those WTO bodies that deal with the specific agreements involved for further work. Category III refers to the most controversial proposals on which negotiations have not yet been conducted. Five proposals have been made containing 12 specific recommendations that relate to Articles 9 and 10 of the *SPS Agreement*.<sup>83</sup>

Three recommendations relevant to SDT deal with Article 10.1 of the *SPS Agreement* and are regarded as Category II proposals. These proposals were referred to the SPS Committee by the General Council in May 2003. One of these is a proposal by a group

<sup>77</sup> Ministerial Conference, *Doha Ministerial Declaration*. Adopted on 14 November 2001, WT/MIN(01)/DEC/1, circulated on 20 November 2001, para. 44.

<sup>78</sup> In early 2002, the Trade Negotiations Committee established the Special Session of the Committee on Trade and Development to be the body responsible for carrying out the Doha mandate with regard to special and differential treatment negotiations.

<sup>79</sup> See above, Part I, Section 1.8.

<sup>80</sup> ‘WTO S&D Talks Focus on Process In “Positive” Session’, *Bridges Weekly Trade News Digest*, 3 November 2004.

<sup>81</sup> *Ibid.* Switzerland reportedly proposed the clustering of proposals around specific themes, such as technical assistance or capacity constraints, and approaching the cross-cutting issues in a more focused manner so that the two aspects of the negotiations are complementary.

<sup>82</sup> See above, Part I, Section 1.8.

<sup>83</sup> These proposals are contained in: Committee on Trade and Development Special Session, *Special and Differential Treatment Provisions. Joint Communication from Cuba, Dominican Republic, Egypt, Honduras, India, Indonesia, Kenya, Mauritius, Pakistan, Sri Lanka, Tanzania and Zimbabwe*, TN/CTD/W/2, circulated on 14 May 2002; Committee on Trade and Development, *Special and Differential Treatment Provisions Joint Communication from the African Group in the WTO. Revision*, TN/CTD/W/3/Rev.2, circulated on 17 July 2002; Committee on Trade and Development Special Session, *Special and Differential Treatment Provisions. Communication from India*, TN/CTD/W/6, circulated on 17 June 2002.

of Members referred to as the ‘Like-Minded Group’ suggests an addition to Article 10.1 to require consultations, upon request, if a developing-country Member identifies specific problems in complying with SPS measures of a developed-country Member. This addition specifies that the ‘special needs’ of developing countries referred to should be interpreted to include securing and enhancing export levels and maintaining market share, as well as developing technological and infrastructural capabilities.<sup>84</sup> The African group has made two proposals in its submission regarding the interpretation of Article 10.1. It suggests that the requirement to ‘take account of the special needs’ of developing- and least-developed-country Members be understood to mean that an importing Member must either withdraw measures that adversely affect such exporting Members or must provide the technical and financial resources necessary for compliance.<sup>85</sup> Further it proposes that this requirement be interpreted to mean that Members are obliged to initiate consultations in the SPS Committee if they intend to take measures that are likely to affect developing- or least-developed-country exporting Members. These consultations aim to determine whether the proposed measures, if in conformity with the *SPS Agreement*, adversely affect such exporting Members.<sup>86</sup>

In addition, two SDT recommendations deal with Article 10.3 of the *SPS Agreement* and are regarded as Category I proposals. One of these is a proposal by Egypt to amend Article 10.3 of the *SPS Agreement* to make obligatory the granting of time-limited exemptions by the SPS Committee to developing-country Members that request such exemptions.<sup>87</sup> New Zealand submitted a compromise proposal in this regard, proposing a specification in Article 10.3 that the SPS Committee should take a decision on an exemption request no later than at the third meeting of the Committee following the meeting where the request was tabled. The remaining proposal is in Category III. It is the Indian proposal for a revision of Article 10.2, to make mandatory the additional time frame of at least six months for developing-country Members to comply with new or amended SPS measures, with the exception of emergency measures.<sup>88</sup>

From November 2002 onwards, the Special Session of the CTD has been discussing the Category I and III proposals.<sup>89</sup> India’s proposal to establish a mandatory additional time

<sup>84</sup> Committee on Trade and Development Special Session, *Special and Differential Treatment Provisions. Joint Communication from Cuba, Dominican Republic, Egypt, Honduras, India, Indonesia, Kenya, Mauritius, Pakistan, Sri Lanka, Tanzania and Zimbabwe*, TN/CTD/W/2, circulated on 14 May 2002. Further, the importing Member is required to indicate the systems and/or equivalent systems that can be used to comply with its SPS measure and the names of the developing- and least-developed-country Members that could be affected by the measure.

<sup>85</sup> Committee on Trade and Development Special Session, *Special and Differential Treatment Provision: Joint Communication from the African Group in the WTO*, TN/CTD/W/3, circulated on 24 May 2002.

<sup>86</sup> *Ibid.*

<sup>87</sup> The proposal states that the SPS Committee ‘shall grant’ such exemptions upon request. ‘Friends of the Chair Looking to Save WTO’s S&D Review’, *Bridges Weekly Trade News Digest*, 12 June 2003.

<sup>88</sup> The two proposals with regard to Article 10.3 of the *SPS Agreement* were considered to be proposals on which recommendations were more likely to be made by the General Council, and were therefore discussed in the Special Sessions of the CTD. The proposal with regard to Article 10.2 was characterised as a proposal where a wide divergence of views existed and on which progress was unlikely without redrafting the original text. This proposal is also discussed in the Special Sessions of the CTD. Committee on Sanitary and Phytosanitary Measures, *Special and Differential Treatment Proposals – Schedule of Work: Proposal by the Chairman*, G/SPS/W/135, circulated on 13 June 2002, para. 1.

<sup>89</sup> Committee on Trade and Development Special Session, *Note on the Meeting of 6 November 2002*, TN/

frame for developing countries to comply with SPS measures under Article 10.2 was rejected by many developed-country Members, who felt that it would undermine their right to set science-based SPS measures and implement them in accordance with the identified risk.<sup>90</sup> These Members noted that an obligatory minimum period disregards the fact that the possibilities for extended compliance periods can only be assessed on a case-by-case basis depending on the nature or the risk.<sup>91</sup> While India tabled a revised proposal, taking into account informal discussions, it remained of the view that a specific time frame is necessary to prevent Article 10.2 remaining a ‘non-implementable best endeavour clause’.<sup>92</sup> India, supported by Pakistan, China and Egypt, felt that alternatives proposals made would dilute the strength of its proposal.<sup>93</sup> China pointed out that developed-country Members’ concerns are already reflected in the fact that Article 10.2 contains the condition that extended compliance periods are only accorded when the appropriate level of SPS protection allows.<sup>94</sup> As noted by the Chair, significant divergences remain and no agreement seems likely.<sup>95</sup>

As was to be expected, there is also no support from developed-country Members for Egypt’s proposal to make mandatory the granting by the SPS Committee of an exemption from specific obligations in the *SPS Agreement* under Article 10.3.<sup>96</sup> While the US, Canada, Australia, Switzerland, Japan and Hungary have expressly opposed the automatic nature of the proposed exemption, the EC supported changing the wording of Article 10.3 from ‘is enabled to grant’ to ‘shall positively consider’.<sup>97</sup> A revised text was submitted by Egypt, indicating that the ‘eligibility’ of developing-country Members for an exemption refers to their right to request an exemption, not their right to have an exemption granted.<sup>98</sup> As these Members are already eligible to request exemptions, this does not add anything to Article 10.3. Further, the revised proposal incorporates the EC’s suggestion by creating an obligation of ‘positive and expeditious consideration’ by the SPS Committee to exemption requests. To indicate that the word ‘positive’ does not prejudice

---

CTD/M/10, circulated on 21 January 2002.

<sup>90</sup> Special Session Committee on Trade and Development, *Note on the Meeting of 7 December 2007*, TN/CTD/M/32, circulated on 9 January 2008, para. 6.

<sup>91</sup> *Ibid.*, paras 10, 13, 14 and 15. This comment was first made by Australia, which then called for more creative thinking in this regard, to ensure that the nature and purpose of the *SPS Agreement* is respected. Similar comments were made by the US, Canada and the EC.

<sup>92</sup> *Ibid.*, para. 7. India pointed out that the objective of its proposal was to address the practical problems faced by developing-country exporters with short time frames for compliance with new and onerous SPS measures, resulting in virtual denial of market access.

<sup>93</sup> *Ibid.*, paras 6, 8, 11 and 12. Pakistan gave concrete examples of where non-compliance with new SPS measures has resulted not only in a rejection of its exports but also in their confiscation. It has attempted to resolve these issues bilaterally rather than through the use of Article 10.2 due to the uncertainty that results can be achieved through this avenue, and the need to resolve issues promptly to minimise the damage suffered by exporters.

<sup>94</sup> *Ibid.*, para. 17.

<sup>95</sup> *Ibid.*, para. 6. The assessment of the Chair was agreed with by Australia and the US.

<sup>96</sup> It is therefore surprising that this proposal was classified as a Category I proposal, which are those on which agreement seems likely in the short term.

<sup>97</sup> This discussion took place at the meeting of the General Council Chair and the Heads of Delegations of Members on 5 June 2003, where, *inter alia*, Article 10.3 of the *SPS Agreement* was on the table. ‘Friends of the Chair Looking to Save WTO’s S&D Review’, *Bridges Weekly Trade News Digest*, 12 June 2003.

<sup>98</sup> Special Session Committee on Trade and Development, *Note on the Meeting of 7 December 2007*, TN/CTD/M/32, circulated on 9 January 2008, para. 5.

the outcome of the decision, Egypt added that the decision would be taken ‘as appropriate’. Finally, Egypt added a sentence specifying that assistance can be provided either bilaterally or through the appropriate international organisations. Egypt clarified that the proposal does not aim to make technical assistance mandatory, but only seeks to ensure that it is targeted and linked to the request.<sup>99</sup> Despite these broad concessions, there were still some Members that remained concerned and sought further revisions. The Chair noted the considerable progress on this issue and urged Members to show flexibility.<sup>100</sup>

The SPS Committee has set up a work programme of formal and informal meetings to address the Category II SDT proposals referred to it by the General Council.<sup>101</sup> In particular, the two proposals on Article 10.1 were discussed. Some Members opposed the Like-Minded Group’s proposal for the creation of a legally binding obligation to enter into consultations if a developing-country Member identifies problems in complying with an SPS measure, on the basis that if no mutually satisfactory solution could be reached in consultations, the proposal might lead to ‘other legal solutions’ with other effects on the *SPS Agreement*.<sup>102</sup> Further, Canada indicated that its proposal on transparency procedure for SDT, subsequently adopted in revised form, reflected the same concerns as the Like-Minded Group’s proposal.<sup>103</sup> However, Egypt pointed out that the Canadian proposal did not contain the requirement to ensure and enhance current export levels, as embodied in the Like-Minded Group’s proposal. This requirement was strongly opposed by Norway and New Zealand, as it would oblige Members to maintain market access in disregard of national SPS requirements.<sup>104</sup> Pakistan and Sri Lanka clarified that importing Members were not being asked to surrender their right to regulate, but only to compensate for the resulting loss of export revenue, or to assist developing-country Members to acquire the infrastructure and capacity to comply with the SPS requirements of the importing Members. A revised proposal by the Africa Group suggested that before a new SPS requirement is adopted by a developed-country Member, it must carry out an impact assessment to establish whether an adverse effect on developing-country trade is likely to result.<sup>105</sup> In the event that such adverse effects are identified, the new measure may not

<sup>99</sup> *Ibid.*

<sup>100</sup> *Ibid.*

<sup>102</sup> Committee on Sanitary and Phytosanitary Measures, *Proposals and Progress on Special and Differential Treatment. Note by the Secretariat*, G/SPS/GEN/543, circulated on 28 February 2005, para 26.

<sup>103</sup> The SDT transparency procedure is discussed below, Part V, Section 1.8.

<sup>104</sup> Committee on Sanitary and Phytosanitary Measures, *Proposals and Progress on Special and Differential Treatment. Note by the Secretariat*, G/SPS/GEN/543, circulated on 28 February 2005, para. 30.

<sup>105</sup> Committee on Trade and Development, *Special and Differential Treatment Provisions Joint Communication from the African Group in the WTO. Revision*, TN/CTD/W/3/Rev.2, circulated on 17 July 2002. Scott supports the idea of prior impact assessment, referring to the 2005 World Bank report that recommends that industrialised countries include in their SPS regulatory assessments the prospective impact of their measures on developing countries, and inform developing countries of these effects. Steven Jaffee *et al.*, *Food Safety and Agricultural Health Standards: Challenges and Opportunities for Developing Country Exports*, 31207 (World Bank, Poverty Reduction & Economic Management Trade Unit and Agriculture and Rural Development Department, Washington D.C.), 10 January 2005, 34, available at: [http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016\\_20050125093841/Rendered/PDF/31207.pdf](http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016_20050125093841/Rendered/PDF/31207.pdf), visited on 18 May 2008. Naturally, Scott does not support the idea that SPS measures must be delayed pending the establishment of the ability of the affected Members to comply with the new measure. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford

come into force until it is established that the affected Members have acquired the capacity to comply. In June 2007, Egypt informally tabled a new proposal on Article 10.1, with a view to making it an obligation of result, rather than of conduct.<sup>106</sup> The same objections were raised.

During these discussions, developing-country Members complained that the provisions on technical assistance and special and differential treatment are either couched in non-mandatory language or constitute at most ‘best-endeavour’ obligations without being fully operational.<sup>107</sup> In particular, they noted that additional time for compliance with new SPS measures has seldom been granted. In addition, their continued problems with regard to effective participation in international standard setting were pointed out. A number of developing-country Members indicated their concern with ensuring that proposed changes did not result in discrimination among developing countries.<sup>108</sup> In its 2005 report, the SPS Committee noted a strong resistance by many Members to changes in the text of the *SPS Agreement* and indicated an emerging broad consensus to actively seek alternative, concrete avenues to fulfil the mandate before undertaking specific changes in the text of the *SPS Agreement*. It reiterated the major concern repeatedly raised that modification could result in changes to the balance of rights and obligations established by the *SPS Agreement*. This could result in changes in the text of other provisions.<sup>109</sup>

The common thread running through many of the responses of developed-country Members to the SDT proposals is the concern with disturbing the balance between trade and health achieved in the *SPS Agreement*.<sup>110</sup> For example, the US expressed the view that SDT under the *SPS Agreement* is fundamentally different than under other WTO agreements, and that some of the proposals for mandatory SDT put at risk the balance of the *SPS Agreement*.<sup>111</sup> The EC pointed out that as health protection is at stake, some of the SDT proposals are unfeasible.<sup>112</sup> Similarly, Australia stated that once a risk has been scientifically established, the risk is not diminished by virtue of the exporting Member being

<sup>108</sup> Committee on Sanitary and Phytosanitary Measures, *Implementation and Special and Differential Treatment. Report by the Chairman to the General Council*, G/SPS/27, circulated on 4 July 2003, para. 13.

<sup>109</sup> Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment: Adopted by the Committee on 30 June 2005*, G/SPS/35, circulated on 7 July 2005, para. 4.

<sup>110</sup> Low notes that some of the proposals made for reform of SDT, such as those regarding the reduction of SPS requirements in importing countries in order to meet the development needs of developing countries, would be ‘difficult to accommodate’. Patrick Low, ‘Is the WTO Doing Enough for Developing Countries?’ in *WTO Law and Developing Countries*, George A. Bermann and Petros C. Mavroidis (eds.) (Cambridge University Press, Cambridge), 2007, 324-358.

<sup>111</sup> Committee on Trade and Development Special Session, *Note on the Meeting of 6 November 2002*, TN/CTD/M/10, circulated on 21 January 2002, para. 5. Argentina rejected the idea that SDT in the *SPS Agreement* is different from that under any other WTO agreement. Committee on Trade and Development Special Session, *Note on the Meeting of 6 November 2002. Corrigendum*, TN/CTD/M/10/Corr.1, circulated on 21 February 2002, para. 7.

<sup>112</sup> Committee on Trade and Development Special Session, *Note on the Meeting of 6 November 2002*, TN/CTD/M/10, circulated on 21 January 2002, para. 6. In the same line, Switzerland argued that it did not see how it would be possible to reconcile the right to maintain the desired level of health protection with an obligation to maintain a certain market share for developing-country exporting Members. *Ibid.*, para. 11.

a developing or developed country. Therefore, to make SDT mandatory would deny the sovereign right of an importing Member, enshrined in the *SPS Agreement*, to determine its own level of protection.<sup>113</sup> It noted that efforts to strengthen special provisions for developing countries are more likely to take the form of stronger commitments to provide technical assistance under Article 9 of the *SPS Agreement*, than making mandatory the SDT provisions of Article 10. Many of the comments of developing-country Members in this discussion recognised the right of other Members to impose SPS measures, and emphasised that they were not attempting to change the balance in the *SPS Agreement*.<sup>114</sup> Instead, they stressed the need to address the capacity constraints of developing-country Members in complying with these measures through technical assistance. In addition, several Members supported work on procedural issues improving the transparency of SDT and the development of guidelines on the recognition of equivalence.<sup>115</sup>

The SDT discussions bring to light the difficulty inherent in attempts to reform the SDT provisions of the *SPS Agreement* in a manner that does not threaten the delicate balance achieved by its provisions between trade and health. Although the regulatory disciplines of the *SPS Agreement*, unlike traditional trade liberalisation rules, entail real costs for developing-country Members, the solution does not lie in weakening the disciplines when it comes to developing countries. Neither can it lie in greater limitations to the right of developed-country Members to regulate or to maintain their chosen level of protection. A different solution must be sought.

In the academic and policy discussion on how to strengthen SDT, the possibility of differentiation between developing-country Members is increasingly raised.<sup>116</sup> Developed-country

<sup>113</sup> *Ibid.*, para. 9.

<sup>114</sup> See for example the remarks made by the representatives of Pakistan, India and Kenya. Committee on Sanitary and Phytosanitary Measures, *Procedure to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members. Decision by the Committee of 27 October 2004*, G/SPS/33, circulated on 2 November 2004, paras 10, 12 and 13.

<sup>115</sup> *Ibid.*, paras 4, and 6-8.

<sup>116</sup> Some authors argue for a revision of the current groupings in the WTO, away from self-selection of developing-country status towards more objective criteria. For instance, Hoekman *et al.* suggest the development of criteria to identify an LDC+ group of small and poor developing-country Members to capture those Members most in need of SDT for all WTO agreements. Bernard Hoekman *et al.*, *Special and Differential Treatment for Developing Countries: Towards a New Approach in the WTO* (World Bank, Washington D.C.), 4 April 2003. Kasteng proposes a more advanced country classification system, based on mutually exclusive indicators. The criteria examined are based on food security, rural development, and significance of net exports of agricultural products. Jonas Kasteng *et al.*, *Differentiation between Developing Countries in the WTO*, Report 2004:14 E (Swedish Board of Agriculture, International Affairs Division, Jönköping), June 2004, available at: [http://www.sjv.se/webdav/files/SJV/trycksaker/Pdf\\_rapporter/ra04\\_14E.pdf](http://www.sjv.se/webdav/files/SJV/trycksaker/Pdf_rapporter/ra04_14E.pdf), visited on 15 July 2004. Prowse recommends an 'issues-based' approach, assessing a Member's overall development strategy and transition requirements to determine the sequencing for implementation of WTO agreements. Susan Prowse, 'The Role of the International and National Agencies in the Trade-Related Capacity Building', *The World Economy* 25 (9), 2002, 1235-1261. Others, such as Keck and Low, argue for the need to move away from classification of countries but instead disaggregate SDT by means of agreement-specific criteria. Susan Prowse, 'The Role of the International and National Agencies in the Trade-Related Capacity Building', *The World Economy* 25 (9), 2002, 1235-1261. For example, Stevens argues for the development of criteria or indicators, on the basis of an analysis of what is supportive of development, to establishment the readiness of Members to commit to certain obligations. Graduation would then automatically be triggered for specific Members with regard to specific obligations at a time established by the development process itself. Christopher Stevens, *The Future of the Special and Differential Treatment (SDT) for Developing Countries in the WTO*, IDS Working Paper 163 (Institute for Development Studies, Brighton), September 2002. An ICTSD policy

Members have suggested that strengthening SDT will not be achieved unless it is possible to differentiate between developing-country Members at different levels of development, so that these Members could progressively graduate from SDT eligibility. Developing-country Members, however, have consistently refused to engage in any discussion of differentiation and graduation.<sup>117</sup> As noted by Thomas Cottier, while improving SDT by means of progressive application, or phasing-in, of prescriptive rules may be a solution for other WTO agreements, it is not the case for the *SPS Agreement*.<sup>118</sup> This is due to the special nature of the conflict it mediates, involving both a particularly crucial area of trade liberalisation, namely agricultural trade, and a highly important societal value, namely health.

Consequently, while effective solutions to the problems of developing countries are essential, they will not be found in changing the substantive rights and obligations through strengthening and differentiating the SDT provisions. Instead, progress can be, and to some extent already has been, made in resolving the problems that underlie the SDT proposals by improving the implementation of the procedural rules (for example, those on transparency, equivalence and regionalisation). The remaining concerns that form the basis for the SDT proposals can only be addressed through technical assistance.

This conclusion is reflected in the outcome of the work on SDT in the SPS Committee. The work programme of the SPS Committee did not result in any decisions on the Category II proposals.<sup>119</sup> However, SDT remains an agenda item at each of the regular meetings of the SPS Committee. In this regard, the SPS Committee has taken a two pronged approach.<sup>120</sup> Not only does the Committee continue to discuss the SDT proposals,<sup>121</sup> but it usefully

---

paper of 2007 focuses on distinctions in SDT provision based on differences in 'development situations', i.e. the special needs or constraints of particular countries in specific situations. This avoids an 'all-or-nothing' approach to differentiation and graduation. International Centre for Trade and Sustainable Development, *An Approach to Special and Differential Treatment Based On "Development Situations"* (International Centre for Trade and Sustainable Development, May 2007, available at: [http://www.ictsd.org/issarea/S&DT/Docs/Policy%20Paper%20FT2%20\(2\).pdf](http://www.ictsd.org/issarea/S&DT/Docs/Policy%20Paper%20FT2%20(2).pdf), visited on 11 June 2008).

<sup>117</sup> Patrick Low, 'Is the WTO Doing Enough for Developing Countries?' in *WTO Law and Developing Countries*, George A. Bermann and Petros C. Mavroidis (eds.) (Cambridge University Press, Cambridge), 2007, 324-358, 334. Low regards this as a major impediment to progress in the SDT discussions.

<sup>118</sup> Cottier develops the idea of a new type of graduation in SDT, through progressive application of substantive prescriptive rules to developing countries, commensurate to their divergent levels of development, based on economic factors *within* the substantive rules (rather than through exemptions from the rules). This is analogous to the idea of progressive liberalisation, which historically underlies the GATT, and now the WTO, framework. However, Cottier points out that this approach is not possible in the area of SPS regulation, since health protection is 'indivisible'. Therefore the only solution in this area is technical assistance. T. Cottier, 'From Progressive Liberalization to Progressive Regulation in WTO Law', *Journal of International Economic Law* 9 (4), 2006, 779-821, 794 and 800.

<sup>119</sup> The report at the end of the initial work programme indicates the absence of decisions. Committee on Sanitary and Phytosanitary Measures, *Implementation and Special and Differential Treatment: Report by the Chairman to the General Council*, G/SPS/30, circulated on 20 November 2003. In August 2004 the General Council again referred the agreement-specific proposals to the relevant WTO bodies, with the instruction to expeditiously complete work on these proposals and report back with clear recommendations for a decision by July 2005. The SPS Committee was again unable to develop any recommendations on the proposals by this date. Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment. Adopted by the Committee on 30 June 2005*, G/SPS/35, circulated on 7 July 2005, para. 41.

<sup>120</sup> Committee on Sanitary and Phytosanitary Measures, *Special and Differential Treatment. Report by the Chairman to the General Council*, G/SPS/44, circulated on 23 April 2007, para. 1.

<sup>121</sup> In 2006 and 2007, discussions centred on the revised proposal of the African Group and the new informal

identifies possible pragmatic and concrete actions that could address the concerns that *underlie* the SDT proposals made.<sup>122</sup> One example of this approach is the concerted attention currently given in the SPS Committee to the question of how to improve technical assistance provision, addressed further below. Other examples are the outcomes of the work done in the SPS Committee to improve compliance with the procedural rules on transparency, equivalence and regionalisation, discussed above. Finally, the recent agreement reached in the SPS Committee regarding transparency of special and differential treatment falls into this category.

The latter agreement, although not directly based on the proposals forwarded to the Committee, was mentioned by Canada at the October 2004 meeting of the Special Session of the CTD as a positive result achieved with regard to Category II proposals.<sup>123</sup> It deserves further attention and is therefore discussed below.

### 1.8 Transparency in the provision of SDT

During discussions on the *Recommended Transparency Procedures* at the SPS Committee meeting of March 2002, Egypt made a last minute proposal with the objective of improving transparency with regard to the operation of the SDT provisions of the *SPS Agreement*. Egypt proposed the inclusion in the SPS notification form of a box for countries to state what special and differential treatment they were applying to assist compliance with the notified measure. This proposal was supported by many developing-country Members as they believed it would encourage developed-country Members to build in leniency for developing countries such as longer time periods for compliance. Developed countries (in particular the EC, Canada and the US), while agreeing broadly with the need to promote transparency in the operation of SDT provisions in the *SPS Agreement*, questioned whether the Egyptian proposal would be effective in ensuring SDT. The difficulty of determining, *ex ante*, the specific Members that would need SDT to comply with a notified measure and what type of SDT would be appropriate was raised.

A Canadian proposal, building upon the Egyptian proposal, was submitted in October 2002.<sup>124</sup> This proposal required notifying Members to submit an Addendum to their original notification *ex post*, regarding the provision or non-provision of SDT after consultations had been held on concerns raised by affected Members. Discussions arose around

---

proposal of Egypt, discussed above.

<sup>122</sup> Committee on Sanitary and Phytosanitary Measures, *Special and Differential Treatment. Report by the Chairman to the General Council*, G/SPS/44, circulated on 23 April 2007, paras 7 and 20-24. In this regard, the SPS Committee has formulated a list of 5 elements for discussion. It is interesting to note that *all* of these concern either procedural improvements or technical assistance. None of these elements address SDT in the sense of special flexibilities for developing-country Members. Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment. Adopted by the Committee on 30 June 2005*, G/SPS/35, circulated on 7 July 2005, para. 43. These elements for discussion are set out below, Part V, Section 2.7.

<sup>123</sup> 'WTO S&D Talks Focus on Progress In "Positive" Session', *Bridges Weekly Trade News Digest*, 3 November 2004.

<sup>124</sup> Committee on Sanitary and Phytosanitary Measures, *Enhancing Transparency of Special and Differential (S&D) Treatment within the SPS Agreement. Submission by Canada*, G/SPS/W/127, circulated on 30 October 2002.

the Canadian proposal at the SPS Committee meeting of 7-8 November 2002,<sup>125</sup> resulting in amendments.

The amended Canadian proposal<sup>126</sup> was adopted, in principle, in April 2003, pending further elaboration. However, adoption of the subsequent proposal of the WTO Secretariat<sup>127</sup> for the elaboration of the original proposal was prevented by the US, which opposed the idea of an unlimited consultation period and proposed modifications in this regard.<sup>128</sup> The SPS Committee reverted to this issue in its meeting in March of 2004 and a revised version of the Secretariat proposal was adopted.<sup>129</sup>

However, this revised proposal was not finally adopted at the meeting of 22-23 June 2004, as Malaysia expressed objections. Malaysia argued that the onus should not be on developing-country Members to request SDT but rather on developed-country Members introducing new measures to provide SDT to affected countries. Certain Members disagreed with Malaysia, noting that without the comments from the affected exporting Member, importing Members have difficulty in assessing what SDT they need. Canada noted that *SPS Agreement* already obliges developed countries to provide SDT and that its proposal addressed instead the developing-country concern that SDT does not meet their needs. Therefore the proposal allows them to specify the additional SDT they seek. Several other countries (Jamaica, Nicaragua, Ecuador, Cuba, Peru, Brazil, and the US) urged Malaysia to join the consensus in support of the revised proposal. After a compromise between Canada and Malaysia on this issue, the SPS Committee finally reached agreement on a procedure for the transparency of SDT and this procedure was adopted in October 2004.<sup>130</sup>

The new procedure, known as the *Procedure to Enhance Transparency of SDT*, was adopted without prejudice to Members' rights under Article 10.1 of the *SPS Agreement*.<sup>131</sup> It expressly recognises that it does not fully resolve the SDT issue, but is only one step to-

---

<sup>125</sup> Egypt submitted written comments on the Canadian proposal. See Committee on Sanitary and Phytosanitary Measures, *Comments on the Canadian Proposal. Statement by Egypt at the Meeting of 7-8 November 2002*, G/SPS/GEN/358, circulated on 15 November 2002.

<sup>126</sup> Committee on Sanitary and Phytosanitary Measures, *Enhancing Transparency of Special and Differential (S&D) Treatment within the SPS Agreement. Submission by Canada*, G/SPS/W/127, circulated on 30 October 2002.

<sup>127</sup> Committee on Sanitary and Phytosanitary Measures, *Elaboration of the Proposal to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members*, G/SPS/W/132/Rev.1, circulated on 8 July 2003.

<sup>128</sup> Committee on Sanitary and Phytosanitary Measures, *Elaboration of the Proposal to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members: Proposal by the United States*, G/SPS/W/141, circulated on 27 October 2003.

<sup>129</sup> Committee on Sanitary and Phytosanitary Measures, *Elaboration of the Proposal to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Measures. Note by the Secretariat – Revision*, G/SPS/W/132/Rev.2, circulated on 19 March 2004. According to the revision, Members are obliged to engage in bilateral consultations if an exporting Member identifies significant difficulties in complying with the SPS measure of the importing Member. Thereafter the notifying Member must inform the WTO, by means of an addendum to the original notification, of the SDT requested and provided, or reasons for its non-provision.

<sup>130</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members. Decision by the Committee of 27 October 2004*, G/SPS/33, circulated on 2 November 2004.

<sup>131</sup> *Ibid.*

wards addressing the problem of SDT implementation.<sup>132</sup> In spite of its title, the *Procedure to Enhance Transparency of SDT* is not limited to transparency aspects, but instead and perhaps more importantly, it sets out procedural steps for the identification of SDT needs and discussion of these needs between the Members involved, and suggests possible actions to provide SDT. In this respect it resembles the procedures for the recognition of equivalence and regionalisation adopted by the SPS Committee.<sup>133</sup> The *Procedure to Enhance Transparency of SDT* comprises seven steps, still requiring bilateral consultations if an exporting Member identifies significant difficulties with a proposed SPS measure. In particular, the procedure provides that an exporting Member that identifies a concern with the content of a proposed SPS measure should contact the notifying Member, preferably within the comment period.<sup>134</sup> Where requested by an exporting Member, and particularly where there have been delays in receiving or translating documents or where the notified measure needs further clarification, the importing Member ‘should’ extend the comment period ‘wherever practicable’, usually by 30 days.<sup>135</sup> The notifying Member should acknowledge receipt of the request, and explain to any Member from which it has received comments how it will take these comments into account.<sup>136</sup> If the exporting Member identifies significant difficulties with the notified measure, it may request an opportunity to discuss and resolve the potential difficulty with the notifying Member. The latter will contact the appropriate officials of the exporting Member and enter into bilateral discussions to attempt resolve the problem. If the exporting Member is a developing country, its special needs will be taken into account in determining how to best address the problem.<sup>137</sup> Possible ways in which concerns raised by Members could be resolved are set out in the procedure, including the provision of SDT (applied equally to all developing-country Members), a change in the measure on most-favoured-nation basis or the provision of technical assistance to the affected Member. A similar consultation obligation applies, upon request, where following the entry into force of a new or modified SPS measure, including an emergency measure, significant difficulties in compliance are identified by an exporting Member.<sup>138</sup> The notifying Member is obliged to subsequently submit an Addendum to its original notification where the SDT treatment requested and provided is specified, or reasons are given why SDT was not provided and information is given regarding whether technical assistance or any other solution was found to address the identified concern.<sup>139</sup> The Decision provided for a review of the *Procedure to Enhance Transparency of SDT* within a year of its adoption.<sup>140</sup>

---

<sup>132</sup> *Ibid.*, para. 3.

<sup>133</sup> These procedures are discussed above, Part IV, Sections 1.1.6 and 1.2.6.

<sup>134</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members. Decision by the Committee of 27 October 2004*, G/SPS/33, circulated on 2 November 2004, Step 3. Steps 1 and 2 are the usual requirements of prior notification of new or modified SPS measures, with a reasonable comment period of normally not less than 6 months, and circulation of the notification by the WTO Secretariat.

<sup>135</sup> *Ibid.*

<sup>136</sup> *Ibid.*, Step 4.

<sup>137</sup> *Ibid.*, Step 5.

<sup>138</sup> *Ibid.*, Step 6. This applies especially if no time, or an insufficient time has been provided for comments.

<sup>139</sup> Committee on Sanitary and Phytosanitary Measures, *Procedure to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members. Decision by the Committee of 27 October 2004*, G/SPS/33, circulated on 2 November 2004, Step 7.

<sup>140</sup> *Ibid.*, para. 2.

The SPS Committee noted in February 2006 that the *Procedure to Enhance Transparency of SDT* had only been used a few times. Therefore, it was unable to review its procedures and assess its implementation in order to evaluate whether changes are needed, as required under paragraph 4 of that procedure. As more experience with its application was necessary for an appropriate assessment, the SPS Committee decided to extend the procedure until 2008, and to conduct a review at that time.<sup>141</sup> In June 2008, the Secretariat pointed out that the use of the *Procedure to Enhance Transparency of SDT* had never been notified.<sup>142</sup> This is rather ironic since the stated objective of the procedure is to promote transparency. Following the revision of the general *Recommended Transparency Procedures*, adopted in April 2008,<sup>143</sup> and in light of an additional informal proposal by Egypt<sup>144</sup> and discussions in the SPS Committee, the WTO Secretariat proposed a revision to the SDT transparency procedures for consideration by the SPS Committee.<sup>145</sup> The proposed revisions aim to make the SDT transparency procedure easier to use and reflect the recent changes to the overall transparency procedures. These revisions were considered at the SPS Committee meeting in June 2008, but as no agreement could be reached Members decided to revert to the matter at the following meeting.

The lack of notification of SDT may be misleading as to the usefulness of the *Procedure to Enhance Transparency of SDT*. The apparent contradiction between the 2006 report of the SPS Committee that the procedure had been used a few times and the 2008 statement by the Secretariat indicating the absence of notifications under this procedure can be explained with reference to the responses of Members to the questionnaire on transparency circulated by the Secretariat. Some Members have indicated that they *have* used the *Procedure to Enhance Transparency of SDT*, to raise their compliance concerns regarding notified or published measures, and to initiate discussions with the notifying Member, but the outcome of these discussions has not been notified as an Addendum to the original notification as required by this procedure.<sup>146</sup> In the absence of notifications it is difficult to judge to what extent the procedure has proved useful.<sup>147</sup> However, a tentative conclu-

<sup>141</sup> Committee on Sanitary and Phytosanitary Measures, *Decision to Extend the Procedure to Enhance Transparency of Special and Differential Treatment in Favour of Developing Countries. Decision by the Committee of 1 February 2006. Addendum*, G/SPS/33/Add.1, circulated on 6 February 2006.

<sup>142</sup> As the report of the discussion at the June meeting of the SPS Committee has not been circulated yet, this information is taken from the WTO News Item 'Members turn Attention to Improving SPS Mediation', available at: [http://www.wto.org/english/news\\_e/news08\\_e/sps\\_24june08\\_e.htm](http://www.wto.org/english/news_e/news08_e/sps_24june08_e.htm), visited on 26 June 2008.

<sup>143</sup> Committee on Sanitary and Phytosanitary Measures, *Recommended Procedures for Implementing the Transparency Obligations of the SPS Agreement (Article 7) as of 1 December 2008. Revision*, G/SPS/7/Rev.3, circulated on 20 June 2008. This was adopted *ad referendum*. As no objections were received, the revision was finally on 30 April 2008, but will come into force only on 1 December 2008 to give the Secretariat time to make the necessary changes to the SPS Information Management System.

<sup>144</sup> Job(07)/104.

<sup>145</sup> Committee on Sanitary and Phytosanitary Measures, *Proposed Revision of the Procedure to Enhance Transparency of Special and Differential Treatment in Favour of Developing Country Members (G/SPS/33)*, G/SPS/W/224, circulated on 6 June 2008. The changes in this revision mostly entail an incorporation of the changes to the general notification procedures. In addition, the provision of information at Step 4 is expressly extended to testing and inspection procedures, and the word 'would' is changed to 'will' in Steps 5 and 6 to reflect that this is no longer a proposed procedure, but an adopted procedure.

<sup>146</sup> Committee on Sanitary and Phytosanitary Measures, *Analysis of Replies to the Questionnaire on the Operation of Enquiry Points and National Notification Authorities. Note by the Secretariat. Revision*, G/SPS/GEN/751/Rev.1, circulated on 18 June 2007, para. 28.

<sup>147</sup> It should be noted that other respondents to the Secretariat's questionnaire indicated that the lack of

sion can be drawn that despite the continued reluctance of Members to notify their actions in the area of SDT, the progress made by the *Procedure to Enhance Transparency of SDT* in setting out procedural guidelines for requests for SDT and the discussions on these requests may represent a first step towards operationalising SDT under the *SPS Agreement*.

## 1.9 Conclusion

If developing-country Members are to benefit fully from the rules of the *SPS Agreement*, without being overwhelmed by the costs of compliance, appropriate flexibilities are necessary to take account of their special constraints. These flexibilities are necessary with regard to compliance not only with the resource intensive obligations of the *SPS Agreement* but also with new or modified SPS measures imposed by their trading partners. It is therefore important that the provision of SDT in this agreement not remain at the level of rhetoric, but be effective and operational.

The main form of SDT in the *SPS Agreement* actually applied in favour of developing countries was the provision for transitional periods, as a result of which most disciplines of the *SPS Agreement* only became binding on developing countries in January 1997, and on least-developed countries in January 2000.<sup>148</sup> It has been pointed out in the 2005 report by the SPS Committee on SDT proposals that the *SPS Agreement* is, consequently, still fairly new for developing-country Members, which are still in the process of adjusting to its rules. Other SDT provisions are not very far-reaching or effective and have proved of limited use in helping developing countries adjust to their new obligations.

Although implementation of SDT in the *SPS Agreement* has been disappointing to date, the examination in this Chapter of the various forms of SDT provided for in the *SPS Agreement* indicates that real possibilities exist for panels and the Appellate Body to take a more progressive approach than that adopted by the Panel in the *EC – Approval and Marketing of Biotech Products* dispute, to operationalise SDT provisions through effective treaty interpretation. These possibilities arguably allow for the recognition that several provisions contain enforceable obligations that give effect to the general policy of consideration for the special needs of developing countries, thereby ensuring that the negotiated rights enshrined in these provisions are not rendered illusory. The WTO adjudicatory bodies should shoulder their responsibility to apply the SDT provisions effectively, in the light of the circumstances of each case. However, the possibilities for strengthening SDT through effective treaty interpretation are restricted – they have their bounds in the terms of the provisions themselves, which respect the right of importing Members to secure the level of health protection on their territories that they deem appropriate, and in the object and purpose of the *SPS Agreement*. No interpretation of SDT can go beyond these limitations without undermining the balance in the *SPS Agreement*.

---

notification is because developing-country Members are using other channels to request SDT or because developing-country Members lack resources to screen notifications quickly enough to identify compliance difficulties that could be addressed through SDT. *Ibid.*

<sup>148</sup> This point is made in Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment. Adopted by the Committee on 30 June 2005, G/SPS/35*, circulated on 7 July 2005, para. 6.

This conclusion has implications for the ongoing Doha Round negotiations on SDT and technical assistance, at least as they relate to the *SPS Agreement*. Very little has been achieved by way of operationalising SDT, aside from the *Procedure to Enhance Transparency of SDT*, which has almost never been used. The deadlocked negotiations reflect an impasse between two opposing positions. On the one side are developing-country Members, who view the operationalisation of SDT and technical assistance provisions through amendments or clarifications to strengthen them and make them enforceable, as merely ensuring the implementation of existing negotiated rules. They are therefore not prepared to make concessions in other areas to get, as *quid pro quo*, the agreement of developed countries to these amendments. On the other side are several developed-country Members, who regard the strengthening of SDT and technical assistance provisions as the creation of new rights and obligations, and thus as something developing countries should ‘pay’ for by means of concessions in other areas. In the area of SPS, the additional complication arises that many of the proposals on SDT would have the effect of either requiring developed-country Members to lower their levels of SPS protection when it comes to developing-country products, or would create exemptions from the disciplines of the *SPS Agreement* for developing-country Members. Developed-country Members are extremely hesitant to agree to any amendments of the *SPS Agreement* which might disturb its balance.

If Members recognise that most of the existing SDT provisions could be operationalised by effective treaty interpretation in dispute settlement proceedings, the basis for this deadlock falls away. Members are then left with two options. They can leave the fleshing out of SDT provisions to panels and the Appellate Body, on a case-by-case basis as they are faced with claims such as that of Argentina in *EC – Approval and Marketing of Biotech Products*, or instead they can reach political agreement on the nature and extent of these obligations.

Nevertheless, the limits of SDT should not be forgotten. New or strengthened SDT provisions cannot be framed in a way that would undermine the careful balance between trade and health objectives that is the core purpose of the *SPS Agreement*. This would be the case both if Members were obliged to allow market access to developing-country products that do not meet their chosen level of protection, thus compromising Members’ policy autonomy in the area of SPS protection and if SPS disciplines on SPS regulation were relaxed for developing countries allowing protectionist SPS measures taken by developing-country Members to slip through. The need to avoid such undesirable results means that SDT, even if strengthened within these limits, will in many cases be an insufficient instrument to resolve the problems that developing countries face. Thus, technical assistance assumes greater importance as a tool to help developing-country Members overcome their constraints.

## CHAPTER 2

### Technical assistance for developing countries

It is currently widely acknowledged that technical assistance is crucial for developing-country Members to be able to implement those WTO agreements requiring regulatory capacity and infrastructure, such as the *SPS Agreement*. Without such assistance, the costs of compliance with such agreements could outweigh the benefits from trade liberalisation gains. For this reason, secure, predictable and effective provision of technical and financial assistance is indispensable in the case of trade rules involving regulatory disciplines.<sup>1</sup>

The recognition of this fact is most clearly reflected in the explicit link in the Doha mandate between the negotiations on new trade facilitation rules,<sup>2</sup> and the provision of technical assistance. Rules on trade facilitation resemble rules on SPS regulation in the sense that both aim to improve market access through disciplines on national regulatory and administrative systems, thus requiring investment in infrastructure and human resources for implementation. The mandate for trade facilitation negotiations spells out:

... it is recognized that negotiations could lead to certain commitments whose implementation would require support for infrastructure development on the part of some Members. In these limited cases, developed-country Members will make every effort to ensure support and assistance directly related to the nature and scope of the commitments in order to allow implementation. It is understood, however, that in cases where required support and assistance for such infrastructure is not forthcoming, and where a developing or least-developed

---

<sup>1</sup> Finger points out that while traditional trade liberalisation concessions, in the form of tariff reductions or the removal of quotas, benefit both the country making the concession and the countries receiving the concession in real economic terms, this is not the case for 'New Area' concessions. By 'New Area' Finger means concessions that involve significant implementation costs for policy and institutional reform. Real economics provides no guarantee that the concession giver will benefit from 'new area' concessions. Finger notes that, 'to make development sense, New Area reforms must *be packaged* with capacity-building. Not just the capacity to participate in WTO business in Geneva, capacity as well for the relevant commercial activities. ... This point was clearly made by an African whose government had been provided with technical assistance on Sanitary and Phytosanitary (SPS) implementation by one of the WTO's powerful members: *they want us to understand SPS so that we will import more chicken.*' J. Michael Finger, 'The Uruguay Round North-South Bargain: Will the WTO Get over It?' in *The Political Economy of International Trade Law. Essays in Honor of Robert E. Hudec*, Daniel L. M. Kennedy and James D. Southwick (eds.) (Cambridge University Press, Cambridge), 2002, 301-310, 305.

<sup>2</sup> Trade facilitation is one of the four so-called 'Singapore issues' (competition, investment, trade facilitation and transparency in government procurement) on which, according to the Doha Ministerial Declaration, negotiations would be launched after 'explicit consensus' had been reached on the modalities for negotiation at the Cancun Ministerial Conference. Most developing-country Members opposed the launching of these negotiations. After their experience with implementation difficulties regarding Uruguay Round agreements creating regulatory obligations, and the lack of provision of the expected technical assistance, developing countries were understandably reluctant to negotiate more such agreements. The Doha Round negotiations deadlocked on this point at the Cancun Ministerial Conference in 2003. As part of the 'July Package' agreed to in August 2004 in order to get the Doha Round negotiations back on track, Members decided to drop the other three Singapore issues and launch negotiations only on trade facilitation. General Council, *Doha Work Programme. Decision Adopted by the General Council on 1 August 2004*, WT/L/579, circulated on 2 August 2004.

Member continues to lack the necessary capacity, implementation will not be required.<sup>3</sup>

Along the same lines, the 2004 report of the Consultative Board, which was established by the WTO Director-General to address the challenges currently facing the WTO, recognises that the implementation burdens of new WTO obligations will fall heavily on least-developed Members. It therefore advises that:

... least-developed countries should have a contractual entitlement to capacity building support to implement new commitments in the WTO. It is not good enough for advanced Members merely to express their political intent to provide support – it should be part and parcel of the new agreements.<sup>4</sup>

The Consultative Board therefore recommends the inclusion of provisions in new agreements containing such a contractual right, including the necessary funding arrangements.<sup>5</sup>

This recognition of the need to couple regulatory disciplines with the provision of technical assistance was lacking during the Uruguay Round negotiations leading to the *SPS Agreement*. Instead, the technical assistance provisions of the *SPS Agreement* are loosely framed and no direct link is made between the obligation on Members to implement resource-intensive commitments and the provision of technical assistance to do so.

This Chapter will examine the adequacy of the technical assistance provisions in the *SPS Agreement* and their implementation in practice. In order to do so, however, it is necessary to begin by identifying the needs of developing-country Members in this area. Only with these needs in mind can the sufficiency of the relevant provisions and of technical assistance initiatives be evaluated properly.

## 2.1 Technical assistance needs of developing-country Members

In a 2004 report prepared by Joseph Stiglitz and Andrew Charlton for the Commonwealth Secretariat, they note that although the Doha Development Round has re-emphasised ‘the importance of sharing the benefits of trade reform fairly between developed and developing countries. ... there has been less attention to the distribution of adjustment costs among countries’<sup>6</sup> With regard to the *SPS Agreement*, these adjustment costs relate not only to the reforms necessary to implement the obligations set out in this Agreement, but also to those necessary to overcome constraints to fully benefiting from its poten-

---

<sup>5</sup> *Ibid.*, para. 311.

<sup>6</sup> Joseph E. Stiglitz and Andrew Charlton, *The Development Round of Trade Negotiations in the Aftermath of Cancun* (Commonwealth Secretariat and Initiative for Policy Dialogue, June 2004, 3, available at: [http://www.thecommonwealth.org/shared\\_asp\\_files/uploadedfiles/{F1997C23-BC54-44D0-8E66-7D1166FC9937}\\_StiglitzPaperComsec.pdf](http://www.thecommonwealth.org/shared_asp_files/uploadedfiles/{F1997C23-BC54-44D0-8E66-7D1166FC9937}_StiglitzPaperComsec.pdf), visited on 6 December 2004.

tial for increased market access.<sup>7</sup> The latter type of adjustment costs would necessitate improvements in the ability of developing-country Members to enforce their rights under the *SPS Agreement* when confronted with non-compliant measures as well as actions to address supply-side constraints with regard to meeting legitimate SPS requirements.<sup>8</sup>

The differences in the technical assistance needs of specific Members at different levels economic and human development became apparent from the case studies conducted in Part II of this book. Much depends on the existing SPS regulatory system in the country, its administrative institutional capacity, the importance of agricultural and food trade for its economy, and the availability of human and financial resources. Nevertheless, in broad terms, certain common elements can be found, which necessitate concerted efforts to provide effective technical assistance. A thorough study of the problems of developing countries in the area of SPS regulation, carried out under the auspices of the International Trade Centre (ITC) and the Commonwealth Secretariat points out that:

Particularly having regard to those needs being common to many developing countries, very substantial long-term technical assistance requirements exist.<sup>9</sup>

Some of the common needs identified in various studies will now be briefly set out.

Training and information is needed to improve developing-country Members' understanding of the disciplines of the *SPS Agreement*.<sup>10</sup> Such training is essential to assist

<sup>7</sup> In his overview of UNCTAD's Least Developed Country Report 2004, UNCTAD Secretary-General Rubens Ricupero has identified the need for international assistance for developing production and trade capacities in least-developed countries as one of the three pillars necessary for effective poverty reduction. In this regard he noted, 'Building productive and supply capacities at the national level will contribute to both trade expansion and poverty reduction and play a central role in improving the trade-poverty relationship in the LDCs. There is a need for massive investment in enhancing the supply capacities of the LDCs and improving their competitiveness. In the approach being advocated here, trade capacity building is central to that process. ... The need for international financial and technical assistance arises because of the limited domestic resources available for doing this, the short-term trade-off between domestic resource mobilization and poverty reduction, and also limits to the potential of private capital inflows to meet many of the investment needs.' United Nations Conference on Trade and Development, *The Least Developed Countries Report 2004: Linking International Trade with Poverty Reduction*, UNCTAD/LDC/2004 (UNCTAD, Geneva), 27 May 2004, 29-30, available at: [http://www.unctad.org/en/docs/lde2004\\_en.pdf](http://www.unctad.org/en/docs/lde2004_en.pdf), visited on 7 June 2008.

<sup>8</sup> In more general terms, Stiglitz and Charlton note, 'Assistance is required not only to help bear the often large costs associated with trade reform, but also to enable developing countries to avail themselves of the new opportunities provided by a more integrated global economy.' Joseph E. Stiglitz and Andrew Charlton, *The Development Round of Trade Negotiations in the Aftermath of Cancun* (Commonwealth Secretariat and Initiative for Policy Dialogue, June 2004, 4, available at: [http://www.thecommonwealth.org/shared\\_asp\\_files/uploadedfiles/{F1997C23-BC54-44D0-8E66-7D1166FC9937}\\_StiglitzPaperComsec.pdf](http://www.thecommonwealth.org/shared_asp_files/uploadedfiles/{F1997C23-BC54-44D0-8E66-7D1166FC9937}_StiglitzPaperComsec.pdf), visited on 6 December 2004.

<sup>9</sup> Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume I: Background Information, Findings from Case Studies and Technical Assistance Needs* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2003, 88. This study notes that technical assistance needs are country-specific and cannot simply be seen as the gap between developed and developing countries. It notes, in particular, the differences in level of industrial development between countries, and the differences in priorities between food-importing and food-exporting countries. It stresses the importance of identifying, evaluating and quantifying the specific needs of each country. *Ibid.*, 86.

<sup>10</sup> This need is emphasised in Gonzalo K. Ríos 'Technical Assistance Needs of Developing Countries and Mechanisms to Provide Technical Assistance', presented at the *Conference on International Food Trade Beyond 2000: Science-Based Decisions, Harmonization, Equivalence and Mutual Recognition* (Food and Agriculture Organization of the United Nations, Melbourne, Australia) 11-15 October 1999, para. 42,

developing countries to comply with their obligations under the Agreement. Further, it would help developing-country Members to enforce their rights and make use of the opportunities the *SPS Agreement* provides for enhanced market access, for example by challenging an SPS measure of another Member before the SPS Committee or in dispute settlement proceedings. The need for improved understanding of the *SPS Agreement* was underlined several times in the case studies set out in Part II above. In addition, training is needed to improve the SPS regulatory capacity of developing countries, particularly when it comes to setting up complex systems such as HACCP and conducting pest risk assessments.<sup>11</sup>

Although such training programmes are necessary in many countries, technical assistance needs do not stop here. Developing-country Members have often pointed to the fact that the recent proliferation of workshops on SPS issues cannot bear fruit without accompanying resources to implement reforms. In the report of the in-depth study conducted jointly by the ITC and the Commonwealth Secretariat, it is stated with regard to the provision of training without resources:

This can be compared to training a carpenter, but that carpenter then having no tools (equipment) or timber (financial resources) to actually work with.<sup>12</sup>

For this reason, technical assistance must extend to addressing resource constraints and improving supply-side capacity. As repeatedly noted above, the *SPS Agreement* is resource-intensive, as it requires the creation of institutional structures for transparency and the creation of an SPS regulatory system reflecting best practices in developed countries. Technical assistance is needed by developing-country Members to alleviate the burden of compliance with their obligations under the *SPS Agreement*.

This entails, *inter alia*, support for the establishment of a well functioning National Notification Authority and Enquiry Point. Although most Members, including developing countries, have now designated bodies to fulfil these functions, there are many shortcomings in their operation.<sup>13</sup> Developing-country Members often lack the capacity to issue timely and complete notifications of their SPS measures, provide the relevant documentation, and create procedures for receipt and consideration of comments on notified measures. Similarly, with regard to the notifications of their trading partners, developing-country Members may not have the resources to keep track of all notifications and identify those of interest to them, even with the help of the improved Secretariat lists of notifications.<sup>14</sup> They may also not have mechanisms in place for the circulation of notifications to interested private parties who are in a position to identify problems with notified measures. As a result, they may fail to make use of the opportunity to provide

---

<sup>11</sup> With regard to the problems with existing training programmes, see below, Part V, Sections 2.5.2.1 and 2.6.

<sup>12</sup> Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume I: Background Information, Findings from Case Studies and Technical Assistance Needs* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2003, 88. The report, in this context, makes mention of the considerable amount of training provided to African and Pacific countries on pest risk analysis by various agencies, the effectiveness of which could not be maximised due to a lack of resources.

<sup>13</sup> These implementation problems are discussed further above, Part IV, Section 1.3.6.

<sup>14</sup> See further on the notification procedure above, Part IV, Section 1.3.2.2.

comments on draft measures in order that their interests may be considered by regulators in the relevant importing Members.

Many developing-country Members also need assistance to improve their effective participation in international standard-setting bodies.<sup>15</sup> The new importance of the harmonised standards set by these bodies since the coming into force of the *SPS Agreement*, as discussed above,<sup>16</sup> is of particular consequence for developing-country Members. Often, these Members do not have the capacity to provide the required scientific justification for deviation from harmonised standards. They must thus conform their measures to the relevant international standards or face the possibility of a challenge under the *SPS Agreement*. It is therefore essential that developing-country interests and circumstances be properly reflected in all stages of the international standard-setting process, including the initiation of new standards, the technical drafting of standards, and the adoption of the resulting standards.<sup>17</sup> This can be achieved only if the technical, financial and human resources are available to allow not only attendance of meetings of the international standard-setting bodies, but also the collection of relevant data and the formulation of national positions in advance.<sup>18</sup> This requires technical assistance.<sup>19</sup>

Further, several developing-country Members experience difficulties with the adoption or implementation of internationally harmonised standards. For example, as set out in Part II above,<sup>20</sup> the implementation of international standards is difficult for Bangladesh, Bangladesh points to the lack of domestic expertise and institutional structures for the adoption of these standards and the additional financial burden these standards place on its exporters.<sup>21</sup> Without technical assistance to overcome these constraints, countries like Bangladesh cannot comply with Article 3 of the *SPS Agreement*, nor benefit from the adoption of harmonised SPS measures by its trading partners.

Closely linked to the above, is the fact that developing countries need help to strengthen their national SPS regulatory systems, through legislative and institutional reforms. Well-functioning SPS systems would make it easier for developing countries to be able to comply with international standards, or to justify deviating measures. One particular area of SPS regulatory capacity for which technical assistance is needed, is risk assess-

---

<sup>15</sup> This conclusion is also come to in Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume I: Background Information, Findings from Case Studies and Technical Assistance Needs* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2003, 72.

<sup>16</sup> See above, Part III, Section 4.3.

<sup>17</sup> With regard to the extent of participation by developing-country Members in the various stages of international standard setting procedures, see above, Part II, Sections 3.2.1.5, 3.2.2.5 and 3.2.3.5.

<sup>18</sup> Gonzalo K. Ríos, 'Technical Assistance Needs of Developing Countries and Mechanisms to Provide Technical Assistance', presented at the *Conference on International Food Trade Beyond 2000: Science-Based Decisions, Harmonization, Equivalence and Mutual Recognition* (Food and Agriculture Organization of the United Nations, Melbourne, Australia) 11-15 October 1999, para. 27, available at: [www.fao.org/docrep/meeting/X2674e.htm](http://www.fao.org/docrep/meeting/X2674e.htm), visited on 6 November 1999.

<sup>19</sup> The initiatives to provide such assistance to facilitate developing-country participation in international standard-setting are discussed below, Part V, Section 2.4.

<sup>20</sup> See above, Part II, Section 2.7.2.1.

<sup>21</sup> Trade Policy Review Body, *Trade Policy Review: Bangladesh – Report by the Government*, WT/TPR/G/68, circulated on 3 April 2000, para. 19.

ment.<sup>22</sup> Support for building the capacity to conduct scientific analysis is necessary for developing-country Members to be able to meet the scientific requirements of the *SPS Agreement* for their SPS measures, on the one hand, and to be able to challenge SPS measures of other Members lacking the required scientific basis, on the other. For this, expertise must be developed, risk analysis units must be established in government bodies, laboratory facilities must be upgraded, channels must be created for the involvement of universities and the private sector in data collection and analysis, and coordination mechanisms must be set up between the responsible government authorities.<sup>23</sup>

Assistance is further needed to improve developing countries' ability to comply with the applicable SPS requirements for their export products. This necessitates both development of private sector capacity to implement the required reforms and enhancement of public sector facilities to support such compliance. The new trend in many developed countries towards laying down systems-wide SPS requirements, for example HACCP, GAP and GMP,<sup>24</sup> necessitates far-reaching reforms and substantial investments for compliance by developing countries. The additional increasing application of 'zero tolerance' or 'lowest achievable level' requirements for certain contaminants or toxins by some importing Members exacerbates compliance problems.

As has been previously noted, it is not sufficient to be able to comply with the SPS requirements of trading partners. It is also necessary to be able to prove such compliance, in order to gain market access. Although most importing countries have effective import control systems in place to ensure compliance with their requirements, it is important for exporting countries to have strong export control systems in place as well. This would, *inter alia*, serve to reduce delays from inspection and testing at the point of entry, ensure that decisions on what to do with non-complying products can be taken by the exporting rather than importing Member,<sup>25</sup> protect the reputation of the exporting country as a source of safe products,<sup>26</sup> and eliminate the risk of rejection.<sup>27</sup> Developing-country

---

<sup>22</sup> Gonzalo K. Ríos 'Technical Assistance Needs of Developing Countries and Mechanisms to Provide Technical Assistance', presented at the *Conference on International Food Trade Beyond 2000: Science-Based Decisions, Harmonization, Equivalence and Mutual Recognition* (Food and Agriculture Organization of the United Nations, Melbourne, Australia) 11-15 October 1999, para. 40, available at: [www.fao.org/docrep/meeting/X2674e.htm](http://www.fao.org/docrep/meeting/X2674e.htm), visited on 6 November 1999.

<sup>23</sup> *Ibid.*, para. 53. Ríos further points to the need to implement GAP and GMP in developing countries.

<sup>24</sup> This trend towards systems-wide requirements is discussed above, Part II, Section 1.3.

<sup>25</sup> For example, the exporter, with the approval of the export control authority, could send the non-complying product to another country with less strict SPS requirements. If the decision is left to the importing country, non-complying products are often destroyed or at best sent back to the exporting country, possibly causing spoilage due to delays in getting the product onto the market.

<sup>26</sup> The WHO Regional Office for Africa has noted that, 'Losses from export rejection not only rob countries of critical revenues but also of credibility as reliable trading partners.' WHO Regional Office for Africa, 'Developing and Maintaining Food Safety Control Systems for Africa – Current Status and Prospects for Change', presented at the *FAO/WHO Second Global Forum of Food Safety Regulators*, Conference Room Document 32 (Food and Agriculture Organization and World Health Organization, Bangkok, Thailand) 12-14 October 2004, 2, available at: <ftp://ftp.fao.org/docrep/fao/meeting/008/ae144e/ae144e00.pdf>, visited on 24 June 2008.

<sup>27</sup> These advantages are listed, among others, in Shashi Sareen, 'Food Export Control and Certification', presented at the *FAO/WHO Second Global Forum of Food Safety Regulators*, GF 02/8a (Food and Agriculture Organization and World Health Organization, Bangkok, Thailand) 12-14 October 2004, available at: <ftp://ftp.fao.org/docrep/fao/meeting/008/j2747e.pdf>, visited on 6 November 2004.

Members therefore need help to establish reliable quality control systems for conformity assessment (such as product testing and certification).<sup>28</sup> These require well-equipped and adequately staffed laboratories,<sup>29</sup> which are accredited according to international standards.<sup>30</sup> For example, as we have seen above, the new EC chemicals regime resulting in setting permissible level of pesticide residues at zero (or the lowest detection level) has raised considerable concerns in Mauritius, which would require substantial laboratory capacity in order to be able to test for all relevant residues.<sup>31</sup> In addition, a well-functioning export control programme must be in place, involving official inspection and certification bodies<sup>32</sup> that can undertake inspections, sampling, examinations of records, and audits of establishments and are competent to issue certificates of compliance.<sup>33</sup>

From the above discussion, it appears that technical assistance should be seen broadly. In keeping with this, the WTO Secretariat has developed a typology of technical assistance for purposes of the *SPS Agreement* including: the provision of information to enhance Members' understanding of their rights and obligations under the *SPS Agreement*; the provision of practical and detailed training on the operation of the *SPS Agreement*; the provision of 'soft' infrastructure (training and formation of technical and scientific personnel and the development of national regulatory frameworks); and 'hard' infrastructure (laboratories, equipment, veterinary services and the establishment of disease free areas).<sup>34</sup>

As recently noted by the UNCTAD Secretariat with regard to technical assistance in the context of the WTO in general:

Developing countries require concrete assistance to build supply capacity...  
Targeted, comprehensive and high-quality technical assistance and deeper

<sup>28</sup> See Gonzalo K. Ríos 'Technical Assistance Needs of Developing Countries and Mechanisms to Provide Technical Assistance', presented at the *Conference on International Food Trade Beyond 2000: Science-Based Decisions, Harmonization, Equivalence and Mutual Recognition* (Food and Agriculture Organization of the United Nations, Melbourne, Australia) 11-15 October 1999, para. 39, available at: [www.fao.org/docrep/meeting/X2674e.htm](http://www.fao.org/docrep/meeting/X2674e.htm), visited on 6 November 1999.

<sup>29</sup> The WHO Regional Office for Africa reports that most public sector laboratories in that region do not have the capacity to test for naturally occurring toxins and chemical contaminants. It notes that 'this may be due to lack of financial resources for the development and maintenance of equipment and manpower.' WHO Regional Office for Africa, 'Developing and Maintaining Food Safety Control Systems for Africa – Current Status and Prospects for Change', presented at the *FAO/WHO Second Global Forum of Food Safety Regulators*, Conference Room Document 32 (Food and Agriculture Organization and World Health Organization, Bangkok, Thailand) 12-14 October 2004, 5, available at: <ftp://ftp.fao.org/docrep/fao/meeting/008/ae144e/ae144e00.pdf>, visited on 24 June 2008.

<sup>30</sup> The International Standardisation Organisation (ISO) has developed standard ISO 17025 for laboratory accreditation. Such internationally recognised standards ensure that the results of laboratory tests are accepted as reliable.

<sup>31</sup> The EU's technical assistance efforts, under the *Cotonou Agreement*, to enable Mauritius to meet the new requirements are noted above Part II, Section 2.5.2.1.

<sup>32</sup> ISO also lays down standards for accreditation of inspection bodies (ISO 17020) and certification bodies (ISO guides 62 and 65). See Shashi Sareen, 'Food Export Control and Certification', presented at the *FAO/WHO Second Global Forum of Food Safety Regulators*, GF 02/8a (Food and Agriculture Organization and World Health Organization, Bangkok, Thailand) 12-14 October 2004, 11, available at: <ftp://ftp.fao.org/docrep/fao/meeting/008/j2747e.pdf>, visited on 6 November 2004.

<sup>33</sup> These and other elements of a good export control system are discussed in *Ibid.*, 3-5.

<sup>34</sup> Committee on Sanitary and Phytosanitary Measures, *Technical Assistance Typology: Note by the Secretariat*, G/SPS/GEN/206, circulated on 18 October 2000.

institutional and structural capacity building are important components. They need to be enhanced and to go beyond traditional technical cooperation directed at implementing World Trade Organization (WTO) Agreements by providing for, inter alia, deeper institutional and structural capacity building.<sup>35</sup>

The abovementioned report of the ITC and Commonwealth Secretariat project states:

Without targeted technical assistance based on a sound strategy, and in-country commitment to support the efforts made, it is highly unlikely that developing countries will be able to extract benefits from the existence of the [*SPS Agreement*].<sup>36</sup>

Whether the relevant technical assistance provisions of the *SPS Agreement* meet these needs, must now be examined. Technical assistance provisions are found not only in Article 9, which is entitled ‘Technical Assistance’, but also in Article 10.4 of the *SPS Agreement*.<sup>37</sup> These provisions will now be discussed in turn.

## 2.2 Facilitation of provision of technical assistance

The first general provision addressing technical assistance in the *SPS Agreement* is found in Article 9.1. Its terms are remarkably weak. Under this provision, Members ‘agree to facilitate’ the bilateral or multilateral provision of technical assistance to other Members, especially developing countries. According to this Article, such assistance may take various forms, including advice, credits, and grants and donations, and may be in the areas of processing technologies or research and infrastructure, including the creation of national regulatory bodies. Such assistance may also aim at helping developing countries adjust to and comply with SPS measures necessary to achieve the appropriate level of protection in their export markets.

It is difficult to determine what the agreement to *facilitate* the provision of technical assistance entails. It does not seem to require the actual provision of technical assistance. Instead, it would seem to imply a ‘best endeavour’ commitment by Members, acting both individually and within international organisations, with regard to a broad range of possible assistance initiatives. Such an open-ended commitment is unlikely to be enforceable through dispute settlement proceedings. As aptly stated by Joanne Scott:

The anaemic quality to the language would seem to be matched by the inadequacy of the provision of technical assistance to date.<sup>38</sup>

<sup>35</sup> United Nations Conference on Trade and Development, *UNCTAD XI – the Spirit of Sao Paulo*, TD/L.382 (United Nations, Sao Paulo), 17 June 2004, para. 3, available at: [www.unctad.org/en/docs/TDL382\\_en/pdf](http://www.unctad.org/en/docs/TDL382_en/pdf), visited on 1 June 2005.

<sup>36</sup> Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume I: Background Information, Findings from Case Studies and Technical Assistance Needs* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2003, 88.

<sup>37</sup> As previously pointed out, despite the fact that Article 10 is entitled ‘Special and Differential Treatment’ paragraph 4 thereof deals with technical assistance rather than SDT in the narrow sense, as it is used in this Chapter. Thus this paragraph fits better into the discussion in this Section.

<sup>38</sup> Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford

Concerns with lack of implementation of technical assistance, particularly for least-developed-country Members, in the run-up to the Doha Ministerial Conference led to the inclusion in the Doha *Implementation Decision* of a provision urging Members to ensure that technical assistance is provided to least-developed countries to respond to the special problems they face in implementing the *SPS Agreement*.<sup>39</sup> This exhortation evinces the importance of the issue but does nothing to operationalise Article 9.1.

### 2.3 Technical assistance for compliance with SPS measures

A more concrete obligation with regard to the provision of technical assistance is contained in Article 9.2 of the *SPS Agreement*. It refers specifically to the case where the SPS measures put in place by an importing Member necessitate substantial investments in order for a developing-country exporting Member to be able to comply with these measures. In such a case, the importing Member ‘shall consider providing’ technical assistance that will enable the developing-country Member to maintain and expand its market access opportunities for that product. This provision is therefore framed in mandatory terms. However, the obligation contained therein stops short of requiring Members actually to provide technical assistance.

Instead, in light of the case law on SDT provisions in other agreements discussed above, the obligation in Article 9.2 would seem to be limited to the requirement that the Member imposing the SPS measure requiring substantial investments ‘actively consider with an open mind’ and ‘with a willingness to reach a positive outcome’<sup>40</sup> the provision of technical assistance to allow the affected developing country to maintain or expand its market share in the product. In line with the approach of the Panel in *EC-Bed Linen*, one could argue that this obligation would be violated by pure passivity on the part of the Member imposing the measure, or the failure of that Member to respond to a request for technical assistance other than by mere rejection of the request.<sup>41</sup> Such an interpretation would

---

Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 297.

<sup>39</sup> Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001.

<sup>40</sup> As set out above, Part V, Section 1.1, note 15, the Panel in *EC – Bed Linen* found that the SDT provision in the Article 15 of the Anti-Dumping Agreement providing that Members ‘shall’ explore the possibilities of constructive remedies, does not imply a particular outcome. Instead, taken in its context, and in light of its object and purpose, the Panel found the obligation in Article 15 to require that the exploration of possibilities be actively undertaken by the developed-country authorities ‘with a willingness to reach a positive outcome’. In other words, it imposes ‘an obligation to actively consider, with an open mind, the possibility of such a remedy prior to imposition of an anti-dumping measure that would affect the essential interests of a developing country.’ Panel Report, *EC – Bed Linen*, para. 6.233.

<sup>41</sup> In *EC – Bed Linen*, the Panel held, ‘...In our view, the European Communities simply did nothing different in this case, than it would have done in any other anti-dumping proceeding (...) nothing that would demonstrate that the European Communities actively undertook the obligation imposed by Article 15 of the AD Agreement. Pure passivity is not sufficient, in our view, to satisfy the obligation to “explore” possibilities of constructive remedies (...) Thus, we consider that the failure of the European Communities to respond in some fashion other than bare rejection, particularly once the desire to offer undertakings had been communicated to it, constituted a failure to “explore possibilities of constructive remedies”, and therefore conclude that the European Communities failed to act consistently with its obligations under Article 15 of the AD Agreement.’ *Ibid.*, para. 6.238. This issue was not appealed.

contribute to the effectiveness of Article 9.2, by ensuring that Members at least give their attention to the possibilities for technical assistance, or risk exposing themselves to challenges under Article 9.2 in dispute settlement proceedings. Still, this remains an obligation of conduct rather than of result.

In an effort to spur implementation of this provision, at least with respect to least-developed-country Members, the Doha *Implementation Decision* urges Members to provide, to the extent possible, technical and financial assistance to least-developed countries to enable them to respond to new SPS measures that may have significant negative effects on their trade.<sup>42</sup> Once again, this does little more than focus the attention of Members on the importance of this issue.

## 2.4 Technical assistance for participation in international standard-setting

The issue of developing-country participation in international standard setting is currently at the forefront of policy discussions and reforms in the standard-setting bodies. As noted above, participation in the numerous committees of the international bodies where harmonised standards are initiated, developed and proposed for adoption is onerous. It requires not only financial and human resources for attendance of meetings, but also scientific data and technical capabilities for the formulation of national positions regarding standards of interest to the country. An actively involved private sector is also crucial to provide important inputs for the identification of areas where standards are needed, and the formulation of standards that are feasible and appropriate for national conditions. Deficient developing-country participation in international standard setting, since the coming into force of the *SPS Agreement* and its use of international standards as benchmarks, has significant implications for developing-country Members. These Members assert that, due to their inability to participate effectively, the standards set by the relevant international bodies do not sufficiently cover areas of interest to them, and do not reflect a level of protection that is realistic or desirable for them.

Although in recent years, the number of developing-country delegates attending meetings of the standard-setting bodies has increased and their participation has been more active, considerable room for improvement remains. This has led to assertions that the standards set by the international bodies do not cover areas of interest for developing countries and do not reflect a level of protection that is realistic or desirable for developing countries.

Already at the time of drafting the *SPS Agreement*, the importance of improving developing-country participation in international standard setting was recognised. This concern is reflected in Article 10.4, which provides that Members ‘should’ encourage and facilitate the active participation of developing countries in the relevant international organisations. The ‘relevant international organizations’ would seem to be a reference to the international standard-setting bodies.<sup>43</sup> Although it falls under Article 10, which is entitled

---

<sup>42</sup> Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001, para. 3.6(i).

<sup>43</sup> Not all these international standard setting bodies are international organizations in the strict sense of the term. However, the *SPS Agreement* does seem to regard them as such, as evinced by the wording of Annex A paragraph 3, which in its definition of international standards, guidelines and recommendations, lists the

‘Special and Differential Treatment’, this paragraph seems to fit more comfortably into the category of technical assistance provisions. It does not create flexibilities for developing countries, but rather calls for assistance to promote the participation of developing countries in standard setting.

Article 10.4 is addressed to WTO Members, rather than to the international standard setting bodies themselves. This is logical since the WTO agreements can only create obligations for WTO Members and organs. Despite the fact that the *SPS Agreement* makes use of the standards set by the relevant international standard-setting bodies, these bodies are not under the authority of the WTO but are independent institutions.<sup>44</sup> Any WTO provisions relating to improving developing-country participation in the standard-setting process in these international bodies must therefore be addressed to WTO Members. These Members may give effect to Article 10.4 in their individual capacities through bilateral technical assistance initiatives, or through efforts undertaken within the relevant standard-setting bodies, in their capacities as members of these bodies.

Like Article 10.2, discussed above, Article 10.4 is couched in hortatory language and the question arises whether any binding obligations can be derived from its terms. The same argument developed above would apply here, to support the interpretation of Article 10.4 in the light of the guiding principle, laid down in Article 10.1, that developing countries interests ‘shall’ be taken into account in the development and application of SPS measures. International SPS standards can be seen as part of the process of development of SPS measures, as they are required to form the basis of SPS measures adopted by Members, unless deviation can be scientifically justified. Consequently, Article 10.4 should be seen as one concrete indication of the specific action required by the general obligation in Article 10.1.<sup>45</sup> However, it is unlikely that an enforceable obligation will be derived from the terms of Article 10.4, calling on Members to ‘encourage and facilitate’ active developing-country participation in standard setting. Since no concrete action is specified, it is to be expected that panels will see this provision as unable to create an obligation for Members as ‘Members cannot be expected to comply with an obligation whose parameters are entirely undefined.’<sup>46</sup>

Nevertheless, it should be noted that both individual WTO Members and international organisations, including the standard-setting bodies themselves, are taking steps to address the problem of developing-country participation.<sup>47</sup> Such efforts seem motivated by the need to ensure the legitimacy and acceptability of the international standards, in the light of the changed situation since the coming into force of the *SPS Agreement*, rather

---

three main standard-setting bodies (CAC, OIE, and IPPC) and then provides that ‘for matters not covered by the above *organizations...*’ regard may be had to standards, guidelines and recommendations ‘promulgated by *other relevant international organizations*, open for membership to all Members, as identified by the Committee’ (emphasis added).

<sup>44</sup> See further on this point above, Part II, Section 3.2.

<sup>45</sup> This would be in line with the approach of the Panel in *EC – Tube or Pipe Fittings*, where the second sentence of Article 15 was held to provide ‘operational indications as to the nature of the specific action required [by the first sentence]’. Panel Report, *EC – Tube or Pipe Fittings*, para. 7.68.

<sup>46</sup> Panel Report, *US – Steel Plate*, para. 7.110. This is also in line with the approach of the Panel in *EC-Pipe Fittings*, discussed above. See Panel Report, *EC – Tube or Pipe Fittings*, para. 7.68.

<sup>47</sup> Some of these initiatives are set out below, Part V, Section 2.5.2.2. Others are discussed above, Part II, Sections 3.2.1.4, 3.2.1.5, 3.2.2.4, 3.2.3.4 and 3.2.3.5.

than by any perception of an obligation to do so by Members under Article 10.4 of the *SPS Agreement*.

The *Implementation Decision* adopted at the Doha Ministerial Conference, mentioned above, addresses the issue of participation of developing-country Members in international standard setting. In particular, it takes note of the efforts of the WTO Director-General ‘to facilitate the increased participation of members at different levels of development in the work of the relevant international standard setting organizations’ and to coordinate with these organisations and financial institutions on the identification and addressing of technical assistance needs.<sup>48</sup> This refers to the work of the Director General following the request of the General Council in October 2000,<sup>49</sup> which led, in part, to the establishment of trust funds under the auspices of the three standard-setting bodies, to improve developing-country participation.<sup>50</sup> The *Implementation Decision* urges the Director-General to continue his work in this regard, giving priority to LDCs therein.<sup>51</sup>

In this respect, it is important to note the declaration, at the Doha Ministerial Conference, by the Director-Generals of the WTO, FAO, and OIE and the President of the World Bank of their commitment to promote the participation of developing countries in international standard setting.<sup>52</sup> This work has led to the establishment of the Standards and Trade Development Facility (STDF), a significant achievement which is discussed further below.<sup>53</sup>

## 2.5 Provision of technical assistance

The question arises to what extent WTO Members give effect to the exhortations in Article 9 of the *SPS Agreement* to provide technical assistance. This issue has particular significance in view of the conclusions drawn from the analysis conducted in the previous Chapter of this book. These indicate that the serious problems faced by developing-country Members, which make the *SPS Agreement* of limited benefit to them, cannot be

<sup>48</sup> Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001, para. 3.5(i).

<sup>49</sup> The Director-General submitted three reports outlining his work in this area. General Council Special Session on Implementation, *Actions to Increase the Participation of Developing Country Members in the Work of Relevant Sanitary and Phytosanitary International Standard-Setting Organizations: Second Report by the Director General*, WT/GC/45, circulated on 7 March 2001; General Council, *Actions to Increase the Participation of Developing Country Members in the Work of Relevant International Standard-Setting Organizations – Information from Financial Institutions*, WT/GC/46/Rev.1, circulated on 16 July 2001; General Council, *Actions to Increase the Participation of Developing Country Members in the Work of Relevant Sanitary and Phytosanitary International Standard-Setting Organizations*, WT/GC/54, circulated on 7 November 2001. See further Committee on Sanitary and Phytosanitary Measures, *Proposals and Progress on Special and Differential Treatment. Note by the Secretariat*, G/SPS/GEN/543, circulated on 28 February 2005, para. 49.

<sup>50</sup> On the trust funds, see below, Part V, Section 2.5.2.2.

<sup>51</sup> Ministerial Conference, *Implementation-Related Issues and Concerns. Decision of 14 November 2001*, WT/MIN(01)/17, circulated on 20 November 2001, para. 3.5(ii).

<sup>52</sup> Ministerial Conference, *Participation of Developing Countries in the Development and Application of International Standards, Guidelines and Recommendations on Food Safety, Animal and Plant Health*, WT/MIN(01)/ST/97, circulated on 11 November 2001.

<sup>53</sup> See below, Part V, Section 2.5.2.4.

addressed through changes to the substantive rules through SDT. Consequently, technical assistance becomes the crucial aspect of any solution to these problems.

A rigorous analysis of the extent and nature of SPS-related technical assistance is currently not possible, due to the fact that data is only partially available. Although efforts have been made to collect data from donors and recipients of technical assistance through questionnaires and to compile such data in technical assistance databases, as discussed below, these efforts are constrained by serious problems of under-reporting. Not only do many instances of technical assistance go unreported, but even reported initiatives suffer from incomplete information. This problem has been highlighted in a recent review of SPS-related technical assistance carried out in the context of the review of the Aid-for-Trade initiative.<sup>54</sup> Similarly, the WTO Secretariat's most recent overview of reported SPS-related technical assistance mentions under-reporting as a major difficulty it encountered in its efforts to identify accurately SPS-related technical assistance flows.<sup>55</sup>

The provision of technical assistance to developing countries involves several actors, including other WTO Members, the WTO Secretariat, as well as other international organisations and bodies such as the FAO (including with respect to Codex and the IPPC), the WHO, the OIE and the World Bank. A brief overview is provided here of selected technical assistance initiatives at both bilateral and multilateral level. No attempt is made to address all the work currently being done in this area. Instead the objective of the discussion in this section is limited to an effort to illustrate the range and diversity of such initiatives by looking at selected examples.

### 2.5.1 Bilateral provision of technical assistance

Many WTO Members provide SPS-related technical assistance to developing-country Members. Regular reports to the SPS Committee in this regard reflect the diversity of initiatives in this regard. Particular donors tend to focus on regions of particular interest to them.<sup>56</sup> For example, the US is the largest provider of SPS-related technical assistance to Central American countries accounting for 50 percent of all such assistance granted in 2002-2006. The EC focuses on the ACP region, accounting for 74 percent of SPS-related technical assistance to that region in the same period (or 97 percent if aid by EC Member

---

<sup>54</sup> Committee on Sanitary and Phytosanitary Measures, *Background Document from the Standards and Trade Development Facility for the Global Review of Aid for Trade: Note by the Secretariat*, G/SPS/GEN/812, circulated on 22 November 2007, paras 16-17.

<sup>55</sup> Committee on Sanitary and Phytosanitary Measures, *Overview of SPS-Related Technical Assistance Reported to the WTO/OECD Trade Capacity Building Database. Note by the Secretariat*, G/SPS/GEN/726, circulated on 4 October 2006, paras 1-2.

<sup>56</sup> In addition, it is interesting to note that various donors seem to target different categories of beneficiaries in general. For instance, countries with a colonial past, such as the UK and the Netherlands, have been shown to direct a large part their assistance to their former colonies. They also direct much of their bilateral assistance to the poorest countries. In contrast, Japan and the US show a preference for small but relatively well-off countries. Bob Baulch, *Aid for the Poorest? The Distribution and Maldistribution of International Development Assistance*, CPRC Working Paper No 35 Institute of Development Studies, 2003, available at: <http://www.chronicpoverty.org/pdfs/35Baulch.pdf>, visited on 10 June 2008.

States is included).<sup>57</sup> Australia and Canada are the main suppliers of SPS-related technical assistance to certain ASEAN countries.<sup>58</sup>

Donors also tend to concentrate their efforts on particular areas of SPS capacity, sometimes leading to an unbalanced outcome. For example, the assistance provided by Denmark to the fisheries sector in Viet Nam accounted for 27 percent of all SPS-related technical assistance to the region as a whole in 2002-2006.<sup>59</sup> In some cases, the area of focus relates to the donor's concerns, as an importing country, with particular risks. For instance, Australia's technical assistance tends to focus on plant health issues, whereas Japan and the US concentrate on food safety.<sup>60</sup> In other cases, donors give priority to projects that help address the SPS restrictions that they themselves impose on access to their markets.<sup>61</sup> For example, the EC gives most attention to certain thematic areas, namely pesticides, fisheries and animal health. In fact, one of the most successful capacity building projects in Senegal was the upgrading of fisheries production processes to meet EC HACCP requirements.<sup>62</sup> It has been noted with regard to trade capacity building in general that: '[a]s the development objectives of developed countries (as donors) overlap with their commercial interests (as trading powers) they may be prone to decide *what type of assistance* to provide according to their own interests rather than those of the recipient countries.'<sup>63</sup>

Another difficulty that arises from bilateral technical assistance, particularly in the area of training for participation in negotiations (for example discussions in the SPS Committee of at the standard-setting bodies), is the indirect influence that may be exerted on the recipient's own goals.<sup>64</sup> While effective capacity building in this respect should result in the recipient Member being able to formulate and defend its own policy interests, in practice training strongly emphasises issues that are priorities for the donor country.<sup>65</sup> Further, it is

<sup>57</sup> Committee on Sanitary and Phytosanitary Measures, *Background Document from the Standards and Trade Development Facility for the Global Review of Aid for Trade: Note by the Secretariat*, G/SPS/GEN/812, circulated on 22 November 2007, paras 18 and 20.

<sup>58</sup> *Ibid.*, para. 24. This study examined ASEAN members Cambodia, Lao PDR and Viet Nam only. Other important bilateral donors to this region are the EC, Japan and Norway.

<sup>59</sup> *Ibid.*, para. 22.

<sup>60</sup> *Ibid.*, para. 24. Wiig and Kolstad note that one of the criteria used by the US in choosing between technical assistance projects is whether the project will improve US public health by increasing the ability to control public health risks associated with products exported to the US. Arne Wiig and Ivar Kolstad, 'Lowering Barriers to Agricultural Exports through Technical Assistance', *Food Policy* 30, 2005, 185 – 204, 189.

<sup>62</sup> *Ibid.*

<sup>63</sup> *Ibid.*

<sup>64</sup> For example, in April 2007 the US sponsored a workshop for large scale African farmers, policy makers and seed trade association representatives in South Africa to promote the acceptance and development of agricultural biotechnology in Africa. This initiative is reported in the US overview of its technical assistance activities contained in Committee on Sanitary and Phytosanitary Measures, *Technical Assistance to Developing Countries Provided by the United States. Submission by the United States. Addendum*, G/SPS/GEN/181/Add.7, circulated on 18 June 2008, 47. The resistance of many African countries to the introduction of biotechnology has been an ongoing concern for the US, whose biotechnology industry needs to recoup large investments in developing biotech products.

<sup>65</sup> Henri-Bernard Solignac Lecomte and Kathleen Van Hove, *Building Capacity to Trade: A Road Map for*

difficult for a recipient to defend interests that are in contradiction to those of the donor, when the donor is sitting at the same negotiating table.<sup>66</sup>

As an illustration of bilateral provision of SPS-related technical assistance, Australia's efforts are discussed here. Australia is chosen for practical reasons, since it is the developed-country Member used as an example elsewhere in this book. As a result, some background already exists to the particular SPS concerns and trade interests of Australia.

### 2.5.1.1 Technical assistance by Australia

In its report on technical assistance submitted to the SPS Committee, Australia states that in the period January 2006 to December 2007, it has provided technical assistance amounting to over A\$31.4 million.<sup>67</sup> This technical assistance took the form of training, information, and the development of both soft and hard infrastructure.<sup>68</sup>

This assistance was provided to 36 individual countries, most of which were Asia-Pacific countries, but a few African and Middle Eastern countries were also included.<sup>69</sup> Some assistance was also provided to groups of countries or regional organisations, such as the Pacific Island group of countries, ASEAN and APEC.

In its report, Australia lists 90 technical assistance projects. Of these, 50 percent relate to phytosanitary protection. In addition, 16 percent of the projects relate to animal health, 14 percent to food safety, and the remaining 20 percent involve a combination of two or all three of these objectives.

In Australia, technical assistance provision is mainly in the hands of the Commonwealth Government and the State and Territory governments. Within the Commonwealth government, the departments responsible for the provision of SPS-related technical assistance are the same ones who are in charge of SPS protection in Australia, namely the Department of Agriculture, Fisheries and Forestry, the Department of Health and Aging and the Department of Foreign Affairs and Trade.<sup>70</sup> The technical assistance work of these departments is managed primarily by the Australian Agency for International Development (AusAID), an administratively autonomous agency, and the Australian Centre for International Agricultural Research (ACIAR), a statutory agency. Both of these agencies fall under the foreign affairs and trade portfolio of Australia. AusAID manages about 75 percent of Australia's official development assistance, including its

contributions to the Doha Development Agenda Global Trust Fund (which covers also SPS-related activities).<sup>71</sup>

Some examples of technical assistance initiatives undertaken by Australia in 2002-2006 are the following. Research funding has been provided to Bangladesh for plant health management for faba bean, lentils and chickpeas. This aims to enable the examination of diseases, biology and host resistance in these plants through screenings to identify new sources of disease resistance.<sup>72</sup> Funding research has also been provided to the Philippines to assist in detection surveys for mango seed and pulp weevils. This project aims to increase the areas of mango production in the Philippines certified as free from seed and pulp weevils, to increase export opportunities.<sup>73</sup> Technical expertise and training has been provided to Papua New Guinea for fruit fly management so as to improve the yield and quality of capsicums, tomatoes, mangoes, papaya, bananas and cucurbits.<sup>74</sup> In addition, a seminar has been given to developing-country members of the Codex with regard to issues being discussed at the Codex Committee on Food Import and Export Inspection and Certification Systems.<sup>75</sup>

### 2.5.2 Multilateral provision of technical assistance

Many multilateral agencies are involved in the provision of SPS-related technical assistance. The nature and extent of the technical assistance provided at multilateral level varies widely. In order to illustrate the diversity of initiatives in this area, a few examples have been selected here.

The nature of the relevant multilateral agency, its mandate and its technical assistance budget play a role in the type technical assistance provided. Some of these multilateral agencies provide SPS related technical assistance as part of more general trade-related technical assistance activities, as in the case of the WTO. Others, whose work focuses on an SPS-related area, provide technical assistance within their specific area of activity, such as the CAC. In both these cases, technical assistance is not the main activity of the agency involved and therefore has a limited budget and is focused on assisting developing countries to participate effectively in the work of the multilateral body involved, rather than to build SPS capacity in general.

In addition, cooperative initiatives exist between several multilateral agencies which make use of complementarities in their areas of expertise to provide more coherent SPS-related technical assistance, for example the STDF and the International Portal for Food Safety, Animal and Plant Health (IPFSAPH). These initiatives both have as their focus the improvement of SPS capacity, but they differ greatly in their scope of activity and tools used to build capacity. While the IPFSAPH is an information tool, available to all, but with a particular interest in improving its utility for developing-country users, the STDF is a financing and coordination mechanism for SPS-related capacity building projects.

<sup>71</sup> Committee on Sanitary and Phytosanitary Measures, *Technical Assistance to Developing Countries Provided by Australia. Addendum*, G/SPS/GEN/717/Add.1, circulated on 11 October 2007, para. 13.

<sup>72</sup> *Ibid.*, Table 1.

<sup>73</sup> *Ibid.*

<sup>74</sup> *Ibid.*

<sup>75</sup> *Ibid.*

A brief overview of these multilateral initiatives is given below to provide a practical illustration of the nature and extent of some of the SPS-related technical assistance efforts that currently exist at multilateral level.

### 2.5.2.1 Technical assistance by the WTO

The Doha Development Agenda recognises the importance of technical assistance and capacity building for developing countries in order to enable these Members to benefit fully from the multilateral trading system. For this reason, a Doha Development Agenda Global Trust Fund has been established, to which donor countries pledged CHF 30 million.

The WTO Secretariat regularly provides technical assistance to developing-country Members for the implementation of the *SPS Agreement*, in particular through training programs organized by the WTO or through WTO participation in training programs organised by other organisations or institutions.<sup>76</sup> The main objective of SPS technical assistance by the WTO Secretariat is to increase the awareness of participants of their rights and obligations under the *SPS Agreement* and its implications for their national policies.<sup>77</sup> Typically, training courses last 3 days, but to meet demands for more advanced SPS training, a three-week SPS Specialised Trade Policy Course has been developed.<sup>78</sup> From 1 September 1994 to 31 December 2007, the Secretariat has carried out 158 SPS technical assistance and training activities. These have been conducted at national and regional level, and were organised in close cooperation with the three international standard setting bodies, WTO Members and regional organisations where appropriate.<sup>79</sup> A further 37 activities are planned for 2008.<sup>80</sup>

To ensure that the officials that participate in these training activities are the persons responsible for SPS activities within their national administrations and have the expertise to be able to benefit from the training, the Secretariat has developed the practice sending the invitations to the CAC, OIE and IPPC contact points of Members and to their SPS Enquiry Points.<sup>81</sup> By December 2007, 6,040 persons had received training by the WTO Secretariat on the *SPS Agreement*, 24 percent of which were from least-developed-country Members.<sup>82</sup>

---

<sup>76</sup> For a list of SPS-related technical assistance activities in 2007, see Committee on Sanitary and Phytosanitary Measures, *SPS Technical Assistance Activities in 2007. Information from the Secretariat* G/SPS/GEN/797, circulated on 5 September 2007.

<sup>77</sup> Committee on Sanitary and Phytosanitary Measures, *SPS Technical Assistance and Training Activities (1 September 1994 to 31 December 2007). Note by the Secretariat. Revision*, G/SPS/GEN/521/Rev.3, circulated on 9 June 2008, para. 2. These workshops are adapted to reflect the level of development of the participants, their familiarity with the *SPS Agreement* and any specific concerns they may have relating to the implementation of the Agreement.

<sup>78</sup> *Ibid.*, para. 8. The first SPS Specialised Trade Policy Course was held in 2005, and since then one such course has been organised each year.

<sup>79</sup> Of the 158 technical assistance activities, the CAC participated in 65, the OIE in 62 and the IPPC in 52. *Ibid.*, para. 6.

<sup>80</sup> Committee on Sanitary and Phytosanitary Measures, *SPS Technical Assistance Activities in 2008. Information from the Secretariat*, G/SPS/GEN/851, circulated on 18 June 2008.

<sup>81</sup> Committee on Sanitary and Phytosanitary Measures, *SPS Technical Assistance and Training Activities (1 September 1994 to 31 December 2007). Note by the Secretariat. Revision*, G/SPS/GEN/521/Rev.3, circulated on 9 June 2008, para. 7.

<sup>82</sup> *Ibid.*, paras 13-14.

The Secretariat has also developed a number of tools to facilitate developing-country Members' compliance with the *SPS Agreement*. These include the *Handbook on Transparency* which provides guidance on the application of the transparency provisions of the *SPS Agreement*, the booklet on the *SPS Agreement* published as volume 4 in the WTO Agreements Series, and an interactive CD-rom providing detailed information of the provisions of the *SPS Agreement*, and dealing in particular implementation, transparency, SDT and dispute settlement issues.

The WTO Secretariat has further attempted to improve its compliance with the technical assistance task laid down for it in Annex B.9. In the context of the second periodic review of the *SPS Agreement*, New Zealand indicated its support for a Secretariat proposal in June 2004 for the creation of a user-friendly database on notified SPS measures, which it felt could form a meaningful implementation of the Secretariat's obligations under Annex B.9.<sup>83</sup> The report of the SPS Committee on the second review of the *SPS Agreement* states that the Secretariat has initiated such an SPS IMS.<sup>84</sup> The SPS IMS is a comprehensive source for searching for information on SPS measures.<sup>85</sup> It allows users to obtain information on SPS measures that Members have notified to the WTO, specific trade concerns raised in the SPS Committee, official WTO documents circulated by the SPS Committee, and details of Members' national enquiry points and national notification authorities.

The WTO's work on technical assistance in general also has an impact on SPS-related technical assistance. The new WTO work programme on Aid-for-Trade,<sup>86</sup> launched in the Hong Kong Ministerial Conference in 2005,<sup>87</sup> points to the challenges posed by developing countries' supply side constraints for their ability to benefit from the multilateral trading system and implement the WTO agreements. It notes the need for aid-for-trade to address this problem, as a valuable complement to the Doha Development Agenda. A task force was created to provide recommendations on how to operationalise aid-for-trade and to increase financial resources for aid-for-trade. This task force recommended that the WTO fulfil a monitoring and evaluation role consisting of annual reviews and debates on aid-for-trade.<sup>88</sup> The Global Review of Aid-for-Trade conducted in November 2007 aimed to take stock of what is – and what is not – happening in the delivery of aid-for-trade,<sup>89</sup>

<sup>85</sup> The SPS IMS is available at: <http://spsims.wto.org>, visited on 12 June 2008

<sup>86</sup> For more information on the Aid-for-Trade work programme, see the dedicated page on the WTO website, available at: [http://www.wto.org/english/tratop\\_e/devel\\_e/a4t\\_e/aid4trade\\_e.htm](http://www.wto.org/english/tratop_e/devel_e/a4t_e/aid4trade_e.htm), visited on 10 June 2008.

<sup>87</sup> Ministerial Conference, *Doha Work Programme. Ministerial Declaration Adopted on 18 December 2005*, WT/MIN(05)/DEC, circulated on 22 December 2005, para 57.

<sup>88</sup> The monitoring takes place at three levels: global monitoring by the OECD; donor monitoring, in the form of self-evaluations; and in-country monitoring, also in the form of self-assessments. These aspects are brought together in an annual report and an Aid-for-Trade debate in the WTO General Council.

<sup>89</sup> In terms of financial resources, the OECD and the WTO assessed that donors have committed US\$21 billion per year to the aid categories more closely associated with aid-for-trade in 2002-2005. Of this, around US\$11.2 billion was allocated to building economic infrastructure, US\$8.9 billion to promoting productive capacities (including US\$2 billion for trade development), and US\$0.6 billion to increasing the understanding and implementation of trade policy and regulations. At the Hong Kong Ministerial Conference in 2005, the EU, the

to identify the next steps and to improve monitoring and evaluation by the WTO. It is expected that the Aid-for-Trade initiative will improve the effectiveness and coherence of technical assistance and increase beneficiary ownership of assistance projects.<sup>90</sup> This work programme will have implications for SPS-related technical assistance.

To improve transparency with regard to the provision of technical assistance, the Doha Development Agenda Trade Capacity Building Database (TCBDB) has been created by the WTO jointly with the OECD.<sup>91</sup> It aims to promote information-sharing so as to improve coordination and coherence in capacity building projects and avoid duplication of efforts. The projects covered are not limited to SPS-related technical assistance but extend to all trade-related technical assistance and capacity building projects, both at national and at regional level. Data is obtained from reports of bilateral donors and multi-lateral/regional agencies. However, as noted above, under-reporting is a serious problem. The WTO Secretariat has noted that, for example, data reported for one Member in the TCBDB showed only 8 SPS-related technical assistance projects in 2001-2003, whereas it had notified the SPS Committee of 115 projects in 2000-2002.<sup>92</sup> As a result of this discovery, the TCBDB has been extended by additional entries on the basis of the submissions of Members and Observers to the SPS Committee.

The Secretariat's work in the area of SPS-related technical assistance is very useful, particularly due to its extensive expertise in substantive and institutional aspects of WTO law. It is therefore particularly well-placed to assist developing-country Members to understand their rights and obligations under the *SPS Agreement* and to develop mechanisms, such as the SPS IMS, to promote the sharing of information among WTO Members. However, the early technical assistance efforts of the Secretariat were criticised as being focused on quantity rather than quality and lacking coordination with national capitals.<sup>93</sup> In addition, at first the technical assistance work of the Secretariat was largely dependant on *ad hoc* extra-budgetary contributions, undermining its sustainability and predictability.<sup>94</sup> In 2001, a 'new strategy' for WTO technical assistance was announced, to address

---

US, and Japan committed themselves to increasing aid-for-trade spending, which they reaffirmed later. 'WTO Global Review puts 'Spotlight' on Aid-for-Trade', *Bridges Weekly Trade New Digest*, 28 November 2007.

<sup>90</sup> However, it is reported that Anne-Laure Constantin, of the Institute for Agriculture and Trade Policy, was critical about the WTO's work on aid-for-trade, stating: 'After two years, there is still no clearly accepted definition of what counts as an aid-for-trade initiative, no guidelines for accessing funds, only a questionable list of priorities, no effective monitoring and evaluation mechanisms, and none of the promised additional money.' 'WTO Global Review puts 'Spotlight' on Aid-for-Trade', *Bridges Weekly Trade New Digest*, 28 November 2007.

<sup>91</sup> The TCBDB is available at: <http://tcbdb.wto.org/index.aspx?lg=EN>, visited on 13 June 2008.

<sup>92</sup> Committee on Sanitary and Phytosanitary Measures, *Overview of SPS-Related Technical Assistance Reported to the WTO/OECD Trade Capacity Building Database. Note by the Secretariat*, G/SPS/GEN/726, circulated on 4 October 2006, para. 2.

<sup>93</sup> Committee on Trade and Development, *Technical Cooperation Audit Report for 2002: Note by the Secretariat*, WT/COMTD/W/111, circulated on 28 March 2003, para. 49.

<sup>94</sup> Kostecki points out that this situation encourages a 'hit-and-run' approach, with too much emphasis on one-off seminars and insufficient efforts to ensure the sustainability of the capacities created. In addition, sometimes the donors of extra-budgetary funds determine the allocation of the resources they provide, making it difficult to apply a coherent technical assistance strategy. Michel Kostecki, *Technical Assistance Services in Trade-Policy: A Contribution to the Discussion on Capacity-Building in the WTO*, Resource Paper No. 2 (International Centre for Trade and Sustainable Development, Geneva), November 2001, 18, available at: [www.ictsd.org/pubs/respaper/TApaper5-12-01.pdf](http://www.ictsd.org/pubs/respaper/TApaper5-12-01.pdf), visited on 12 May 2002.

the prevailing problems.<sup>95</sup> This strategy aims at moving from traditional ‘technical assistance’ towards ‘capacity building’ by becoming more demand driven, coherent and flexible. The financial stability needed to undertake projects in a predictable manner,<sup>96</sup> has improved with the creation of the Doha Development Agenda Global Trust Fund in 2002.<sup>97</sup> However, it is still insufficient to undertake large-scale projects. The Hong Kong Ministerial Declaration calls on strengthening the WTO Secretariat structures for trade-related capacity building and enhancing its resources. It reaffirms the commitment of Members to secure and adequate funding for trade-related capacity building, including in the Doha Development Agenda Global Trust Fund, to complete the Doha work programme and to implement its results.<sup>98</sup>

However, it should be noted that the role of the WTO Secretariat in the provision of SPS-related technical assistance is necessarily limited, even if its resources were to be sufficiently increased. As argued by Gregory Shaffer, this limitation lies in the manner in which the Secretariat sees its role in the context of the WTO’s view of itself as a ‘member-driven’ institution. Traditionally, this has meant that the Secretariat’s task is limited to servicing the Member’s activities in the various WTO organs and promoting implementation of the agreed rules, rather than policy formulation. This approach filters through to the Secretariat’s technical assistance activities, which aim to promote compliance with WTO disciplines rather than to assist beneficiary Members to ‘critically engage with the rules in light of their perceptions of their national interests.’<sup>99</sup> Even the ‘new strategy’ for technical assistance reiterates the traditional approach, stating: ‘The core mandate of the WTO is trade liberalization ... WTO technical assistance is a key component of the development dimension of the multilateral trading system ... It provides enabling assistance for Members to undertake trade liberalization... It involves support by the Secretariat ... to assist them in understanding WTO rules and disciplines.’<sup>100</sup>

While the Secretariat’s work in providing training with regard to the implementation and operation of the *SPS Agreement* is invaluable, other multilateral bodies, in particular the three international standard-setting bodies (CAC, OIE and IPPC) as well as the World

<sup>95</sup> Committee on Trade and Development, *A New Strategy for WTO Technical Cooperation: Technical Cooperation for Capacity Building, Growth and Integration. Note by the Secretariat*, WT/COMTD/W/90, circulated on 21 September 2001.

<sup>96</sup> The WTO Technical Assistance Plan costs around CHF 30 million to implement. Of this CHF 6 million is financed from the regular WTO budget and CHF24 million from extra budgetary funding.

<sup>97</sup> The Doha Development Agenda Global Trust Fund receives the extra-budgetary contributions of Members and uses them towards implementation of the Technical Assistance Plan. It is operated against periodic benchmarks, under the strict supervision of the Committee on Budget Finance and Administration and the Committee and Trade and Development.

<sup>98</sup> Ministerial Conference, Doha Work Programme. Ministerial Declaration Adopted on 18 December 2005, WT/MIN(05)/DEC, circulated on 22 December 2005, para. 54.

<sup>99</sup> Gregory Shaffer, ‘Can WTO Technical Assistance and Capacity-Building Serve Developing Countries?’ *Wisconsin International Law Journal*, 2005, 656. Shaffer states that if WTO Secretariat officials in their technical assistance activities simply promote existing WTO rules, ‘[t]hey cut off what could be a valuable discussion, in meetings with those most up-to-date about WTO developments, as to how developing countries can shape the rules through implementation and renegotiation in order to advance trade related development objectives.’ *Ibid.*

<sup>100</sup> Committee on Trade and Development, *A New Strategy for WTO Technical Cooperation: Technical Cooperation for Capacity Building, Growth and Integration. Note by the Secretariat*, WT/COMTD/W/90, circulated on 21 September 2001, para. 1.

Bank, FAO and WHO, with which the WTO cooperates closely, and regional organisations (such as IICA and OIRSA)<sup>101</sup> are better suited to the provision of technical assistance in areas requiring scientific or technical expertise, such as building regulatory systems or strengthening infrastructure in the SPS sector.<sup>102</sup> Improved national SPS capacity empowers Members not only to implement and enforce the existing rules of the *SPS Agreement* but also to engage as active participants in framing the norms within which this system operates.<sup>103</sup>

### 2.5.2.2 Technical assistance by the Codex Alimentarius Commission

The FAO/WHO Project and Fund for Enhanced Participation in Codex (commonly known as the Codex Trust Fund) was launched in February 2003 during the 25<sup>th</sup> (Extraordinary) Session of the Codex Alimentarius Commission. It was created to help developing countries and countries with transition economies improve their level of effective participation in Codex standard setting.<sup>104</sup> Further, such active participation was recognised by CAC members as enhancing the ability of countries to develop their food safety systems and thereby improve public health and promote food trade.<sup>105</sup>

The Codex Trust Fund seeks funding from national governments, multilateral organisations, private foundations and trusts that do not create conflicts of interests. It requires an estimated US\$40 million over a 12-year period to meet its objectives. It became operational in March 2004, upon reaching the agreed minimum level of funding (US\$ 500 000),<sup>106</sup> and has since received additional contributions.<sup>107</sup> The funding is administered by the WHO on behalf of both the WHO and FAO.<sup>108</sup>

<sup>101</sup> IICA is the Inter-American Institute for Cooperation on Agriculture and OIRSA is the International Regional Organization for Plant and Animal Health.

<sup>102</sup> On this point, see also Michel Kostecki, *Technical Assistance Services in Trade-Policy: A Contribution to the Discussion on Capacity-Building in the WTO*, Resource Paper No. 2 (International Centre for Trade and Sustainable Development, Geneva), November 2001, 12, available at: [www.ictsd.org/pubs/respaper/TApaper5-12-01.pdf](http://www.ictsd.org/pubs/respaper/TApaper5-12-01.pdf), visited on 12 May 2002.

<sup>103</sup> Here it is useful to recall the opportunities to participate in developing relevant norms in the form of international standards relevant to the *SPS Agreement*, as discussed above, Part II, Sections 3.2.1.5, 3.2.2.5 and 3.2.3.5; and in the form of non-binding procedural rules drafted by the SPS Committee for the operationalisation of provisions of the *SPS Agreement*, as discussed above, Part IV, Section 2.1.1.

<sup>104</sup> In the Codex Alimentarius Commission's Strategic Framework, adopted at its 24<sup>th</sup> Session in 2001, the issue of improving developing-country participation was included as an objective. See Codex Alimentarius Commission, *Report of the Twenty-Fourth Session*, ALINORM 01/41 (Joint FAO/WHO Food Standards Programme, Geneva), 2-7 July 2001, Appendix II, 16. The objectives of the Strategic Framework were to be implemented through a Medium Term Plan for 2003-2007.

<sup>105</sup> FAO/WHO Project and Fund for Participation in Codex, *Annual Report for 2004* (Food and Agriculture Organization and World Health Organization, Geneva), December 2004, 1.

<sup>106</sup> Codex Alimentarius Commission, *FAO/WHO Project and Fund for Enhanced Participation in Codex. Second Progress Report to the 26th Session of the Codex Alimentarius Commission, 30 June – 7 July 2003*, ALINORM 03/26/12 (Joint FAO/WHO Food Standards Programme, Rome), May 2003, para. 17, available at: <http://www.who.int/foodsafety/codex/en/prog2e.pdf>, visited on 25 June 2007.

<sup>107</sup> During the period from January 2003 to December 2007, a total of US\$ 5,485,396 was received as contributions from 12 high-income CAC member countries and the European Community. For the first time in 2008, a Codex member classified as an upper middle income economy, Malaysia made a contribution (US\$10 000) to the Codex Trust Fund. It has benefited from the Codex Trust Fund support in the past.

<sup>108</sup> The administration of funding is conducted through the WHO's Voluntary Fund for Health Promotion, but separate financial records and reporting are maintained for the Codex Trust Fund. See FAO/WHO Project and Fund for Participation in Codex, *Annual Report for 2004* (Food and Agriculture Organization and World

Guidance for the operation of the Codex Trust Fund is in the hands of a Consultative Group on the Trust Fund (CGTF), composed of senior officials of the FAO and WHO.<sup>109</sup> The CGTF gives strategic guidance to the Fund, establishes guidelines and criteria for its activities, and monitors their implementation.<sup>110</sup> Further, the CGTF is responsible for ensuring coherence and complementarity between the Codex Trust Fund and other international funding mechanisms in the area, including the Standards and Trade Development Facility, the FAO Trust Fund for Food Security and Food Safety and the FAO Integrated Programme for Building Capacity for Biotechnology, Food Quality and Safety and Phyto- and Zoosanitary Standards. The CGTF also annually reviews eligibility of Codex members to apply for support from the Codex Trust Fund.

The eligibility of Codex members for support is based on three official classifications:<sup>111</sup> the list of LDCs produced by the UN Economic and Social Council;<sup>112</sup> the World Bank classification of countries according to income level;<sup>113</sup> and the UN Human Development Index.<sup>114</sup> Since not all Codex members appear on each of these lists, the CGTF drew up a list combining the three classifications.<sup>115</sup> The financial resources of the Fund are

---

Health Organization, Geneva), December 2004, 1. The internal and external auditing procedures provided for in the WHO Financial Regulations and Rules apply to the Codex Trust Fund. See Codex Alimentarius Commission, *FAO/WHO Project and Fund for Enhanced Participation in Codex. First Progress Report to the 25th (Extraordinary) Session of the Codex Alimentarius Commission, 13-15 February 2003*, ALINORM 03/25/4 (Joint FAO/WHO Food Standards Programme, Geneva), January 2003, para. 6, available at: <http://www.who.int/foodsafety/codex/en/prog1e.pdf>, visited on 25 June 2007.

<sup>109</sup> Codex Alimentarius Commission, *FAO/WHO Project and Fund for Enhanced Participation in Codex. First Progress Report to the 25th (Extraordinary) Session of the Codex Alimentarius Commission, 13-15 February 2003*, ALINORM 03/25/4 (Joint FAO/WHO Food Standards Programme, Geneva), January 2003, para. 5, available at: <http://www.who.int/foodsafety/codex/en/prog1e.pdf>, visited on 25 June 2007.

<sup>110</sup> *Ibid.*, para. 11.

<sup>111</sup> The original proposal by the CGTF was to use only the World Bank income classification. However, in response to comments made by Codex members regarding the desirability of taking into account factors other than purely economic ones, this was revised to include the three classifications mentioned below.

<sup>112</sup> As set out above, Part I, Section 1.2, note 54, this classification lists countries regarded as LDCs based on criteria reflecting low income, weak human resources and economic vulnerability.

<sup>113</sup> The World Bank classification of countries on the basis of GNI per capita into low-income, lower-middle income, upper-middle income and high-income countries is set out above Part II, Section 2.1. The CGTF reconsidered the use of the World Bank income classification, on the basis of comments received regarding other comparable classifications (such as the OECD's DAC list of recipients), and noted in its second progress report that there were no significant differences in these lists, and that the World Bank list was more appropriate for use in the context of the UN system. It was further decided that countries in the categories low-income, lower-middle income and upper-middle income would be considered eligible for support from the Codex Trust Fund, but low-income countries would be favoured as donors both wish to increase the participation of low-income countries and to improve the representativeness of Codex as an institution. See Codex Alimentarius Commission, *FAO/WHO Project and Fund for Enhanced Participation in Codex. Second Progress Report to the 26th Session of the Codex Alimentarius Commission, 30 June – 7 July 2003*, ALINORM 03/26/12 (Joint FAO/WHO Food Standards Programme, Rome), May 2003, paras 3-4, available at: <http://www.who.int/foodsafety/codex/en/prog2e.pdf>, visited on 25 June 2007.

<sup>114</sup> The Human Development Index of the UNDP divides countries into the categories low, medium and high human development based on the criteria of life expectancy, adult literacy rate and educational enrolment ratio, and standard of living as reflected by per capita GDP. This is further elaborated above, Part II, Section 2.2.

<sup>115</sup> This list divides Codex members into three groups, two of which as subdivided, as follows: Group 1A: LDCs; Group 1B: Other low-income countries, listed as low-income countries by the World Bank or as low human development countries by the UNDP; Group 2: Countries listed as lower-middle income countries by the World Bank or as medium human development countries by the UNDP; Group 3A: Countries listed as upper-middle income countries by the World Bank and medium human development by the UNDP; and

distributed among the resulting three groups according to an agreed ratio.<sup>116</sup> Between applicant countries within the same group, funds are distributed equitably.<sup>117</sup> In 2008, 133 of the 176 Codex members were considered eligible for support, including all three developing countries selected as case studies in this book.<sup>118</sup>

In addition, all applicants for funding must meet the following four basic requirements:<sup>119</sup> (1) the country must be a Codex member; (2) the country must have identified a Codex Contact Point;<sup>120</sup> (3) the application must outline national objectives in the framework of Codex;<sup>121</sup> and (4) coordination between government entities must be demonstrated.<sup>122</sup> For applications for continued funding, an additional requirement applies: (5) the country must have submitted a written report and evaluation of progress towards the objectives identified in (3) above, within two months of the relevant meeting. It has been recog-

Group 3B: Countries listed as upper-middle income countries by the World Bank. All other countries (i.e. those listed as either high-income countries by the World Bank or high human development countries by the UNDP) are not eligible for support from the Codex Trust Fund. See Codex Alimentarius Commission, *FAO/WHO Project and Fund for Enhanced Participation in Codex. Third Progress Report to the 53rd Session of the Executive Committee of the Codex Alimentarius Commission, 4-6 February 2004*, CX/EXEC 04/53/3 (Joint FAO/WHO Food Standards Programme, Geneva), December 2003, paras 9-10, available at: <http://www.who.int/foodsafety/codex/en/prog3e.pdf>, visited on 25 June 2007.

<sup>116</sup> Available funds will be allocated as follows: Group 1: 60%, Group 2: 30% and Group 3: 10%. See *Ibid.*, Table 1. Originally a further allocation was made according to the category of output for which the funding was requested. However, this element was dropped from the application form due to the difficulty experienced by applicant countries in organising their requests according to output categories. See Codex Alimentarius Commission, *FAO/WHO Project and Fund for Enhanced Participation in Codex. Fourth Progress Report to the 27th Session of the Codex Alimentarius Commission, 28 June – 3 July 2004*, ALINORM 02/27/10F (Joint FAO/WHO Food Standards Programme, Geneva), May 2004, para. 17, available at: <http://www.who.int/foodsafety/codex/en/prog4e.pdf>, visited on 25 June 2007.

<sup>117</sup> Making choices between various group members was regarded as undesirable, and all eligible applicant countries should obtain at least their priority request, depending on the availability of funding.

<sup>118</sup> FAO/WHO Project and Fund for Participation in Codex, *Countries Eligible to Apply for Support in 2006* (Food and Agriculture Organisation and World Health Organization, Rome), 17 June 2005.

<sup>119</sup> Codex Alimentarius Commission, *FAO/WHO Project and Fund for Enhanced Participation in Codex. Third Progress Report to the 53rd Session of the Executive Committee of the Codex Alimentarius Commission, 4-6 February 2004*, CX/EXEC 04/53/3 (Joint FAO/WHO Food Standards Programme, Geneva), December 2003, Annex 1, available at: <http://www.who.int/foodsafety/codex/en/prog3e.pdf>, visited on 25 June 2008.

<sup>120</sup> The identification of a Codex Contact Point is considered crucial as it is the only point of access to the country that can be used by the Trust Fund Secretariat, due to the fact that Codex issues cut across sectors and areas of responsibility of government ministries. For this reason, for funding requests for 2005 and onwards, only applications submitted by a Codex Contact Point will be considered. Codex Alimentarius Commission, *FAO/WHO Project and Fund for Enhanced Participation in Codex. Fourth Progress Report to the 27th Session of the Codex Alimentarius Commission, 28 June – 3 July 2004*, ALINORM 02/27/10F (Joint FAO/WHO Food Standards Programme, Geneva), May 2004, para. 10, available at: <http://www.who.int/foodsafety/codex/en/prog4e.pdf>, visited on 25 June 2007.

<sup>121</sup> The CGTF has outlined certain requirements for funding of suitable activities, other than travel to Codex meetings, which must be met if a country wishes to be eligible for support for that activity from the Codex Trust Fund. It has dropped the requirement that activities fall within the three 'output level' categories initially identified, due to the difficulty applicants experienced in organising their requests according to these categories. See *Ibid.*, paras 12-17.

<sup>122</sup> Compliance with this requirement is strictly enforced, and may in no case be waived. This is due to the fact that one of the major objectives of the Codex Trust Fund is the improvement of coordination and communication between the relevant stakeholders and increasing multidisciplinary. This has proved to be the most difficult requirement to meet, and in some cases several funding applications were received from different government bodies, listing different proposed participants. *Ibid.*, para. 8.

nised that some countries may need financial support to enable them to meet the basic requirements mentioned above. Such countries only have to meet requirement (1).

In 2007, the Codex Trust Fund was used to support the attendance of a total of 224 participants from 96 countries of 16 Codex meetings.<sup>123</sup> For the period January to December 2008, the participation in CAC meetings by 314 participants from 96 countries is being supported by the Fund. Of the latter participants, 64 percent are from LDCs and other low-income countries, 33 percent from lower-middle income countries and 3 percent from upper-middle income countries.<sup>124</sup>

From its inception until the end of 2007, the Codex Trust Fund enabled around 750 participants from almost 100 developing countries to attend over than 60 CAC meetings.<sup>125</sup> Further, 111 persons from 72 countries participated in the Codex training programme.<sup>126</sup> This is expected to assist them to participate more actively in CAC meetings. Least-developed countries and other low-income countries have received about 60 percent of the support provided.<sup>127</sup> As noted in a recent evaluation of the Trust Fund, their delegates would probably have been unable to participate in these meetings without its support.<sup>128</sup> In respect of the three developing-country Members used as illustrations in this book, applications for funding have been received by all three and the Codex Trust Fund has funded the attendance of participants from Jamaica to three meetings of various Codex committees.<sup>129</sup> No participants from Mauritius or Bangladesh have been supported thus far.<sup>130</sup>

Countries that are beneficiaries of the Codex Trust Fund are expected to conduct national consultations and research prior to the relevant meeting, be present and participate in the whole meeting, report back to interested parties at the national level after the meeting, and, as set out above, are required, as a precondition for further funding, to submit a written report following a prescribed format to the Trust Fund Secretariat, as well as their national Codex Contact Point and interested parties, within two months of the meeting.

<sup>130</sup> Stuart A. Slorach, *Enquiry Concerning the FAO/WHO Project and Trust Fund for Enhanced Participation in Codex ("Codex Trust Fund")* (Swedish International Development Cooperation Agency, Stockholm), 12 October 2007, 51, available at: [http://www.who.int/foodsafety/codex/Slorach\\_report.pdf](http://www.who.int/foodsafety/codex/Slorach_report.pdf), visited on 10 June 2008.

As of 31 December 2007, 73 reports had been submitted by beneficiary countries (a compliance rate of 76 percent). The standard of reporting is variable. Only a few countries submit high quality reports that follow the standard reporting format. Other countries do not follow the reporting format and/or do not provide sufficient information that would allow the Codex Trust Fund to exploit this information to track progress in enhancing participation in the CAC. Member countries that did not comply with reporting obligations are not eligible for support in 2008.<sup>131</sup>

In 2004, being the first year of operation of the Codex Trust Fund, it was decided to fund only participation in Codex meetings. However, it has been recognised that other activities that contribute to improved participation should be eligible for funding as well. The CGTF set out an initial list of suitable activities, including training, guidance on setting up a Codex Contact Point, and support for taking on regional responsibilities.<sup>132</sup> Aside from applications for support to attend Codex meetings, some countries have requested support for capacity building by means of training. A Codex Training Package was developed using contributions from Canada and Switzerland and it was field tested in Tanzania in March 2004. It was used to conduct regional training courses on the Codex.<sup>133</sup> In the period from its establishment in 2004 until 2007, 80 percent of the resources of the Trust Fund have been used to fund participation in Codex meetings, eight percent to fund Codex training activities and 12 percent for administrative costs.<sup>134</sup>

The operation and impact of the Codex Trust Fund can be evaluated on the basis of the comments made in the reports received from beneficiaries. These were summarised by the Codex Secretariat in 2004.<sup>135</sup> Several of these reports indicated that the relevant delegate was a first-time participant in Codex meetings, and that much work remained to be done in his or her country as a result of lack of experience in CAC work, weak national food-safety legislation and infrastructure, lack of political awareness of the importance of the CAC for international trade, and capacity constraints with regard to implementation of Codex standards.<sup>136</sup> Other reports reflected significant existing understanding of and participation in CAC work, and highlighted the contribution of the Trust Fund support

<sup>135</sup> FAO/WHO Project and Fund for Participation in Codex, *Reported Issues Drawn from 24 Supported Participants' Reports (March – July 2004)* (Food and Agriculture Organisation and World Health Organization, Geneva), 2004.

<sup>136</sup> FAO/WHO Project and Fund for Participation in Codex, *Annual Report for 2004* (Food and Agriculture Organization and World Health Organization, Geneva), December 2004, 3.

to increasing broad government participation and improving the level of coordination of country positions.<sup>137</sup> Other benefits of Codex Trust Fund support identified in beneficiary reports included better understanding of CAC work and the roles and responsibilities of member countries; improved understanding of CAC documents and of the positions of different countries; the opportunity to establish networks with technically experienced colleagues from other countries; the possibility to interact with other countries and within regions to establish common positions; increased knowledge of how standards impact on food safety and trade; and increased impetus for the development of national food safety legislation based on Codex standards.<sup>138</sup>

Three issues emerge from beneficiaries' reports as requiring attention. First, timely approval of applications is crucial to enable participants to make the necessary practical arrangements. Last minute approvals have led to problems with visas and travel arrangements. Second, and related to the above, participants need sufficient time before a meeting to prepare properly and develop a national position, including the collection of the necessary scientific and factual data. Third, the need has been identified to link Trust Fund support to support for policy development, capacity building and training activities, regional activities, and implementation of Codex standards.<sup>139</sup>

Two studies evaluating the Codex Trust Fund were undertaken in 2007. One, entitled *Initiative to Explore Linkages between Increased Participation in Codex and Enhanced International Food Trade Opportunities* was financed by Department for International Development (DFID) of the UK.<sup>140</sup> Its preliminary findings and recommendations were circulated at the 30th Session of the Codex Alimentarius Commission in July 2007. This report found that the Codex Trust Fund has contributed significantly to increased participation of persons from eligible countries in Codex standard-setting. However, the report notes that it is too early to tell if countries will be able to sustain their participation in Codex activities that address health and economic issues that are priorities for them.<sup>141</sup> Some progress has been made through ensuring the delivery of Codex training to strengthen participation in Codex. The study recommends, however, more in-country support before and after Codex meetings to strengthen the capacity of the regulatory system. The Trust Fund has been weak in enhancing the scientific or technical ability of countries to participate in Codex.<sup>142</sup> Without effective participation on technical level,

<sup>137</sup> *Ibid.*

<sup>138</sup> FAO/WHO Project and Fund for Participation in Codex, *Reported Issues Drawn from 24 Supported Participants' Reports (March – July 2004)* (Food and Agriculture Organisation and World Health Organization, Geneva), 2004, para. 1.

<sup>139</sup> *Ibid.*, para. 2.

<sup>140</sup> Robert J. Connor, *Initiative to Explore Linkages between Increased Participation in Codex and Enhanced International Food Trade Opportunities. Final Report*, Project number RNRAT 012 (Department for International Development, Geneva), August 2007, available at: [http://www.who.int/foodsafety/codex/Connor\\_report.pdf](http://www.who.int/foodsafety/codex/Connor_report.pdf), visited on 10 June 2008.

<sup>141</sup> The report notes: 'It is unlikely that small island developing states (SIDS) would sustain funding the routine participation of their national delegates in Codex meetings because of the proportional high cost to their national budgets.' *Ibid.*, 15.

<sup>142</sup> The report states; 'Although it is an important objective of the Codex Trust Fund to assist the generation of scientific data to support the development of new Codex standards, there was a widespread view that there had been negligible progress in this area. A number of respondents mentioned the lack of support from the Codex Trust Fund for the development of national food control systems or national position papers, although

including through submission of relevant scientific data, developing countries cannot obtain Codex standards in areas they need. The report notes the following example:

Australian maximum permissible concentration (MPC) for arsenic in foods has been set for total arsenic only – at 1 mg/kg – which does not take into account the great differences in toxicity between organic and inorganic arsenic species. Clearly, this represents an opportunity for developing countries to become engaged in data generation and collection as part of the standard setting process. Similarly, the continuing debate on methyl mercury levels in fish is of relevance to many developing countries' exports.<sup>1</sup>

A second review of the Codex Trust fund entitled *Enquiry Concerning the FAO/WHO Project and Trust Fund for Enhanced Participation in Codex* ("Codex Trust Fund") was commissioned by the SIDA and undertaken between August and October 2007.<sup>2</sup> The functioning and progress of the Trust Fund in achieving its objectives and expected outputs were assessed. The study also gave particular attention to the African region. Many of its findings confirmed those of the first report mentioned above. In particular, the report notes that while the Trust Fund has successfully widened participation in Codex activities; it has not yet deepened the level of this participation. Developing countries that benefit from the Trust Fund still do not yet take an active part in the discussions at Codex meetings. This may be due to their inexperience with Codex terminology and procedures as well as to the often late arrival of working documents in a language with which the participant is familiar. In addition, sometimes a country position had not been developed on the issues under discussion, resulting in poor preparation for meetings.<sup>3</sup> In addition, the report notes that very little progress has been made in increasing developing countries' scientific and technical input into Codex standard-setting work. This can be ascribed to these countries' lack of technical and scientific infrastructure and resources, making it impossible or very difficult for them to produce reliable data, for example, on the levels of residues of pesticides and veterinary drugs and other contaminants in food.<sup>4</sup> This requires technical assistance to build technical capacity. The Codex Trust Fund role in capacity

---

other initiatives had made valuable contributions to such developments (e.g., the FAO in Cambodia, Viet Nam and Uganda; and Swedish International Development Agency (SIDA) and UNIDO in Uganda).<sup>1</sup> *Ibid.*, 18.

<sup>1</sup> *Ibid.*, 41. Further examples mentioned are the fact that discussions with a food processor in showed its interest in developing a standard for passion fruit syrup for export. Viet Nam and Thailand need a standard for fish sauce.

<sup>2</sup> Stuart A. Slorach, *Enquiry Concerning the FAO/WHO Project and Trust Fund for Enhanced Participation in Codex* ("Codex Trust Fund") (Swedish International Development Cooperation Agency, Stockholm), 12 October 2007, available at: [http://www.who.int/foodsafety/codex/Slorach\\_report.pdf](http://www.who.int/foodsafety/codex/Slorach_report.pdf), visited on 10 June 2008. Sweden, through the Swedish International Development Cooperation Agency (SIDA), has been the largest single contributor to the Codex Trust Fund so far (more than 30% of the total of contributions). Before deciding on further contributions SIDA commissioned this enquiry.

<sup>3</sup> *Ibid.*, 19. However, some progress is starting to be made in this area. The report notes a 'growing number of examples of countries supported by the CTF making important contributions to Codex debates, e.g. the interventions of Samoa in the discussions at CCGP in 2007 on the Code of Ethics. At the CAC meeting in July 2007, Paraguay made several interventions on the issue of a natural sweetener which is of particular interest to that country.'

<sup>4</sup> *Ibid.*, 20.

building is very limited and specialised. It complements the wider programmes of FAO and WHO that are aimed at building the capacity of national food safety control systems.<sup>5</sup>

Although not discussed in detail here, it is useful to note that not only the CAC but also the OIE and IPPC have trust funds in place to assist developing countries in improving their sanitary and phytosanitary capacities or to facilitate their participation in the standard-setting work.

The OIE created the World Animal Health and Welfare Fund on 28 May 2004,<sup>6</sup> from which its capacity building activities are financed. It aims to strengthen the capacity of developing-country OIE members to deal with animal health and welfare. In particular, it supports implementation of training programmes and action programmes; the organisation of seminars, workshops and conferences; the development of information media; the editing and distribution of scientific and technical publications; the implementation of scientific research programmes; the OIE Strategic Plans; and the activities of developing countries in all these areas.<sup>7</sup> In October 2006, the OIE held a meeting with its newly created 'Advisory Committee' for the Fund, consisting of high level representatives of the WTO, FAO, WHO and World Bank and possible donor countries (the US, the EC, Australia, Japan and France).<sup>8</sup> The fund has received US\$ 13 million and is being used to conduct economic studies, identify areas for priority investments, train developing-country trainers and evaluate the veterinary services in 15 pilot countries.<sup>9</sup> Aside from this trust fund, the OIE continues its existing practice of funding the participation of the Chief Veterinary Officers of its members in OIE standard-setting work.<sup>10</sup>

The IPPC established a Trust Fund in 2004, under FAO rules, to facilitate the participation of developing-country contracting parties in all IPPC activities. These include the meetings of the CPM and EWG as well as regional workshops on draft standards.<sup>11</sup> There have been no indications from any contracting party of an intention to contribute to this Trust Fund in 2008.<sup>12</sup> The IPPC also provides technical assistance to build phytosanitary capacity under the FAO Technical Cooperation Programme.<sup>13</sup>

### 2.5.2.3 The International Portal for Food Safety, Animal and Plant Health (IPFSAPH)

IPFSAPH was set up through an initiative led by the FAO, in partnership with the CBD, OIE, WHO and WTO. It has been active since May 2004. This is an internet-based resource, through which users can search for national SPS regulations; international SPS standards, guidelines and codes of practice; risk analyses; and national contact points for the Codex, OIE, IPPC, SPS Committee and CBD. It aims to facilitate trade in food and agricultural products and support the implementation of the *SPS Agreement* by providing a reliable single access point for official international and national SPS-related information.<sup>14</sup>

This portal integrates data sources maintained by the Codex, CBD, FAO, IAEA, IPPC, OIE, WHO and WTO as well as some national data sources (currently mainly from the US and EC). As of April 2008, it contains over 35 000 records.<sup>15</sup> By linking through to locally-managed sources, it makes it possible for users to find a wide range of SPS information and official documents through a single portal without duplicating the work of identifying and uploading documents. At the same time, the IPFSAPH is often more user-friendly than the source site and provides a one-stop search tool.

A unique feature of the IPFSAPH is that ‘cross-sectoral’ searches are possible, as information uniformly ‘described’ through appropriate keywords.<sup>16</sup> It facilitates accurately comparison of information within the IPFSAPH system that originally derives from different sources. Information can be searched relating to specific commodities (such as dairy, nuts etc.), countries, sources, information types (such as official texts, supporting materials, contacts etc.) and cross-sectoral issues (such as equivalence, HACCP, accreditation, specific pathogens, pests or diseases, etc.).<sup>17</sup> The information is updated each month.

To facilitate the use of the IPFSAPH by persons in developing countries with limited Internet access, a CD-Rom version of the portal has been created.<sup>18</sup> This makes it possible to search offline and download all main Codex, OIE and IPPC documents. Connecting to the Internet is then only necessary to download a document that is not available on the CD.

The IPFSAPH is useful both in creating awareness among officials of important international SPS standards and national measures taken to implement them, and in providing information on SPS requirements on export markets to actual or potential trading partners.<sup>19</sup> It makes use of partnerships in order to reach as wide a range of users as possible.<sup>20</sup>

<sup>14</sup> Animal & Plant Health International Portal on Food Safety, *IPFSAPH Users Guide* (Food and Agriculture Organization, Rome), 2008, 1, available at: [http://www.ipfsaph.org/En/Help/IPFSAPH\\_UserGuide\\_EN.pdf](http://www.ipfsaph.org/En/Help/IPFSAPH_UserGuide_EN.pdf), visited on 30 June 2008.

<sup>17</sup> See the website of the IPFSAPH, available at: <http://www.ipfsaph.org/En/default.jsp>, visited on 10 June 2008.

<sup>18</sup> The CD-Rom was distributed in May-June 2005 by means of a news item on the FAO website. See Codex Alimentarius Commission, *The International Portal for Food Safety, Animal and Plant Health. Submission from the FAO*, CAC/28 INF/4 (Joint FAO/WHO Food Standards Programme, Rome), June 2005, para. 6, available at: <http://www.ipfsaph.org/En/default.jsp>, visited on 10 June 2008.

<sup>19</sup> *Ibid.*, para. 9.

<sup>20</sup> For example, it collaborated in JITAP projects with regard to briefing national SPS Enquiry Points and

The figures on the use of the IPFSAPH to date indicate that it has proved to be a valuable resource.<sup>21</sup> In order to further improve its operation, the IPFSAPH conducted a user survey. It has extended its data to include up to eight additional major importing countries in Asia and Latin America, and to refine existing data on the US and EC. Countries are encouraged to take the initiative to make their own legislation and other information available to the portal.

The major challenge faced by the IPFSAPH is to promote its wider use among key target groups in developing countries. Workshops run jointly with the CAC in 2006 have introduced this tool to academics teaching courses on food safety, biological risk assessment, international trade and consumer protection. The long term vision is that national stakeholders should be able to draw on the IPFSAPH for core SPS-related information.<sup>22</sup>

#### 2.5.2.4 The Standards and Trade Development Facility

As mentioned above, the STDF was established in 2002 by five organisations: the FAO, the World Bank, the WHO, the OIE and the WTO, following a commitment made at the Doha Ministerial Conference in 2001. It is both a financing and a coordination mechanism.<sup>23</sup>

The STDF is administered by a Secretariat, under the responsibility of the WTO.<sup>24</sup> It has a Policy Committee composed of high-level representatives of the five partners and other stakeholders responsible for overseeing its activities. A Working Group, made up of representatives of the partner organisations and standard-setting bodies, is tasked with approving the STDF work programme, approving grants, overseeing the Secretariat, and appointing committees for special tasks.

The STDF was established with seed funding from the World Bank Development Grant Facility and a contribution from the WTO Doha Development Agenda Global Trust Fund,<sup>25</sup> and since then 11 WTO Members have made contributions.<sup>26</sup> The STDF has thus

---

provided training materials for programmes run by others (e.g. the World Bank and the WTO Secretariat) regarding the use of the portal. *Ibid.*, para. 11.

<sup>21</sup> Just after its launch, the portal averaged 5 000 page views a day, which increased to 11 000 by May 2007. Over 600 documents are downloaded from the site each day, and an increasing number of queries are being received by the helpdesk and Webmaster. Codex Alimentarius Commission, *The International Portal on Food Safety, Animal and Plant Health: Progress in 2006/7. Submission from FAO, CAC/30 INF/11* (Joint FAO/WHO Food Standards Programme, Rome), May 2007, para. 6.

<sup>22</sup> *Ibid.*, para. 15.

<sup>23</sup> Committee on Sanitary and Phytosanitary Measures, *Update on the Operation of the Standards and Trade Development Facility, G/SPS/GEN/748*, circulated on 2 February 2007, Annex, para. 11.

<sup>24</sup> The Secretariat is responsible for public relations, project screening, project management and financial management of the STDF. The Secretariat's staff consists of one full-time WTO Secretariat staff member and the part-time services of another. These staff resources are insufficient as the STDF has grown, and there is a need to establish separate management unit either at the WTO or at one of the partner agencies. Committee on Sanitary and Phytosanitary Measures, *Update on the Operation of the Standards and Trade Development Facility. Note by the Secretariat, G/SPS/GEN/648*, circulated on 24 March 2006, para. 8.

<sup>25</sup> The World Bank Development Grant Facility contributed US\$300 000 per year for 3 years (ending in June 2005) and the WTO committed to contributing CHF100 000 in 2003 and 2004, and CHF225 000 in 2005 and 2006 from the Doha Development Agenda Global Trust Fund.

<sup>26</sup> The fund grew from US\$1.4 million in 2004 to US\$5.3 million in September 2005. Since then additional contributions were received from Sweden (12 million Swedish Kronor), the US (US\$100 000) and Denmark

proved to be quite successful in attracting one-off donor funds. However, the STDF faces challenges in obtaining sustained commitments to donor funding. Only two Members have made formal multi-annual funding commitments thus far.

The STDF aims to help developing countries build their capacity to analyse and implement SPS requirements, and thereby to gain and maintain market access. Public or private entities in developing countries may request financing. The STDF provides both project preparation grants and project grants.<sup>27</sup> To date the STDF has approved funding for 27 projects and 25 project preparation grants.<sup>28</sup>

In addition, the STDF aims to act as a vehicle for coordination among providers of technical assistance, for the mobilisation of funds, the exchange of experience and the dissemination of good practices with regard to SPS-related technical assistance. Its partner institutions have extensive experience and skills in the areas of SPS and technical assistance, and are thus extremely well-suited to assist developing countries to build capacity in this area. The STDF benefits from this collective expertise. It does not compete with or replace existing technical assistance activities conducted by its partners, but is complementary to them.<sup>29</sup> In December 2006, a new medium-term strategy (2007-2011) was agreed for the STDF by its Policy Committee. This strategy puts more focus on the STDF's function as a vehicle for co-ordination, fund mobilization and the identification and dissemination of best practices in SPS-related technical assistance.<sup>30</sup> While funding will still be provided for technical assistance projects, tighter eligibility criteria will be imposed and there will be more emphasis on project preparation grants.<sup>31</sup>

The new strategy aims at achieving an annual funding target of US\$5 million. The project preparation grants are expected to attract funds from both the STDF itself and the wider donor community.<sup>32</sup> Synergies are expected between the STDF and the Integrated Framework for Trade-Related Technical Assistance to Least-Developed Countries (IF)<sup>33</sup>

---

(2.5 million Danish Kronor). Committee on Sanitary and Phytosanitary Measures, *Update on the Operation of the Standards and Trade Development Facility. Note by the Secretariat, G/SPS/GEN/648*, circulated on 24 March 2006, para. 3.

<sup>27</sup> *Ibid.*, para. 1.

<sup>28</sup> Committee on Sanitary and Phytosanitary Measures, *Update on the Operation of the Standards and Trade Development Facility. Note by the Secretariat, G/SPS/GEN/829*, circulated on 25 March 2008, para. 19. Of the 27 projects, 11 projects have been completed, 12 were in progress and 4 are awaiting contracting. Of the 25 project preparation grants, 17 have been completed and 8 are being implemented.

<sup>29</sup> For example, the STDF does not fund participation in the international standard-setting bodies but instead the capacity built through STDF projects is expected to improve the ability of developing countries to participate effectively in these international bodies. Committee on Sanitary and Phytosanitary Measures, *Update on the Operation of the Standards and Trade Development Facility, G/SPS/GEN/748*, circulated on 2 February 2007, para. 17.

<sup>30</sup> *Ibid.*, para. 1.

<sup>31</sup> *Ibid.*, para. 2 and Annex, para. 4. Projects funded should be innovative, sustainable, preventative and replicable; address gaps in SPS information and training materials; or aim to improve coordination between SPS technical assistance providers.

<sup>32</sup> *Ibid.*, Annex, para. 3.

<sup>33</sup> The IF is a multi-agency, multi-donor initiative. It was launched based on the commitment of ministers at the 1996 Singapore Ministerial Conference to address the increasing marginalisation of least-developed-countries in world trade, and to improve the coherence of technical assistance activities. A Plan of Action was developed, which led to the establishment of the IF in 1997 under the joint responsibility of the WTO, World Bank, UNDP, UNCTAD, IMF and ITC. The IF process is comprised of four steps, namely (1) the creation of

and the Joint Integrated Technical Assistance Programme for selected least-developed and other African countries (JITAP).<sup>34</sup> In particular, the needs identified in the national diagnostic studies conducted in the IF framework will be addressed by inviting the partners to assist in developing a project preparation grant.<sup>35</sup> Forty per cent of STDF resources are committed for least-developed countries and other low income economies.<sup>36</sup>

The STDF does not only fund national and regional capacity building initiatives, such as the project to support compliance with regulatory and private SPS export standards in the fruit and vegetable sector in Guinea. It also undertakes global initiatives. For example, the STDF has completed a project establishing a database on SPS-related technical assistance and capacity building projects, including national and regional projects.<sup>37</sup> This electronic resource compiles data reported by the five partner institutions, multilateral agencies, and regional and bilateral donors. It draws upon the existing WTO/OECD Trade-Related Technical Assistance and Capacity Building Database.<sup>38</sup> This database has been criticised for the overwhelming mass of information it contains on technical assistance initiatives, many of which are limited to one-time capacity building events, while only a fraction entail sustained capacity building efforts.<sup>39</sup> Another global initiative is the workshop on SPS capacity evaluation tools organised by the STDF on 31 March 2008.<sup>40</sup> The various

---

awareness regarding the importance of trade for the promotion of development; (2) the conduct of a Diagnostic Trade Integration Study (DTIS) to identify areas of greatest export potential and constraints in these areas, and establish a plan of action; (3) the integration of the plan of action into national development plans such as the Poverty Reduction Strategy Process; and (4) the implementation of the plan of action together with the development cooperation community. Funding for implementation comes primarily from bilateral donors, but the IF Trust Fund has been established to finance the preparation of the DTIS and to provide some bridging funds for capacity building projects that are part of the action plan. In the context of the DTIS, SPS-related issues have sometimes been identified as forming constraints to the export potential of a country. These have been compiled by the WTO Secretariat. See Committee on Sanitary and Phytosanitary Measures, *Review of Standards Related Issues Identified in the Integrated Framework Diagnostic Trade Integration Studies. Note by the Secretariat*, G/SPS/GEN/545, circulated on 28 February 2005. More information is to be found on the IF website, available at: <http://www.integratedframework.org/>, visited on 30 June 2008.

<sup>34</sup> The JITAP aims to develop human and institutional capacity of selected African countries to support their integration in the multilateral trading system. It was launched by the heads of the WTO, UNCTAD and the ITC in 1996. Initially 8 beneficiary countries were selected to participate. With the launch of JITAP II in 2002 another 8 beneficiaries were included. JITAP is designed to enhance synergies among the WTO, UNCTAD and ITC and to ensure efficient use of resources, through economies of scale and scope in management and programme implementation. A key feature is the role of JITAP as a framework for catalyzing other trade-related technical assistance, including that provided under the Integrated Framework. This information is drawn from the JITAP website, available at: <http://www.jitap.org/info-e.htm>, visited on 30 June 2008.

<sup>35</sup> Committee on Sanitary and Phytosanitary Measures, *Update on the Operation of the Standards and Trade Development Facility*, G/SPS/GEN/748, circulated on 2 February 2007, Annex, para. 13.

<sup>36</sup> *Ibid.*, Annex, para. 3.

<sup>37</sup> This database is available at: <http://stdfdb.wto.org>, visited on 1 June 2008.

<sup>38</sup> Committee on Sanitary and Phytosanitary Measures, *Update on the Operation of the Standards and Trade Development Facility. Note by the Secretariat*, G/SPS/GEN/648, circulated on 24 March 2006, para. 12.

<sup>39</sup> Steven Jaffee *et al.*, *Food Safety and Agricultural Health Standards: Challenges and Opportunities for Developing Country Exports*, 31207 (World Bank, Poverty Reduction & Economic Management Trade Unit and Agriculture and Rural Development Department, Washington D.C.), 10 January 2005, footnote 69, available at: [http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016\\_20050125093841/Rendered/PDF/31207.pdf](http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016_20050125093841/Rendered/PDF/31207.pdf), visited on 18 May 2008. This criticism is reiterated by Scott. Joanne Scott, *The WTO Agreement on Sanitary and Phytosanitary Measures: A Commentary*, Oxford Commentaries on the GATT/WTO Agreements (Oxford University Press, Oxford), 2007, 301.

<sup>40</sup> Committee on Sanitary and Phytosanitary Measures, *Overview of SPS Capacity Evaluation Tools. Note by the Secretariat*, G/SPS/GEN/821, circulated on 18 February 2008.

capacity evaluation tools were assessed and the possibilities for collaboration and cooperation between organisations in the development and use of such tools were discussed.<sup>41</sup> In addition, on 26 June 2008, the STDF organised an information session on private standards, in which representatives of the World Bank, the Africa Observer Project, the Global Food Safety Initiative and the International Certification and Risk Services made presentations. The issues addressed included how to make developing countries' voices heard in the area of private standards; how to reduce the costs of certification; how to promote dialogue between private standard holders, suppliers, certifiers and other interested parties; and advancements with respect to the recognition of equivalence between various schemes.<sup>42</sup>

A mid-term review of the STDF was commissioned in 2005.<sup>43</sup> While it was too early to determine if STDF projects had been effective, since none had yet reached their end, the report of this review was positive about the profile of the projects funded by the STDF. The STDF was judged to have been successful in attracting considerable donor interest as well as many projects from a range of beneficiaries. However, to *sustain* such interest and funding it is important to show demonstrable results. It is recommended that procedures be established for the monitoring and measurement of the results of projects. The review finds that the STDF has been a learning experience for the partner institutions. It fills a niche in the 'crowded market of development assistance in support of trade development by focusing on a highly technical area neglected by donors.'<sup>44</sup> It has been a successful forum for knowledge sharing on SPS and for building coherence in technical assistance.<sup>45</sup> However, more attention must be given to the coherence of the STDF's actions with the IF and other capacity building activities.<sup>46</sup> The review warns that due to lack of administrative capacity, the STDF could 'become asphyxiated by its own success'.<sup>47</sup> The creation of a project management unit is recommended.

## 2.6 Problems with the implementation of technical assistance

There are many flaws in the current implementation of technical assistance. Although from the description provided above of technical assistance initiatives it would appear that donor countries allocate substantial financial resources to SPS technical assistance, in practice often the amount actually provided is much less than that committed to. While the amount of technical assistance granted has increased since the launch of the Doha Development Round,<sup>48</sup> it is still inadequate. In fact, a report by the World Bank

This review led to the new Medium term Strategy discussed above.

<sup>44</sup> *Ibid.*, para. 47.

<sup>45</sup> *Ibid.*, paras 54-55.

<sup>46</sup> *Ibid.*, para. 61.

<sup>47</sup> *Ibid.*, para. 57.

<sup>48</sup> The Hong Kong Ministerial Declaration notes with appreciation 'the substantial increase in trade-related

characterises the level of technical assistance in the area of SPS capacity building as ‘extremely modest given the significance of the challenges (and opportunities) facing developing countries.’<sup>49</sup> In the implementation discussions at the WTO, developing-country Members have complained that they most often do not receive technical assistance to facilitate adjustment to SPS measures that affect their trade. Further, the prevalent reactive approach to technical assistance, where assistance is only provided once an exporting Member has already lost market access due to an SPS trade barrier, has been criticised by Members.<sup>50</sup> In addition, long delays between allocation of funds and their actual provision are common, frustrating attempts at long term planning.<sup>51</sup> The lack of certainty and predictability in the provision of technical assistance aggravates this problem.<sup>52</sup>

Another often-heard complaint is that bilateral technical assistance is frequently geared towards furthering the interests of the donor country.<sup>53</sup> This perception was given voice in an aptly-worded comment by a representative of an African country that received SPS-related technical assistance: ‘[T]hey want us to understand SPS so that we will import more chicken.’<sup>54</sup> This remark powerfully captures the prevailing idea that the strategic interests of developed countries, rather than real needs in developing countries, underlie decisions on bilateral technical assistance.<sup>55</sup> A 2005 report by the World Bank confirms this view.<sup>56</sup> Even where donor-driven technical assistance does not directly conflict with

---

technical assistance since [its] Fourth Session, which reflects the enhanced commitment of Members to address the increased demand for technical assistance, through both bilateral and multilateral programmes. Ministerial Conference, *Doha Work Programme. Ministerial Declaration Adopted on 18 December 2005*, WT/MIN(05)/DEC, circulated on 22 December 2005, para. 52.

<sup>49</sup> Steven Jaffee *et al.*, *Food Safety and Agricultural Health Standards: Challenges and Opportunities for Developing Country Exports*, 31207 (World Bank, Poverty Reduction & Economic Management Trade Unit and Agriculture and Rural Development Department, Washington D.C.), 10 January 2005, 119, available at: [http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016\\_20050125093841/Rendered/PDF/31207.pdf](http://www-wds.worldbank.org/external/default/WDSContentServer/WDSP/IB/2005/01/25/000160016_20050125093841/Rendered/PDF/31207.pdf), visited on 18 May 2008.

<sup>50</sup> Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment. Adopted by the Committee on 30 June 2005*, G/SPS/35, circulated on 7 July 2005, para. 21.

<sup>51</sup> Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume I: Background Information, Findings from Case Studies and Technical Assistance Needs* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2003, 70.

<sup>52</sup> Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment. Adopted by the Committee on 30 June 2005*, G/SPS/35, circulated on 7 July 2005, para. 21. This is the underlying concern leading to the calls for mandatory technical assistance provisions in the *SPS Agreement*, discussed below, Part V, Section 2.7.

<sup>53</sup> In the discussions in the SPS Committee on strengthening technical assistance, Members characterised much of the technical assistance received as ‘supply-driven’ and ‘determined to a greater extent by the policy interests of the donor than the specific needs of the recipient’. *Ibid.*

<sup>54</sup> J. Michael Finger, ‘The Uruguay Round North-South Bargain: Will the WTO Get over It?’ in *The Political Economy of International Trade Law. Essays in Honor of Robert E. Hudec*, Daniel L. M. Kennedy and James D. Southwick (eds.) (Cambridge University Press, Cambridge), 2002, 301-310, 306.

<sup>55</sup> This concern is also reflected in United Nations Development Programme, *Human Development Report 2005. International Cooperation at a Crossroads: Aid, Trade and Security in an Unequal World* (United Nations, New York), 2005, 11, available at: [http://hdr.undp.org/en/media/hdr05\\_complete.pdf](http://hdr.undp.org/en/media/hdr05_complete.pdf), visited on 2 January 2008. While emphasizing the importance of capacity building for trade, this report notes that ‘[u]nfortunately, there is an unhealthy concentration on capacity building in areas that rich countries consider strategically useful.’

<sup>56</sup> Steven Jaffee *et al.*, *Food Safety and Agricultural Health Standards: Challenges and Opportunities for Developing Country Exports*, 31207 (World Bank, Poverty Reduction & Economic Management Trade Unit and Agriculture and Rural Development Department, Washington D.C.), 10 January 2005, 116, available at:

the interests of the recipient Member, ‘in a world of limited resources, technical assistance in one area can divert human and material resources from others that may be of greater priority.’<sup>57</sup> It is interesting to note that the Hong Kong Ministerial Declaration urges the WTO Director-General ‘to ensure that [technical assistance] programmes focus accordingly on the needs of beneficiary countries and reflect the priorities and mandates adopted by Members.’<sup>58</sup>

There is therefore a need to ensure that technical assistance is demand-driven, focusing on the priorities of the beneficiary country. As recommended by the World Bank study mentioned above, developing countries need to be assisted in making their *own* strategic decisions with regard to how to respond to new SPS measures, including possibly challenging those measures or negotiating changes.<sup>59</sup> In order to effectuate this, there needs to be a willingness on the part of donor countries to look beyond their own interests in providing technical assistance. As noted by Michel Kostecki, ‘ownership’ by the beneficiary is the most important feature of the new approach to technical assistance. This new approach focuses on the idea of partnership between the donor and the beneficiary. To distinguish it from traditional donor-driven technical assistance, this is referred to as ‘capacity building’.<sup>60</sup>

A precondition for needs-driven capacity building is the determination by developing-country Members of their capacity needs. It has been noted that the paucity of demand-driven requests for technical assistance is partly due to institutional capacity constraints.<sup>61</sup> In addition, there is a need for ‘effective prioritizing and planning mechanisms within developing countries.’<sup>62</sup> The input of various relevant government agencies and the private sector is essential in the determination of national priorities. As many developing countries do not have effective channels in place for inter-agency coordination or for communication with the private sector,<sup>63</sup> assistance may be needed already at this level. It

<sup>61</sup> Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment. Adopted by the Committee on 30 June 2005*, G/SPS/35, circulated on 7 July 2005, para. 21.

<sup>62</sup> Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume I: Background Information, Findings from Case Studies and Technical Assistance Needs* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2003, 89.

<sup>63</sup> The problem of lack of internal communication and coordination between the various experts and bodies active in the area of SPS was highlighted in Gonzalo K. Rios ‘Technical Assistance Needs of Developing Countries and Mechanisms to Provide Technical Assistance’, presented at the *Conference on International Food Trade Beyond 2000: Science-Based Decisions, Harmonization, Equivalence and Mutual Recognition*

is important to do the groundwork in this regard, since without it the assistance provided may be a wasted effort. The ITC/Commonwealth Secretariat report mentioned above notes:

For example sophisticated laboratory equipment may have been provided even though the recipient country does not have the means or is unwilling to commit to provide the skilled human resources to operate it, essential maintenance, consumables and so forth. Indeed it is possible for export capacity to be developed that is beyond the needs of developing country exporters. Not only does this waste scarce technical assistance, but it can tie developing countries into longer term resource demands to maintain this capacity. This underlines the need for technical assistance to be ‘appropriate’ and problem-focused.<sup>64</sup>

Efforts made to address this problem through the development of capacity evaluation tools, discussed below,<sup>65</sup> have resulted in a considerable body of research work on capacity needs. However, the evaluation of SPS-related technical assistance conducted by the STDF in the context of the Aid-For-Trade review points put that a ‘single common analysis of SPS-related technical cooperation needs shared between donors, international organisations and beneficiaries is missing.’<sup>66</sup> It points out the danger of duplication of efforts in the absence of greater coordination.

Further, the effectiveness of the technical assistance provided has been questioned by several developing-country Members. Much of the assistance received has not had the desired result of enabling recipient Members to maintain or expand market access for their products when faced with new SPS requirements.<sup>67</sup> This has partly been ascribed to the fact that decisions on the allocation of technical assistance are driven by the political considerations of the funding agency rather than based on systematic criteria to determine where technical assistance will have most practical effect.<sup>68</sup> The STDF evaluation of technical assistance in 2007, in the context of the Aid-for-Trade review, notes that ‘a strong conclusion which emerged related to the difficulty of translating the need for strengthening SPS functions into concrete actions which will have a tangible impact, in particular in the area of market access.’<sup>69</sup>

<sup>67</sup> Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment. Adopted by the Committee on 30 June 2005*, G/SPS/35, circulated on 7 July 2005, para. 22.

<sup>68</sup> Arne Wiig and Ivar Kolstad, ‘Lowering Barriers to Agricultural Exports through Technical Assistance’, *Food Policy* 30, 2005, 185 – 204. Wiig and Kolstad conducted a survey of the major providers of SPS-related technical assistance (US, EC, WTO, FAO, and World Bank) which found that even in those cases where a set of formal criteria for the allocation of SPS-related assistance exists, their application is weak and in practice the allocation of funds is politically driven.

<sup>69</sup> Committee on Sanitary and Phytosanitary Measures, *Background Document from the Standards and Trade Development Facility for the Global Review of Aid for Trade: Note by the Secretariat*, G/SPS/GEN/812,

The provision of technical assistance is characteristically fragmented, focusing on particular projects rather than system-wide improvements. The STDF evaluation of technical assistance initiatives concludes that ‘capacity building is being undertaken on an ad hoc basis with specific donors looking at specific interventions, rather than as part of an over-arching development plan which includes a clear vision of national SPS strategy.’<sup>70</sup> It notes, for example, the rapid rise in technical assistance related to highly pathogenic avian influenza (bird flu) in Asian countries and the provision by the EC of assistance with regard to very large thematic projects on pesticides, fisheries and animal health. These areas of assistance are closely related to the particular interests of the donors. The type and nature of assistance provided varies widely between different regions, between countries in the same region, and between different sectors within the same country.<sup>71</sup>

Another problem that is prevalent with regard to technical assistance initiatives is the lack of coherence and coordination between various projects. This shortcoming is reflected in the discussion of technical assistance activities above. As noted in the abovementioned STDF evaluation, the importance of greater coordination between donor activities is further underlined by the fact that donor funding in the area of SPS-related technical assistance is growing due to increasing attention of donors to SPS issues. The multiplicity of projects leads to frequent overlaps and duplication of efforts to address particular capacity needs.<sup>72</sup> This leads to wasted resources. At the same time, other needs are neglected, leading to gaps in SPS capacity. An integrated approach is called for.

## 2.7 Efforts to improve the implementation of technical assistance

High-level as well as technical meetings have been held between the WTO and other international organisations to coordinate the provision of technical assistance. In addition, regular updates on technical assistance activities are provided to the SPS Committee by the three international standard setting bodies, international organisations (such as the FAO, the World Bank, OIRSA, IICA, and UNCTAD) and some Members. While this should lead to greater coherence, in fact an examination of the submissions reveals that fragmentation and duplication are still prevalent.

The Hong Kong Ministerial Declaration has reaffirmed the priorities set out in the Doha Ministerial Declaration with regard to technical assistance. It invites the Director-General to reinforce the cooperation with other agencies in the design and implementation of

---

circulated on 22 November 2007, para. 27.

<sup>70</sup> *Ibid.*

<sup>71</sup> *Ibid.*, para. 26.

<sup>72</sup> These problems were identified in the ITC/Commonwealth Secretariat report, based on concrete case studies. Vinod Rege *et al.*, *Influencing and Meeting International Standards: Challenges for Developing Countries. Volume I: Background Information, Findings from Case Studies and Technical Assistance Needs* (International Trade Centre UNCTAD/WTO and Commonwealth Secretariat, Geneva), 2003, 88. This report mentions the example of the overlap between its own country papers and those drafted with the assistance of funding from the German technical cooperation through the SADC Secretariat for the SADC SPS/Food Safety Conference in 2000, on similar issues. Further, it mentions USAID funding for SPS capacity building in SADC countries, and the World Bank’s intention to fund a similar study, covering the many of the same countries. The 2003 World Bank report in this regard is contained in John S. Wilson and Victor O. Abiola, eds., *Standards and Global Trade: A Voice for Africa* (World Bank, Washington D.C.), 2003.

technical assistance programmes, ‘so that all dimensions of trade-related capacity building are addressed, in a manner coherent with the programmes of other providers.’<sup>1</sup>

The WTO Secretariat makes concerted efforts to help Members identify problems in the delivery of technical assistance and to find solutions through shared experiences. Already in 1999 and 2001 the Secretariat undertook a survey of technical assistance needs and activities by means of questionnaires,<sup>2</sup> and has drawn up a technical assistance typology to help Members identify the most appropriate type of technical assistance.<sup>3</sup> In November 2002, prior to the SPS Committee meeting, the WTO Secretariat organised a seminar on SPS-related technical assistance and capacity building. At this seminar, information was presented by international and regional organisations as well as developing-country Members regarding their experiences with technical assistance in the SPS area.<sup>4</sup>

Technical assistance has been a standing item on the agenda of SPS Committee meetings since 1995, where Members are encouraged to identify specific technical assistance needs and report on technical assistance activities.<sup>5</sup> In addition, informal discussions on technical assistance and co-operation have been held in the SPS Committee. In these discussions, concrete proposals were put forward to improve the effectiveness of the technical assistance provisions, including creating a coherent program for the provision of technical assistance, regardless of the source of the assistance, and placing emphasis on the development of human resources.<sup>6</sup>

<sup>5</sup> Committee on Sanitary and Phytosanitary Measures, *Proposals and Progress on Special and Differential Treatment. Note by the Secretariat*, G/SPS/GEN/543, circulated on 28 February 2005, para. 37. A compilation of all documents submitted to and drafted by the SPS Committee on this issue was circulated to all Members in 2002. Committee on Sanitary and Phytosanitary Measures, *Technical Assistance and Capacity Building in the Context of the SPS Committee. Note by the Secretariat*, G/SPS/GEN/332, circulated on 24 June 2002.

<sup>6</sup> The first meeting was held in July 2001. Committee on Sanitary and Phytosanitary Measures, *Discussion on Technical Assistance and Cooperation – Informal Meeting of the SPS Committee of 9 July 2001*, G/SPS/GEN/267, circulated on 16 July 2001. The second was held on 18 March 2002 (report not yet derestricted).

This work gathered momentum in the context of the Doha Round work programme on implementation issues. Among the Category II proposals referred to the SPS Committee by the General Council in 2003, were several proposals on strengthening Article 9 of the *SPS Agreement*. In addition, some of the proposals made with regard to Article 10 in fact deal with technical assistance. An examination of these proposals and of the discussions in this regard provides an indication of the current positions of WTO Members on the possibilities for strengthening an operationalising technical assistance under the *SPS Agreement*.

Relevant to Article 9.1, the African Group has proposed the establishment of a facility within the Global Trust Fund to ensure that developing countries and LDCs: (i) have the technical and financial capacity to meet the requirements of the *SPS Agreement*; (ii) can send delegations and effectively participate in meetings of the SPS Committee and the relevant international standard-setting bodies; (iii) can effectively utilise the flexibilities under the *SPS Agreement*; and (iv) have their rights protected against contravention by measures adopted under the *SPS Agreement*.<sup>7</sup> In addition, this proposal suggests that it be understood that technical and financial assistance as well as transfer of technology to developing countries and LDCs shall be cost free.<sup>8</sup>

Two proposals have been received with regard to Article 9.2 of the *SPS Agreement*, which deals with the situation where compliance with an SPS measure requires substantial investments from a developing-country Member. The Group of Like-Minded Countries has suggested replacing the words ‘shall consider providing’ with ‘shall provide’, making the provision of technical assistance obligatory in such cases. This proposal further extends the obligation to provide technical assistance to cases where a developing-country Member identifies specific problems of inadequate technology and infrastructure to meet the SPS requirements of an importing developed-country Member.<sup>9</sup> The African Group’s proposal suggests that the phrase ‘substantial investments’ in Article 9.2 be interpreted in relation to the resources of the government departments of the affected Members and their development needs. Any changes to SPS requirements that would necessitate additional resources (greater expenditure, restructuring, additional staff or training) would be considered to require ‘substantial investments’. This proposal further specifies that ‘technical assistance’ shall be understood as fully funded technical assistance, not entailing financial obligations on the part of the beneficiaries. In addition, the African Group proposes to add to Article 9.2, for cases where no technical assistance is provided, the obligation to withdraw the measures immediately and unconditionally, or to compensate the exporting developing-country Members for the losses arising directly or indirectly from the measures. Finally, this proposal, as already mentioned above, calls for the WTO to recommend prior impact assessments with regard to the likely effects of draft SPS measures on developing- and least-developed-country trade. Where adverse effects are

<sup>7</sup> This proposal was made in connection with Art. 10 of the *SPS Agreement*, but seems to relate more to the issue of technical assistance. Committee on Trade and Development, *Special and Differential Treatment Provisions. Joint Communication from the African Group in the WTO. Revision*, TN/CTD/W/3/Rev.1, circulated on 24 June 2002, para. 54(c).

<sup>8</sup> *Ibid.*, para. 54(d).

<sup>9</sup> Committee on Trade and Development Special Session, *Special and Differential Treatment Provisions. Joint Communication from Cuba, Dominican Republic, Egypt, Honduras, India, Indonesia, Kenya, Mauritius, Pakistan, Sri Lanka, Tanzania and Zimbabwe*, TN/CTD/W/2, circulated on 14 May 2002.

identified, SPS requirements would not be applicable until affected Members have acquired the capacity to comply with the requirements.

With regard to Article 10.4 of the *SPS Agreement*, which deals with facilitation of developing-country Members in the international standard setting bodies, India has proposed that the word ‘should’ be read as a duty rather than an exhortation. It recommends the adoption of an authoritative interpretation under Article IX:2 of the *WTO Agreement* to this effect.<sup>10</sup> The African Group’s proposal regarding the use of its proposed Trust Fund facility to enable developing- and least-developed-country Members to participate effectively in international standard setting bodies is also relevant to Article 10.4.<sup>11</sup>

Discussions on these proposals indicated some receptivity to the idea that technical assistance must be made more effective and needs-driven.<sup>12</sup> While many Members pointed to the various existing technical assistance initiatives,<sup>13</sup> at bilateral and multilateral level, they also indicated their willingness to take the underlying concerns of developing-country Members seriously, and to address the problems with existing technical assistance.<sup>14</sup> Australia, as mentioned above, indicated that firm commitments in the area of technical assistance were more likely than agreement on mandatory SDT. In particular, Australia was willing to consider India’s proposal that Article 10.4 be read as mandatory, obliging Members to encourage developing-country participation in international standard-setting bodies.<sup>15</sup> However, the idea that the application of SPS measures would be conditional on granting cost-free technical assistance or compensation was firmly rejected.<sup>16</sup> Similarly, developed-country Members did not see mandatory technical assistance as a feasible option, due to its unlimited budgetary implications.<sup>17</sup> Further, the paucity of concrete technical assistance requests from developing countries was noted. Developing-country Members countered that without binding technical assistance, they could not be assured that requests would actually be honoured. In addition, the capacity constraints they face in undertaking specific needs assessments should be borne in mind. Developing-country Members sought a clear commitment that technical assistance would be provided when an SPS requirement caused compliance difficulties.

<sup>10</sup> Committee on Trade and Development Special Session, *Special and Differential Treatment Provisions. Communication from India*, TN/CTD/W/6, circulated on 17 June 2002.

<sup>11</sup> Committee on Trade and Development, *Special and Differential Treatment Provisions. Joint Communication from the African Group in the WTO. Revision*, TN/CTD/W/3/Rev.1, circulated on 24 June 2002, para. 54(c).

<sup>12</sup> Committee on Trade and Development Special Session, *Note on the Meeting of 6 November 2002*, TN/CTD/M/10, circulated on 21 January 2002, para. 30.

<sup>13</sup> For example, Canada pointed to the mechanism run by the Standards Council of Canada to assist developing countries to participate in the international standard setting bodies. The US drew attention to a programme funded by it and other developed-country Members to assist 32 Latin American and Caribbean countries to participate in SPS Committee meetings since 2002. Committee on Sanitary and Phytosanitary Measures, *Proposals and Progress on Special and Differential Treatment. Note by the Secretariat*, G/SPS/GEN/543, circulated on 28 February 2005, paras 33-34.

<sup>14</sup> *Ibid.*, para. 23.

<sup>15</sup> Committee on Trade and Development Special Session, *Note on the Meeting of 6 November 2002*, TN/CTD/M/10, circulated on 21 January 2002, para. 9.

<sup>16</sup> *Ibid.*

<sup>17</sup> Committee on Sanitary and Phytosanitary Measures, *Proposals and Progress on Special and Differential Treatment. Note by the Secretariat*, G/SPS/GEN/543, circulated on 28 February 2005, para. 22.

The failure of the discussions on technical assistance to lead to recommendations for operationalising the relevant provisions of the *SPS Agreement* has been ascribed to a number of constraints faced by the SPS Committee. One of these is the fact that few concrete proposals have been made in this regard, and those that have been made require actions outside the sphere of competence of the SPS Committee. For example, they involve actions at bilateral level, at the level of the international standard-setting bodies, and at the level of the WTO as a whole. Further, discussions on the proposals only became specific and concrete very late in the process. In addition, the ‘expectations gap’ between Members on the issue of technical assistance has proven intractable.<sup>18</sup>

In view of this deadlock, the SPS Committee has undertaken to discuss further work that could address the concerns that underlie the proposals made. As mentioned above, the initial elements for discussion identified by the SPS Committee in this regard relate to improvements in the procedural mechanisms provided by the *SPS Agreement*, to make them better suited to resolve the SPS problems faced by developing-country Members. These include the identification of best practices in transparency procedures to ensure timely receipt by these Members of information on SPS measures relevant to their trade; the identification of mechanisms for efficient and early evaluation by developing-country Members of potential trade problems in notified measures; and the consideration of ways for these Members to make greater use of the opportunities provided by the SPS Committee to resolve specific trade concerns. In addition, two elements are identified with regard to technical assistance, namely the establishment of an effective mechanism to monitor the demand for and supply of technical assistance, in order to improve its predictability, timeliness and effectiveness relative to developing-country Members’ needs; and the development of best practices for SPS technical assistance under the WTO Doha Development Agenda Global Trust Fund.<sup>19</sup>

Work on some of these elements is underway. In January 2008, the WTO Secretariat requested Members to provide information on SPS-related technical capacity building projects that could be regarded as ‘good practice’, by means of the provided questionnaire.<sup>20</sup> On the basis of responses, field research will be undertaken in the beneficiary and a separate questionnaire circulated to determine the beneficiary’s assessment of the project. The information gathered in this way will be used to identify best practices in technical assistance and presented in a workshop.

In October 2007, at a special workshop on transparency issues, New Zealand proposed the establishment of a voluntary ‘mentoring’ system to help developing-country Members implement and fully benefit from the transparency obligations of the *SPS Agreement*.<sup>21</sup>

---

<sup>18</sup> Committee on Sanitary and Phytosanitary Measures, *Report on Proposals for Special and Differential Treatment. Adopted by the Committee on 30 June 2005*, G/SPS/35, circulated on 7 July 2005, paras 37–40.

<sup>19</sup> *Ibid.*, para. 43.

<sup>20</sup> As only seven Members responded to this request (Australia, Canada, Chinese Taipei, Costa Rica, the EC, Sweden and Switzerland) the deadline for the request for information was extended to 30 April 2008. Committee on Sanitary and Phytosanitary Measures, *Request for Information on Good Practice in SPS-Related Technical Cooperation. Note by the Secretariat*, G/SPS/GEN/816, circulated on 18 January 2008; Committee on Sanitary and Phytosanitary Measures, *Request for Information on Good Practice in SPS-Related Technical Cooperation. Extension of Deadline. Note by the Secretariat. Addendum*, G/SPS/GEN/816/Add.1, circulated on 20 March 2008.

<sup>21</sup> Committee on Sanitary and Phytosanitary Measures, *Technical Assistance for Operating the SPS Notification*

Members showed interest in this proposal and it was developed further by the WTO Secretariat.<sup>22</sup> In terms of this proposal, Members who need assistance in operating their national notification agency or enquiry point would request help.<sup>23</sup> Developed and developing-country Members that have experience in this area would volunteer to be ‘mentors’ by registering with the WTO Secretariat, which would have the task of matching mentors and mentees. This proposal envisages a ‘long term, positive and proactive relationship’ between the officials involved, which is ‘based on trust, which requires thoughtful interaction and a commitment to providing ongoing assistance and support to those being mentored.’<sup>24</sup> The ‘mentor’ Member could provide support in a variety of ways, including through the provision of information by telephone or email; by giving guidance on the development of legislation and the operation of procedures; by providing in-house training or hands-on workshops; by assisting with resources or translations.<sup>25</sup> The mentoring system is expressly stated not to imply any *commitment* to provide financial or other types of assistance and does not replace other technical assistance activities.<sup>26</sup>

Efforts are also being undertaken in the international standard-setting bodies to address problems in the provision of technical assistance. Particularly useful are the initiatives to develop tools to assist developing countries in evaluating their current capacities and needs in the area of SPS regulation. As noted above, this evaluation is a crucial first step in the technical assistance process if such assistance is to be driven by the needs of beneficiaries rather than by donor interests. In this regard it is useful to note the OIE’s Evaluation of Performance of Veterinary Services Tool (commonly referred to as the PVS Tool).<sup>27</sup> This tool was developed with STDF funding in collaboration with IICA, and builds on capacity building experiences of both organisations. It aims to establish the capacity of a country to meet the standards set out in the OIE Terrestrial Animal Health Code. The OIE trains and certifies experts to carry out PVS evaluations and feedback from experienced assessors is used to further refine the PVS Tool.<sup>28</sup> In addition, in collaboration with international donors, the OIE is undertaking PVS evaluations of 105 countries over a three-year period.<sup>29</sup> Similarly, a Phytosanitary Capacity Evaluation Tool

*Authority and SPS Enquiry Point. Proposal by New Zealand*, G/SPS/W/214, circulated on 1 October 2007.

<sup>22</sup> Committee on Sanitary and Phytosanitary Measures, *Proposal for A “Mentoring” System of Assistance Relating to the Transparency Provisions of the SPS Agreement. Note by the Secretariat*, G/SPS/W/217, circulated on 20 February 2008.

<sup>23</sup> In view of the General Council’s decision on measures to assist small economies to meet their obligations under the *SPS Agreement* (WT/COMTD/SE/5 and WT/COMTD/SE/W/16), this mentoring system makes it possible to request that the assistance be provided via a relevant international secretariat, rather than to a national official. *Ibid.*, para. 4.

<sup>24</sup> Committee on Sanitary and Phytosanitary Measures, *Technical Assistance for Operating the SPS Notification Authority and SPS Enquiry Point. Proposal by New Zealand*, G/SPS/W/214, circulated on 1 October 2007, para. 7.

<sup>25</sup> Committee on Sanitary and Phytosanitary Measures, *Proposal for A “Mentoring” System of Assistance Relating to the Transparency Provisions of the SPS Agreement. Note by the Secretariat*, G/SPS/W/217, circulated on 20 February 2008, para. 3(a)-(g).

<sup>26</sup> *Ibid.*, para. 4.

<sup>27</sup> The PVS Tool may be downloaded from the OIE website, available at: [http://www.oie.int/eng/oie/organisation/EN\\_update2007\\_pvs\\_out.pdf](http://www.oie.int/eng/oie/organisation/EN_update2007_pvs_out.pdf), visited on 10 June 2008.

<sup>28</sup> For a recent update on the PVS Tool, see Committee on Sanitary and Phytosanitary Measures, *Capacity-Building Tools and Activities. Communication from the World Organization for Animal Health (OIE)*, G/SPS/GEN/830, circulated on 27 March 2008, paras 10-21.

<sup>29</sup> *Ibid.*, paras 22-24. By the end of May 2008, PVS evaluation missions had been conducted in 56 OIE members,

(PCE Tool) has been developed by the FAO, under the auspices of the IPPC.<sup>30</sup> It aims to establish the capacity of an National Plant Protection Organisation to implement the international phytosanitary standards elaborated by the IPPC. The application of the PCE Tool is built into many of FAO's Technical Cooperation Programme Projects funded in response to requests for assistance in developing phytosanitary systems. The PCE tool has been applied in over 60 countries worldwide, including Jamaica.<sup>31</sup> Finally, in 2006 the FAO, in collaboration with the WHO, developed a set of guidelines for capacity needs assessment in the area of food safety, contained in the publication *Strengthening National Food Control Systems: Guidelines to Assess Capacity Building Needs*.<sup>32</sup> The Guidelines aim to assist governments to assess their capacity in the core elements of a national food control system and identify their related capacity building needs. Unlike other assessment tools which are used to verify whether particular regulations or standards are met by the food industry, these Guidelines focus on the role of government agencies within a comprehensive system for food safety and quality. They are unique in that they establish a methodology for self-assessment of capacity building needs and as well as internationally accepted benchmarks and principles for each of the core components of a food-safety regulatory system.<sup>33</sup> These three tools have been broadly applied and have resulted in various sector-specific assessments of needs.<sup>34</sup> The Hong Kong Ministerial Declaration on the Doha Work Programme endorses the application of appropriate needs assessment mechanisms and supports the efforts to enhance ownership by beneficiaries, in order to ensure the sustainability of trade related capacity building.<sup>35</sup>

These concrete initiatives are commendable and are likely to have real benefits for developing-country Members. However, more is needed if real progress is to be made in addressing the capacity constraints that make it difficult for developing countries to benefit from the *SPS Agreement*. The question arises whether the proposals to make technical

---

with the support of international donors. Committee on Sanitary and Phytosanitary Measures, *Report on OIE Activities to the Meeting of the SPS Committee to Be Held on 24-25 June 2008*, G/SPS/GEN/853, circulated on 20 June 2008, para. 3.

<sup>30</sup> This tool is based on a pilot project conducted in 1999 in 6 countries (Cook Islands, Fiji, Solomon Islands, Indonesia, Bangladesh and Viet Nam) with funding from New Zealand. The IPPC Secretariat, after a field evaluation on 30 countries, recommended the inclusion of new components to the PCE. At the Fourth Session of the ICPM, the PCE was adopted as the preferred tool for phytosanitary needs assessment. Committee on Sanitary and Phytosanitary Measures, *FAO Evaluation Tools for Safety, Biosecurity and Plant Protection*, G/SPS/GEN/831, circulated on 27 March 2008, para. 29.

A condensed version, entitled *Strengthening National Food Control Systems: A Quick Guide to Assess Capacity Building Needs*, has been developed for use in situations that require a faster assessment.

<sup>33</sup> *Ibid.*, xii. See also Committee on Sanitary and Phytosanitary Measures, *FAO Evaluation Tools for Safety, Biosecurity and Plant Protection*, G/SPS/GEN/831, circulated on 27 March 2008, para. 7.

<sup>34</sup> For a review of the capacity evaluation studies conducted in three pilot regions (Central America, the East African Community and some ASEAN countries, in the context of the review of the Aid-for-Trade initiative, see Committee on Sanitary and Phytosanitary Measures, *Background Document from the Standards and Trade Development Facility for the Global Review of Aid for Trade: Note by the Secretariat*, G/SPS/GEN/812, circulated on 22 November 2007, paras 5-14.

<sup>35</sup> Ministerial Conference, *Doha Work Programme. Ministerial Declaration Adopted on 18 December 2005*, WT/MIN(05)/DEC, circulated on 22 December 2005, para. 53.

assistance mandatory under the *SPS Agreement* would contribute to resolving some of the current inadequacies in its provision. Hoekman has argued that an obligation to compensate developing-country Members for the adoption of new measures would be at the expense of donor country support for the recipient's own development priorities.<sup>36</sup> In addition, in light of the fact that currently there is no differentiation among developing countries, creating an obligation to grant technical assistance whenever a developing-country Member has to make substantial investments to comply with an SPS measure is simply not feasible. As noted above, this would require developed-country Members to undertake a financial obligation of unlimited proportions. Further, while obligatory technical assistance may result in a greater number of technical assistance projects, it would do nothing to ensure that these project amount to real 'capacity building'.

## 2.8 Conclusion

As noted from the start of the analysis of the provisions of the *SPS Agreement* conducted in this book,<sup>37</sup> technical assistance is not a magic bullet solution to all developing-country concerns with WTO obligations. It certainly does not obviate the need for a rigorous analysis of substantive and procedural rules to ensure that they are appropriate for all Members as tools to achieve the agreed objectives of a particular agreement. It also does not preclude the need to take seriously the provisions on SDT negotiated as a *quid pro quo* for the extensive obligations taken on by developing countries in the Uruguay Round.

Previous Parts and Chapters of this book have examined these issues in detail. This examination has led to the conclusion that, in view of the delicate balance struck by the provisions of the *SPS Agreement* between trade and health, it is difficult to adjust those aspects of its substantive disciplines that create problems for developing-country Members without doing damage to its ability to meet its objectives. Similarly, there is limited scope for strengthening SDT in the *SPS Agreement*, beyond operationalising the current rules through interpretation or negotiated clarification. While very useful work has been done, and is continuing, by the SPS Committee in developing procedural guidelines to facilitate the implementation of certain provisions of the *SPS Agreement* of particular importance to less-developed Members, significant problems remain. Consequently, while far from being a panacea, technical assistance assumes a crucial role in addressing the very real problems that Members at lower levels of development face in implementing their obligations, and enforcing their rights under this Agreement.

The current provisions on technical assistance in the *SPS Agreement* are loosely worded and difficult to enforce. As a result, the provision of SPS-related technical assistance leaves much to be desired. Discussions on ways to strengthen these provisions have proved fruitless. In many cases this can be ascribed to the unrealistic nature of the proposals made, making the imposition of SPS requirements with adverse effects on developing-country Members' exports conditional on granting cost-free technical assistance upon request. This would have enormous budgetary implications, impossible to determine in

---

<sup>36</sup> J. Michael Finger and Philip Schuler, 'Implementation of Uruguay Round Commitments: The Development Challenge', *The World Economy* 23 (4), 2000, 511-525.

<sup>37</sup> See above, Introduction to Part III.

advance, and would risk undermining the regulatory autonomy of importing Members. Nevertheless, the concerns underlying these proposals cannot be discounted. The experience of developing-country Members with the voluntary provision of technical assistance has been disheartening. It is therefore not surprising that they are seeking real commitments from their developed trading partners in the area of technical assistance.

An examination of a few illustrative examples of technical assistance initiatives in place has shown that the current approach is fragmented and lacking in coherence. Bilateral technical assistance tends to reflect donor interests and areas of concern, resulting in a disregard for the priorities of beneficiaries. Recent efforts to develop tools to assist developing countries to identify their capacity needs are useful, but must be coupled with the appropriate response to ensure that the project truly builds capacity in the beneficiary in a sustainable manner. Currently, political considerations rather than objective criteria determine which technical assistance projects are supported by donors. The lack of predictability resulting from the voluntary nature of assistance provided currently makes long-term planning difficult.

Multilateral efforts are characterised by inefficiencies and overlaps. The limited mandate of some organisations in the area of technical assistance means that additional efforts in the area of technical assistance result in widening its reach but not deepening its impact. Concerted efforts are needed not only in the areas of training and funding of participation in SPS-related fora, but also in respect of building technical and scientific capacity and infrastructure. Without the latter, participation will not bring the desired results.

The STDF represents an important step forward in coordinating the plethora of technical assistance initiatives. It creates a cooperative framework of partners with a wide range of high-level technical expertise and significant financial resources. In addition, making use of complementarities with needs-assessment mechanisms such as those in the IF and JITAP, it ensures that the priorities and capacity needs of beneficiary countries are an integral part of the framing of a project. Consequently, it is in a position to provide needs-driven and expert assistance. The STDF's new approach is to reduce its focus on actually funding projects and turn its attention to the coordination aspect of its mandate. It aims to use its project preparation grants to facilitate the securing of funds and assistance from its partner institutions and other donors. This may indeed be a more efficient use of its unique capacities to promote coordination in technical assistance. It is to be hoped that the work of the STDF will fulfil the potential it has for turning *ad hoc* technical assistance projects into coherent and needs-driven capacity building programmes in developing countries. For this to occur, however, donors must show a new willingness to make multi-annual commitments to funding the STDF. Without such commitment, the lack of certainty regarding sustained funding makes the development of a long-term strategy difficult.

It is clear that more work is needed in this area. It is beyond the scope of this book to examine the possibilities for developing a useful mechanism for effective, needs-driven and coherent capacity building in the SPS area. This seems to be a field where multidisciplinary research could make a significant contribution.

## Conclusion to Part V

Undoubtedly, the problems faced by developing-country Members in enforcing their rights and complying with their obligations under the *SPS Agreement* need to be urgently addressed. However, it has been argued here that the answer does not lie in broad exemptions from the obligations contained in this Agreement. Allowing the undisciplined use of SPS measures by developing-country Members will result in disguised protectionism and will not contribute to the development of competitive food and agricultural industries in these Members.<sup>1</sup> Equally, the solution cannot lie in requiring importing Members to allow the importation of unsafe products, if they originate in developing-country Members. As discussed above, such solutions would be counterproductive and damaging to developing-country Members themselves. Forcing a lowering of SPS requirements in importing Members will not only endanger health in such countries, but also not achieve increased market access. Importers will continue to respond to consumer demands by laying down private standards that their suppliers must comply with. Thus, other more constructive solutions must be found that do not upset the balance achieved by the *SPS Agreement* between health protection and trade liberalisation.

It is argued here that the answer lies in a new, more effective approach to SPS-related assistance that is more in line with the current conception of ‘capacity building’. In other words, what is needed is effective, predictable and needs-driven assistance that creates capacity in a sustainable manner. Real commitments must be made to the provision of such assistance. While this is unlikely to happen at bilateral level, where the interests and limited resources of donors lead to *ad hoc* projects, multilateral cooperative initiatives such as the STDF show promise. The acceptability of binding commitments towards financing a new technical assistance mechanism, will in turn depend on the willingness of developing-country Members to accept differentiation across levels of development, reflecting differences in regulatory capacity and dependence on agricultural exports. This would mirror the reality of development, which is a continuum.

Innovative research is urgently needed to identify the necessary conditions for such a mechanism. While research in this area lies beyond the scope of this book and the expertise of its author, there is much room for useful contributions to thinking in this respect from other disciplines. Here an important input can be made by rigorous study, based on empirical research and economic analysis and taking into account the lessons of political science.

---

<sup>1</sup> The Consultative Board noted in its report that many least-developed-country governments actively use WTO disciplines to ‘secure internal reform and integrate into the global trading economy.’ See Peter Sutherland *et al.*, *The Future of the WTO: Addressing Institutional Challenges in the New Millennium. Report by the Consultative Board to the Director-General Supachai Panitchpakdi* (World Trade Organization, Geneva), 2004, para. 310.

## Conclusion

---

This book analysed the implications of the rules of the SPS Agreement for WTO Members at different levels of development. More specifically, it evaluated whether the tools used by the SPS Agreement to achieve a balance between the often competing goals of trade liberalisation and health protection are appropriate also for Members at lower levels of development.

In doing so, it aimed to elucidate what can be seen as the ‘development dimension’ of the *SPS Agreement*. This analysis has two aspects, namely first, a consideration of the limits on policy space defined by the general disciplines of the *SPS Agreement*, and its effect of developing-country Members as agri-food exporters and SPS regulators; and second, an examination of the special provisions for developing-country Members in the *SPS Agreement*.

### **1. The SPS Agreement as a product of historical developments forming its background**

The analysis conducted in this book takes place against the background of the delicate position of the *SPS Agreement* on the interface between two aspects of the process of globalisation, namely the globalisation of trade and the globalisation of health. This background was set out in Part I.

The term ‘globalisation of trade’, as discussed in Chapter 1 of Part I, refers to the process of increasing involvement of countries at lower levels of development in the multilateral trading system. This process must be seen in its normative context, which is to be found in the growing recognition of the right to development. This right encompasses not only economic growth but also the progressive realisation of all human rights. In this light, it is clear that it is necessary to ensure that the participation of countries at lower levels of development in the international trade regime is supportive of their development, so that trade fulfils its potential to be an engine for growth, without endangering the attainment of other human rights including the rights to life, health and safe food. This necessitates the recognition of the special position of countries at lower levels of development in the rules of the international trading system. If developing-country Members of the WTO are to benefit fully from the market access gains that can be derived from its rules and not bear excessive implementation costs to the detriment of their development objectives, mechanisms must be found to ensure that their constraints are taken into account by the rules of the system. In particular, the right to development encompasses the responsibility of the international community to work towards an appropriate enabling environment at international level for the realisation of this right. In the context of the international trading system this, *inter alia*, requires the provision of flexibility in the applicable disciplines to make them workable for developing-country Members and the creation of mechanisms for assistance of these Members.

Thus two main conclusions can be derived from the normative framework established by international human rights law of relevance to the analysis of the *SPS Agreement*. First, international trade rules must balance the important objective of economic growth through trade liberalisation with the equally important objective of human rights protection. In the

context of the *SPS Agreement* this means that its disciplines to promote market access for food and agricultural products, a sector of vital importance to the economies of many developing countries, must not undermine the ability of its Members to take measures to protect health in their territories. Therefore any evaluation of the *SPS Agreement* must be fully cognisant of the fundamental importance of its trade/health balance. Second, the normative context establishes the need to ensure that trade liberalisation objectives are achieved by disciplines that are responsive to the special position of developing countries in order to be truly supportive of development. As mentioned above, this entails not only the requirement that the rules be workable for developing countries but also the need to provide flexibility in the rules, where appropriate, and to promote assistance of developing countries to address their supply-side constraints. The assessment of the development dimension of the *SPS Agreement* therefore requires an evaluation of both the appropriateness of its general disciplines for developing-country Members and the effectiveness of its provisions giving special treatment to developing-country Members.

The overview of the historical developments in the international trading system with respect to the progressive integration of developing countries, sketched in Chapter 1, indicates a changing approach to the concept of special treatment for these countries. The early demands of developing countries for exemptions from the rules of the trading system are in marked contrast to their approach by the time the Uruguay Round negotiations were launched. Developing countries then showed a new willingness to bind themselves to extensive obligations contained in the Uruguay Round agreements, including those imposing regulatory disciplines that entailed high compliance costs, such as the *SPS Agreement*. The calls of developing countries for special treatment were limited to the provision of longer transition periods, the consideration for their special position and the provision of technical assistance. The latter types of provisions can be found in the *SPS Agreement*. However, the lack of implementation by developed-country Members of the special provisions for developing-country Members in WTO agreements, coupled with the high compliance costs for developing-country Members of implementing the disciplines of agreements creating disciplines for behind-the-border areas of regulatory policy, results in asymmetry in the costs and benefits of the multilateral trading system. The new assertiveness shown by developing-country Members in the run-up to the Seattle Ministerial Conference and since then, has convinced developed-country Members of the need to take their concerns seriously, as reflected in the development focus of the Doha Round of negotiations. However, as indicated in this Chapter, negotiations in the context of the Doha Round to address implementation problems have borne little fruit thus far.

This discussion forms the background for the assessment of the development dimension of the *SPS Agreement*. It indicates that the approach taken in the *SPS Agreement* is characteristic of the new Uruguay Round agreements aimed at addressing non-tariff barriers to trade through disciplines on regulatory activities. In spite of the high implementation costs entailed by these disciplines, the *SPS Agreement* contains weak provisions on special and differential treatment and technical assistance for developing countries. In analysing the development dimension of the *SPS Agreement* it is therefore important to assess both the appropriateness of its general disciplines for Members at lower levels of development and the effectiveness of its special provisions for developing-country Members.

For trade to be supportive of development, it is crucial that developing-country Members be fully integrated into the international trading system so that they are in a position to benefit from the increased market access achieved by its rules without bearing high implementation costs. This necessitates a re-evaluation of the Uruguay Round agreements that require regulatory investments, on the basis of thorough agreement-specific research to identify concretely both the problems with the general disciplines and the weaknesses in the special provisions for developing countries. This book conducted such analysis with respect to one WTO agreement, namely the *SPS Agreement*. This detailed and technical review aims to provide useful input to help Members move away from their current polarised positions in the implementation discussions and engage in seeking constructive solutions. This goal informed the analysis conducted in this book.

The second, and related, aspect of the globalisation process forming the background to the discussion of the *SPS Agreement* is the globalisation of health. This results from the exponential increase in the movement of food, plants, animals and their products across borders so that national strategies are no longer sufficient to address the health risks arising there from. A historical overview of this process, provided in Chapter 2 of Part I, indicated the growing realisation of the need for international cooperation in addressing SPS risks as well as the limitations of such an international approach. In particular, it is instructive to note the role played in this process by achievements in the use of science as a tool for risk regulation.

Scientific developments in the late nineteenth century led to a better understanding of the way in which certain substances in food as well as pests and diseases affect health, which initially facilitated international consensus on risk mitigation mechanisms. Science provided a possibility to avoid trade conflicts arising from the effect of SPS measures on imports, by establishing a seemingly objective and universally valid basis for international harmonisation of SPS requirements. However, advances in science in the first half of the twentieth century led to a 're-nationalisation' of SPS regulation in developed countries. These countries used scientific advances to develop a strong national regulatory and institutional infrastructure to deal with SPS risks, including those from imported products. International cooperation was no longer seen as a priority. This complacent attitude was shaken in the second half of the twentieth century, when the rapid increase in trade with developing countries where SPS risks were endemic led to new threats from imported products, challenging the capacity of national SPS systems. Renewed international cooperation, firmly based on science, took the form of the creation of formalised international arrangements and institutions to promote common action against SPS risks while facilitating trade. Examples of these are the creation of the OIE to prevent the spread of animal diseases through trade, the establishment of the CAC by the FAO and WHO in order to administer their Joint Food Standards Programme, and the adoption of the IPPC by the FAO to formalise international cooperation in the field of plant health.

While these international efforts were a significant achievement, they failed to take account of the vast differences in national SPS conditions and regulatory capacities. These differences often meant that developed countries chose for risk management strategies that were stricter than the harmonised standards developed at international level. They also meant that several developing countries were unable to meet the minimum requirements reflected in the international harmonised standards. This led to a rethinking of the

strategy needed to address the globalisation of SPS risks in the face of the exponential growth in trade. Currently, a multifaceted approach is followed with regard to the challenges posed by globalised health risks. It continues to rely on international cooperation, based on scientific risk assessment and information-sharing by experts. Through this cooperation, harmonised standards and guidelines are developed for the management of SPS risks, in order to facilitate trade. However, the emphasis has shifted to national sovereignty in policy decisions regarding SPS risks, to allow for particularised approaches that are responsive to national differences, within the framework of international cooperation. In addition, especially in developed countries, a crisis of confidence in the ability of national regulators to provide effective SPS protection (among other factors) has led to increasing involvement of local, transnational and private governance structures in laying down SPS requirements.

The *SPS Agreement* must be understood against this complex regulatory background, which has had an important effect on the framing of its disciplines. As a product of the late twentieth century, the *SPS Agreement* embodies the multifaceted approach to risk regulation prevailing since that time in developed countries. Acknowledging the achievements made at international level in setting science-based harmonised SPS standards, the *SPS Agreement* incorporates these standards into its rules as benchmarks for SPS measures in order to facilitate trade. However, in recognition of the need to allow for different policy choices based on national priorities and capacities, the *SPS Agreement* allows for deviation from harmonised standards. It reflects the focus on science as a neutral and universally valid touchstone for SPS regulation that prevailed at the time of its negotiation in developed countries, and requires scientific justification for non-harmonised measures. The background sketched in Chapter 2 thus elucidated the manner in which the *SPS Agreement* tries to achieve a balance between trade and health, and provided an indication of the developed-country regulatory concerns embedded in its disciplines.

Chapter 3 of Part I completed the background discussion by situating the *SPS Agreement* on the interface between globalised trade and globalised health. It pointed out that the globalisation of trade, in the sense of the full integration of developing countries into the international trading system, is greatly affected by measures to deal with globalised health risks, in the form of both national and international SPS regulations and standards. This is due to the importance of agricultural and food exports for the foreign revenue earnings of many developing countries, and the effect of the proliferation of SPS regulations and standards on such exports.

In particular, Chapter 3 established the importance of food and agricultural trade to the economies of many developing-country Members, not only in terms of income generation but also in terms of both formal and informal employment of the poorest sector of the population. The great potential of trade in food and agricultural products to contribute to poverty alleviation and development is constrained not only by traditional barriers to agricultural trade (such as tariff peaks, tariff escalation, domestic support and export subsidies) but also increasingly by SPS measures. SPS measures are particularly prevalent with respect to high-value perishable products, such as fish, fresh flowers, fruit and vegetables, and processed agri-food products. This diminishes the possibilities for developing-country Members to diversify from bulk agricultural commodities to high-value and processed products.

As discussed in this Chapter, SPS requirements continue to increase in number and strictness, in response to factors such as elevated consumer demands due to increased affluence, well-publicised food-safety scares and fears regarding new technologies in agricultural production; growing pressure from domestic agricultural lobbies in the face of increased competition; scientific developments that make it possible to regulate ever-more strictly and to control compliance accurately; and the increased sourcing of products from suppliers in developing countries where national SPS regulation and infrastructure is weak. By limiting market access for food and agricultural products, these SPS measures undermine the hard-won steps towards liberalising the agricultural sector and are a real obstacle to development.

While legitimate SPS regulation to address SPS risks from traded products must be allowed, disguised protectionist measures in the form of unfounded SPS requirements must be effectively disciplined if the full integration of developing countries into the international trading system is to be achieved. It is here, on the interface between globalised trade and globalised risk, that the *SPS Agreement* plays a role. In this book, its impact on developing-country Members is evaluated in this light.

## **2. The factual context of national and international SPS systems within which the SPS Agreement operates**

The evaluation of the ‘development dimension’ of the *SPS Agreement* conducted in this book is fully cognisant of the fact that developing-country Members are not a monolithic group. Instead, development takes place on a continuum, along which there may be great divergences in economic resources, regulatory capacity, export interests and health status. All these factors play a role in determining the impact of the *SPS Agreement* on particular Members, and the question of how workable its rules are for the relevant Member. An analysis of the implications of the *SPS Agreement* for developing-country Members must therefore take into account these divergences.

In order to do so, Part II of this book examined the factual context for the operation of the *SPS Agreement* as embodied in national and international systems for SPS regulation and standard setting, with a particular focus on the impact of differences in the levels of development of Members for the functioning of these systems.

Chapter 1 of Part II set out the underlying normative rationale for national SPS regulatory systems, embodied in international human rights law. It is widely recognised that among the fundamental duties of states, and an integral part of both the right to life and the right to development, is the obligation to ensure safe food and to protect human health. This creates a normative framework that informs the discussion of SPS protection and, therefore, also of international rules that limit the ability of governments to regulate in this area. The analysis of this framework in Chapter 1 established that a government has an obligation to take steps, to the maximum of its available resources, to progressively realise the human rights to adequate food and the highest attainable standard of health, and to address threats to the agricultural sector in the form of pests and diseases. Further, it made clear that assistance from the international community in this regard is essential.

Trade plays an important role as an engine for growth and development. The role of trade, however, is tempered by the recognition, in the understanding of the right to development, that economic growth may not be achieved at the cost of other rights, such as the right to life, adequate food and the highest attainable standard of health.

The way in which governments carry out their responsibilities with regard to SPS protection varies greatly across different levels of development. As elucidated by the law-and-economics analysis conducted in Chapter 1, national SPS regulation is necessitated by the failure of the market in providing public goods, including SPS protection. This requires domestic regulators to step in to correct the deficiencies in the market to ensure that an optimal level of SPS protection is provided, as explained by the public interest theory of regulation. This entails a weighing up of the various costs and benefits of SPS regulation in a particular risk situation. The costs and benefits of SPS regulation differ significantly depending on the particular situation of a country, including its regulatory capacity, resources and health and trade priorities. In this light, the differences in domestic SPS regulation can be ascribed to legitimate regulatory choices that are responsive to differences in national conditions. However, the public choice theory of regulation indicates that regulators are vulnerable to pressure from private interest groups, including industry lobbies, and may enact inefficient, or protectionist, regulations. There is therefore a need for disciplines to distinguish legitimate SPS regulation from disguised protectionism.

Due to the cost and difficulty of obtaining all the necessary information to conduct a cost/benefit analysis of SPS regulation as a tool to differentiate between legitimate measures for the protection of health on the one hand, and disguised protectionist measures on the other, regulatory systems in developed countries rely on science as a proxy for the variables that would ideally be considered. The *SPS Agreement* has taken over this reliance on science as the touchstone against which to evaluate SPS measures. However, care must be taken not to adopt a simplistic view of science as a neutral and universally valid tool to depoliticise SPS regulation. In fact, science is characterised by value-ridden assumptions and subjective choices that reflect particular paradigms and ideologies of the scientific community generating the science. While science remains a useful tool, a nuanced and realistic view must be taken of its justificatory capacity. In particular, account must be taken of the fact that diverging scientific opinions on the same set of factual data may be equally valid. In addition science cannot always resolve uncertainties with regard to the existence and magnitude of a particular SPS risk. In response to the realisation of the prevalence of uncertainties in science, many regulators take a precautionary approach to risk regulation.

Both the use of science as a tool, albeit an inherently limited one, to discipline and legitimate regulatory action *and* the attendant emergence of precautionary approaches to deal with situations of scientific uncertainty are developments rooted in advances in the regulatory regimes of developed countries. They entail a high level of human and financial resources devoted to risk regulation and reflect best practices in dealing with the complexities of SPS risks. It should be borne in mind that these best practices do not present an accurate picture of the regulatory systems with regard to SPS risks in countries at lower levels of development. In fact, many less developed countries lack the capacity to staff and operate the scientific committees and regulatory agencies necessary to enact SPS regulations in a manner that conforms to these best practices. In addition, their particular development priorities and health concerns may dictate the use of their scarce

resources in areas other than SPS regulation, for example, the provision of safe drinking water, basic sanitation and primary health care.

The understanding of the great differences in national SPS systems, and the link to differences in trade and health priorities, is facilitated by an examination, in Chapter 2 of Part II, of four illustrative examples of WTO Members in different income categories and in different geographical regions, namely Australia, Mauritius, Jamaica and Bangladesh. These examples show that while vast differences exist in SPS regulatory systems between developed and developing countries, there are also significant differences *among* developing-country Members. Clearly, some developing countries have been more successful than others in upgrading their SPS systems and securing access to the markets of their trading partners.

In addition, it has been shown that differences are also prevalent between different sectors *within* certain Members. Some sectors are operating at high levels of SPS safety, while others remain underdeveloped in this regard. This reflects national priorities with regard to export promotion as well as technical and financial assistance received in a particular area. Generally, the Members studied have in place relatively strong SPS controls over the most important SPS risks they face in economically significant areas. There is therefore clearly a need for a more nuanced understanding of the SPS *problematique* than to see it merely in terms of a developed country versus developing country issue.

Nevertheless, two general conclusions can be drawn regarding differences in SPS regimes according to the level of development as discussed in Chapter 2. First, the *level* of SPS protection exhibits marked differences, being substantially higher in more developed countries due to better technological capacity, higher consumer demands, and a more developed regulatory infrastructure. Second, the *regulatory focus* differs. Less developed countries tend to rely on product requirements, which are enforced by means of testing and inspections by government authorities at the point of exit or entry. Product requirements are easier to comply with as they leave the means of compliance up to the producer and are usually based on objective, testable properties that can more readily be ascertained. By contrast, developed countries are increasingly, especially in the area of food safety, moving towards *process* requirements, such as those embodied in the Hazard Analysis and Critical Control Point (HACCP) system, which require the producers themselves to take responsibility for ensuring that the entire chain, 'from farm to fork' meets certain standards of hygiene and safety. These process requirements entail a systems-wide approach to SPS issues, which necessitates significant technical expertise, supporting infrastructure and control systems.

These differences in SPS regimes have notable consequences for the impact both of SPS measures themselves and of the *SPS Agreement* on Members at different levels of development. The illustrative examples provided identify, by means of the discussion of practical situations, various problems faced by developing-country Members in complying with SPS measures in developed-country markets. These problems reflect the fact that the difficulty and costs of compliance are directly related to the extent of the gap between the existing domestic SPS regime and the SPS requirements in foreign markets. Several factors play a role here, such as weak domestic SPS regulation, inadequate public infra-

structure, unreliable compliance assessment and certification, insufficient dissemination of information on SPS requirements abroad, and poor laboratory equipment and staff.

However, it would be an over-generalisation to state that middle- and low-income Members are entirely incapable of meeting SPS requirements on their export markets, or of upgrading their SPS systems to protect their territories from SPS risks. Examples were provided in Chapter 2 of success stories in this respect, such as the lifting of the fumigation requirement for Jamaica's hot pepper exports to the US, after its implementation of an integrated pest management system. It is, nevertheless, important to note the central role played by technical and financial support from the importing Member in some of these situations. In the Jamaican example just mentioned, the achievements were made possible by a collaborative effort with USAID. In many of the examples given in Chapter 2, it is unlikely that, without the necessary technical assistance, the exporting Member would have been able to resolve the SPS problems facing its industry. This puts those Members that face capacity constraints in the area of SPS regulation in a very dependent position.

The differences in the legal and institutional capacity for SPS regulation between Members at different levels of development, illustrated by the selected Members used as examples in Chapter 2, have a bearing on the way in which the *SPS Agreement* impacts on them. These examples of divergent SPS regulatory systems therefore provide the factual context for the discussion of the provisions of the *SPS Agreement* in Parts III to V of this book.

The factual context within which the *SPS Agreement* operates also includes *international* systems for the elaboration of SPS standards. These were discussed in Chapter 3 of Part II. As explained in this Chapter, divergence in national SPS regulations impedes trade by reducing the possibilities to exploit economies of scale. Therefore harmonisation around international standards is promoted by free trade regimes, including by the WTO in the *SPS Agreement*. However, internationally-set standards cannot mirror the diversity of circumstances in countries around the world. Instead, they reflect a compromise position accepted by the delegates of those countries present and active in the standard-setting process, and developed according to the procedures of the relevant standardising body. An examination of the institutional structure and standard-setting procedures of the international bodies referenced in the *SPS Agreement*, namely the Codex Alimentarius Commission, the International Office of Epizootics and the Secretariat of the International Plant Protection Convention, shows that they are such that the participation of developing-country Members is limited. This is due to the fact that the structures and procedures do not sufficiently take into account the resource and capacity constraints of countries at lower levels of development. For example, in some cases the number and location of the committee meetings in which standards are developed may make regular participation difficult for countries with resource constraints.

Chapter 3 noted improvements that have been made in this situation in recent years, due to the realisation by developing-country Members of the increased importance of international standards under the *SPS Agreement*, and the efforts of the abovementioned three international standard-setting bodies to enhance their participation. Nevertheless, as seen from the data presented in this Chapter, developing-country Members still tend to

be most widely represented in *plenary* sessions of the relevant standard-setting bodies, where standards are initiated and adopted. However, their participation in technical committees where scientific evidence is discussed and standards are prepared, and even more so in the scientific bodies that conduct the risk assessments on which standards are based, often leaves much to be desired. This is a significant problem as it is at this technical level that participation can be most effective. This inadequate participation is often due to the lack of human and financial resources necessary to ensure attendance of the plethora of committee meetings by well-prepared specialists in the areas in which standards are set. In addition, the lack of effective national infrastructures for the evaluation of draft standards and the formulation of positions was identified as a problem.

International standard-setting is therefore dominated by developed-country Members, resulting in standards that are often not appropriate for Members at lower levels of development. This is problematic as these are the Members that most depend on international standards as a basis for national regulation. More work is needed, not only in the form of simplification and improvement of the standard-setting procedures of the relevant bodies, but also in the form of efforts to build the capacity of Members at lower levels of development to participate effectively in these procedures. Here, once again, technical assistance has an important role to play.

The factual context provided by an examination of national SPS regulation and international SPS standard setting in Part II showed the great need for technical assistance of developing-country Members in order to build SPS capacity. However, there is a danger in seeing technical assistance as a magic bullet solution, assuming that developing-country Members can and should meet any obligation as long as they are provided with technical assistance to do so. Technical assistance is not an alternative to analysing whether a rule is appropriate for developing-country Members to implement. While it can address some of the costs of implementation, it cannot take away the long term disadvantages of the application of inappropriate disciplines. Consequently, it is essential to begin by assessing, on the basis of the detailed examination conducted in Parts III and IV of this book, whether the substantive and procedural rules of the *SPS Agreement* are appropriate for developing-country Members. To facilitate this assessment, the legal analysis of the regulatory disciplines and procedural arrangements under the *SPS Agreement* conducted in Parts III and IV of this book takes place against the factual background and regulatory context sketched in Parts I and II.

### **3. The relevance of the history of the SPS Agreement**

Part III of this book turned to examine the *SPS Agreement*. In Chapter 1, this Part discussed the history of the Agreement, which has its roots in the inadequacy of the previously existing rules, contained in the GATT 1947 and the Tokyo Round *Standards Code*, to deal with SPS measures. This inadequacy was highlighted by the unresolved dispute between the EC and US with regard to the EC ban on beef from cattle treated with growth hormones. The *SPS Agreement* was negotiated in the Uruguay Round to address the fraught situation of the conflicting objectives of liberalisation of trade in food and agricultural products, on the one hand, and the protection of health against SPS risks, on the

other. Its disciplines take on board the existing GATT rules applicable to health measures, as interpreted in the early case law, but do not stop here. Instead, the *SPS Agreement* builds upon the existing rules and creates novel disciplines. In addition, it *balances* the disciplines on SPS measures with an express recognition of the right of Members to regulate to protect against SPS risks. This balancing objective pervades the *SPS Agreement* and informs the choice of disciplines it contains.

However, the disciplines of the *SPS Agreement* are also a reflection of the fact that the most active participants in the negotiations towards this Agreement were developed countries and the Cairns Group of agriculture-exporting countries, as apparent from the discussion of the negotiating history set out in Chapter 1 of Part III. As a result of the differences in the extent and effectiveness of participation of countries at different levels of development in the negotiations, the disciplines of the *SPS Agreement* can be said to embody a regulatory model that reflects best practices in developed-country Members with regard to SPS regulation. The illustrative examples of different WTO Members set out in Part II showed that the reality in many developing-country Members is quite different. While disciplines reflecting a best-practice regulatory model could have the salutary effect of improving the quality of SPS regulation worldwide, it is important to ensure that these disciplines are achievable for all Members.

It may be expected that compliance with the requirements in the *SPS Agreement* for SPS regulation, in terms of both scientific basis and procedural mechanisms, is more difficult and costly for less-developed Members. Many of these Members have to make significant investments to upgrade their SPS systems in order to be able to comply with the disciplines of the *SPS Agreement*. In addition, institutional and scientific capacity constraints are likely to affect the possibilities that less-developed Members have to use the substantive rules and procedural mechanisms of the *SPS Agreement* to gain access to foreign markets. Whether this is, in fact, the case is the question addressed in the subsequent analysis of those substantive rules that limit the scope for regulation in this area and the procedural arrangements under the *SPS Agreement*, in the rest of Part III and in Part IV of this book.

#### **4. The limits of the coverage of the SPS Agreement**

The disciplines of the *SPS Agreement* were negotiated to deal with a specific type of situation, involving a conflict between two particularly politically sensitive objectives, namely the liberalisation of agri-food trade and the protection of health against SPS risks. The *SPS Agreement* aims to achieve an appropriate balance between these two objectives. This limited objective is reflected in the *SPS Agreement* by its careful demarcation of its scope of application in Article 1.1 read together with Annex A.1, as discussed in Chapter 2 of Part III.

The provisions delimiting the coverage of the *SPS Agreement* encompass measures to address those risks to human, animal or plant life or health that may arise from trade in primary and processed agricultural products. These include, for example, food safety risks and risks from pests and diseases of animals or plants. The provisions of the *SPS*

*Agreement* dealing with its scope of application consequently primarily focus on the *purpose* of the measure to determine whether it falls within the ambit of the Agreement, while leaving the form that such a measure might take broadly defined by means of an illustrative list of possible types of measures.

However, the discussion in Chapter 2 of Part III demonstrated that the current interpretation of the scope of application of the *SPS Agreement* in the case law, since the *EC – Approval and Marketing of Biotech Products* dispute, is very broad. In particular, the Agreement has been held by the Panel in that case to cover measures aiming at a broad array of purposes beyond the particular situations that seem to have been envisaged by negotiators when drafting its strict scientific disciplines. It now eats into the coverage of the *TBT Agreement* and the GATT 1994 in situations where the disciplines of those Agreements would have been more appropriate. An example of such a situation is where a measure aims at the protection of the environment *per se*, not involving a risk to plant or animal life or health. Not only do the scientific obligations of the *SPS Agreement* inordinately restrict Members' scope for regulatory action in such situations, due to the significant differences in the state of scientific knowledge and extent of uncertainty in the field of environmental protection, but there is also little to be gained for agricultural trade through their application. While many types of measures can be crammed into the definition of Annex A.1 to the *SPS Agreement* by both stretching its terms, and travelling far down the chain of causality to find a risk to which the measure can be said to be 'rationally related', this does not seem a wise course to take. It reduces to inefficacy the list of enumerated purposes in Annex A.1(a) to (d) as a tool limiting the scope of application of the *SPS Agreement* to those situations most likely to entail a conflict between health protection and agricultural trade.

The artificial insertion, by the Panel in *EC – Approval and Marketing of Biotech Products*, of a limited 'nature' element, in addition to the inclusive 'form' element, into the definition of an SPS measure does not ameliorate the problem caused by its expansive interpretation of the enumerated purposes in Annex A.1 (a) to (d). The term 'requirements and procedures' in Annex A.1 would normally cover most types of measures, doing little to limit the applicability of the *SPS Agreement*. However, the formalistic character of the Panel's 'nature' requirement may create adverse incentives for Members to devise measures of another 'nature' in such a way that they escape the disciplines of the *SPS Agreement*. For example, a measure that amounts to the *application* of a requirement or procedure would fail to meet the 'nature' test and thus fall outside the scope of application of the *SPS Agreement*. The distinction between the types of measures that, under this interpretation, fall within and without the *SPS Agreement* bears no relation to the objective of the Agreement and only a strained connection to its wording. Instead, the interpretation is artificial, arbitrary and open to abuse.

The unexpectedly extensive substantive coverage of the *SPS Agreement* under the above-mentioned Panel's approach is not necessarily to the benefit of developing-country Members. It would be too simplistic to think that these Members automatically benefit from as wide an application of the *SPS Agreement* as possible, extending its strict disciplines to a broad range of situations. It must be recognised, as discussed in Part II, that the positions and interests of developing-country Members are diverse, and that these Members are not only exporters of food and agricultural products, but are also importers

of these products. They, like other WTO Members, benefit from the limited application of the disciplines of the *SPS Agreement* to the particular situations these are tailored to address. An inappropriate expansion of the application of this Agreement tilts the balance it aims to achieve and disturbs the relationship between it and the other relevant WTO agreements. It is important to bear in mind that measures not falling under the *SPS Agreement* are not undisciplined; they are merely disciplined in ways more appropriate to them by other WTO agreements.

The finding by the Panel in *EC – Approval and Marketing of Biotech Products* that a measure can be both an ‘SPS measure’ and a ‘non-SPS measure’ when it has multiple objectives, further complicates the situation. It has the effect of subjecting a single measure to multiple, differing, disciplines. The result is that the policy space of a Member is even more greatly restricted as its measure is vulnerable to a multitude of challenges under agreements with quite different objectives. Consequently the particular objectives sought by the provisions of the relevant agreements in specific situations are undermined. This cannot be what is meant by a ‘harmonious interpretation’ of the ‘inseparable package’ of WTO agreements. It is hoped that the Appellate Body will correct this problem in future cases.

Chapter 2 of Part III further addressed the difficult issue of the applicability of the *SPS Agreement* to the SPS requirements of bodies other than central government. The increasing shift of SPS norm creation and implementation to subnational and transnational levels in the last decade has brought this issue to the forefront of attention. While the idea that Members are responsible for compliance with WTO obligations by their subnational levels of government is now generally accepted, the same cannot be said for non-governmental entities. The principle of attribution to a Member of acts of private bodies in cases where there is a sufficient level of intervention by the government in the private action, only addresses the problem to a limited degree. A rapidly growing number of SPS requirements are developed and applied by private bodies free of governmental influence, in response to consumer demand, especially in affluent Members. The fact that the market for food and agricultural products, particularly in the high-value sector, is dominated by retail conglomerates which require compliance with specific private sector standards results in the blurring of the distinction between public and private SPS requirements in terms of their impact on exporters. Private sector standards act as significant barriers to developing-country exports, particularly those of their small-scale producers. The question thus arises to what extent Article 13 of the *SPS Agreement* may be relied upon to compel Members to discipline private sector bodies in their territories, or regional bodies in which entities on their territories are members.

It was argued in Chapter 2 that the concepts of ‘non-governmental entities’ and ‘regional bodies’ in Article 13 of the *SPS Agreement* should be interpreted to include private sector bodies at subnational and transnational level, to take account of the rapid proliferation of private sector standards. However, the extent of the obligation to take ‘such reasonable measures as may be available’ must be seen as limited. What is ‘reasonable’ depends on the circumstances of the case, and in particular on the type of entity involved. The view espoused here is that it would not be appropriate to require Members to enact legislation to impose the existing disciplines of the *SPS Agreement* on private sector bodies, such as supermarkets, as these disciplines lay down best regulatory practice requirements not

suitable for such bodies. A Code of Good Practice for the *SPS Agreement*, with appropriate procedural disciplines to promote transparency, consultation and the recognition of equivalence should ideally be drafted. However, in view of the fact that agreement is unlikely to be reached on this, it is recommended that the Code of Good Practice of the *TBT Agreement* be interpreted as applicable to private sector SPS standards.

Even if a Code of Good Practice were in place to discipline the procedural aspects of private sector standards, the burden of compliance with these standards remains high due to their demanding nature. Current practices with regard to the provision of technical assistance by vertically integrated companies that source their produce in developing countries lead to dependent relationships and the potential for abuse. Instead, effective and disinterested capacity building is called for to achieve sustainable and equitable results. In the meantime, a pragmatic approach to this problem could be the continued use of the multilateral forum provided by the SPS Committee to raise concrete examples of the challenges posed by private sector standards, in an effort to stimulate private bodies to be responsive to developing-country Members' needs in the elaboration and implementation of their standards, and to spur donors to provide technical assistance.

Finally, Chapter 2 noted the applicability of the *SPS Agreement* to all SPS measures still in force, including those enacted before the coming into force of the Agreement. This has the benefit of avoiding the creation of an exemption for all pre-existing measures, something that would weaken the effectiveness of the *SPS Agreement*. However, its downside is the heavy burden it imposes by creating an obligation on Members to revise SPS measures that predate the *SPS Agreement* in order to ensure their conformity with its new rules. In Members with less advanced SPS regulatory systems, where the conduct of risk assessments and consideration of international standards was not a matter of course, this may be a difficult and costly task. On balance, however, this interpretation seems to be the preferable one. It is argued here, as elsewhere in this book, that the capacity constraints of Members at lower levels of development should be addressed through capacity building initiatives rather than by weakening the disciplines of the *SPS Agreement*, including through creating a wide exemption for pre-existing measures. It is certainly not to the advantage of developing-country Members to create a safe haven for the plethora of SPS measures that were already in place on 1 January 1995, particularly in developed-country Members. The most lucrative markets for agricultural and food products are, at the same time, those on which SPS measures have a long history and a vigorous application. Holding pre-existing SPS measures to the same scientific standards as new SPS measures brings some much-needed discipline to this area.

As set out in Chapter 2, the current position of measures for the protection of health under WTO law is determined by the relevant provisions of the *SPS Agreement*, the *TBT Agreement* and the GATT 1994 within their respective spheres of application. The measure could thus be caught by any of the three agreements, depending on its objective(s), form and nature and its effect on trade. Which agreement (or agreements) applies in a particular case has far-reaching implications for the type of disciplines to which the measure is subjected, and in particular for the extent of policy space left to Members within which to exercise their regulatory autonomy.

## 5. The delicate trade/health balance in the regulatory disciplines

Within the limits of the applicability of the *SPS Agreement*, certain of its substantive disciplines, as interpreted by panels and the Appellate Body, determine the scope for regulatory action by Members against SPS risks. The basic rights and obligations set out in Article 2 of the *SPS Agreement* epitomise the trade/health balance aimed at by the Agreement and the manner in which this balance is struck in its substantive rules. These were discussed in Chapter 3 of Part III.

The express recognition in Article 2.1 of the *right* of Members to take SPS measures is key in this respect. It has the result that, unlike the situation under the GATT 1994, Members imposing measures covered by the *SPS Agreement* do not bear the burden of justifying these measures under an exception to trade liberalisation disciplines. Instead, a Member wishing to challenge an SPS measure must establish a *prima facie* case of violation of specific disciplines of the *SPS Agreement*. The limits to the right to take SPS measures, first outlined in Articles 2.2 and 2.3, recur in more specific form in the rest of the *SPS Agreement*. These provisions reflect and build upon familiar GATT disciplines, requiring that health measures be limited to what is ‘necessary’ to achieve their aim, and prohibiting arbitrary or unjustifiable discrimination and disguised trade restrictions. Further, Article 2.2 introduces an innovative aspect of the *SPS Agreement*, namely the use of science as the scale on which the competing interests of trade and health are balanced.

The careful balance aimed at by these substantive disciplines of the *SPS Agreement* must be respected in their interpretation. There is therefore no room for the importation of a strong proportionality test arising from the ‘necessary’ requirement of Article XX(b) of the GATT 1994 into the ‘necessary’ requirement of Article 2.2 of the *SPS Agreement*. Neither is the strong proportionality test read into the ‘sufficient scientific evidence’ requirement of Article 2.2 by the Panel in *Japan – Apples* to be condoned. Requiring an SPS measure to be proportional to the seriousness or magnitude of the risk at issue is contrary to the balance that is the object and purpose of the Agreement. It deprives Members of the room to make their own policy decisions in their responses to risk. In view of the diversity in priorities, economic resources and risk-averseness of Members at different levels of development, reflected in the policy choices inherent to risk regulation, this result is to be avoided.

Harmonisation of SPS measures is promoted by Article 3 of the *SPS Agreement* in order to reduce the barriers to trade created by disparate SPS requirements in various importing Members. Chapter 4 of Part III examined this provision. In the absence of a rule-making body in the WTO entrusted with the task of providing generally applicable SPS requirements, Article 3 of the *SPS Agreement* makes use of other international bodies as authoritative providers of uniform standards, namely the international standard-setting bodies referenced in Annex A.3 thereof. These bodies use recognised risk assessment procedures conducted by scientific expert groups and discussed in committees to draw up standards. Their standards aim to reflect a large degree of scientific consensus on risk as well as policy agreement on the best way to address such risks. WTO Members are therefore encouraged to use these standards through the disciplines of Article 3 of the *SPS Agreement*.

Harmonisation of SPS measures around international standards has the potential to assist less-developed Members that lack the scientific capacity to undertake their own risk assessments as a basis for regulatory decisions. It thus seems imperative to interpret the autonomous options provided by Articles 3.1 to 3.3 of the *SPS Agreement* in a manner that provides real benefits to Members that choose to base their SPS measures on international standards or to conform their measures to these standards, in contrast to the current interpretation in the case law. If an SPS measure that is ‘based on’ an international standard would be regarded as complying with the requirement of a scientific basis (in Articles 2.2 and 5.1), less-developed Members with limited scientific capacity could rely on the relevant international standard, and in particular on the risk assessment that underlies it, while adjusting the aspects of the international standard that are not well-suited to their particular situations. While such a measure could still be challenged under the remaining disciplines of the *SPS Agreement*, such as those relating to necessity, consistency and non-discrimination, it would be safe from scientific challenges – a significant advantage for Members with weak scientific capacities. Similarly, if the presumption that SPS measures that ‘conform to’ international standards are consistent with the GATT 1994 and the *SPS Agreement*, contained in Article 3.2 of the *SPS Agreement*, would be interpreted as irrebuttable, it would provide a safe harbour for those Members whose weak regulatory capacity prompts them to fully adopt international standards. Such interpretations create a stronger impetus for harmonisation around international standards, without calling into question the right of Members to deviate from international standards if this is necessitated by their chosen level of protection. This interpretation therefore furthers the objective of Article 3 as outlined in the Preamble to the *SPS Agreement*. Such an interpretation is proposed here as preferable to the one currently followed in the case law.

However, any discussion of the potential benefits of the harmonisation provisions of the *SPS Agreement* for less-developed Members must be seen against the factual background of the problems of participation of these Members in the international standard-setting process, as set out in Part II. The preferences of the most active participants in the standard-setting process are reflected both in the science policy choices underlying the risk assessments on which international standards are based and in the risk management decisions taken in the international standard-setting bodies. The most influential participants are those with the most resources to dedicate to ensure the effectiveness of their participation, namely developed countries and industry groups. Efforts are already underway within the international standard-setting bodies to address the institutional and procedural constraints to developing-country participation, as discussed in Parts II and V of this book. However, it is clear that much remains to be done to redress the imbalance in participation of Members at different levels of development in the international standard-setting bodies. Without successful efforts in this regard, the harmonisation disciplines of the *SPS Agreement* will have a negative impact on development, contrary to their objective.

Harmonisation is not always possible, nor is it always desirable. Diverging SPS measures may be a reflection of the diversity in both capacity and policy priorities that exists in different Members and can be seen as a natural outcome of the exercise of sovereign regulatory authority by their governments. In the absence of harmonisation, the *SPS Agreement* relies on scientific justification to discipline regulatory decisions. These

scientific disciplines, discussed in Chapter 5 of Part III, counterbalance the regulatory autonomy of Members, reflected in the policy space reserved to them in the *SPS Agreement*. Science is regarded as a value-neutral benchmark, universally accepted and thus valid for all. As a result, the *SPS Agreement* requires that SPS measures that deviate from harmonised standards are rationally supported by science as embodied in a risk assessment.

A more nuanced understanding of science and the subjective choices inherent in the assessment of risks has emerged since the negotiation of the *SPS Agreement*, undermining the possibilities for reliance on science as an objective yardstick against which to judge SPS regulation. However, this does not mean that the use of science in the disciplines on SPS measures is completely misplaced. The scientific disciplines of the *SPS Agreement* have the definite benefit of encouraging rationality in risk regulation and thereby improving the quality of SPS decision making. The Appellate Body has taken steps to prevent the scientific obligations of the *SPS Agreement* from becoming rigid and unworkable restrictions on the regulatory autonomy of Members. In this way, it has been careful to ensure that the use of science as a tool to balance trade and health in the *SPS Agreement* does not result in a skewed outcome through the unrealistic application of this tool.

This realistic approach has unfortunately not been taken by panels in their application of the scientific obligations of the *SPS Agreement* to the factual situations before them. Instead, panels have seen it as their task to engage in a detailed assessment of the scientific evidence underlying a Member's measure, and to come to an independent conclusion regarding the existence and extent of the risk at issue. The invasive application of the scientific rules of the *SPS Agreement* by panels might be expected to be advantageous to developing-country Members that export agri-food products, since it provides greater opportunities to challenge the SPS requirements of their trading partners. However, in order to do so, the complaining Member needs to have sufficient scientific capacity to identify the flaws in the scientific basis for the regulating Member's measure, and to pursue challenges on this basis. This capacity is frequently lacking in Members at lower levels of development. In addition, even where the necessary capacity to bring scientific challenges is present, the intrusive approach of panels does not, in fact, lead to increased opportunities for market access. By undermining the scope for national choices in science policy decisions, and thereby skewing the delicate balance of the *SPS Agreement*, these panel decisions result in politically unacceptable outcomes of dispute settlement. This increases the chances of non-compliance by a regulating Member with the recommendations and rulings of the DSB, thereby undermining the effectiveness of the *SPS Agreement*.

The scientific disciplines of the *SPS Agreement* also entail significant compliance costs for Members at lower levels of development. The rigorous requirements for a risk assessment necessitate a high level of scientific and technical capacity, something which is lacking in many less-developed Members. The possibility for these Members to make use of 'borrowed' risk assessments to fill the gap left by their own lack of scientific capacity has been significantly narrowed by the requirement of a great degree of specificity read into the two definitions of 'risk assessment' in Annex A.4, and by the additional restrictions read into the criterion of a risk assessment 'as appropriate to the circumstances' in the case law. Consequently, the SPS regulations of less-developed Members are often vulnerable to challenges under the scientific obligations of the *SPS Agreement*.

In contrast to its strict scientific disciplines with regard to risk assessment, the *SPS Agreement* provides considerable latitude for Members to give effect to their policy choices in their risk management decisions, as discussed in Chapter 5 of Part III. This policy space left to Members is indicative of the balancing approach of the *SPS Agreement*. It acknowledges that Members have the right to choose the levels of protection against SPS risks that they deem appropriate. Such decisions are taken by national regulators on grounds of societal value judgements on issues such as what level of risk is considered acceptable in society, not purely on the basis of scientific analysis of risk. The *SPS Agreement* recognises this, by placing no requirement of establishing a scientific basis on the choice of the appropriate level of protection. Neither does it place any restrictions on the types of factors that Members may consider when deciding on their choice of level of protection. Thus divergent, particularised national health measures result even where the scientific basis for the measures is the same everywhere.

The only real discipline on the choice of a level of protection is the prohibition, in Article 5.5 of the *SPS Agreement*, on arbitrary or unjustifiable distinctions in levels of protection applied in different but comparable situations, if these distinctions would lead to discrimination or a disguised restriction on trade. The broad ambit given in the case law to the situations that may be considered ‘comparable’ is tempered by the fact that distinctions in the levels of protection applied are only caught by the prohibition if they are arbitrary or unjustifiable. Panels and the Appellate Body have considered factors relating to the level of risk and difficulties of controlling the risk in the situations compared, to determine if the differences in the level of protection chosen by a Member in these situations can be justified. However, in some cases, divergence in the appropriate level of protection is grounded in (often irrational) societal preferences rather than objective differences in risk. This is particularly the case with regard to the risks to which people voluntarily expose themselves, due to particular cultural practices. The SPS Committee is instructed, in Article 5.5, to take this into account in developing guidelines for the implementation of Article 5.5. Room has also been made by the Appellate Body for considerations unrelated to the risk at issue, including consumer concerns, to be factored into the determination of an appropriate level of protection, by finding that such considerations will not render the chosen level of protection a ‘disguised restriction on trade’ for purposes of Article 5.5. This decision implies a positive recognition by the Appellate Body of the important role of societal value judgements in the making of risk management decisions.

The choice of an SPS measure to achieve a Member’s appropriate level of protection is also disciplined in the *SPS Agreement*. Not only must these measures bear a rational relationship to a risk assessment, but they must also not be more trade-restrictive than required to achieve the appropriate level of protection of the regulating Member. While the least-trade-restrictive discipline is clearly drawn from the ‘necessary’ test of Article XX of the GATT, unlike the GATT the *SPS Agreement* clearly excludes the possibility for strong proportionality testing by explicitly providing that any alternative measure proposed must achieve the regulating Member’s appropriate level of protection. In addition, the technical and economic feasibility of the alternative measures is expressly considered. This ensures that unrealistic limits on a Member’s choice of measure are avoided, in recognition of the fact that resource and capacity constraints play an important role in regulatory decisions. The examination of the space left to Members in the *SPS Agreement*

to carry out their risk management policies is indicative of the balancing approach of the *SPS Agreement*.

The *SPS Agreement* allows for risk management choices in the face of insufficient scientific evidence by providing scope, in Article 5.7, for provisional measures. When the four requirements of Article 5.7 are met, the relevant SPS measure is exempted from the scientific disciplines of Articles 2.2 and 5.1 of the *SPS Agreement*. Article 5.7 seems to provide an adequate vehicle for the incorporation of the precautionary principle into the SPS disciplines relating to risk management. By laying down specific requirements for the exercise of the right to take provisional measures, Article 5.7 operates to avoid abuse of this right. It ensures that a framework is in place within which risk management decisions taken in the face of insufficient scientific evidence can be disciplined, to promote rationality.

The examination of the relevant substantive disciplines of the *SPS Agreement* leads to two related conclusions. The first is that the balancing objective of the *SPS Agreement* is unmistakably reflected in the way in which these substantive provisions are framed. As identified above, there are aspects of the interpretation of these provisions that do not fully give effect to the careful balance embodied in their terms, and leave room for improvement. Nevertheless, the provisions themselves seem appropriate to address the sensitive trade/health conflict in a way that promotes the liberalisation of agri-food trade while respecting the right of Members to regulate against SPS risks. However, the second conclusion that is evident from the discussion of the relevant substantive rules of the *SPS Agreement* is that these rules impose a regulatory model that is currently not achievable for many Members at lower levels of development. Neither are these Members able to use these substantive rules effectively to procure market access for their products.

The fact that the SPS measures of Members at lower levels of development have rarely been challenged in dispute settlement proceedings to date, should not create the impression that this means that their inability to comply with the disciplines of the *SPS Agreement* has no real consequences for them. Many instances of non-compliance by these Members with the regulatory obligations of the Agreement have been challenged in the multilateral forum of the SPS Committee, or in bilateral discussions between Members. In these situations, it is often difficult for the regulating Member to justify its measure, other than to refer to its capacity constraints. This situation leaves less-developed Members vulnerable to pressure by other Members to settle other SPS conflicts in ways unfavourable to them.

Aside from the particular aspects of the interpretation of the substantive rules of the *SPS Agreement*, identified throughout Part III, that leave scope for improvement, it is difficult to see how changes can be made to address developing-country constraints without skewing the careful balance sought by the Agreement. The rules themselves seem appropriate for the fulfilment of their function of allowing sufficient room for Members to regulate in a manner that gives effect to their policy priorities in the area of SPS risk, while disciplining such regulation to eliminate the possibilities for disguised protectionism and to reduce the adverse trade effects of legitimate measures. Nevertheless, the very real problem of the constraints that less-developed Members face in complying with, and benefiting from, these rules cannot be disregarded.

The question arises to what extent the remaining provisions of the *SPS Agreement* ameliorate this problem by taking account of the capacity constraints of Members at lower levels of development, both in respect of compliance with the disciplines of the Agreement and in respect of enforcement of these disciplines against other Members in order to gain market access. This question is addressed in Parts IV and V of this book.

## **6. The underestimated benefits of the procedural and institutional arrangements**

Alone, the substantive disciplines of the *SPS Agreement* discussed above would not be sufficient to achieve significant gains in market access for food and agricultural products from developing-country Members. As was pointed out, these Members lack the scientific and technical capacity to identify instances of non-compliance with the complex regulatory disciplines of the *SPS Agreement*, and to formulate effective challenges in this regard. In addition, many legitimate SPS regulations that pass muster under the relevant substantive disciplines of the *SPS Agreement* nevertheless form significant trade barriers. This is particularly so for Members that face capacity constraints in keeping track of new and changed measures, understanding their implications and proving their compliance with SPS requirements (including by demonstrating the equivalence of their own SPS requirements, or by gaining recognition of the pest- or disease-free status of their territories or of regions within their territories). Additionally, substantive disciplines on their own are not useful without effective tools to monitor their implementation, resolve conflicts between Members with regard to these disciplines and if necessary enforce compliance therewith. The rules of the *SPS Agreement* that address these institutional and procedural matters were discussed in Part IV. These institutional and procedural provisions have an important impact on the effectiveness of the *SPS Agreement* in achieving its goals. The examination of these provisions aimed to determine the extent to which they are effective tools for exporting Members at lower levels of development to gain market access without endangering the ability of importing Members to protect health in their territories.

First, Chapter 1 discussed those provisions in the *SPS Agreement* under which mechanisms creating disciplines of an institutional or procedural nature on Members are established. These institutional or procedural disciplines leave undisturbed Members' policy choices within the bounds of the relevant substantive disciplines of the Agreement, but address the way in which these policies are achieved in order to minimise as far as possible their trade-restrictive effects. Often the procedural obligations in the *SPS Agreement* are combined with a substantive discipline, yet the procedural mechanism under the provision is key to its potential in improving market access. It is useful to note that procedures may be abused to prevent the achievement of the goals of the relevant substantive disciplines, thereby undermining the trade/health balance of the Agreement. In other words, in many cases it is not *what* is done but the *way* in which it is done that creates problems. These problems may be especially burdensome for Members at lower levels of development, due to their lack of resources to devote to compliance with complex procedural requirements.

The *SPS Agreement* contains some rules dealing directly with procedures imposed by Members to check compliance with their SPS measures. These are contained in Article 8 and Annex C, which address control, inspection and approval procedures. Annex C.1 sets out a list of disciplines, which broadly speaking aim to ensure that these procedures are not more lengthy and burdensome than is reasonable and necessary, and that they do not discriminate against imports. A few of these disciplines have been clarified by the Panel in *EC – Approval and Marketing of Biotech Products*. Further clarification and a rigorous application of these rules are called for, to give full effect to the potential of Annex C.1 to discipline the relevant procedures.

Further, Annex C.1 contains a weak additional discipline for systems of prior approval of additives and establishment of tolerances for contaminants, requiring consideration of the use of international standards pending a final determination. While these systems sit uncomfortably with the general regime established by the *SPS Agreement*, they do fall within the definition of SPS measures and are covered by all the disciplines of the Agreement, not just Annex C.1. Members are, however, reluctant to challenge prior approval systems as such under the *SPS Agreement*. This is evinced by the fact that the only challenge relating to a prior approval system to date is that in *EC – Approval and Marketing of Biotech Products*, where the challenge did not address the system itself but only the delays in its application, as reflected in the *de facto* moratorium and product-specific measures.

The additional procedural mechanisms under the *SPS Agreement* aim to operationalise certain of its substantive obligations. The substantive obligations on Members in respect of the recognition of equivalence, the adaptation of their SPS measures to regional conditions and transparency in respect of their SPS measures would achieve little without procedural arrangements to give effect to them. Yet, the procedural aspects of the provisions on these matters in the *SPS Agreement*, aside from the provisions on transparency, are extremely weak. This has led to very poor implementation of the obligations on equivalence and regionalisation, rendering ineffective these provisions despite the very significant potential they hold for market access improvements.

These potential benefits are of particular relevance for Members at lower levels of development. The recognition of equivalence, unlike harmonisation rules, allows for differences between Members, including those relating to consumer preferences and technical and financial resources, that lead to divergent SPS measures. Yet it limits the trade-restrictive effect of the divergent measures by acknowledging that it is possible for different SPS measures to achieve the same level of protection. Thus by recognising equivalence an importing Member would allow imports of products that comply with different, but equally effective, SPS measures. This leaves flexibility for Members at lower levels of development to apply SPS measures suited to their capacities and still gain market access, provided that the measures achieve the importing Member's chosen level of protection. Similarly, regionalisation holds great potential by recognising that SPS conditions, and in particular the incidence of pests and diseases, are not determined by national borders, and may differ between various regions within a country. In some large developing countries, conditions may vary greatly from region to region, due to variations in climate, environmental or geographic conditions within the country and/or due to the efforts of the regulatory authorities to eradicate a pest or disease from specific areas. Adaptation of SPS measures of importing Members to the pest or disease conditions of the region of

origin of the product could greatly improve market access possibilities. This enables the exporting Member to limit the costs of eradicating a pest or disease or keeping pest- or disease-free status by focusing on specific areas.

In order to realise the potential of the obligations on the recognition of equivalence and adaptation to regional conditions, the SPS Committee has adopted decisions setting out procedural mechanisms. These decisions do not amend the substantive obligations on equivalence and regionalisation, but instead provide guidelines for their effective implementation. Developed on the basis of concrete information provided by Members on their experiences in the relevant areas, and elaborated in technical discussions among SPS regulatory officials, these procedures illustrate the potential of the SPS Committee to find cooperative solutions to implementation problems.

The substantive transparency obligations of the *SPS Agreement* regarding prior notification of changes to SPS measures, publication of adopted measures and the explanation, upon request, of reasons for SPS measures also hold great potential to improve market access possibilities. Prior notification enables exporting Members to be informed of proposed new or amended SPS measures and to transmit this information to their exporters. This gives Members, and through them their exporters, the opportunity to make comments regarding these proposals at an early stage and to have these comments taken into account in the regulatory process. Members can also raise concerns on notified measures in multilateral discussions at SPS Committee meetings. The publication requirement for adopted SPS measures is crucial in facilitating market access for exports from less-developed Members by greatly reducing the cost and difficulty of obtaining information on their trading partners' SPS measures. It also enables exporting Members to exercise their rights and police the implementation of the obligations of the *SPS Agreement*, by ensuring that these Members obtain full information on the content of the SPS measures of importing Members in order to identify whether they are consistent with the *SPS Agreement*. The provision of an adaptation period before the entry into force of a published measure is of particular importance to developing-country Members as their exporters may need more time to adjust to new requirements. The obligation to provide reasons supplements the other transparency provisions by enabling Members to obtain information beyond that on the existence and content of SPS measures, such as that regarding the scientific basis of the measure, the level of protection it seeks to achieve and other aspects of the reasons for its imposition. This information enables an exporting Member to raise its concerns regarding the measure in a focused manner, by pointing to specific inconsistencies with the *SPS Agreement* in bilateral discussions or in the multilateral forum of the SPS Committee. It can also play a useful role in dispute settlement proceedings by assisting an exporting Member in establishing a *prima facie* case, for example, that an importing Member's SPS measure is not based on a risk assessment or sufficient scientific evidence. To give effect to these transparency obligations, the *SPS Agreement*, in Annex B, contains some procedural rules, particularly in respect of notification. However, these procedural rules are not sufficiently detailed and have given rise to difficulties of implementation, undermining the effect of the substantive obligations.

The impact of the transparency obligations for Members at different levels of development varies, both in terms of the compliance burden they impose and in terms of the potential benefits they offer. Not only the implementation of transparency obligations

but also the need to manage the inflow of information from other Members resulting from increased transparency require institutional infrastructure and human and financial resources. This was illustrated by an examination of the greatly varying transparency practice of the four Members selected as examples in this book. To facilitate compliance with the transparency obligations and to assist Members to derive full benefits from them, the SPS Committee has adopted recommended transparency procedures and formats for notifications. The procedures and formats, while not binding, are commonly followed by Members, and have resulted in great improvements in transparency. On the basis of experience with their use and new suggestions for improvement, the transparency procedures have been revised three times and they can be regarded as a 'work in progress'. Transparency procedures have also been adopted by the SPS Committee in respect of determinations on equivalence and regionalisation, as well as with regard to requests for special and differential treatment and responses to such requests. The *Recommended Transparency Procedures* currently also incorporate references to mechanisms designed by the WTO Secretariat, on the initiative of Members, to address constraints faced by developing-country Members. Examples are the mechanisms to improve access to unofficial translations of documents; to provide access to a database, known as the SPS IMS, where notifications of SPS measures and other relevant sources of information are compiled; and to facilitate access to notified draft SPS measures by storing documents electronically on the WTO server and enabling access to these documents through hyperlinks in notifications. In this way, the work of the SPS Committee, supported by the WTO Secretariat, with regard to improving the procedural arrangements for transparency under the *SPS Agreement* has been instrumental in furthering the realisation of the benefits of transparency while reducing some of its costs.

A second category of procedural and institutional mechanisms, discussed in Chapter 2 of Part IV, covers those provisions in the *SPS Agreement* that deal with the institutions and procedures necessary at WTO level for the smooth and effective implementation of the *SPS Agreement*. The proper implementation and operation of the *SPS Agreement* is ensured through two institutional and procedural avenues, that provided by the bargaining forum of the SPS Committee and that provided by the adjudicatory mechanism of the dispute settlement system. The provisions relating to the SPS Committee and to dispute settlement are essential in promoting and monitoring the implementation of the disciplines of the *SPS Agreement*, resolving conflicts between Members with regard to these disciplines and, if necessary, enforcing compliance therewith.

The question of whether Members' trade concerns with respect to the SPS measures of other Members are dealt with through multilateral discussions at SPS Committee meetings or instead through formal adjudication is not without significance. It is highly relevant for the manner in which the trade/health balance is struck, which, in turn, is closely tied to the questions of who participates in framing the issues under discussion and who decides on the outcome of the dispute. These questions are particularly pertinent when one bears in mind the differences in opportunities for effective participation available to Members at different levels of development under each of the two mechanisms. The discussion in Part IV made abundantly clear that, currently, alternative mechanisms to dispute settlement represent the best way forward in ensuring that developing-country

Members benefit as fully as possible from the advantages offered by the disciplines of the *SPS Agreement*.

In particular, the discussion of the role and functioning of the SPS Committee showed much greater possibilities for participation of Members at lower levels of development than exist currently in the dispute settlement system. The specific trade concern mechanism of the SPS Committee has proved very effective in providing opportunities for Members to address the problems they face regarding the SPS measures of their trading partners in an inexpensive and constructive way. Most often, bilateral discussions on trade concerns placed on the agenda are held in the margins of SPS Committee meetings and may resolve the matter. If not, discussions are held in the multilateral forum of the SPS Committee, which enables other Members to comment on the issue and support the trade concern raised. This could lead to the revision of the notified measure or to further bilateral consultations between the Members involved. It may also facilitate compliance with the SPS measure complained of by the Member raising the concern, through increased clarity on the requirements and ways to meet them, and in some cases by means of the provision of technical or financial assistance by the importing Member. In this way disputes can be resolved without recourse to the expensive, time-consuming and confrontational process of formal dispute settlement.

The specific trade concerns mechanism of the SPS Committee also has indirect benefits, including increased familiarity of Members with each other's regulatory systems due to the regular contact and sharing of experiences between Members' officials. Members may gain confidence in the regulatory capacity of the alternative SPS regimes maintained by other Members. This confidence has an impact on issues such as the recognition of equivalence and of pest- or disease free areas.

As shown by the examination of participation by Members at different levels of development in the specific trade concerns mechanism, while developing-country Members have featured strongly, both as initiators or supporters of issues raised, and as subjects of concerns raised, the number of *different* developing countries participating to date has been limited. Participation in the specific trade concerns mechanism is certainly broader than in dispute settlement, yet there is still room for improvement. The constraints to the use of this mechanism seem to lie, not in the mechanism itself but rather in the capacity of Members at lower levels of development to keep track of notified measures, consult with their export industries to identify specific trade concerns arising from these measures, understand the extent to which these concerns can be addressed under the rules of the *SPS Agreement*, and send a national expert to the meetings of the SPS Committee to raise a trade concern. This is an area where capacity building is sorely needed. Efforts such as IICA's SPS Initiative for the Americas are to be applauded. It not only funds participation in SPS Committee meetings by capital-based experts but also promotes the establishment of offices at national level to follow the activities of SPS-related international bodies, particularly the SPS Committee. As the support provided by this initiative is being phased out, new and more broadly-applicable efforts along the same lines are essential.

The SPS Committee not only provides a forum for the discussion and resolution of specific trade concerns, but it also promotes regulatory learning and creates possibilities for building professional networks. It provides a mechanism for the monitoring of harmonisation

that allows concerns regarding the lack of international standards, or problems with existing standards, to be raised and forwarded to the relevant international standard setting body. In addition, it plays a crucial role in addressing broader SPS concerns by promoting the implementation of particular disciplines in the *SPS Agreement* through developing and adopting procedural guidelines. The disciplines addressed, such as those on equivalence, adaptation to regional conditions, special and differential treatment and transparency, are particularly important for developing-country Members, as already noted, in that they hold great potential for market access gains while fully respecting the level of protection chosen by importing Members.

As noted, the SPS Committee provides much greater possibilities for participation than the adjudicatory system. Nevertheless, currently attendance and effective participation by Members at different levels of development in meetings of the SPS Committee varies greatly. As illustrated by the four Members used as examples in this book, high-income Members tend to participate actively and effectively in SPS Committee meetings and are represented by experts from their relevant ministries. However, many Members at lower levels of development do not have the resources to send an SPS official from their capitals, and are represented in meetings of the SPS Committee by diplomats from their missions in Geneva, often lacking the necessary technical knowledge. There are also some Members that are unable to send any representative to most SPS Committee meetings.

The problems this situation creates for effective participation by Members at lower levels of development in the decisions of the SPS Committee are mitigated by two practices of the Committee. The first is its practice to canvass all Members, by means of questionnaires, to submit their practical experiences with regard to the issue under discussion and to compile these experiences as the basis for the development of the new guidelines. The second practice that addresses participation problems is that of *ad referendum* decision making. This entails that a decision is only provisionally adopted at a meeting of the SPS Committee, and a period is then provided for Members to raise objections to the provisional decision. This enables Members that were not present at the relevant meeting, or those that were represented by delegates lacking the necessary expertise to evaluate the impact of the provisional decision, to have the decision examined by their ministry officials and to raise objections if necessary. Objections are addressed through revisions and the agreement of the objecting Member is obtained before the provisional decision is finally adopted. This practice ensures broad participation in the decisions of the SPS Committee, increasing their legitimacy and the 'ownership' of the decision by Members. This is important in view of the fact that decisions of the SPS Committee are not directly enforceable in dispute settlement proceedings. Implementation of decisions of the SPS Committee therefore relies upon the willingness of Members to follow the procedural guidelines set out therein. In view of the current problems with the use of the dispute settlement system faced by Members at lower levels of development that lack the scientific capacity essential to mounting an effective challenge, set out below, there is little to be gained by converting the procedural guidelines of the SPS Committee into enforceable rules, and much to be lost. The weak legal status of decisions of the SPS Committee, as compared to the binding status of an amendment, makes it easier for Members to reach consensus on new norms. In addition, the flexibility to respond to new problems and to

improve the existing procedures that is provided by their 'soft law' nature is highly valued by Members.

The positive light in which Members view the role of the SPS Committee is evinced by the outcome of the second review of the *SPS Agreement*. Many of the recommendations coming out of this review relate to maintaining as standing agenda items for SPS Committee meetings the various issues addressed in the decisions of the Committee and to continuing work on these issues. In addition, the second review mandates the SPS Committee to pursue work on new issues, based on information provided by Members regarding their experiences and on specific suggestions submitted by Members to the Committee. None of the recommendations suggest that proposals for amendments to the *SPS Agreement* be submitted to the Council for Trade in Goods, as allowed by Article 12.7 of the *SPS Agreement*. This despite the fact that it would be possible in this way to initiate discussions on giving the procedural guidelines developed by the SPS Committee binding force. It is apparent that Members wish to continue the current successful *modus operandi* of working towards the resolution of implementation problems through decisions of the Committee, based on technical discussions and shared experiences, and reviewing these decisions as needed.

The dispute settlement mechanism of the WTO, through which non-compliance with the obligations of the *SPS Agreement* can be challenged by Members, is a great improvement above that existing under the GATT 1947. While a very small proportion of the SPS-related conflicts between Members result in the initiation of WTO dispute settlement proceedings, and even fewer actually proceed to adjudication, the importance of the dispute settlement system to SPS disputes should not be underestimated. The very existence of the dispute settlement system creates an incentive for Members against whose SPS measures concerns are raised to address these concerns through negotiated solutions. In addition, the clarifications developed by panels and the Appellate Body with regard to the provisions of the *SPS Agreement* are essential in establishing the legal framework within which Members address their SPS conflicts. These clarifications are taken up in decisions of the SPS Committee that elaborate procedural guidelines for the operationalisation of provisions of the *SPS Agreement*. Equally importantly, they inform discussions between Members, bilaterally but even more so in the multilateral forum of the SPS Committee, to resolve trade concerns. These have been referred to as 'settlements negotiated in law's shadow'.<sup>1</sup> It was therefore necessary to examine specific aspects of the dispute settlement system that are of particular relevance to SPS disputes, and to determine the opportunities for effective participation by Members at lower levels of development.

The question of which party bears the burden of proof in dispute settlement proceedings is particularly significant in the case of SPS disputes due to the difficult and intricate factual issues involved in this area. The approach to the burden of proof in complaints under the *SPS Agreement*, as clarified by the Appellate Body, reflects the difference in the regime created by the *SPS Agreement* to balance trade and health objectives, from the regime applicable to health measures under the GATT 1994, where health measures were

<sup>1</sup> Gregory Shaffer, 'Recognising Public Goods in WTO Dispute Settlement: Who Participates? Who Decides? The Case of TRIPS and Pharmaceutical Patent Protection', *Journal of International Economic Law* 7 (2), 2004, 459-482, 471.

seen as exceptional and needing justification. The new approach of the *SPS Agreement* is to recognise that Members have the right to regulate to the extent necessary to address SPS risks, but to subject such regulation to disciplines. It is therefore for the complaining Member to bring a *prima facie* case to show that the SPS measure complained of violates the disciplines of the *SPS Agreement*. Complaining Members are assisted in their task by the possibility created in Article 5.8 of the *SPS Agreement* to request information on the SPS measures of other Members. The Appellate Body's view of Articles 3.3 and Article 5.7 of the *SPS Agreement* as autonomous rights rather than as exceptions to the harmonisation discipline in Article 3.1 and the scientific disciplines in Articles 2.2 and 5.1, respectively, results in maintaining the burden of proof firmly on the complaining Member. This reflects the leeway provided to regulating Members by the Appellate Body in order to ensure that the policy space left to Members by the *SPS Agreement* is not undermined.

As noted, many developing-country Members may not have the resources to gather the scientific information necessary to bring a challenge under the *SPS Agreement*, in order to make a *prima facie* case of violation. In addition, the difficulties they face in complying with the regulatory disciplines of the Agreement mean that these Members are unlikely to be able to defend their SPS measures in case of a challenge. High-income Members have experienced serious difficulties in this regard in the SPS disputes heard thus far. For less-developed Members the hurdle seems almost insurmountable. These Members may not have the resources to commission the necessary research and will therefore depend on the chance that there are already existing studies of relevance. The duty to cooperate in dispute settlement proceedings, identified by the Panel in *Japan – Apples*, is unlikely to lead Members, in an adversarial system, to provide data supportive of the position of the opposing party.

The issue of the burden of proof on Members in dispute settlement proceedings is closely linked with the question of the investigative authority of a panel, the standard of review it applies when assessing the facts before it and the question of the appropriate role of experts advising the Panel.

The question of the appropriate standard of review to be applied in dispute settlement proceedings plays a significant role in the allocation of authority to make policy choices balancing competing trade and health interests. The particular standard of review applied determines the extent to which the WTO adjudicatory bodies are entitled to interfere in Members' regulatory determinations. Currently, while panels customarily state that they will not conduct their own risk assessment or impose a particular scientific view on the regulating Member in reviewing the scientific evidence, in practice this is increasingly what they do. This is in part due to the interpretation given to the 'rational relationship' requirement entailed by the scientific disciplines of the *SPS Agreement* as involving an assessment of the quality and weight of the scientific evidence. This opens the door for an intrusive review. It is proposed here that a panel should limit its examination of the scientific evidence to the question whether the regulatory disciplines of the *SPS Agreement*, including that an SPS measure is based on a risk assessment as defined in the Agreement, have been complied with. It should stop short of completely reassessing the scientific evidence itself to determine the existence and extent of a risk. Limiting the factual assessment to the question whether the regulatory determination by the Member is plausible on the scientific evidence before it, allows some deference to national authorities' scientific

determinations. Such a review ensures that the regulating Member respects the balance struck in the rules of the *SPS Agreement* between its health concerns and the trade interests of other Members, but the review does not intrude too far into the regulatory competence of Members by interfering unduly in their assessment of scientific evidence. This would make room for the diversity of priorities, consumer preferences and regulatory capacity between Members at different levels of development to be reflected in the science policy choices incorporated into national risk assessments. This type of review would also reduce the disadvantage at which Members that lack scientific capacity find themselves in challenging or defending measures under the *SPS Agreement*. The current intrusive approach may skew the outcome of judicial review in favour of developed-country Members that have the resources to bring convincing scientific evidence and persuasive legal arguments in support of their positions.

The standard of review currently applied by panels is made even more problematic by the practice with regard to the consultation of experts by panels. While the use of panel experts is essential in assisting panels, which are usually composed of trade specialists rather than SPS experts, to understand the highly complex scientific evidence before them, it is important to ensure that appropriate regard is had to the role of such experts in dispute settlement. The use of panel experts aims to ensure that the assessment and choice between the competing scientific views presented by the parties is not made by a panel on its own, but rather that the panel is advised on this by persons with the necessary expertise. The prevailing practice of panels of appointing individual experts rather than expert review groups has the contrary effect, adding to the competing scientific opinions before a panel. It allows a panel to pick and choose between the various opinions, which is troubling in view of the lack of scientific expertise of panellists to undertake this task. It is recommended that panels make use of expert review groups, in order to ensure that the scientific basis for their decisions is authoritative. In cases involving a developing-country Member, the expert review group should include at least one expert from a developing-country Member to ensure that the assessments provided by the group incorporate developing-country realities. In addition, it is important that a panel respects the distinction between the respective roles of the panel, its experts and the parties before it in the proceedings. Panels should resist the temptation to expand the role of the experts to providing the evidence in support of the position of one of the parties, or to address the legal questions before the panel that require a basis in scientific assessments. Such inappropriate use of experts undermines the legitimacy of the outcome of dispute settlement.

The argument has been made that the 'normative vacuum' in which the *SPS Agreement* is currently interpreted has led to the strong focus on science, and the concomitant heavy reliance on the opinions of panel experts in assessing this science, by panels in reviewing the SPS measures of Members. Panels see science as providing a neutral and universal benchmark against which SPS measures can be tested to distinguish SPS protection from disguised protectionism. It is submitted here that consideration of the international law context within which the *SPS Agreement* functions, in particular international human rights norms relating to the rights to life, health, safe food and development, in addressing the rights and obligations laid down in the *SPS Agreement* could operate to provide the urgently needed normative framework to guide WTO adjudicators in striking a more appropriate balance between the competing goals of trade liberalisation and health protection.

The recognition of this normative basis for interpretation, on which they can rely to enhance the legitimacy of their decisions, may make panels less inclined to continue their current intrusive approach to the review of the scientific basis for Member's SPS measures. It may also make them more willing to use the flexibilities in the *SPS Agreement* to allow for the consideration of developing-country Members' constraints in the application of the scientific disciplines on regulation, to ensure that the *SPS Agreement* does not operate to undermine the protection of health in these Members.

The weak use of the dispute settlement system by Members at lower levels of development attests to high political and financial costs of dispute settlement for these Members and the limited chance of success they foresee. The Advisory Centre on WTO Law is a welcome development in providing much-needed assistance in dispute settlement. However, without concerted efforts to build SPS capacity in developing countries, these Members are unlikely to overcome the remaining hurdles to participation in dispute settlement. It is essential to address these hurdles, as the bargaining that occurs at the SPS Committee, both with regard to specific trade concerns and with regard to broader implementation issues, takes place 'in the shadow' of dispute settlement. Without participation in dispute settlement, less-developed Members are unable to influence the normative framework within which negotiations to address SPS issues occur.

This brings us once again to the need for effective initiatives to build the capacity of Members at lower levels of development to make use of the dispute settlement system to resolve their SPS disputes. An essential component of the capacity needed in this regard relates to the SPS regulatory systems and scientific competence in these Members.

## **7. The limits of special and differential treatment for developing-country Members in the SPS Agreement**

The *SPS Agreement*, as one of the WTO agreements creating disciplines for behind-the-border regulatory regimes, necessitates special recognition of differences in SPS capacity of Members across different levels of development. As has been seen from the discussion thus far, the ability of Members to comply with, and benefit from, the disciplines of the *SPS Agreement* depends on their 'starting position.' In other words, the existing situation in a Member, such as the strength of its regulatory system, its infrastructure and its human and financial resources will affect the impact of regulatory disciplines of the *SPS Agreement* on that Member, and its ability to use those disciplines against other Members to gain market access. To be 'development-friendly' it is important that the *SPS Agreement* leaves sufficient space for less-developed Members to pursue their development policies through national SPS regulation, while at the same time creates clear and workable rules that these Members can use to gain market access. This difficult balance is not only achieved in the substantive and procedural disciplines, but is contributed to by provisions in the *SPS Agreement* providing special treatment for developing-country Members. These provisions, discussed in Part V, take the form of rules on special and differential treatment (SDT) of developing-country Members and rules on the provision of technical assistance.

The rules on SDT were examined in Chapter 1 of Part V. These rules aim to ensure that developing-country Members benefit fully from the rules of the *SPS Agreement*, without being overwhelmed by the costs of compliance. To achieve this objective, appropriate flexibilities are necessary to take account of the special constraint faced by these Members. These flexibilities are needed with regard to compliance not only with the resource intensive obligations of the *SPS Agreement* but also with new or modified SPS measures imposed by their trading partners.

The current provisions on SDT of developing-country Members are, however, mostly hortatory and ineffective. This problem has been exacerbated by the unwillingness of panels to interpret SDT provisions, even those phrased in mandatory language, as imposing any enforceable obligations. While this could be improved by a more progressive interpretation of the relevant provisions in dispute settlement, to ensure that developed-country Members take seriously their commitments to take account of developing-country constraints, this possibility has clear limits. Members cannot be obliged to import risky products simply because not to do so would restrict developing-country trade. Differential treatment of developing-country Members with regard to the imposition of SPS measures would be counterproductive, leading to consumer concerns regarding the safety of products from developing-country Members.

Work in the SPS Committee on operationalising SDT has been unsuccessful, aside from the adoption of the *Decision to Enhance Transparency of SDT* in 2004. The discussions in the SPS Committee on the SDT proposals forwarded to it in the context of the Doha Round negotiations remain polarised. It is unlikely that a constructive solution to strengthen SDT for developing-country Members would take the form of the current proposals. These proposals amount to a limitation on the right of Members to apply SPS measures to achieve the level of protection they deem appropriate if this entails market access restrictions for developing-country Members; or to the possibility for broad exemptions for developing-country Members from the disciplines of the *SPS Agreement*. It is widely recognised by WTO Members that any mechanisms to deal with developing-country concerns should not jeopardise the right of a Member to impose scientifically-justified measures necessary to prevent risks to human, plant or animal life or health that they consider unacceptable. To do so would not only lead to risks of harmful effects on human health and agricultural production, contrary to the obligations of governments, but would also be counterproductive. It would fuel consumer fears, leading to a decrease in demand for products originating in developing-country Members, and harm the reputation of such exporting Members by casting doubt on their regulatory capacities. Similarly, difficulties with implementation of the regulatory disciplines of the *SPS Agreement* should not be dealt with by means of a wholesale relaxation of its rules in respect of developing-country Members. Creating loopholes through which measures that are disguised forms of protectionism can slip, would undermine the market access gains achieved by the *SPS Agreement*. The proposed solutions would skew the delicate balance between trade liberalisation and health protection achieved in the *SPS Agreement*. This would be contrary to the normative framework established by the right to development which recognises both the importance of trade as an engine for growth and the obligation to ensure that such growth does not come at the cost of the protection of human rights, including the rights to life, health and safe food. Nevertheless, the rejection of the current proposals does not diminish the need to

recognise the reality of the underlying concerns of developing-country Members and to address them urgently.

Thus, it is important to find more constructive ways of helping developing-country Members to overcome their constraints without weakening legitimate SPS measures or watering down the disciplines of the *SPS Agreement*. The question therefore arises whether the second category of special rules for developing-country Members contained in the *SPS Agreement*, those on technical assistance, provides a more effective solution.

### **8. The need to turn technical assistance into capacity building**

As noted from the start of the analysis conducted in this book, technical assistance is not a magic bullet solution to all developing-country Members' concerns with regard to the obligations of the *SPS Agreement*. It certainly does not obviate the need for a rigorous analysis of substantive and procedural rules to ensure that they are appropriate for all Members as tools to achieve the agreed objectives of the Agreement. It also does not preclude the need to take seriously the provisions on SDT negotiated as a *quid pro quo* for the extensive obligations taken on by developing countries in the *SPS Agreement*.

Parts III and IV and Chapter 1 of Part V have examined these issues in detail. This examination has led to the conclusion that, in view of the delicate balance struck by the provisions of the *SPS Agreement* between trade and health, it is difficult to adjust those aspects of its substantive disciplines that create problems for developing-country Members without doing damage to its ability to meet its objectives. Similarly, there is limited scope for strengthening SDT in the *SPS Agreement*, beyond operationalising the current rules through interpretation or negotiated clarification. While very useful work has been done, and is continuing, by the SPS Committee in developing procedural guidelines to facilitate the implementation of certain provisions of the *SPS Agreement* of particular importance to less-developed Members, significant problems remain. Consequently, while far from being a panacea, technical assistance assumes a crucial role in addressing the very real problems that Members at lower levels of development face in implementing their obligations, and enforcing their rights under this Agreement.

In particular, technical assistance is needed to ensure that the regulatory disciplines of the *SPS Agreement* do not have the effect of forcing developing-country Members to divert resources from other areas of public spending which may be more crucial to their development needs, such as the provision of basic health and sanitation services. In addition, it is essential to address the fact that many legitimate SPS measures of importing Members present significant compliance problems for developing-country Members. The extent to which the rules on technical assistance in the *SPS Agreement* provide the means to effectively support developing-country Members' compliance efforts, was examined in Chapter 2 of Part V.

This examination showed that the current provisions on technical assistance in the *SPS Agreement* are loosely worded and difficult to enforce. As a result, the provision of SPS-related technical assistance leaves much to be desired. Discussions in the SPS Committee on ways to strengthen and operationalise the provisions on technical assistance in the *SPS*

*Agreement* have proved fruitless. In many cases this can be ascribed to the unrealistic nature of the proposals made, such as making the imposition of SPS requirements with adverse trade effects for developing-country Members conditional on granting cost-free technical assistance upon request. This would have enormous budgetary implications for importing Members, impossible to determine in advance, and would risk undermining their regulatory autonomy. Nevertheless, the concerns underlying these proposals cannot be discounted. The experience of developing-country Members with the voluntary provision of technical assistance has been disheartening. It is therefore not surprising that they are seeking real commitments from their developed trading partners in the area of technical assistance.

The discussion of illustrative examples of technical assistance initiatives currently in place highlighted the insufficiencies of the current approach, which is fragmented and lacking in coherence. Bilateral technical assistance tends to reflect donor interests and areas of concern, resulting in a disregard for the priorities of beneficiaries. Recent efforts to develop tools to assist developing countries to identify their own capacity needs are useful, but must be coupled with the appropriate response to ensure that the project truly builds capacity in the beneficiary in a sustainable manner. Currently, political considerations rather than objective criteria determine which technical assistance projects are supported by donors. The lack of predictability resulting from the voluntary nature of assistance provided currently makes long-term planning difficult.

Multilateral efforts are characterised by inefficiencies and overlaps. The limited mandate of some organisations in the area of technical assistance means that additional efforts in the area of technical assistance result in widening its reach but not deepening its impact. Concerted efforts are needed not only in the areas of training and funding of participation in SPS-related fora, but also in respect of building technical and scientific capacity and infrastructure. Without the latter, participation will not bring the desired results.

The Standards and Trade Development Facility (STDF) represents an important step forward in coordinating the plethora of technical assistance initiatives. It creates a cooperative framework of partners with a wide range of high-level technical expertise and significant financial resources. In addition, making use of complementarities with needs-assessment mechanisms (such as those in the Integrated Framework for Trade-Related Technical Assistance to Least-Developed Countries and the Joint Integrated Technical Assistance Programme for selected least-developed and other African countries), the STDF ensures that the priorities and capacity needs of beneficiary countries are an integral part of the framing of a project. Consequently, it is in a position to provide needs-driven and expert assistance. The STDF's new approach is to reduce its focus on actually funding projects and turn its attention to the coordination aspect of its mandate. It aims to use its project preparation grants to facilitate the securing of funds and assistance from its partner institutions and other donors. This may indeed be a more efficient use of its unique capacities to promote coordination in technical assistance. It is to be hoped that the work of the STDF will fulfil the potential it has for turning *ad hoc* technical assistance projects into coherent and needs-driven capacity building programmes in developing countries. However, the unwillingness of donors to make multi-year commitments to funding the STDF results in budgetary unpredictability and the inability to undertake long term projects.

It is argued here that an important part of the solution to the problems that less-developed Members face in implementing their obligations and enforcing their rights under the *SPS Agreement*, lies in a new, more effective approach to SPS-related technical assistance that reflects the current conception of ‘capacity building’. In other words, what is needed is effective, predictable and needs-driven assistance that creates capacity in a sustainable manner. While this is unlikely to happen at bilateral level, where the interests and limited resources of donors lead to *ad hoc* projects, multilateral cooperative initiatives such as the STDF show promise. However, real commitments must be made to fund the provision of such assistance in a predictable and sustainable manner. The acceptability of binding commitments towards financing a new technical assistance mechanism, will in turn depend on the willingness of developing-country Members to accept differentiation across levels of development, reflecting differences in regulatory capacity and dependence on agricultural exports. This would mirror the reality of development, which occurs along a continuum.

## 9. Concluding remarks

This book examined the ‘development dimension’ of the *SPS Agreement* by evaluating the impact of the disciplines used in this Agreement on WTO Members at lower levels of development. In particular, it assessed whether the *balance* achieved by these disciplines between the often competing goals of trade liberalisation and health protection is ‘appropriate’ for less-developed Members in the sense that it effectively increases their market access opportunities while leaving these Members sufficient policy space for SPS regulation. The analysis conducted to address this question in Parts I to V of this book gave rise to the following conclusions.

The globalisation of trade, including the growth in the participation of less-developed countries, has brought with it increased threats of international spread of risks to human, animal and plant life and health. Acting on the interface between the parallel processes of the globalisation of trade and the globalisation of health, the *SPS Agreement* is best seen as a negotiated instrument embodying new ways to mediate the trade/health conflict. The normative framework provided by the emerging ‘right to development’ establishes the importance of ensuring that, in doing so, the *SPS Agreement* promotes agri-food trade without endangering the protection of health.

The question whether this objective is achieved cannot be answered with easy generalisations regarding the impact of the *SPS Agreement* on market access and regulatory autonomy in developing-country Members. A factual examination of the SPS regulatory systems of selected WTO Members at different income levels, and with different trade and health priorities, makes clear that any analysis of the impact of the *SPS Agreement* on developing-country Members must be informed by a realisation of the heterogeneity of this group. A similar conclusion flows from a factual examination of the institutions and procedures through which the international standards used as benchmarks in the *SPS Agreement* are developed, and the participation of Members at different income levels therein. Consequently, while specific difficulties can be identified as deriving from the level of development of certain Members, linked to their SPS regulatory capacity and

their financial and technical constraints, these difficulties do not affect all developing-country Members or not all to the same extent.

With this *caveat* in mind, the legal analysis of those substantive provisions of the *SPS Agreement* that discipline the way in which WTO Members exercise their SPS regulatory autonomy leads to two main conclusions. First, although these disciplines reflect a regulatory model currently not achievable for many less-developed Members, the solution to this problem does not seem to lie in weakening the rules. To do so would skew the delicate trade/health balance in the *SPS Agreement*, to the detriment of *all* Members. Second, the opportunities that do present themselves to ameliorate the difficulties with the relevant substantive disciplines faced by various Members at lower levels of development seem to lie most often in addressing the problems of interpretation and application of these rules in dispute settlement. Most importantly, it is recommended that panels, in interpreting the *SPS Agreement*, relinquish their heavy reliance on science as a seemingly objective and universal touchstone for distinguishing SPS protection from trade protectionism, and their accompanying intrusive approach to the review of the scientific basis for Members' SPS measures. Instead, it is suggested that panels would do better to recognise the normative basis for interpretation of the *SPS Agreement* provided by international human rights law, on which they can rely to enhance the legitimacy of their decisions. This may make panels more inclined to use the flexibilities inherent in disciplines of the *SPS Agreement* in order to achieve the trade/health balance aimed at by the Agreement in a manner more appropriate to the capacities of less-developed Members.

Greater opportunities for enhancing the benefits of the *SPS Agreement* for less-developed Members, while reducing its costs, arise from the institutional and procedural rules contained in the Agreement and those developed by the SPS Committee to operationalise its provisions. These procedural arrangements address several of the implementation problems faced by many less-developed Members, yet do so without undermining the trade/health balance achieved by the relevant substantive disciplines. Great strides have been taken in this regard by the SPS Committee and this work is continuing. Yet many hurdles remain to the full realisation of the potential benefits of the *SPS Agreement* by Members at lower levels of development. These hurdles are rooted in the capacity constraints of these Members, which limit their ability to enforce their rights and comply with their obligations under the Agreement.

The special provisions in the *SPS Agreement* that aim to take account of developing-country constraints, namely the rules on SDT and those on technical assistance leave much to be desired. Both their weak terms and the ineffectual interpretation given to them in dispute settlement have contributed to the disappointing implementation of these provisions to date. In the case of the SDT provisions, the possibilities for strengthening them through negotiated revisions or interpretation are clearly limited by the need to avoid skewing the trade/health balance of the *SPS Agreement*. Consequently, SDT is an inadequate instrument to resolve the problems that developing countries face. Instead, technical assistance takes on greater importance as a tool to help developing-country Members overcome their constraints. What is needed is a new, more effective approach to SPS-related assistance that is more in line with the current understanding of 'capacity building', which refers to a mechanism for effective, predictable and needs-driven assistance that creates

capacity in a sustainable manner. Here the academic community can play an essential role in identifying the necessary conditions for such a mechanism.

## Summary

### Introduction

The link between free trade and measures for the protection of health is not new, but has been recognised since the commencement of trading activities between newly emerged city-states in the fourteenth century. Today, however, the proliferation of health measures, on the one hand, and the great advancements in trade liberalisation, on the other, mean that the interaction between these two policy areas has assumed critical importance.

The exponential increase in the speed and volume of trade and in the diversity of traded products in the last fifty years, and the accompanying proliferation of health risks and SPS measures, has meant that the international trade regime, currently embodied in the rules of the World Trade Organisation (WTO), has had to find new ways of mediating the conflict between free trade and health protection. Acting on the interface of globalised trade and globalised health risks, is the WTO's *Agreement on the Application of Sanitary and Phytosanitary Measures (SPS Agreement)*. It reflects a negotiated balance between the competing goals of the liberalisation of trade in the food and agricultural sector and the protection of health by national governments.

Developing-country Members of the WTO have a significant interest in the way in which these two competing societal aims are balanced in the *SPS Agreement*. On one side, as agricultural products often form an important part of the merchandise export trade of developing-country Members, they are concerned with gaining market access in this sector in order to earn the foreign revenue necessary to meet their development needs. Hard-won achievements in liberalising trade in agricultural products can easily be undermined by the misuse of SPS measures for protectionist purposes. Developing-country Members thus depend on effective disciplines in international trade rules to prevent this. On the other side, one should not forget the fact that developing-country Members are also important importers of food and agricultural products, and face sanitary and phytosanitary risks from imported products. In this respect, they have an interest in being allowed sufficient flexibility by international trade rules to enact SPS regulations appropriate to their needs and capabilities. It is therefore important to recognise that the interests balanced in the *SPS Agreement* are those of conflicting societal goals of importance to both developed and developing-country Members, rather than competing developed and developing country interests. Nevertheless, the mechanisms used to achieve this balance in the *SPS Agreement* may have a disparate impact on Members at different levels of development.

This book analyses the implications of the rules of the *SPS Agreement* for WTO Members at different levels of development. More specifically, it evaluates the tools used by the *SPS Agreement* to achieve a balance between the often competing goals of trade liberalisation and health protection from the perspective of Members at lower levels of development. In doing so, it elucidates what can be seen as the 'development dimension' of the *SPS Agreement*. The 'development dimension' of this Agreement can be seen as composed of two distinct, but interrelated elements, which are determinative for the impact of the *SPS Agreement* on the trade and health interests of Members at different levels of development. These two complementary elements are: (1) the limits of policy space

defined by the general disciplines of the *SPS Agreement*, and their effect on developing-country Members as agri-food exporters and SPS regulators; and (2) special treatment for developing-country Members in the *SPS Agreement*.

## **1. The SPS Agreement on the interface between globalised trade and globalised health**

Understanding the impact of the disciplines used in the *SPS Agreement* to achieve a balance between trade and health objectives on Members at different levels of development necessitates a grasp of the context within which this Agreement functions. This context encompasses the twin processes of the globalisation of trade and the globalisation of health. Therefore, Part I of this book provides the background necessary for a full understanding of the research problem, and the development focus adopted therein, by examining the parallel processes of globalisation in the area of trade and in the area of health, in order to situate the *SPS Agreement* in this context.

It does so firstly by examining, in Chapter 1, the changing role of developing countries in the world trading system to determine why an examination of the development dimension of international trade rules, and more specifically on the *SPS Agreement*, is urgently needed. The progressive integration of developing countries into the trading system is referred to as the *globalisation of trade* for purposes of this book. This process has to be seen in the normative framework provided by the emerging recognition of the ‘right to development’. This framework serves to establish, on the one hand, the importance of trade as an engine for economic growth in the service of development and the responsibility of the international community to create favourable conditions to facilitate this growth. On the other hand, the right to development clarifies that development is more than economic growth. Instead, development entails the progressive realisation of all human rights. This means that mechanisms to promote development, including through trade liberalisation, may not come at the cost of other human rights such as the right to life, health and safe food. Consequently, the *SPS Agreement*, which plays an important role in liberalising agricultural trade, cannot achieve its trade objectives through disciplines that would undermine the ability of Members to protect life and health in their territories.

Secondly, Chapter 2 of Part I sketches the historical developments relating to the recognition of the *globalisation of health* in the face of transboundary health risks and the initiatives for international cooperation in this regard. The globalisation of trade has brought with it the international spread of threats to human, animal and plant life and health. The evolution in the strategies to deal with this problem has been determined to some extent by developments in scientific understandings of risk. Science has formed the basis both for common understandings that support international cooperation, and for national strategies to mitigate risk. The failure of purely national approaches as well as international regulatory approaches to provide an effective strategy in the face of globalised risk, has led to a new, multifaceted approach to risk management. This involves both national and international initiatives in both public and private arenas. These complex governance structures for the protection against SPS risk form the backdrop for the operation of the *SPS Agreement*. Acknowledging the achievements made on international level in setting

voluntary harmonised standards, the *SPS Agreement* incorporates these standards into its rules, while allowing for deviation. Reflecting the view of science as a neutral and universally valid benchmark for SPS regulation that prevailed at the time of its negotiation, the *SPS Agreement* requires scientific justification for non-harmonised measures.

The dual aspects of the process of globalisation discussed in Chapters 1 and 2 are brought together, and related to the core theme of this book, in Chapter 3 of Part I by means of an examination of the importance for developing country trade of regulations and standards imposed to address globalised health risks. The proliferation of SPS requirements to mitigate risks from traded products has important implications for trade in the agri-food sector, particularly for countries at lower levels of development. These countries are often largely dependent on agricultural exports for their foreign revenue earnings. Hard-won gains in the liberalisation of agricultural trade achieved through rules on traditional trade barriers can be undermined by the trade restrictive effects of SPS measures. As these measures predominate in the areas of high-value fresh produce and processed food products, the possibilities for developing countries to diversify their exports to these lucrative markets are greatly restricted. While many SPS measures are legitimate efforts to address health risks, they may be more trade restrictive than is necessary to achieve their objectives. In addition, the danger exists that SPS measures may be misused for protectionist purposes.

The *SPS Agreement* acts to address this problem. Situated on the interface of globalised trade and globalised health, this Agreement aims to balance the often conflicting goals of trade liberalisation and health protection. The mechanisms it uses to do so are a reflection of the historical developments outlined above.

## **2. National and international SPS regulation and standard setting**

The evaluation of the ‘development dimension’ of the *SPS Agreement* conducted in this book is fully cognisant of the fact that developing-country Members are not a monolithic group. Instead, development takes place on a continuum, along which there may be great divergences in economic resources, regulatory capacity, export interests and health status. All these factors play a role in determining the impact of the *SPS Agreement* on particular Members, and the question of how workable its rules are for the relevant Member. An analysis of the implications of the *SPS Agreement* for developing-country Members must therefore take into account these divergences.

In order to do so, Part II of this book examines the factual context for the operation of the *SPS Agreement* as embodied in national and international systems for SPS regulation and standard setting, with a particular focus on the impact of differences in levels of development of Members for the functioning of these systems.

Chapter 1 of Part II introduces SPS regulation by addressing specific issues that are necessary to grasp for a full understanding of the thesis of this book. It starts by setting out the normative framework within which SPS regulation occurs, as reflected in international human rights law. Then, in order to facilitate understanding of the role played by the level of development of a country in its regulatory choices, this Chapter undertakes a

brief law-and-economics analysis of SPS regulation. This analysis highlights the divergent costs and benefits of SPS regulation for countries at different levels of development. Finally, Chapter 1 sets out the role and limits of science in the SPS regulatory process. This theoretical discussion sets the stage for the factual analysis conducted in the following Chapters of Part II.

Chapter 2 of Part II examines the great differences in national SPS systems by means of four illustrative examples of WTO Members in different income categories and in different geographical regions, namely Australia, Mauritius, Jamaica and Bangladesh. These examples show that while vast differences exist in SPS regulatory systems between developed and developing countries, there are also significant differences *among* developing-country Members. Clearly, some developing countries have been more successful than others in upgrading their SPS systems and securing access to the markets of their trading partners. Nevertheless, two general conclusions can be drawn regarding differences in SPS regimes according to level of development. First, the *level* of SPS protection exhibits marked differences, being substantially higher in more developed countries due to better technological capacity, higher consumer demands, and more developed regulatory infrastructure. Second, the *regulatory focus* differs. Less developed countries tend to rely on product requirements, which are enforced by means of testing and inspections by government authorities at the point of exit or entry. Product requirements are usually easier to comply with as they leave the means of compliance up to the producer and are typically based on objective, testable properties that can be more readily ascertained. By contrast, developed countries are increasingly, especially in the area of food safety, moving towards *process* requirements, such as those embodied in the Hazard Analysis and Critical Control Point (HACCP) system. Process requirements oblige the producers themselves to take responsibility for ensuring that the entire production chain, ‘from farm to fork’ meets certain standards of hygiene and safety. These process requirements entail a systems-wide approach to SPS issues, which necessitates significant technical expertise, supporting infrastructure and control systems.

These differences in SPS regimes have notable consequences for the impact both of SPS measures themselves and of the *SPS Agreement* on Members at different levels of development. The illustrative case studies provided identify, by means of the discussion of practical examples, various problems faced by developing-country Members in complying with SPS measures in developed-country markets. These problems reflect the fact that the difficulty and costs of compliance are directly related to the extent of the gap between the existing domestic SPS regime and the SPS requirements in foreign markets. Several factors play a role here, such as weak domestic SPS regulation, inadequate public infrastructure, unreliable compliance assessment and certification, insufficient dissemination of information on SPS requirements abroad, and poor laboratory equipment and staff. However, it would be an over-generalisation to state that middle- and low-income Members are entirely incapable of meeting SPS requirements on their export markets, or of upgrading their SPS systems to protect their territories from SPS risks. Examples are provided in Chapter 2 of success stories in this respect. It is, nevertheless, important to note the central role played by technical and financial support from the importing Member in some of these situations. This puts those Members that face capacity constraints in the area of SPS regulation in a very dependent position.

The differences in the legal and institutional capacity for SPS regulation between Members at different levels of development, illustrated by the selected Members used as examples in Chapter 2, have a bearing on the way in which the *SPS Agreement* impacts on them. These examples of divergent SPS regulatory systems therefore provide the factual context for the later discussion of the provisions of the *SPS Agreement*.

The factual context within which the *SPS Agreement* operates also includes *international* systems for the elaboration of SPS standards. These are discussed in Chapter 3 of Part II. Divergence in national SPS regulations is an impediment to trade as it reduces the possibilities to exploit economies of scale. Therefore harmonisation around international standards is promoted by free trade regimes, including by the WTO in the *SPS Agreement*. However, internationally-set standards cannot mirror the diversity of circumstances in countries around the world. Instead, they reflect a compromise position accepted by the delegates of the countries present and active in the standard-setting process, and developed according to the procedures of the relevant standardising body. An examination of the institutional structure and standard-setting procedures of the international bodies referenced in the *SPS Agreement* shows that they are such that the participation of developing-country Members is limited. This is due to the fact that the structures and procedures do not sufficiently take into account the resource and capacity constraints of countries at lower levels of development. While improvements have been made in this situation in recent years, developing-country Members still tend to be most widely represented in *plenary* sessions of the relevant standard-setting bodies, where standards are initiated and adopted. However, their participation in technical committees where scientific evidence is discussed and standards are prepared, and even more so in the scientific bodies that conduct the risk assessments on which standards are based, often leaves much to be desired. This is a significant problem as it is at this technical level that participation can be most effective. This inadequate participation is often due to the lack of human and financial resources necessary to ensure attendance of the plethora of committee meetings by well-prepared specialists in the areas in which standards are set. In addition, the lack of effective national infrastructures for the evaluation of draft standards, the collection of information from national stakeholders and the formulation of positions is identified as a problem.

International standard-setting is therefore dominated by developed-country Members, resulting in standards that are often not appropriate for Members at lower levels of development. This is problematic as the latter Members depend most on international standards as a basis for national regulation. More work is needed, not only in the form of simplification and improvement of the standard-setting procedures of the relevant bodies, but also in the form of efforts to build the capacity of Members at lower levels of development to participate effectively in these procedures. Here, once again, technical assistance has an important role to play.

The factual context provided by an examination of national SPS regulation and international SPS standard setting in Part II shows the great need for technical assistance of developing-country Members in order to build SPS capacity. However, there is a danger in seeing technical assistance as a magic bullet solution, assuming that developing-country Members can and should meet any SPS-related obligation as long as they are provided with technical assistance to do so. Technical assistance is not an alternative to

analysing whether the disciplines of the *SPS Agreement* are appropriate for developing-country Members to implement. It can address some of the costs of implementation, but cannot take away the long term disadvantages of the application of inappropriate disciplines. Consequently, it is essential to begin by assessing whether the substantive rules and procedural mechanisms of the *SPS Agreement* are appropriate for developing-country Members. This is the aim of the detailed examination conducted in Parts III and IV of this book.

### **3. The rules balancing trade and health in the SPS Agreement**

Several of the substantive obligations of the *SPS Agreement* aim to set the limits of the policy space left to Members in the area of SPS regulation, by combining the traditional trade disciplines found in the GATT 1994 with new scientific disciplines and by encouraging harmonisation. These disciplines together function as a filter, to distinguish measures legitimately aimed at health protection from measures that are a disguised form of protectionism. In this way, the *SPS Agreement* tries to balance the often competing interests of trade liberalisation and health protection.

The question arises whether the substantive rules in the *SPS Agreement* that aim to achieve this balance are appropriate for Members at lower levels of development. The criteria used to answer this question are those set out in the Introduction to this book, namely whether the relevant rules effectively increase market access opportunities for WTO Members at lower levels of development; and whether they leave these Members sufficient policy space for SPS regulation. Viewed in the light of the normative framework provided by the concept of the ‘right to development’, set out in Part I, the importance of assessing the ability of the *SPS Agreement* to promote agri-food trade without endangering the protection of health in less developed Members is evident. Herein lies the development dimension of the *SPS Agreement*.

It is apparent from the overview of the negotiating history set out in Chapter 1 of Part III that the regulatory model embodied in the substantive disciplines of the *SPS Agreement* is that to be found in the proposals of the most active participants in the negotiations, namely key developed-country Members and the Cairns Group. The Agreement closely reflects best regulatory practices in developed-country Members. While the ideal of improving the practice of SPS regulation among Members through such best-practice disciplines is, in itself, laudatory, there is a danger that a model of regulatory practice that is unworkable for less-developed Members has been created.

The examination, in Chapters 2 to 5 of Part III, of the relevant substantive disciplines of the *SPS Agreement* that define the limits of policy space available to Members for SPS regulation leads to two related conclusions. The first is that the balancing objective of the *SPS Agreement* is unmistakably reflected in the way in which these substantive provisions are framed. While there are aspects of the interpretation of these provisions that do not fully give effect to the careful balance embodied in their terms, and leave room for improvement, the provisions themselves seem appropriate to address the sensitive trade/health conflict in a way that promotes the liberalisation of agri-food trade while

respecting the right of Members to regulate against SPS risks. However, the second conclusion that is evident from the discussion of the relevant substantive rules of the *SPS Agreement* is that these rules impose a regulatory model that is currently not achievable for many Members at lower levels of development. Neither are these Members able to use these substantive rules effectively to procure market access for their products.

The fact that most Members at lower levels of development have not been challenged in dispute settlement proceedings under the *SPS Agreement* to date, should not create the impression that their inability to comply with some of the disciplines of the *SPS Agreement* has no real consequences for them. Many instances of non-compliance by these Members with the regulatory obligations of the Agreement *have* been challenged in the multilateral forum of the SPS Committee, or in bilateral discussions between Members. In these situations, it is often difficult for the regulating Member to justify its measure, other than to refer to its capacity constraints. This leaves less-developed Members vulnerable to pressure by other Members to settle other SPS conflicts in ways unfavourable to them.

Aside from the particular aspects of the interpretation of the substantive rules of the *SPS Agreement*, identified throughout Part III, that leave scope for improvement, it is difficult to see how changes can be made to address developing-country constraints without skewing the careful balance sought by the Agreement. The rules themselves seem appropriate for the fulfilment of their function of allowing sufficient room for Members to regulate in a manner that gives effect to their policy priorities in the area of SPS risk, while disciplining such regulation to eliminate the possibilities for disguised protectionism and to reduce the adverse trade effects of legitimate measures. Nevertheless, the very real problem of the constraints that less-developed Members face in complying with, and benefiting from, these rules cannot be disregarded.

The question arises to what extent provisions of the *SPS Agreement* other than those discussed above ameliorate this problem by taking account of the capacity constraints of Members at lower levels of development, both in respect of compliance with the disciplines of the Agreement and in respect of enforcement of these disciplines against other Members in order to gain market access. This question is addressed in Parts IV and V of this book.

#### **4. Procedural and institutional mechanisms under the SPS Agreement**

Alone, the substantive disciplines of the *SPS Agreement* discussed above would not be sufficient to achieve significant gains in market access for food and agricultural products from developing-country Members. These Members lack the scientific and technical capacity to identify instances of non-compliance with the complex regulatory disciplines of the *SPS Agreement*, and to formulate effective challenges in this regard. In addition, many legitimate SPS regulations that pass muster under the relevant substantive disciplines of the *SPS Agreement* nevertheless form significant trade barriers. This is particularly so for Members that face capacity constraints in keeping track of new and changed measures, understanding their implications and proving their compliance with SPS requirements (including by demonstrating the equivalence of their own SPS requirements, or by gaining

recognition of the pest- or disease-free status of their territories or of regions within their territories). Additionally, substantive disciplines on their own are not useful without effective tools to monitor their implementation, resolve conflicts between Members with regard to these disciplines and, if necessary, enforce compliance therewith. The rules of the *SPS Agreement* that address these institutional and procedural matters are discussed in Part IV. These institutional and procedural provisions have an important impact on the effectiveness of the *SPS Agreement* in achieving its goals.

First, Chapter 1 of Part IV discusses those provisions in the *SPS Agreement* under which mechanisms creating disciplines of an institutional or procedural nature on Members are established. These institutional or procedural disciplines leave undisturbed Members' policy choices within the bounds of the relevant substantive disciplines of the Agreement, but address the way in which these policies are achieved in order to minimise as far as possible their trade-restrictive effects. Often the procedural obligations in the *SPS Agreement* are combined with a substantive discipline, yet it is the procedural mechanism under the provision that is key to its potential in improving market access. It is useful to note that national procedures may be abused to prevent the achievement of the goals of the relevant substantive disciplines, thereby undermining the trade/health balance of the Agreement. In other words, in many cases it is not *what* is done but the *way* in which it is done that creates problems. These problems may be especially burdensome for Members at lower levels of development, due to their lack of resources to devote to compliance with complex procedural requirements on their export markets.

The *SPS Agreement* contains some rules dealing directly with procedures imposed by Members to check compliance with their SPS measures. These are contained in Article 8 and Annex C, which address control, inspection and approval procedures. The additional procedural mechanisms under the *SPS Agreement* aim to operationalise certain of its substantive obligations. The substantive obligations on Members in respect of the recognition of equivalence; the adaptation of their SPS measures to regional conditions; and transparency in respect of their SPS measures would achieve little without procedural arrangements to give them effect. Yet, the procedural aspects of the provisions on these matters in the *SPS Agreement*, aside from the provisions on transparency, are extremely weak. This has led to very poor implementation of the obligations on equivalence and regionalisation, rendering ineffective these provisions despite the significant potential they hold for market access improvements.

In order to realise the potential of the obligations on transparency, the recognition of equivalence and adaptation to regional conditions, the SPS Committee has adopted decisions setting out detailed procedural mechanisms. These decisions do not amend the substantive obligations, but instead provide guidelines for their effective implementation. Developed on the basis of concrete information provided by Members regarding their experiences in the relevant areas, and elaborated in technical discussions among SPS regulatory officials, these procedures illustrate the ability of the SPS Committee to find cooperative solutions to implementation problems.

A second category of procedural and institutional mechanisms, discussed in Chapter 2 of Part IV, covers those provisions in the *SPS Agreement* that deal with the institutions and procedures necessary at WTO level for the smooth and effective implementation of

the *SPS Agreement*. The proper implementation and operation of the *SPS Agreement* is ensured through two institutional and procedural avenues, that provided by the bargaining forum of the SPS Committee and that provided by the adjudicatory mechanism of the dispute settlement system. The provisions relating to the SPS Committee and to dispute settlement are essential in promoting and monitoring the implementation of the disciplines of the *SPS Agreement*, resolving conflicts between Members with regard to these disciplines and, if necessary, enforcing compliance therewith.

The question of whether Members' trade concerns with respect to the SPS measures of other Members are dealt with through multilateral discussions at SPS Committee meetings or instead through formal adjudication is not without significance. It is highly relevant for the manner in which the trade/health balance is struck, which is closely tied to the questions of who participates in framing the issues under discussion and who decides on the outcome of the dispute. These questions are particularly pertinent when one bears in mind the differences in opportunities for effective participation available to Members at different levels of development under each of the two mechanisms. The discussion in Part IV makes clear that, currently, alternative mechanisms to dispute settlement represent the best way forward in ensuring that developing-country Members benefit as fully as possible from the benefits offered by the disciplines of the *SPS Agreement*.

In particular, the discussion of the role and functioning of the SPS Committee shows much greater possibilities for participation of Members at lower levels of development than exist currently in the dispute settlement system. The specific trade concern mechanism of the SPS Committee has proved very effective in providing opportunities for Members to address the problems they face regarding the SPS measures of their trading partners in an inexpensive and constructive way. Most often, bilateral discussions on trade concerns placed on the agenda are held in the margins of SPS Committee meetings, and may resolve the matter. If not, discussions are held in the multilateral forum of the SPS Committee, which gives publicity to the trade concern, enables other Members to comment on the issue and support the trade concern raised. This could lead to the revision of the notified measure or to further bilateral consultations between the Members involved. It may also facilitate compliance with the SPS measure complained of by the Member raising the concern, through increased clarity on the requirements and ways to meet them, and in some cases by means of the provision of technical or financial assistance by the importing Member. In this way disputes can be resolved without recourse to the expensive, time-consuming and confrontational process of formal dispute settlement.

The SPS Committee not only affords Members with a forum for the discussion and resolution of specific trade concerns, but it also promotes regulatory learning and creates possibilities for building professional networks. It provides a mechanism for the monitoring of harmonisation that allows concerns regarding the lack of international standards or problems with existing standards to be raised and forwarded to the relevant international standard setting body. In addition, it plays a crucial role in addressing broader SPS concerns by promoting the implementation of particular disciplines in the *SPS Agreement* through developing and adopting non-binding procedural guidelines. The disciplines addressed, such as those on equivalence, adaptation to regional conditions, special and differential treatment and transparency, are particularly important for developing-country Members, as discussed above, in that they hold great potential for market access gains

while fully respecting the level of protection chosen by importing Members. The inclusive nature of the process leading up to the elaboration of these procedural guidelines, based on the collection of practical experiences of Members with the issue under discussion and discussions in formal and informal sessions of the Committee, is crucial to the value of the resulting guidelines. In addition, the practice of *ad referendum* decision-making of the SPS Committee is to be applauded for its effort to ensure the broadest participation possible, including by Members who are unable to attend the meeting where the guidelines are adopted.

Attendance and effective participation by Members at different levels of development in meetings of the SPS Committee varies greatly. As illustrated by the four Members used as examples in this book, high-income Members tend to participate actively and effectively in SPS Committee meetings and are represented by experts from their relevant ministries. However, many Members at lower levels of development do not have the resources to send an SPS official from their capitals, and are represented in meetings of the SPS Committee by diplomats from their missions in Geneva, lacking in the necessary technical knowledge. There are also some Members that are unable to send any representative to most SPS Committee meetings. This diminishes the potential of the SPS Committee to be a mechanism through which less-developed Members can resolve their trade concerns.

The dispute settlement mechanism of the WTO, through which non-compliance with the obligations of the *SPS Agreement* can be challenged by Members, is a great improvement above that existing under the GATT 1947. While a very small proportion of the SPS-related conflicts between Members result in the initiation of WTO dispute settlement proceedings, and even fewer actually proceed to adjudication, the importance of the dispute settlement system to SPS disputes should not be underestimated. The very existence of the dispute settlement system creates an incentive for Members against whose SPS measures concerns are raised to address these concerns through negotiated solutions. In addition, the clarifications developed by panels and the Appellate Body with regard to the provisions of the *SPS Agreement* are essential in establishing the legal framework within which Members address their SPS conflicts. These clarifications are taken up in decisions of the SPS Committee that elaborate procedural guidelines for the operationalisation of provisions of the *SPS Agreement*. Equally importantly, they inform discussions between Members, bilaterally but even more so in the multilateral forum of the SPS Committee, to resolve trade concerns. These have been referred to as ‘settlements negotiated in law’s shadow’.

The relatively weak participation in the dispute settlement system by Members at lower levels of development with respect to SPS issues attests to the high political and financial costs of dispute settlement for these Members and the limited chance of success they foresee. Constraints to effective participation arise in respect of both bringing an SPS dispute and mounting a successful defence in case of a challenge under the *SPS Agreement*. On the one hand, many developing-country Members may not have the resources to gather the scientific information necessary to bring a challenge under the *SPS Agreement*, in order to make a *prima facie* case of violation. On the other hand, the difficulties they face in complying with the regulatory disciplines of the Agreement mean that these Members are unlikely to be able to defend their SPS measures in case they are faced with a challenge. High-income Members have experienced serious difficulties in this regard in the

SPS disputes heard thus far. For less-developed Members the hurdle seems almost insurmountable. These Members may not have the resources to commission the necessary research and will therefore depend on the chance that there are already existing studies of relevance. The Advisory Center on WTO Law is a welcome development in providing much-needed assistance for developing-country Members' participation in WTO dispute settlement. However, without concerted efforts to build SPS capacity in developing countries, these Members are unlikely to overcome the remaining hurdles to effective participation in dispute settlement and thereby to influence the normative framework within which negotiations to address SPS issues occur.

Aside from the problems of participation, another aspect of the dispute settlement process that deserves special attention is that of the standard of review applied by the adjudicatory bodies. The standard of review in dispute settlement proceedings plays a significant role in the allocation of the authority to make policy choices balancing competing trade and health interests. It determines the extent to which the WTO adjudicatory bodies are entitled to interfere in Members' regulatory determinations. Currently, while panels customarily state that they will not conduct their own risk assessment or impose a particular scientific view on the regulating Member in reviewing the scientific evidence before them, in practice this is increasingly what they do. It is proposed in this book that a panel should limit its examination of the scientific evidence to the question whether the regulatory disciplines of the *SPS Agreement*, including the requirement that an SPS measure is based on a risk assessment as defined in the Agreement, have been complied with. It should stop short of completely reassessing the scientific evidence itself to determine the existence and extent of a risk. Such a limited review ensures that the regulating Member respects the balance struck in the rules of the *SPS Agreement* between its health concerns and the trade interests of other Members, but the review does not intrude too far into the regulatory competence of a Member by interfering unduly in its assessment of scientific evidence. This would make room for the diversity of priorities, consumer preferences and regulatory capacity that exists between Members at different levels of development to be reflected in the science policy choices incorporated into national risk assessments. This type of review would also reduce the disadvantage at which Members that lack scientific capacity find themselves in challenging or defending measures under the *SPS Agreement*. The current intrusive approach may skew the outcome of judicial review in favour of developed-country Members that have the resources to bring convincing scientific evidence and persuasive legal arguments in support of their positions.

It has been argued that the 'normative vacuum' in which the *SPS Agreement* is currently interpreted has led to the strong focus on science, and the concomitant heavy reliance on the opinions of panel experts in assessing the science, by panels in reviewing the SPS measures of Members. Science is seen as providing a neutral and universal benchmark against which SPS measures can be tested to distinguish SPS protection from disguised protectionism. It is submitted here that consideration of the international law context within which the *SPS Agreement* functions, in particular international human rights norms relating to the rights to life, health, safe food and development, in addressing the rights and obligations laid down in the *SPS Agreement* is essential. It could operate to provide the urgently needed normative framework to guide WTO adjudicators in striking a more appropriate balance between the competing goals of trade liberalisation and

health protection. The recognition of this normative basis for interpretation, on which they can rely to enhance the legitimacy of their decisions, may make panels less inclined to continue their current intrusive approach to the review of the scientific basis for Member's SPS measures. It may also make them more willing to use the flexibilities in the *SPS Agreement* to allow for the consideration of developing-country Members' constraints in the application of the scientific disciplines on regulation, to ensure that the *SPS Agreement* does not operate to undermine the protection of health in these Members.

## 5. Special provisions for developing countries in the SPS Agreement

WTO agreements creating disciplines for behind-the-border regulatory regimes, such as the *SPS Agreement*, necessitate the recognition of differences in capacity of Members across different levels of development. As noted in Part I of this book, the expansion of trade rules beyond issues of tariffs and quotas into areas of regulatory activity, brings with it new problems. The ability of Members to comply with, and benefit from, such rules depends on their 'starting position.' In other words, the existing situation in a Member, such as the strength of its regulatory system, its infrastructure and its human and financial resources will affect the impact of regulatory disciplines on that Member, and its ability to use those disciplines against other Members to gain market access. It is therefore necessary to find ways to ensure that WTO agreements laying down regulatory disciplines, such as the *SPS Agreement*, are development friendly. To meet this objective, they should leave sufficient space for countries to pursue their development policies through national regulation, while at the same time create clear and workable rules that developing countries can use to gain market access. This difficult balance is not only achieved in the generally applicable substantive disciplines and procedural arrangements under the *SPS Agreement*, but is also contributed to by provisions providing special treatment for developing-country Members.

The extent to which the *SPS Agreement* addresses developing-country constraints, either through providing special flexibilities in the rules for developing-country Members or in the form of provisions on technical assistance to support developing-country Members' compliance efforts is examined in Chapters 1 and 2 of Part IV.

Chapter 1 looks at the special and differential treatment (SDT) provisions of the *SPS Agreement*. It establishes that, although implementation of SDT in the *SPS Agreement* has been disappointing to date, real possibilities exist for panels and the Appellate Body to take a more progressive approach than that adopted by the Panel in the *EC – Approval and Marketing of Biotech Products* dispute, to operationalise SDT provisions through effective treaty interpretation. These possibilities arguably allow for the recognition that several provisions contain enforceable obligations that give effect to the general policy of consideration for the special needs of developing countries, thereby ensuring that the negotiated rights enshrined in these provisions are not rendered illusory. The WTO adjudicatory bodies should shoulder their responsibility to apply the SDT provisions effectively, in the light of the circumstances of each case.

If Members recognise that most of the existing SDT provisions could be operationalised by effective treaty interpretation in dispute settlement proceedings, the basis for the current deadlock in the Doha Development Round negotiations to strengthen the SDT provisions in the *SPS Agreement* falls away. Members are then left with two options. They can leave the fleshing out of SDT provisions to panels and the Appellate Body, on a case-by-case basis as they are faced with claims such as that of Argentina in *EC – Approval and Marketing of Biotech Products*, or instead they can reach political agreement on the nature and extent of these obligations.

Nevertheless, the limits of SDT should not be forgotten. New or strengthened SDT provisions cannot be framed in a way that would undermine the careful balance between trade and health objectives that is the core purpose of the *SPS Agreement*. This would be the case both if Members were to be obliged to allow market access to developing-country products that do not meet their chosen level of protection, thus compromising these Members' policy autonomy in the area of SPS protection; and if the disciplines of the *SPS Agreement* were to be relaxed for developing-country Members allowing protectionist SPS measures taken by these Members to slip through. The need to avoid such undesirable results means that SDT, even if strengthened within these limits, will in many cases be an insufficient instrument to resolve the problems that developing countries face. Thus, technical assistance assumes greater importance as a tool to help developing-country Members overcome their constraints.

It is currently widely acknowledged that technical assistance is crucial for developing-country Members to be able to implement those WTO agreements requiring regulatory capacity and infrastructure, such as the *SPS Agreement*. Without such assistance, the costs of compliance with such agreements could outweigh the benefits from trade liberalisation gains. For this reason, secure, predictable and effective provision of technical and financial assistance is indispensable in the case of trade rules involving regulatory disciplines. The extent to which the technical assistance provisions in the *SPS Agreement* contribute to securing this result is examined in Chapter 2 of Part V.

The current provisions on technical assistance in the *SPS Agreement* are loosely worded and difficult to enforce. As a result, the provision of SPS-related technical assistance leaves much to be desired. Discussions on ways to strengthen these provisions have proved fruitless. In many cases this can be ascribed to the unrealistic nature of the proposals made, making the imposition of SPS requirements with adverse effects on developing-country Members' exports conditional on granting cost-free technical assistance upon request. This would have enormous budgetary implications, impossible to determine in advance, and would risk undermining the regulatory autonomy of importing Members. Nevertheless, the concerns underlying these proposals cannot be discounted. The experience of developing-country Members with the voluntary provision of technical assistance has been disheartening. It is therefore not surprising that they are seeking real commitments from their developed trading partners in the area of technical assistance.

An examination of a few illustrative examples of technical assistance initiatives in place shows that the current approach is fragmented and lacking in coherence. Bilateral technical assistance tends to reflect donor interests and areas of concern, resulting in a disregard for the priorities of beneficiaries. Recent efforts to develop tools to assist developing

countries to identify their capacity needs are useful, but must be coupled with the appropriate response to ensure that the project truly builds capacity in the beneficiary in a sustainable manner. Currently, political considerations rather than objective criteria determine which technical assistance projects are supported by donors. The lack of predictability resulting from the voluntary nature of assistance provided currently makes long-term planning difficult. Multilateral efforts are characterised by inefficiencies and overlaps. The limited mandate of some organisations in the area of technical assistance means that additional efforts in the area of technical assistance result in widening its reach but not deepening its impact. Concerted efforts are needed not only in the areas of training and funding of participation in SPS-related fora, but also in respect of building technical and scientific capacity and infrastructure. Without the latter, participation will not bring the desired results.

The Standards and Trade Development Facility (STDF) represents an important step forward in coordinating the plethora of technical assistance initiatives. It creates a cooperative framework of partners with a wide range of high-level technical expertise and significant financial resources. In addition, making use of complementarities with needs-assessment mechanisms, it ensures that the priorities and capacity needs of beneficiary countries are an integral part of the framing of a project. Consequently, it is in a position to provide needs-driven and expert assistance. The STDF's new approach is to reduce its focus on actually funding projects and turn its attention to the coordination aspect of its mandate. It aims to use its project preparation grants to facilitate the securing of funds and assistance from its partner institutions and other donors. This may indeed be a more efficient use of its unique capacities to promote coordination in technical assistance. It is to be hoped that the work of the STDF will fulfil the potential it has for turning *ad hoc* technical assistance projects into coherent and needs-driven capacity building programmes in developing countries. For this to occur, however, donors must show a new willingness to make multi-annual commitments to funding the STDF. Without such commitment, the lack of certainty regarding sustained funding makes the development of a long-term strategy difficult.

It is argued in this book that the answer lies in a new, more effective approach to SPS-related assistance that is more in line with the current understanding of 'capacity building'. In other words, what is needed is effective, predictable and needs-driven assistance that creates capacity in a sustainable manner. Real commitments must be made to the provision of such assistance. The acceptability of binding commitments towards financing a new technical assistance mechanism will, in turn, depend on the willingness of developing-country Members to accept differentiation across levels of development, reflecting differences in regulatory capacity and dependence on agricultural exports. This would mirror the reality of development, which is a continuum.

Innovative research is urgently needed to identify the necessary conditions for such a mechanism. While research in this area lies beyond the scope of this book and the expertise of its author, there is much room for useful contributions to thinking in this respect from other disciplines. Here an important input can be made by rigorous study, based on empirical research and economic analysis and taking into account the lessons of political science.

## Conclusion

This book examines the ‘development dimension’ of the *SPS Agreement* by evaluating the impact of the disciplines used in this Agreement on WTO Members at lower levels of development. In particular, it assesses whether the *balance* achieved by these disciplines between the often competing goals of trade liberalisation and health protection is ‘appropriate’ for less-developed Members in the sense that it effectively increases their market access opportunities while leaving these Members sufficient policy space for SPS regulation. The analysis conducted to address this question in Parts I to V gives rise to the following conclusions.

The globalisation of trade, including the growth in the participation of less-developed countries, has brought with it increased threats of international spread of risks to human, animal and plant life and health. Acting on the interface between the parallel processes of the globalisation of trade and the globalisation of health, the *SPS Agreement* is best seen as a negotiated instrument embodying new ways to mediate the trade/health conflict. The normative framework provided by the emerging ‘right to development’ establishes the importance of ensuring that, in doing so, the *SPS Agreement* promotes agri-food trade without endangering the protection of health.

The question whether this objective is achieved cannot be answered with easy generalisations regarding the impact of the *SPS Agreement* on market access and regulatory autonomy in developing-country Members. A factual examination of the SPS regulatory systems of selected WTO Members at different income levels, and with different trade and health priorities, makes clear that any analysis of the impact of the *SPS Agreement* on developing-country Members must be informed by a realisation of the heterogeneity of this group. A similar conclusion flows from a factual examination of the institutions and procedures through which the international standards used as benchmarks in the *SPS Agreement* are developed, and the participation of Members at different income levels therein. Consequently, while specific difficulties can be identified as deriving from the level of development of certain Members, linked to their SPS regulatory capacity and their financial and technical constraints, these difficulties do not affect all developing-country Members or not all to the same extent.

With this *caveat* in mind, the legal analysis of those substantive provisions of the *SPS Agreement* that discipline the way in which WTO Members exercise their SPS regulatory autonomy leads to two main conclusions. First, although these disciplines reflect a regulatory model currently not achievable for many less-developed Members, the solution to this problem does not seem to lie in weakening the rules. To do so would skew the delicate trade/health balance in the *SPS Agreement*, to the detriment of *all* Members. Second, the opportunities that do present themselves to ameliorate the difficulties with the relevant substantive disciplines faced by various Members at lower levels of development seem to lie most often in addressing the problems of interpretation and application of these rules in dispute settlement. Most importantly, it is recommended that panels, in interpreting the *SPS Agreement*, relinquish their heavy reliance on science as a seemingly objective and universal touchstone for distinguishing SPS protection from trade protectionism, and their accompanying intrusive approach to the review of the scientific basis for Members’ SPS measures. Instead, it is suggested that panels would do better

to recognise the normative basis for interpretation of the *SPS Agreement* provided by international human rights law, on which they can rely to enhance the legitimacy of their decisions. This may make panels more inclined to use the flexibilities inherent in disciplines of the *SPS Agreement* in order to achieve the trade/health balance aimed at by the Agreement in a manner more appropriate to the capacities of less-developed Members.

Greater opportunities for enhancing the benefits of the *SPS Agreement* for less-developed Members, while reducing its costs, arise from the institutional and procedural rules contained in the Agreement and the procedural arrangements developed by the SPS Committee to operationalise its provisions. These procedures address several of the implementation problems faced by many less-developed Members, yet do so without undermining the trade/health balance achieved by the relevant substantive disciplines. Great strides have been taken in this regard by the SPS Committee and this work is continuing. Yet many hurdles remain to the full realisation of the potential benefits of the *SPS Agreement* by Members at lower levels of development. These hurdles are rooted in the capacity constraints of these Members, which limit their ability to enforce their rights and comply with their obligations under the Agreement.

The special provisions in the *SPS Agreement* that aim to take account of developing-country constraints, namely the rules on SDT and those on technical assistance leave much to be desired. Both their weak terms and the ineffectual interpretation given to them in dispute settlement have contributed to the disappointing implementation of these provisions to date. In the case of the SDT provisions, the possibilities for strengthening them through negotiated revisions or interpretation are clearly limited by the need to avoid skewing the trade/health balance of the *SPS Agreement*. Consequently, SDT is an inadequate instrument to resolve the problems that developing countries face. Instead, technical assistance assumes greater importance as a tool to help developing-country Members overcome their constraints. What is needed is a new, more effective approach to SPS-related assistance that is more in line with the current understanding of ‘capacity building’, which refers to a mechanism for effective, predictable and needs-driven assistance that creates capacity in a sustainable manner. Here the academic community can play an essential role in identifying the necessary conditions for such a mechanism.

## Samenvatting

### Inleiding

In de laatste vijftig jaar zijn de snelheid en omvang van de handel exponentieel toegenomen en is ook de diversiteit van de verhandelde producten gegroeid. Dat heeft een verdere verspreiding van gezondheidsrisico's met zich meegebracht. Het internationale handelsregime, dat is neergelegd in de regels van de Wereldhandelsorganisatie (WTO), heeft daarom nieuwe manieren moeten vinden om het belang van vrije handel en het belang van bescherming van de gezondheid tegen elkaar af te wegen. De *WTO Agreement on the Application of Sanitary and Phytosanitary Measures* (Overeenkomst inzake sanitaire en fytosanitaire maatregelen - *SPS Overeenkomst*) bevindt zich op het raakvlak van de geglobaliseerde handel en geglobaliseerde gezondheidsrisico's. De overeenkomst weerspiegelt een onderhandeld evenwicht tussen concurrerende doelen: liberalisering van de handel in de voedsel- en landbouwsector en bescherming van de gezondheid door nationale overheden.

Ontwikkelingslanden die Lid van de WTO zijn (hierna: 'ontwikkelingslanden') hebben een aanzienlijk belang bij de manier waarop deze twee concurrerende maatschappelijke belangen in de *SPS Overeenkomst* met elkaar in evenwicht worden gebracht. Aangezien landbouwproducten niet zelden een aanzienlijk deel van de uitvoerhandel in goederen van ontwikkelingslanden vormen, proberen deze landen toegang te krijgen tot de markt van deze sector om buitenlands kapitaal te verwerven dat nodig is om hun ontwikkelingsbehoeften te bevredigen. Hard bevochten verworvenheden behaald bij het liberaliseren van de handel in landbouwproducten kunnen gemakkelijk worden aangetast door misbruik van SPS maatregelen voor protectionistische doeleinden. Om dit te verhinderen zijn ontwikkelingslanden afhankelijk van effectieve regels in internationaal handelsrecht. Anderzijds moet niet worden vergeten dat ontwikkelingslanden ook belangrijke importeurs van voedsel en landbouwproducten zijn en worden geconfronteerd met sanitaire en fytosanitaire risico's die geïmporteerde producten met zich meebrengen. In dit opzicht hebben ontwikkelingslanden er belang bij dat internationaal handelsrecht voldoende flexibiliteit biedt voor het vaststellen van SPS regelgeving die aansluit bij de behoeften en capaciteiten van die landen. Het is daarom belangrijk te onderkennen dat de belangen die in de *SPS Overeenkomst* in evenwicht zijn gebracht, belangen zijn van strijdige maatschappelijk doelen die zeer relevant zijn voor zowel ontwikkelde landen als ontwikkelingslanden. Niettemin kan het mechanisme dat wordt gebruikt om dit evenwicht in de *SPS Overeenkomst* te bereiken van uiteenlopende invloed zijn al naar gelang het ontwikkelingsniveau van de WTO Leden.

Dit onderzoek analyseert de gevolgen van de regels van de *SPS Overeenkomst* voor WTO Leden met verschillende ontwikkelingsniveaus. Het evalueert meer in het bijzonder de instrumenten die door de *SPS Overeenkomst* worden gebruikt om een evenwicht te bereiken tussen gezondheid en handel, zodat kan worden bepaald of zij geschikt zijn voor minder ontwikkelde WTO Leden. De "ontwikkelingsdimensie" van de *SPS Overeenkomst* wordt zo verduidelijkt.

## **1. De SPS Overeenkomst op het snijvlak van geglobaliseerde handel en gezondheid**

De *SPS Overeenkomst* functioneert binnen de context van de parallel lopende globaliseringprocessen van handel en gezondheid. In Deel I wordt de *SPS Overeenkomst* in deze context geplaatst. In Hoofdstuk 1 van Deel I wordt de veranderende rol van ontwikkelingslanden in het wereldhandelssysteem onderzocht om zo te kunnen vaststellen waarom een onderzoek van de ontwikkelingsdimensie van de *SPS Overeenkomst* dringend noodzakelijk is. Het normatieve kader dat wordt geboden door de opkomende erkenning van het recht op ontwikkeling dient er enerzijds toe het belang vast te stellen van handel als de motor van economische groei ten dienste van ontwikkeling en van de verantwoordelijkheid die de internationale gemeenschap draagt om gunstige voorwaarden te scheppen om deze groei mogelijk te maken. Anderzijds maakt het recht op ontwikkeling duidelijk dat ontwikkeling niet alleen economische groei, maar tevens een geleidelijke realisering van alle mensenrechten, met inbegrip van het recht op leven, gezondheid en veilig voedsel, met zich mee brengt. De *SPS Overeenkomst*, die een belangrijke rol speelt in de liberalisering van de handel in landbouwproducten, kan dus zijn handeldoeleinden niet realiseren met behulp van regels die het vermogen van WTO Leden tot het beschermen van leven en gezondheid op hun grondgebied nadelig beïnvloeden.

Hoofdstuk 2 van Deel I schetst de historische ontwikkeling van de erkenning van de globalisering van gezondheid in het licht van grensoverschrijdende gezondheidsrisico's en initiatieven op het gebied van internationale samenwerking in dit verband. In dit Hoofdstuk staat de rol van wetenschappelijke ontwikkelingen op het totstandkoming van nieuwe veelzijdige benaderingen ten aanzien van risicobeheer in ontwikkelingslanden, waarmee complexe bestuursstructuren zowel op nationaal als op internationaal niveau gemoeid zijn, centraal. Dit vormt de achtergrond voor de werking van de *SPS Overeenkomst*. De *SPS Overeenkomst* erkent de vorderingen die zijn gemaakt op internationaal niveau met betrekking tot de vrijwillige harmonisatie van normen. Deze normen zijn opgenomen in de regels van de *SPS Overeenkomst*, maar afwijking van de norm is mogelijk. De *SPS Overeenkomst* weerspiegelt de ten tijde van de onderhandelingen heersende opvatting dat wetenschap een onpartijdige (neutrale) universele maatstaf biedt voor SPS regulering en schrijft wetenschappelijke onderbouwing voor als het gaat om niet-geharmoniseerde maatregelen. De twee aspecten van dit globaliseringproces die werden besproken in Hoofdstukken 1 en 2, worden in Hoofdstuk 3 samen in verband gebracht met het kernthema van het boek met de bestudering hierin van het belang van regulering en normering inzake geglobaliseerde gezondheidsrisico's voor de handel van ontwikkelingslanden.

## **2. Nationale en internationale SPS regulering en normstelling**

Bij de evaluatie van de ontwikkelingsdimensie van de *SPS Overeenkomst*, wordt rekening gehouden met het feit dat ontwikkelingslanden geen monolithische groep vormen. Ontwikkeling vindt plaats in een continuüm, waarin er grote verschillen kunnen zijn in economische middelen, regelgevingscapaciteit, exportbelangen en gezondheidsniveaus.

Al deze factoren spelen een rol bij het vaststellen van de invloed van de *SPS Overeenkomst* op bepaalde WTO Leden en op de vraag hoe werkbaar de regels voor het betreffende Lid zijn. Bij de analyse van de gevolgen van de *SPS Overeenkomst* voor ontwikkelingslanden dient daarom met deze verschillen rekening te worden gehouden.

Het is om die reden dat in Deel II van dit boek de feitelijke context van de werking van de *SPS Overeenkomst* zoals neergelegd in nationale en internationale SPS reguleringen en normeringstelsels wordt onderzocht, waarbij bijzondere aandacht wordt besteed aan de invloed van niveauverschillen tussen de WTO Leden op het functioneren van deze stelsels.

Hoofdstuk 1 van Deel II beschrijft het normatieve kader waarbinnen SPS regulering plaatsvindt, namelijk het internationale recht inzake de rechten van de mens. Vervolgens wordt in dit Hoofdstuk een korte rechtseconomische analyse van SPS regulering gemaakt voor een beter begrip van de rol die het ontwikkelingsniveau van een land speelt bij de keuze van regulering. Tot slot worden de rol en de grenzen van de wetenschap in het SPS reguleringsproces uiteengezet. Deze theoretische bespreking bereidt de weg voor de feitelijke analyse die in de daaropvolgende hoofdstukken van Deel II wordt uitgevoerd.

Hoofdstuk 2 van Deel II onderzoekt de aanzienlijke verschillen tussen de nationale SPS stelsels aan de hand van vier illustratieve voorbeelden van WTO Leden in verschillende geografische gebieden: Australië, Mauritius, Jamaica en Bangladesh. Uit deze voorbeelden blijkt dat, hoewel er enorme verschillen bestaan tussen de SPS reguleringstelsels van ontwikkelde landen en die van ontwikkelingslanden, er ook significante verschillen op dit gebied zijn tussen ontwikkelingslanden *onderling*. Deze verschillen in SPS regimes hebben aanmerkelijke gevolgen voor de impact van zowel SPS maatregelen als de *SPS Overeenkomst* zelf op WTO Leden met verschillende ontwikkelingsniveaus. Zij vormen daarom de feitelijke context voor de latere bespreking van de bepalingen van de *SPS Overeenkomst*.

Tot de feitelijke context waarbinnen de *SPS Overeenkomst* functioneert, behoren eveneens de *internationale* stelsels voor de uitwerking van SPS normen. Deze worden besproken in Hoofdstuk 3 van Deel II. De normen die gesteld worden op internationaal niveau, kunnen de diversiteit aan omstandigheden die onder de landen in alle delen van de wereld bestaat, niet weergeven, maar in plaats daarvan laten zij het compromis zien dat werd gesloten door de afgevaardigden van de landen die actief waren bij de totstandkoming van de normen. Onderzoek naar de institutionele structuur en normstellingsprocedures van de internationale organen waarnaar in de *SPS Overeenkomst* wordt verwezen, laat zien dat zij van dien aard zijn dat deelname door ontwikkelingslanden beperkt is. Dit is te wijten aan het feit dat deze structuren en procedures onvoldoende rekening houden met de beperkte middelen en capaciteit in landen met een lager ontwikkelingsniveau. Internationale normstelling wordt daardoor gedomineerd door de ontwikkelde landen, hetgeen heeft geleid tot normen die vaak niet geschikt zijn voor WTO Leden met een lager ontwikkelingsniveau.

De feitelijke context die een onderzoek naar SPS regulering op nationaal niveau en SPS normstelling op internationaal niveau biedt, toont een grote behoefte bij ontwikkelingslanden aan technische ondersteuning bij het opbouwen van SPS capaciteit. Het is echter gevaarlijk om ondersteuning te zien als een wondermiddel door aan te nemen dat

ontwikkelingslanden in staat zijn elke SPS-gerelateerde verplichting na te komen en dat ook zouden moeten doen zolang zij daarbij maar worden voorzien van de nodige ondersteuning. Die technische ondersteuning is geen alternatief voor het uitvoeren van een analyse met betrekking tot de vraag of de regels van de *SPS Overeenkomst* geschikt zijn voor implementatie door ontwikkelingslanden. Het is daarom essentieel te beginnen met de vraag of de materieelrechtelijke regels en de procedurele mechanismen van de *SPS Overeenkomst* geschikt zijn voor ontwikkelingslanden. Dit is het doel van het gedetailleerde onderzoek dat ten grondslag ligt aan Delen III en IV.

### **3. Regels in de SPS Overeenkomst die evenwicht aanbrengen tussen handel en gezondheid**

Verscheidene materieelrechtelijke verplichtingen in de *SPS Overeenkomst* hebben tot doel grenzen te stellen aan de beleidsruimte van WTO Leden waar het SPS regulering betreft door middel van het samenvoegen van de traditionele handelsdisciplines van GATT 1994 en nieuwe wetenschappelijke disciplines, en door harmonisatie te stimuleren. Al deze regels samen fungeren als een filter waarmee gezondheidsbeschermende maatregelen kunnen worden afgescheiden van maatregelen die een verhulde vorm van protectionisme zijn. Op die manier tracht de *SPS Overeenkomst* een evenwicht bereiken tussen de - vaak tegengestelde - belangen van handelsliberalisering enerzijds en bescherming van de gezondheid anderzijds.

De vraag of deze materieelrechtelijke regels in de *SPS Overeenkomst* die dit evenwicht trachten te bewerkstelligen, geschikt zijn voor WTO Leden met een lager ontwikkelingsniveau, wordt behandeld aan de hand van de vraag of de toepasselijke regels daadwerkelijk de kansen op markttoegang vergroten voor minder ontwikkelde WTO Leden en of deze Leden voldoende beleidsruimte laten voor SPS regulering. Gezien in het licht van het normatieve kader dat door het begrip ‘recht op ontwikkeling’ wordt gevormd, zoals is uiteengezet in Deel I, is het belang van het evalueren van het vermogen van de *SPS Overeenkomst* om de handel in landbouw- en voedsel producten te stimuleren zonder de bescherming van de gezondheid in minder ontwikkelde landen in gevaar te brengen, evident. Daarin ligt de ontwikkelingsdimensie van de *SPS Overeenkomst* besloten.

Uit het overzicht van de onderhandelingsgeschiedenis besproken in Hoofdstuk 1 van Deel III blijkt duidelijk dat het reguleringsmodel als neergelegd in de materieelrechtelijke regels van de *SPS Overeenkomst* kan worden teruggevonden in de voorstellen van de meest actieve deelnemers aan die onderhandelingen: de belangrijkste ontwikkelde landen en de Cairns Group. De Overeenkomst weerspiegelt de ‘best regulatory practices’ in ontwikkelde landen vrij precies, zodat het gevaar bestaat dat een model van een regulering-praktijk is opgesteld dat niet werkbaar is voor minder ontwikkelde WTO Leden.

Zoals te lezen is in Hoofdstukken 2 tot 5 van Deel III, laat de analyse van de toepasselijke materieelrechtelijke regels van de *SPS Overeenkomst* die de grenzen bepalen van de beleidsruimte van WTO Leden voor het reguleren van SPS aangelegenheden, zien dat de doelstelling van de *SPS Overeenkomst* evenwicht aan te brengen, duidelijk zichtbaar is in de manier waarop deze materieelrechtelijke bepalingen zijn geformuleerd. Hoewel er

aspecten zijn aan de interpretatie van deze bepalingen die het zorgvuldige evenwicht dat besloten ligt in hun voorwaarden niet volledig tot zijn recht laten komen, lijken de bepalingen zelf geschikt om het gevoelige conflict tussen handel en gezondheid aan te pakken op een manier die liberalisering van de handel in landbouw- en voedselproducten stimuleert en tegelijkertijd het recht van WTO Leden eerbiedigt om regelgeving op te stellen met betrekking tot SPS risico's. De regels laten echter een reguleringsmodel zien dat op dit moment niet haalbaar is voor vele WTO Leden op een lager ontwikkelingsniveau. Evenmin zijn deze WTO Leden in staat om deze materieelrechtelijke regels te gebruiken om daadwerkelijk toegang tot de markt te verkrijgen voor hun producten.

Afgezien van de specifieke interpretatieaspecten van de materieelrechtelijke regels in de *SPS Overeenkomst*, die in Deel III worden geïdentificeerd en die voor verbetering vatbaar zijn, lijkt het niet mogelijk om veranderingen aan te brengen ten einde de problemen van ontwikkelingslanden te verhelpen zonder het evenwicht dat door de Overeenkomst wordt nagestreefd, te verstoren. Niettemin verdient het zeer reële probleem van de beperkingen waarmee de minder ontwikkelde landen kampen bij de nakoming van deze regels en het genieten van de voordelen ervan, meer aandacht.

De vraag rijst in hoeverre andere bepalingen van de *SPS Overeenkomst* dan die hierboven besproken dit probleem kunnen verminderen. Deze vraag wordt behandeld in de Delen IV en V van dit boek.

#### **4. Procedurele en institutionele mechanismen op grond van de SPS Overeenkomst**

Op zichzelf genomen kunnen de materieelrechtelijke regels van de *SPS Overeenkomst* die hierboven werden besproken, niet voldoende zijn om aanzienlijke vorderingen te maken ten aanzien van toegang tot de markt voor voedsel- en landbouwproducten afkomstig uit ontwikkelingslanden. Dit is te wijten aan hun beperkte vermogen deze regels toe te passen. Daar komt bij dat materieelrechtelijke regels op zich geen nut hebben als er geen effectieve instrumenten bestaan voor het toezicht op de implementatie ervan, voor het oplossen van geschillen tussen WTO Leden over deze regels én, waar nodig, voor het afdwingen van de naleving ervan. De regels uit de *SPS Overeenkomst* die deze institutionele en procedurele zaken beheersen, worden besproken in Deel IV.

Hoofdstuk 1 van Deel IV beschrijft de bepalingen in de *SPS Overeenkomst* krachtens welke de mechanismen worden vastgesteld die regels van institutionele of procedurele aard opleggen aan *WTO Leden*. Deze institutionele en procedurele regels laten het beleid van WTO Leden ongemoeid zolang het blijft binnen de grenzen van de toepasselijke materieelrechtelijke regels van de Overeenkomst; zij zijn gericht op de manier waarop dit beleid wordt uitgevoerd, met het oog op het zo klein mogelijk houden van de handelsbeperkende gevolgen van dat beleid. Het verdient te worden opgemerkt dat nationale procedures misbruikt kunnen worden om te voorkomen dat de doelen die door de toepasselijke materieelrechtelijke regels worden gesteld, worden bereikt, waardoor het in de Overeenkomst aangebrachte evenwicht tussen handel en gezondheid wordt verstoord. De *SPS Overeenkomst* bevat een aantal regels die rechtstreeks betrekking hebben

op procedures die door de WTO Leden worden opgelegd om naleving van hun SPS maatregelen te controleren. Voorts bevat de *SPS Overeenkomst* procedurele mechanismen die bedoeld zijn om bepaalde materieelrechtelijke verplichtingen te operationaliseren, namelijk die met betrekking tot erkenning van gelijkwaardigheid, aanpassing van SPS maatregelen aan regionale omstandigheden en transparantie. Gezien de rudimentaire aard van deze procedurele regels, heeft de SPS Commissie niet-bindende besluiten genomen die gedetailleerde aanvullende procedurele mechanismen bevatten. Deze procedures, die werden ontwikkeld aan de hand van door WTO Leden verstrekte specifieke informatie over hun ervaring op relevante gebieden en die werden bewerkt in besprekingen van technische aard tussen SPS regelgevingsambtenaren, zijn een voorbeeld van het vermogen van de SPS Commissie om in gezamenlijk oplossingen voor uitvoeringsproblemen te vinden.

In Hoofdstuk 2 van Deel IV worden vervolgens de bepalingen in de *SPS Overeenkomst* besproken met betrekking tot de organen en procedures die nodig zijn om op *WTO-niveau* de *SPS Overeenkomst* zonder al te veel problemen effectief te kunnen implementeren. De bepalingen aangaande de SPS Commissie en geschillenbeslechting zijn essentieel voor het bevorderen en bewaken van de implementatie van de regels uit de *SPS Overeenkomst*, het oplossen van geschillen tussen WTO Leden aangaande deze regels, en waar nodig het afdwingen van de naleving van deze regels.

De bespreking van de rol en het functioneren van de SPS Commissie laat veel ruimere mogelijkheden zien voor deelname van WTO Leden met een lager ontwikkelingsniveau dan er tot op heden zijn in het kader van geschillenbeslechting. Het specifieke bezwaar-mechanisme van de SPS Commissie is zeer effectief gebleken in de zin dat het mogelijkheden voor WTO Leden schept hun problemen met SPS maatregelen die door hun handelspartners werden genomen op een goedkope, constructieve manier aan te pakken. De discussies in de SPS Commissie verruimen de kennis van regelgevingstechnieken bij nationale ambtenaren. Bovendien schept de SPS Commissie de mogelijkheid professionele netwerken op te bouwen en speelt zij een cruciale rol waar het de meer algemene SPS bezwaren betreft door implementatie van bepaalde regels uit de *SPS Overeenkomst* te stimuleren door middel van het ontwikkelen en aannemen van niet-bindende procedurele richtlijnen. Er zijn echter grote verschillen onder de WTO Leden, al naar gelang hun ontwikkelingsniveau, voor wat betreft hun aanwezigheid bij en daadwerkelijke deelname aan bijeenkomsten van de SPS Commissie. Dit verkleint het potentieel van de SPS Commissie om als mechanisme te fungeren voor minder ontwikkelde WTO Leden bij het oplossen van hun handelsproblemen.

Het geschillenbeslechtingssysteem van de WTO, dat het mogelijk maakt voor WTO Leden te klagen over niet-nakoming van de verplichtingen vervat in de *SPS Overeenkomst*, is een hele verbetering ten opzichte van het systeem dat bestond onder de GATT 1947. Weliswaar wordt voor een zeer klein gedeelte van de geschillen over SPS maatregelen tussen WTO Leden overgegaan tot het instellen van een WTO geschillenbeslechtingsprocedure, en nog minder vaak komt het tot een rechterlijke beoordeling, maar het belang van het geschillenbeslechtingssysteem voor SPS geschillen moet echter niet worden onderschat. Het motiveert WTO Leden tegen wier SPS maatregelen bezwaren zijn gerezen, om deze bezwaren op te lossen door middel van onderhandelingen. Voorts is de uitleg van bepalingen uit de *SPS Overeenkomst* door WTO panels en de Beroepsinstantie essentieel

voor het vaststellen van het juridische kader waarbinnen de WTO Leden hun SPS geschillen behandelen. Deze uitleg wordt niet alleen meegenomen in de besluiten van de SPS Commissie die een uitwerking bevatten van procedurele richtlijnen voor de operationalisering van de bepalingen uit de *SPS Overeenkomst*, zij zijn ook een uitgangspunt bij discussies tussen WTO Leden rondom SPS-gerelateerde handelsproblemen. Men spreekt in dit verband ook van ‘settlements negotiated in law’s shadow’.

De betrekkelijk bescheiden deelname van WTO Leden met een lager ontwikkelingsniveau aan het geschillenbeslechtingsysteem voor SPS zaken is een indicatie van de hoge politieke en financiële kosten die geschillenbeslechting met zich meebrengt voor deze Leden en van hun opvatting dat de kans op een goede afloop beperkt is. Een ontwikkeling met betrekking tot de zeer nodige hulpverlening aan ontwikkelingslanden in WTO geschillenbeslechting die moet worden toegejuicht, is het Advisory Center on WTO Law. Zonder een gezamenlijke inspanning om de SPS regelgevingscapaciteit in ontwikkelingslanden op te bouwen, zullen deze WTO Leden echter naar alle waarschijnlijkheid de overige belemmeringen voor effectieve deelname niet kunnen overwinnen.

Afgezien van de problemen met deelname, is er een ander geschillenbeslechtingsaspect dat bijzondere aandacht verdient. Dat is het aspect van de toetsingsnorm die wordt gehanteerd door de rechtsprekende organen. Tegenwoordig is het zo dat, hoewel panels als regel verklaren dat zij zelf geen risicobeoordeling zullen uitvoeren of een specifieke wetenschappelijke opvatting van reguleren zullen opleggen aan het regulerende WTO Lid bij het beoordelen van het voorliggende wetenschappelijke bewijsmateriaal, zij dit in de praktijk in toenemende mate toch doen. Voorgesteld wordt dat panels zich bij de bestudering van het wetenschappelijk bewijsmateriaal beperken tot de vraag of de reguleringsverplichtingen van de *SPS Overeenkomst*, met inbegrip van de eis dat een SPS maatregel gebaseerd moet zijn op een risicobeoordeling als omschreven in de *Overeenkomst*, in acht zijn genomen. Wat een panel niet zou moeten doen, is het wetenschappelijk bewijsmateriaal zelf volledig opnieuw beoordelen om het bestaan van een risico en de grootte ervan te kunnen vaststellen. Een dergelijke beperkte toetsing zorgt ervoor dat het regulerende WTO Lid het evenwicht eerbiedigt dat in de regels van de *SPS Overeenkomst* is aangebracht tussen zijn eigen zorgen betreffende de gezondheid en de handelsbelangen van andere WTO Leden. Zo’n toetsing, die een te grote bemoeienis met de beoordeling van het wetenschappelijk bewijsmateriaal vermijdt, beperkt de regelgevende bevoegdheid van een WTO Lid in mindere mate. Dit zou er voor zorgen dat de diversiteit aan prioriteiten, consumentenvoorkeuren en regelgevend vermogen onder de WTO Leden met verschillende ontwikkelingsniveaus tot uitdrukking worden gebracht in de keuzes voor wetenschapsbeleid neergelegd in nationale risicobeoordelingen. Een dergelijke toetsing zou tevens de nadelige positie verminderen van WTO Leden die niet beschikken over de nodige wetenschappelijke capaciteit bij het neerleggen van een klacht over of het verdedigen van maatregelen die zijn genomen in het kader van de *SPS Overeenkomst*. De huidige ingrijpende aanpak kan het resultaat van een rechterlijke toetsing doen uitvallen ten gunste van ontwikkelde landen die beschikken over de middelen om met overtuigend wetenschappelijk bewijs en sterke juridische argumenten hun standpunt te onderbouwen.

Er is wel aangevoerd dat het ‘normatieve vacuüm’ waarbinnen de *SPS Overeenkomst* momenteel wordt geïnterpreteerd, er toe heeft geleid dat er door panels die de SPS maatregelen van WTO Leden toetsen nogal wordt geconcentreerd op wetenschappelijk onderzoek

en zij in grote mate afgaan op de opvattingen van panel-deskundigen bij de beoordeling van maatregelen die door WTO Leden zijn genomen. De wetenschap wordt in te sterke mate gezien als een onpartijdige, universele maatstaf aan de hand waarvan SPS maatregelen kunnen worden beoordeeld teneinde SPS bescherming van verholde vormen van protectionisme te onderscheiden. Het is van essentieel belang dat bij de behandeling van de rechten en verplichtingen uit de *SPS Overeenkomst*, de internationaal-rechtelijke context waarbinnen de *SPS Overeenkomst* functioneert, in aanmerking wordt genomen en in het bijzonder de normen die in het internationale mensenrechtenrecht met betrekking tot het recht op leven, gezondheid, veilig voedsel en ontwikkeling worden gehanteerd. Dit recht zou het zo dringend noodzakelijke normatieve kader kunnen vormen dat als leidraad kan dienen voor de rechterlijke instanties van de WTO bij het vinden van een geschikter evenwicht tussen de strijdige belangen van liberalisering van de handel en bescherming van de gezondheid.

## 5. Bijzondere bepalingen voor ontwikkelingslanden in de SPS Overeenkomst

In de Hoofdstukken 1 en 2 van Deel IV wordt onderzocht in welke mate de *SPS Overeenkomst* de beperkingen van ontwikkelingslanden aanpakt, hetzij door middel van het inbouwen van toegesneden flexibiliteit in de regels met betrekking tot ontwikkelingslanden of in de vorm van bepalingen met betrekking tot technische ondersteuning om zo de ontwikkelingslanden te helpen bij de naleving.

Hoofdstuk 1 behandelt de bepalingen uit de *SPS Overeenkomst* over bijzondere en gedifferentieerde behandeling van ontwikkelingslanden (*special and differential treatment* - SDT). Hoewel de implementatie van SDT bepalingen in de *SPS Overeenkomst* tot nu toe teleurstellend is geweest, bestaan er reële mogelijkheden voor de panels en de Beroepsinstantie om een meer vooruitstrevende houding aan te nemen dan die van het Panel in *EC - Approval and Marketing of Biotech Products* bij het operationaliseren van SDT bepalingen door middel van een effectieve verdragsuitleg. De rechtsprekende organen van de WTO moeten hun verantwoordelijkheid dragen en de SDT bepalingen effectief toepassen in het licht van de omstandigheden van de zaak. Nochtans moeten de grenzen van SDT niet uit het oog worden verloren. SDT kan niet zodanig worden toegepast dat dit het zorgvuldig aangebrachte evenwicht tussen handel en gezondheid -het hoofddoel van de *SPS Overeenkomst*- aan het wankelen brengt. SDT zal dus in vele gevallen een onvolledig instrument zijn om problemen waar ontwikkelingslanden mee kampen, op te lossen. En zo gaat technische ondersteuning een grotere plaats innemen als instrument om ontwikkelingslanden te helpen bij het overwinnen van hun beperkingen. De mate waarin bepalingen over technische ondersteuning uit de *SPS Overeenkomst* bijdragen tot het behalen van een resultaat, wordt onderzocht in Hoofdstuk 2 van Deel V.

De thans geldende bepalingen in de *SPS Overeenkomst* aangaande technische ondersteuning zijn vaag geformuleerd en lastig af te dwingen, met als gevolg dat het verschaffen van SPS-gerelateerde technische assistentie nogal wat te wensen overlaat. Onderhandelingen over manieren om deze bepalingen wat steviger te maken zijn op niets uitgelopen. Dit kan in vele gevallen worden toegeschreven aan het niet-realistische karakter van de gedane voorstellen. Niettemin moeten de zorgen die aan deze voorstellen ten grondslag liggen,

serieus worden genomen. De ervaring van ontwikkelingslanden met het op vrijwillige basis verlenen van technische ondersteuning is ontmoedigend te noemen. Het hoeft daarom niet te verbazen dat zij van hun ontwikkelde handelspartners verlangen dat zij zich daadwerkelijk committeren om technische ondersteuning te verlenen.

Onderzoek naar enkele voorbeelden van reeds genomen initiatieven op het gebied van technische ondersteuning laat zien dat er thans sprake is van een versnipperde aanpak zonder enige samenhang. Bilaterale technische ondersteuning weerspiegelt over het algemeen de belangen en aandachtsgebieden van het hulpverlenende land, waardoor er geen aandacht is voor de prioriteiten van de ontvangers. Onlangs gedane pogingen om instrumenten te ontwikkelen om ontwikkelingslanden bij te staan bij het identificeren van hun capaciteitsbehoeften zijn weliswaar nuttig, maar dienen te worden gerelateerd aan de gewenste reactie om te verzekeren dat het project werkelijk duurzame capaciteit opbouwt in het ontvangende land. Overwegingen van politiek aard in plaats van objectieve criteria bepalen heden ten dage wat voor soort technische assistentie wordt onderschreven door de donors. Het gebrek aan voorspelbaarheid dat voortkomt uit het vrijwillige karakter van de ondersteuning die thans wordt verleend, maakt lange-termijn planning moeilijk. Multilaterale pogingen worden gekenmerkt door inefficiëntie en overlap. Een gezamenlijke inspanning is vereist, niet alleen op het gebied van scholing en financiering van deelname in fora voor SPS aangelegenheden, maar ook met betrekking tot het ontwikkelen van technische en wetenschappelijke capaciteit en infrastructuur. Zonder dat laatste zal deelname niet het gewenste resultaat opleveren.

Er is behoefte aan een nieuwe, effectievere aanpak van SPS-gerelateerde ondersteuning die meer aansluit bij de huidige invulling van het begrip ‘capacity building’. Met andere woorden, effectieve, voorspelbare, op behoefte gerichte ondersteuning, die capaciteit op duurzame wijze tot stand brengt, is essentieel. Er moet sprake zijn van een daadwerkelijk verplichting tot het verschaffen van zulke bijstand. De aanvaardbaarheid van zulke verplichtingen, zal dan weer afhangen van de bereidheid van ontwikkelingslanden differentiatie naar ontwikkelingsniveau te aanvaarden, waarin de verschillen in regelgevingscapaciteit en afhankelijkheid van de export in landbouwproducten tot uitdrukking komen. Dit zou een afspiegeling zijn van het feit dat ontwikkeling een continuüm is.

## Appendix:

### Table of Disputes initiated under the SPS Agreement

	Dispute	DS No.	Complainant(s)	Members Joining Consultations	Third Parties	Date Initiated	Agreements	Status of dispute
1	Australia - Measures affecting the importation of apples from New Zealand	367	New Zealand	European Communities; United States	Chile; European Communities; Japan; Pakistan; Chinese Taipei; United States	31.18.2007	SPS	Pending before the Panel
2	Croatia - Measures affecting imports of live animals and meat products	297	Hungary			09.07.2003	SPS, GATT	Pending consultations
3	EC - Measures affecting the approval and marketing of biotech products	293	Argentina	Canada; Mexico; United States; Australia, New Zealand; India; Brazil	Australia; Brazil; Canada; Chile; China; Chinese Taipei; Colombia; El Salvador; Honduras; Mexico; New Zealand; Norway; Paraguay; Peru; Thailand; Uruguay; United States	21.05.2003	SPS, GATT, TBT, Agriculture	Panel Report adopted by DSB on 21 November 2007
4	EC - Measures affecting the approval and marketing of biotech products	292	Canada	Argentina; Mexico; United States; Australia; New Zealand; India; Brazil	Argentina; Australia; Brazil; Chile; China; Chinese Taipei; Colombia; El Salvador; Honduras; Mexico; New Zealand; Norway; Paraguay; Peru; Thailand; Uruguay; United States	20.05.2003	SPS, GATT, TBT, Agriculture	Panel Report adopted by DSB on 21 November 2006
5	EC - Measures affecting the approval and marketing of biotech products	291	United States	Peru; Colombia; Chile; Brazil; Argentina; Mexico; Australia; New Zealand; Canada; India	Argentina; Australia; Brazil; Canada; Chile; China; Chinese Taipei; Colombia; El Salvador; Honduras; Mexico; New Zealand; Norway; Paraguay; Peru; Thailand; Uruguay	20.05.2003	SPS, GATT, TBT, Agriculture	Panel Report adopted by DSB on 21 November 2007

	Dispute	DS No.	Complainant(s)	Members Joining Consultations	Third Parties	Date Initiated	Agreements	Status of dispute
6	Australia - Quarantine regime for Imports	287	European Communities	Canada; India; Chile; Philippines	Canada; Chile; China; India; Philippines; Thailand; United States	09.04.2003	SPS	Mutually agreed solution (WT/DS287/8) on 9 March 2007 after establishment of Panel
7	Mexico - Certain measures preventing the importation of black beans from Nicaragua	284	Nicaragua	United States; Canada		20.03.2003	SPS, GATT, Licensing	Mutually agreed solution (WT/DS284/4) on 11 March 2004
8	India - Import restrictions maintained under the export and import policy 2002-2007	279	European Communities	United States		23.12.2002	SPS, GATT, TBT, Agriculture, Licensing	Pending consultations
9	Australia - Certain measures affecting the importation of fresh pineapple	271	Philippines	European Communities; Thailand		18.10.2003	SPS, GATT, Licensing	Pending consultations
10	Australia - Certain measures affecting the importation of fresh fruit and vegetables	270	Philippines	European Communities; Thailand	Chile; China; European Communities; Ecuador; India; Thailand; United States	18.10.2002	GATT, Licensing, SPS	Pending consultations Panel established on 29 August 2003, but never composed
11	Turkey - Import ban on pet food from Hungary	256	Hungary	European Communities		03.05.2002	SPS, GATT, Agriculture	Mutually agreed solution reported to SPS Committee in June 2004, but not reported to DSB

	Dispute	DS No.	Complainant(s)	Members Joining Consultations	Third Parties	Date Initiated	Agreements	Status of dispute
12	Japan - Measures affecting the importation of apples	245	United States		Australia; Brazil; China; Chinese Taipei; European Communities; New Zealand	06.03.2002	SPS, GATT, Agreement on Agriculture	Mutually agreed solution (WT/DS245/21) on 2 September 2004. Article 21.5 Panel Report adopted by DSB on 20 July 2005. Panel Report and Appellate Body Report adopted by DSB on 10 December 2003.
13	Turkey - Certain import procedures for fresh fruit	237	Ecuador		Colombia; European Communities; United States	10.09.2001	SPS, GATT, GATS, Licensing, Agriculture	Mutually agreed solution (WT/DS237/4) on 29 November 2002 after establishment of Panel
14	Egypt - Import prohibition on canned tuna with soybean oil	205	Thailand			22.09.2000	SPS, GATT	Pending consultations
15	Mexico - Measures affecting trade in live swine	203	United States			10.07.2000	SPS, GATT, TBT, AD, Agriculture	Pending consultations
16	United States - Certain measures affecting the import of swine, cattle and grain from Canada	144	Canada			25.09.1998	SPS, TBT, GATT, Agriculture	Pending consultations
17	EC - Measures affecting imports of wood of conifers from Canada	137	Canada			17.07.2003	SPS, GATT, TBT	Pending consultations

	Dispute	DS No.	Complainant(s)	Members Joining Consultations	Third Parties	Date Initiated	Agreements	Status of dispute
18	EC - Measures affecting Asbestos and products containing asbestos	135	Canada	Brazil	Brazil; Zimbabwe; United States	03.06.1998	SPS, GATT, TBT (SPS not invoked in reports)	Panel Report and Appellate Body Report adopted by DSB on 5 April 2001
19	EC - Restrictions on certain import duties on rice	134	India			25.05.1998	SPS, GATT, Customs, Agriculture, TBT, Licensing	Pending consultations
20	Slovak Republic - Measures concerning the importation of dairy products and the transit of cattle	133	Switzerland	United States		11.05.1998	SPS, GATT, Licensing	Mutually agreed solution notified to SPS Committee in March 1999, but not reported to DSB
21	United States - Measures affecting imports of poultry products	100	European Communities			18.08.1997	SPS, GATT, TBT	Pending consultations
22	India - Quantitative restrictions on imports of agricultural, textile and industrial products	96	European Communities	Japan; United States; Switzerland; Australia; Canada; New Zealand		27.07.1997	SPS, GATT, Agriculture, Licensing	Mutually agreed solution (WT/DS96/8) on 6 May 1998
23	Japan - Measures affecting agricultural products	76	United States		Brazil; European Communities; Hungary	09.04.1997	SPS, GATT, Agriculture	Mutually agreed solution (WT/DS76/12) on 30 August 2001. Panel Report and Appellate Body Report adopted by DSB on 19 March 1999

	Dispute	DS No.	Complainant(s)	Members Joining Consultations	Third Parties	Date Initiated	Agreements	Status of dispute
24	EC - Measures affecting livestock and meat (hormones)	48	Canada	New Zealand; Australia; United States	Australia; New Zealand; Norway; United States	08.07.1996	SPS, GATT, TBT, Agriculture	Panel established to examine continued retaliation (WT/DS321) on 17 February 2005, issued Panel Report on 31 March 2008, appeal pending. Authorisation to retaliate granted on 26 July 1999 to the amount of CD\$11.3 million. Panel Report and Appellate Body Report adopted by DSB on 13 February 1998
25	Korea - Measures concerning inspection of agricultural products	41	United States			24.05.1996	SPS, GATT, TBT, Agriculture	Mutually agreed solution notified to SPS Committee in July 2001, but not reported to DSB

	Dispute	DS No.	Complainant(s)	Members Joining Consultations	Third Parties	Date Initiated	Agreements	Status of dispute
26	EC - Measures concerning meat and meat products (hormones)	26	United States	Australia; New Zealand; Canada	Australia; Canada; New Zealand; Norway	31.01.1996	SPS, GATT, TBT, Agriculture	Panel established to examine continued retaliation (WT/DS320) on 17 February 2005, issued Panel Report on 31 March 2008, appeal pending. Authorisation to retaliate granted on 26 July 1999 to the amount of US\$116.8 million. Panel Report and Appellate Body Report adopted by DSB on 13 February 1998
27	Australia - Measures affecting the importation of salmonids	21	United States	Canada	Canada; European Communities; Hong Kong, China; Iceland; India; Norway	23.11.1995	SPS, GATT	Mutually agreed solution (WT/DS21/10) on 1 November 2000, after establishment of the Panel
28	Korea - Measures concerning bottled water	20	Canada	United States; European Communities		22.11.1995	SPS, GATT, TBT	Mutually agreed solution (WT/DS20/6) on 6 May 1996

	Dispute	DS No.	Complainant(s)	Members Joining Consultations	Third Parties	Date Initiated	Agreements	Status of dispute
29	Australia - Measures affecting the importation of salmon	18	Canada		European Communities; India; Norway; United States	10.10.1995	SPS, GATT	Mutually agreed solution reported to SPS Committee in May 2000, but not reported to DSB. Article 21.5 Panel Report adopted by DSB on 20 March 2000. Panel Report and Appellate Body Report adopted by the DSB on 6 November 1998
30	Korea - Measures concerning the shelf-life of products	5	United States	Japan; Canada		05.05.1995	SPS, GATT, TBT, Agriculture	Mutually agreed solution (WT/DS5/5 and Add.1-5) on 31 July 1995
31	Korea - Measures concerning the testing and inspection of agricultural products	3	United States	Japan		04.04.1995	SPS, GATT, TBT, Agriculture	Mutually agreed solution notified to SPS Committee in July 2001, but not reported to DSB

## List of Abbreviations

AAHL:	Australian Animal Health Laboratory
ABARE:	Australian Bureau of Agricultural and Resource Economics
ACIAR:	Australian Centre for International Agricultural Research
ACP:	African, Caribbean and Pacific
ACWL:	Advisory Centre on WTO Law
ADI:	Acceptable Daily Intake
AHC:	Animal Health Committee of the OIE
ALARA:	As low as reasonably achievable
ANZCERTA:	Australia-New Zealand Closer Economic Relations Trade Agreement of 1983
ANZFA:	Australia New Zealand Food Authority
APCC:	Asian and Pacific Coconut Community
APEC:	Asia Pacific Economic Cooperation
APHIS:	Animal and Plant Health Inspection Service of the US
APO:	Associate Professional Officer
AQIS:	Australian Quarantine and Inspection Service
ASEAN:	Association of Southeast Asian Nations
ASTP:	Australian System of Tariff Preferences
AusAID:	Australian Agency for International Development
AUSFTA:	Australia-United States Free Trade Agreement of 2005
BSE:	Bovine Spongiform Encephalopathy
BSJ:	Bureau of Standards of Jamaica
BSTI:	Bangladesh Standards and Testing Institute
CAC:	Codex Alimentarius Commission
CARIBCAN:	Caribbean-Canada Trade Agreement
CARICOM:	Caribbean Community
CBD:	Convention on Biological Diversity of 1992
CEPM:	Committee of Experts on Phytosanitary Measures of the IPPC
CGTF:	Consultative Group on the Codex Trust Fund
COLEACP:	Committee for Liaison for Europe and the African Caribbean and Pacific countries
COMESA:	Common Market for Eastern and Southern Africa
COPs:	Codes of Practice
CPM:	Commission on Phytosanitary Measures of the IPPC
CROSQ:	CARICOM Regional Organisation for Standards and Quality
CRVDF:	Codex Committee on Residues of Veterinary Drugs in Food

CSIRO:	Commonwealth Scientific and Industrial Research Organisation
DAFF:	Australian Government Department of Agriculture, Fisheries and Forestry
DFID:	Department for International Development of the UK
DSB:	Dispute Settlement Body
DSU:	Dispute Settlement Understanding
EC:	European Communities
EFSA:	European Food Safety Authority
EFTA:	European Free Trade Area
EPA:	Economic Partnership Agreement
EPOPA:	Export Promotion of Organic Products from Africa
EU:	European Union
EUREPGAP:	Euro-Retailer Produce Working Group's Good Agricultural Practice Standards
EWG:	Expert Working Group of the IPPC
FAO:	United Nations Food and Agricultural Organization
FDA:	Food and Drug Administration of the US
FMD:	Foot and Mouth Disease
FSANZ:	Food Standards Australia New Zealand
FSPID:	Food Storage and Prevention of Infestation Division of Jamaica
G-20:	Group of 20 (developing country coalition of varying membership)
G-77:	Group of 77 (developing country coalition originating in UNCTAD)
G-90:	Group of 90 (developing country coalition at Cancun consisting of ACP, AU and LDC countries, not all of which are WTO Members)
GAP:	Good Agricultural Practice
GATT:	General Agreement on Tariffs and Trade
GDP:	Gross Domestic Product
GFSI:	Global Food Safety Initiative
GIFSA:	Global Initiative for Food-Related Scientific Advice
GLOBALGAP:	Global Partnership for Good Agricultural Practices
GMOs:	Genetically Modified Organisms
GMP:	Good Manufacturing Practices
GNI:	Gross National Income
GSO:	Gulf Cooperation Council Standardization Organization
HACCP:	Hazard Analysis and Critical Control Point
HDI:	Human Development Index of the UNDP
IAEA:	International Atomic Energy Agency
IARC:	International Agency for Cancer Research
ICPM:	Interim Committee on Phytosanitary Measures of the IPPC

IC:	International Committee of the OIE
ICCPR:	International Covenant on Civil and Political Rights
ICESCR:	International Covenant on Economic, Social and Cultural Rights
IDRC:	International Development Research Centre
IF:	Integrated Framework for Trade-Related Technical Assistance to Least-Developed Countries
IFAS:	International Food and Agriculture Service of Australia
IHR:	International Health Regulations
IICA:	Inter-American Institute for Agricultural Cooperation
ILC:	International Law Commission
INFOSAN:	International Food Safety Authorities Network
IPFSAPH:	International Portal for Food Safety, Animal and Plant Health
IPM CRSP:	Pest Management Collaborative Research Support Program
IPP:	International Phytosanitary Portal
IPPC:	International Plant Protection Convention
IRA:	Import Risk Analysis
ISC:	Interim Standards Committee of the IPPC
ISPM:	International Standards for Phytosanitary Measures
ITC:	International Trade Centre
JECFA:	Joint FAO/WHO Expert Committee on Food Additives
JEMRA:	Joint FAO/WHO Expert Meetings on Microbiological Risk Assessment
JITAP:	Joint Integrated Technical Assistance Programme
JMPR:	Joint FAO/WHO Expert Meetings on Pesticide Residues
LDCs:	Least Developed Countries
LOD:	Limit of determination
MAURITAS:	Mauritius Accreditation Service
MEAs:	Multilateral Environmental Agreements
MFN:	Most-Favoured Nation
MOE:	Margin of Exposure
MSB:	Mauritius Standards Bureau
MTAs:	Multilateral Trade Agreements
MRL:	Maximum Residue Level
NAHFSCC:	National Agricultural Health and Food Safety Coordinating Committee of Jamaica
NAMA:	Non-Agricultural Market Access
NAFTA:	North American Free Trade Agreement
NASA:	National Aeronautical and Space Administration of the US

NATA:	National Association of Testing Authorities
NAPPO:	North American Plant Protection Organization
NGOs:	Non-Governmental Organisations
NIEO:	New International Economic Order
NPPO:	National Plant Protection Organization
OCPPO:	Office of the Chief Plant Protection Officer of Australia
OCVO:	Office of the Chief Veterinary Officer of Australia
OECD:	Organisation for Economic Cooperation and Development
OIE:	International Office of Epizootics (now the World Animal Health Organisation)
OIRSA:	Regional International Organization for Plant Protection and Animal Health
OIV:	International Vine and Wine Office
PCE:	Phytosanitary Capacity Evaluation
PCE Tool:	Phytosanitary Capacity Evaluation Tool
PHC:	Plant Health Committee of Australia
PIAPH:	Product Integrity, Animal and Plant Health Division of the Australian Government Department of Agriculture, Fisheries and Forestry
PPM:	Process and Production Method
PQ/PI:	Plant Quarantine/Produce Inspection
PRA:	Pest Risk Assessment
PVS Tool:	OIE Evaluation of Performance of Veterinary Services Tool
rBST:	Recombinant Bovine Somatotrophin
REIO:	Regional Economic Integration Organisation
RPPO:	Regional Plant Protection Organization
SAARC:	South Asian Association for Regional Cooperation (consisting of Bangladesh, Bhutan, India, the Maldives, Nepal, Pakistan and Sri Lanka)
SABS:	South African Bureau of Standards
SADC:	Southern African Development Community (consisting of Angola, Botswana, Democratic Republic of Congo, Lesotho, Malawi, Mauritius, Mozambique, Namibia, Seychelles, South Africa, Swaziland, Tanzania, Zambia and Zimbabwe)
SAFTA:	Singapore-Australia Free Trade Agreement of 2005
SBDS:	Subsidiary Body on Dispute Settlement of the IPPC
SC:	Standards Committee of the IPPC
SCVPH:	Scientific Committee on Veterinary Measures relating to Public Health
SELA:	Latin American Economic System
SDC:	Standards Development Committee of Australia and New Zealand
SDT:	Special and differential treatment

SIDA:	Swedish International Development Agency
SIDS:	Small-Island Developing States
SPARTECA:	South Pacific Region Trade and Economic Cooperation Agreement
SPS:	Sanitary and phytosanitary
SPS IMS:	SPS Information Management System
SPTA:	Strategic Planning and Technical Assistance
STDF:	Standards and Trade Development Facility
SVES:	Small Vulnerable Economies
TAFTA:	Thailand-Australia Free Trade Agreement of 2005
TBT:	Technical Barriers to Trade
TCBDC:	Doha Development Agenda Trade Capacity Building Database
TCP:	Technical Cooperation Programme
TP:	Technical Panel of the IPPC
TRTA:	Trade Related Technical Assistance
UK:	United Kingdom
UN:	United Nations
UNCTAD:	United Nations Conference on Trade and Development
UNDP:	United Nations Development Programme
UNECE:	United Nations Economic Commission for Europe
US:	United States of America

USDA:	United States Department of Agriculture
WHO:	World Health Organization
WTO:	World Trade Organization

## Table of Cases

### GATT Panel Reports

<i>Australia – Ammonium Sulphate</i>	GATT Working Party Report, <i>The Australian Subsidy on Ammonium Sulphate</i> , adopted 3 April 1950, BISD II/188
<i>Canada – Gold Coins</i>	GATT Panel Report, <i>Canada – Measures Affecting the Sale of Gold Coins</i> , circulated on 17 September 1985 (unadopted), L/5863
<i>Canada – FIRA</i>	GATT Panel Report, <i>Canada – Administration of the Foreign Investment Review Act</i> , adopted 7 February 1984, BISD 30S/140
<i>Canada – Provincial Liquor</i>	GATT Panel Report, <i>Canada – Import, Distribution and Sale of Boards (EEC) Alcoholic Drinks (EEC) by Canadian Provincial Marketing Agencies</i> , adopted 22 March 1988, BISD 35S/37
<i>Canada – Provincial Liquor</i>	GATT Panel Report, <i>Canada – Import, Distribution and Sale of Boards (US) Alcoholic Drinks (US) by Canadian Provincial Marketing Agencies</i> , adopted 18 February 1992, BISD 39S/27
<i>Canada/Japan – Tariff on Imports of Spruce, Pine, Fir</i>	GATT Panel Report, <i>Canada/Japan – Tariff on Imports of Spruce, Pine, Fir (SPF)</i> , adopted 19 July 1998, BISD 36S/167
<i>EEC – Animal Feed Proteins</i>	GATT Panel Report, <i>EEC – Measures on Animal Feed Proteins</i> , adopted 14 March 1978, BISD 25S/49
<i>EEC – Minimum Import Prices</i>	GATT Panel Report, <i>EEC – Programme of Minimum Import Prices, Licences and Surety Deposits for Certain Processed Fruits and Vegetables</i> , adopted 18 October 1978, BISD 25S/68
<i>Italy – Agricultural Machinery</i>	GATT Panel Report, <i>Italian Discrimination against Imported Agricultural Machinery</i> , adopted 23 October 1958, BISD 7S/60
<i>Japan – Semi-Conductors</i>	GATT Panel Report, <i>Japan – Trade in Semi-Conductors</i> , adopted 4 May 1988, BISD 35S/116
<i>Japan – SPF Dimension Lumber</i>	GATT Panel Report, <i>Canada/Japan – Tariff on Imports of Spruce, Pine, Fir (SPF) Dimension Lumber</i> , adopted 19 July 1989, BISD 36S/167

<i>Spain – Unroasted Coffee</i>	GATT Panel Report, <i>Spain – Tariff Treatment of Unroasted Coffee</i> L/5135, adopted 11 June 1981, BISD 28S/102
<i>Thailand – Cigarettes</i>	GATT Panel Report, <i>Thailand – Restrictions on Importation of and Internal Taxes on Cigarettes</i> , adopted 7 November 1990, BISD 37S/200
<i>US – Malt Beverages</i>	GATT Panel Report, <i>United States – Measures Affecting Alcoholic and Malt Beverages</i> , adopted 19 June 1992, BISD 39S/206
<i>US – Section 337</i>	GATT Panel Report, <i>United States Section 337 of the Tariff Act of 1930</i> , adopted 7 November 1989, BISD 36S/ 345
<i>US – Spring Assemblies</i>	GATT Panel Report, <i>United States – Imports of Certain Automotive Spring Assemblies</i> , adopted 26 May 1983, BISD 30S/107
<i>US – Taxes on Automobiles</i>	GATT Panel Report, <i>United States – Taxes on Automobiles</i> , 11 October 1994, unadopted, DS31/R
<i>US – Tuna (Canada)</i>	GATT Panel Report, <i>United States – Prohibition of Imports of Tuna and Tuna Products from Canada</i> , adopted 22 February 1982, BISD 29S/91611
<i>US – Tuna (EEC)</i>	GATT Panel Report, <i>United States – Restrictions on Imports of Tuna</i> , 16 June 1994, unadopted, DS29/R
<i>US – Tuna (Mexico)</i>	GATT Panel Report, <i>United States – Restriction on Imports of Tuna</i> , 3 September 1991, unadopted, BISD 39S/155
<i>Certificates of origin, marks of origin and consular formalities</i>	Report of the Working Party on Trade and Customs Regulations <i>Certificates of Origin, Marks of Origin and Consular Formalities</i> , 15 November 1956, L/595.

### **WTO Panel Reports**

<i>Argentina – Footwear (EC)</i>	Panel Report, <i>Argentina – Safeguard Measures on Imports of Footwear</i> , WT/DS121/R, adopted 12 January 2000, as modified by Appellate Body Report, WT/DS121/AB/R, DSR 2000:II, 575
----------------------------------	---

<i>Argentina – Hides and Leather</i>	Panel Report, <i>Argentina – Measures Affecting the Export of Bovine Hides and Import of Finished Leather</i> , WT/DS155/R and Corr.1, adopted 16 February 2001, DSR 2001:V, 1779
<i>Australia – Salmon</i>	Panel Report, <i>Australia – Measures Affecting Importation of Salmon</i> , WT/DS18/R and Corr.1, adopted 6 November 1998, as modified by Appellate Body, WT/DS18/AB/R, DSR 1998:VIII, 3407
<i>Australia – Salmon (Article 21.5 – Canada)</i>	Panel Report, <i>Australia – Measures Affecting Importation of Salmon – Recourse to Article 21.5 by Canada</i> , WT/DS18/RW, adopted 20 March 2000, DSR 2000:IV, 2031
<i>Brazil – Desiccated Coconut</i>	Panel Report, <i>Brazil – Measures Affecting Desiccated Coconut</i> , WT/DS22/R, adopted 20 March 1997, upheld by Appellate Body Report, WT/DS22/AB/R, DSR 1997:I, 189
<i>Brazil – Retreaded Tyres</i>	Panel Report, <i>Brazil – Measures Affecting Imports of Retreaded Tyres</i> , WT/DS332/R, adopted 17 December 2007, as modified by Appellate Body Report, WT/DS332/AB/R
<i>Canada – Autos</i>	Panel Report, <i>Canada – Certain Measures Affecting the Automotive Industry</i> , WT/DS139/R, WT/DS142/R, adopted 19 June 2000, as modified by Appellate Body Report, WT/DS139/AB/R, WT/DS142/AB/R, DSR 2000:VII, 3043
<i>Canada – Continued Suspension</i>	Panel Report, <i>Canada – Continued Suspension of Obligations in the EC – Hormones Dispute</i> , WT/DS321/R, adopted 14 November 2008, as modified by Appellate Body Report, WT/DS321/AB/R
<i>Canada – Patent Term</i>	Panel Report, <i>Canada – Term of Patent Protection</i> , WT/DS170/R, adopted 12 October 2000, upheld by Appellate Body Report, WT/DS170/AB/R, DSR 2000:XI, 5121
<i>Canada – Periodicals</i>	Panel Report, <i>Canada – Certain Measures Concerning Periodicals</i> , WT/DS31/R and Corr.1, adopted 30 July 1997, as modified by Appellate Body Report, WT/DS31/AB/R, DSR 1997:I, 481

- Canada – Wheat Exports and Grain Imports* Panel Report, *Canada – Measures Relating to Exports of Wheat and Treatment of Imported Grain*, WT/DS276/R, adopted 27 September 2004, upheld by Appellate Body Report, WT/DS276/AB/R, DSR 2004:VI, 2817
- Dominican Republic – Import and Sale of Cigarettes* Panel Report, *Dominican Republic – Measures Affecting the Importation and Internal Sale of Cigarettes*, WT/DS302/R, adopted 19 May 2005, as modified by Appellate Body Report, WT/DS302/AB/R, DSR 2005:XV, 7425
- EC – Approval and Marketing of Biotech Products* Panel Reports, *European Communities – Measures Affecting the Approval and Marketing of Biotech Products*, WT/DS291/R, WT/DS292/R, WT/DS293/R, Corr.1 and Add.1, 2, 3, 4, 5, 6, 7, 8 and 9, adopted 21 November 2006
- EC – Asbestos* Panel Report, *European Communities – Measures Affecting Asbestos and Asbestos-Containing Products*, WT/DS135/R and Add.1, adopted 5 April 2001, as modified by Appellate Body Report, WT/DS135/AB/R, DSR 2001:VIII, 3305
- EC – Bananas III* Panel Report, *European Communities – Regime for the Importation, Sale and Distribution of Bananas*, WT/DS27/R/GTM, WT/DS27/R/HND, WT/DS27/R/MEX, WT/DS27/R/USA, WT/DS27/R/ECU adopted 25 September 1997, as modified by Appellate Body Report, WT/DS27/AB/R, DSR 1997:II, 695, 803, 943; DSR 1997:III,1085
- EC – Bed Linen* Panel Report, *European Communities – Anti-Dumping Duties on Imports of Cotton-Type Bed Linen from India*, WT/DS141/R, adopted 12 March 2001, as modified by Appellate Body Report, WT/DS141/AB/R, DSR 2001:VI, 2077
- EC – Bed Linen (Article 21.5 – India)* Panel Report, *European Communities – Anti-Dumping Duties on Imports of Cotton-Type Bed Linen from India – Recourse to Article 21.5 of the DSU by India*, WT/DS141/RW, adopted 24 April 2003, as modified by Appellate Body Report, WT/DS141/AB/RW, DSR 2003:IV, 1269

- EC – Hormones (Canada)* Panel Report, *EC Measures Concerning Meat and Meat Products (Hormones), Complaint by Canada*, WT/DS48/R/CAN, adopted 13 February 1998, as modified by Appellate Body Report, WT/DS26/AB/R, WT/DS48/AB/R, DSR 1998:II, 235
- EC – Hormones (US)* Panel Report, *EC Measures Concerning Meat and Meat Products (Hormones), Complaint by the United States*, WT/DS26/R/USA, adopted 13 February 1998, as modified by Appellate Body Report, WT/DS26/AB/R, WT/DS48/AB/R, DSR 1998:III, 699
- EC – Sardines* Panel Report, *European Communities – Trade Description of Sardines*, WT/DS231/R and Corr.1, adopted 23 October 2002, as modified by Appellate Body Report, WT/DS231/AB/R, DSR 2002:VIII, 3451
- EC – Tariff Preferences* Panel Report, *European Communities – Conditions for the Granting of Tariff Preferences to Developing Countries*, WT/DS246/R, adopted 20 April 2004, as modified by Appellate Body Report, WT/DS246AB/R, DSR 2004:III, 1009
- EC – Trademarks and Geographical Indications (Australia)* Panel Report, *European Communities – Protection of Trademarks and Geographical Indications for Agricultural Products and Foodstuffs, Complaint by Australia*, WT/DS290/R, adopted 20 April 2005, DSR 2005:X-XI, 4603

- Indonesia – Autos* Panel Report, *Indonesia – Certain Measures Affecting the Automobile Industry*, WT/DS54/R, WT/DS55/R, WT/DS59/R, WT/DS64/R and Corr.1, 2, 3 and 4, adopted 23 July 1998, DSR 1998:VI, 2201
- Japan – Agricultural Products II* Panel Report, *Japan – Measures Affecting Agricultural Products*, WT/DS76/R, adopted 19 March 1999, as modified by Appellate Body Report, WT/DS76/AB/R, DSR 1999:I, 315
- Japan – Alcoholic Beverages II* Panel Report, *Japan – Taxes on Alcoholic Beverages*, WT/DS8/R, WT/DS10/R, WT/DS11/R, adopted 1 November 1996, as modified by Appellate Body Report, WT/DS8/AB/R, WT/DS10/AB/R, WT/DS11/AB/R, DSR 1996:I, 125
- Japan – Apples* Panel Report, *Japan – Measures Affecting the Importation of Apples*, WT/DS245/R, adopted 10 December 2003, upheld by Appellate Body Report, WT/DS245/AB/R, DSR 2003:IX, 4481
- Japan – Apples (Article 21.5 – US)* Panel Report, *Japan – Measures Affecting the Importation of Apples – Recourse to Article 21.5 of the DSU by the United States*, WT/DS245/RW, adopted 20 July 2005, DSR 2005:XVI, 7911
- Japan – Film* Panel Report, *Japan – Measures Affecting Consumer Photographic Film and Paper*, WT/DS44/R, adopted 22 April 1998, DSR 1998:IV, 1179
- Korea – Alcoholic Beverages* Panel Report, *Korea – Taxes on Alcoholic Beverages*, WT/DS75/R, WT/DS84/R, adopted 17 February 1999, as modified by the Appellate Body Report, WT/DS75/AB/R, WT/DS84/AB/R, DSR 1999:I, 44
- Korea – Dairy* Panel Report, *Korea – Definitive Safeguard Measure on Imports of Certain Dairy Products*, WT/DS98/R and Corr.1, adopted 12 January 2000, as modified by Appellate Body Report, WT/DS98/AB/R, DSR 2000:I, 49

<i>Korea – Procurement</i>	Panel Report, <i>Korea – Measures Affecting Government Procurement</i> , WT/DS163/R, adopted 19 June 2000, DSR 2000:VIII, 3541
<i>Mexico – Corn Syrup</i>	Panel Report, <i>Mexico – Anti-Dumping Investigation of High Fructose Corn Syrup (HFCS) from the United States</i> , WT/DS132/R and Corr.1, adopted 24 February 2000, DSR 2000:III, 1345
<i>Mexico – Taxes on Soft Drinks</i>	Panel Report, <i>Mexico – Tax Measures on Soft Drinks and Other Beverages</i> , WT/DS308/R, adopted 24 March 2006, as modified by Appellate Body Report, WT/DS308/AB/R 49
<i>US – Continued Suspension</i>	Panel Report, <i>US – Continued Suspension of Obligations in the EC – Hormones Dispute</i> , WT/DS320/R, adopted 14 November 2008, as modified by Appellate Body Report, WT/DS320/AB/R
<i>US – Corrosion Resistant Steel Sunset Review</i>	Panel Report, <i>United States – Sunset Review of Anti-Dumping Duties on Corrosion-Resistant Carbon Steel Flat Products from Japan</i> , WT/DS244/R, adopted 9 January 2004, as modified by Appellate Body Report, WTDS244/AB/R, DSR 2004:I, 85
<i>US – Gasoline</i>	Panel Report, <i>United States – Standards for Reformulated and Conventional Gasoline</i> , WT/DS2/R, adopted 20 May 1996, as modified by the Appellate Body Report, WT/DS2/ AB/R, DSR 1996:I, 29
<i>US – Line Pipe</i>	Panel Report, <i>United States – Definitive Safeguard Measures on Imports of Circular Welded Carbon Quality Line Pipe from Korea</i> , WT/DS202/R, adopted 8 March 2002, as modified by Appellate Body Report, WT/DS202/AB/, DSR 2002:IV, 1473
<i>US – Section 301 Trade Act</i>	Panel Report, <i>United States – Section 301-310 of the Trade Act of 1974</i> , WT/DS152/R, adopted 27 January 2000, DSR 2000:II, 815.
<i>US – Shrimp (Article 21.5 – Malaysia)</i>	Panel Report, <i>United States – Import Prohibition of Certain Shrimp and Shrimp Products, Recourse to Article 21.5 of the DSU by Malaysia</i> , WTDS58/RW, adopted 21 November 2001, as upheld by the Appellate Body Report, WT/DS58/AB/RW, DSR 2001:XIII, 6539

<i>US – Steel Plate</i>	Panel Report, <i>United States – Anti Dumping and Countervailing Measures on Steel Plate from India</i> , WT/DS206/R and Corr.1, adopted 29 July 2002, DSR 2002:VI, 2073
<i>US – Underwear</i>	Panel Report, <i>United States – Restrictions on Imports of Cotton and Man-made Fibre Underwear</i> , WT/DS24/R, adopted 25 February 1997, as modified by Appellate Body Report, WT/DS24/AB/R, DSR 1997:I, 31
<i>US – Wool Shirts and Blouses</i>	Panel Report, <i>United States – Measure Affecting Imports of Woven Wool Shirts and Blouses from India</i> , WT/DS33/R, adopted 23 May 1997, upheld by Appellate Body Report, WT/DS33/AB/R, DSR 1997:I, 343
<b>Appellate Body Reports</b>	
<i>Argentina – Footwear (EC)</i>	Appellate Body Report, <i>Argentina – Safeguard Measures on Imports of Footwear</i> , WT/DS121/AB/R, adopted 12 January 2000, DSR 2000:I, 515
<i>Australia – Salmon</i>	Appellate Body Report, <i>Australia – Measures Affecting Importation of Salmon</i> , WT/DS18/AB/R, adopted 6 November 1998, DSR 1998:VIII, 3327
<i>Brazil – Desiccated Coconut</i>	Appellate Body Report, <i>Brazil – Measures Affecting Desiccated Coconut</i> , WT/DS22/AB/R, adopted 20 March 1997, DSR 1997:I, 167
<i>Brazil – Retreaded Tyres</i>	Appellate Body Report, <i>Brazil – Measures Affecting Imports of Retreaded Tyres</i> , WT/DS332/AB/R, adopted 17 December 2007
<i>Canada – Aircraft</i>	Appellate Body Report, <i>Canada – Measures Affecting the Export of Civilian Aircraft</i> , WT/DS70/AB/R, adopted 20 August 1999, DSR 1999:III, 1377
<i>Canada – Patent Term</i>	Appellate Body Report, <i>Canada – Term of Patent Protection</i> , WT/DS170/AB/R, adopted 12 October 2000, DSR 2000:X, 5093
<i>Canada – Periodicals</i>	Appellate Body Report, <i>Canada – Certain Measures Concerning Periodicals</i> , WT/DS31/AB/R, adopted 30 July 1997, DSR 1997:I, 449

- Chile – Alcoholic Beverages* Appellate Body Report, *Chile – Taxes on Alcoholic Beverages*, WT/DS87/AB/R, WT/DS110/AB/R, adopted 12 January 2000, DSR 2000:I, 281
- EC – Asbestos* Appellate Body Report, *European Communities – Measures Affecting Asbestos and Asbestos-Containing Products*, WT/DS135/AB/R, adopted 5 April 2001, DSR 2001:VII, 3243
- EC – Bananas III* Appellate Body Report, *European Communities – Regime for the Importation, Sale and Distribution of Bananas*, WT/DS27/AB/R, adopted 25 September 1997, DSR 1997:II, 591
- EC – Chicken Cuts* Appellate Body Report, *European Communities – Customs Classification of Frozen Boneless Chicken Cuts*, WT/DS269/AB/R, WT/DS286/AB/R and Corr. 1, adopted 27 September 2005, DSR 2005: XIX, 9157
- EC – Hormones* Appellate Body Report, *European Communities – Measures Concerning Meat and Meat Products (Hormones)*, WT/DS26/AB/R, WT/DS48/AB/R, adopted 13 February 1998, DSR 1998:I, 135
- EC – Poultry* Appellate Body Report, *European Communities – Measures Affecting the Importation of Certain Poultry Products*, WT/DS69/AB/R, adopted 23 July 1998, DSR 1998:V, 2031
- EC – Sardines* Appellate Body Report, *European Communities – Trade Description of Sardines*, WT/DS231/AB/R, adopted 23 October 2002, DSR 2002:VIII, 3359
- EC – Tariff Preferences* Appellate Body Report, *European Communities – Conditions for the Granting of Tariff Preferences to Developing Countries*, WT/DS246/AB/R, adopted 20 April 2004, DSR 2004:III, 925
- Guatemala – Cement I* Appellate Body Report, *Guatemala – Anti-Dumping Investigation Regarding Portland Cement from Mexico*, WT/DS60/AB/R, adopted 25 November 1998, DSR 1998:IX, 3767
- India – Patents (US)* Appellate Body Report, *India – Patent Protection for Pharmaceutical and Agricultural Chemical Products*, WT/DS50/AB/R, adopted 16 January 1998, DSR 1998:I, 9

- Japan – Agricultural Products II* Appellate Body Report, *Japan – Measures Affecting Agricultural Products*, WT/DS76/AB/R, adopted 19 March 1999, DSR 1999:I, 277
- Japan – Alcoholic Beverages II* Appellate Body Report, *Japan – Taxes on Alcoholic Beverages*, WT/DS8/AB/R, WT/DS10/AB/R, WT/DS11/AB/R, adopted 1 November 1996, DSR 1996:I, 97
- Japan – Apples* Appellate Body Report, *Japan – Measures Affecting the Importation of Apples*, WT/DS245/AB/R, adopted 10 December 2003, DSR 2003:IX, 4291
- Korea – Dairy* Appellate Body Report, *Korea – Definitive Safeguard Measure on Imports of Certain Dairy Products*, WT/DS98/AB/R, adopted 12 January 2000, DSR 2000:I, 3
- Korea – Various Measures on Beef* Appellate Body Report, *Korea – Measures Affecting Imports of Fresh, Chilled and Frozen Beef*, WT/DS161/AB/R, WT/DS169/AB/R, adopted 10 January 2001, DSR 2001:I, 5
- US – Carbon Steel* Appellate Body Report, *United States – Countervailing Duties on Certain Corrosion-Resistant Carbon Steel Flat Products from Germany*, WT/DS213/AB/R and Corr.1, adopted 19 December 2002, DSR 2002:IX, 3779
- US – Corrosion Resistant Steel Sunset Review* Appellate Body Report, *United States – Sunset Review of Anti-Dumping Duties on Corrosion-Resistant Carbon Steel Flat Products from Japan*, WT/DS244/AB/R, adopted 9 January 2004
- US – FSC (Article 21.5 – EC)* Appellate Body Report, *United States – Tax Treatment for “Foreign Sales Corporations” – Recourse to Article 21.5 of the DSU by the European Communities*, WT/DS108/AB/RW, adopted 29 January 2002, DSR 2002:I, 55
- US – Gambling* Appellate Body Report, *United States – Measures Affecting the Cross-Border Supply of Gambling and Betting Services*, WT/DS285/AB/R and Corr.1, adopted 20 April 2005, DSR 2005:XII, 5663
- US – Gasoline* Appellate Body Report, *United States – Standards for Reformulated and Conventional Gasoline*, WT/DS2/AB/R, adopted 20 May 1996, DSR 1996:I, 3

- US – Lead and Bismuth II* Appellate Body Report, *United States – Imposition of Countervailing Duties on Certain Hot-Rolled Lead and Bismuth Carbon Steel Products Originating in the United Kingdom*, WT/DS138/AB/R, adopted 7 June 2000, DSR 2000:V, 2595
- US – Line Pipe* Appellate Body Report, *United States – Definitive Safeguard Measures on Imports of Circular Welded Carbon Quality Line Pipe from Korea*, WT/DS202/AB/R, adopted 8 March 2002, DSR 2002:IV, 1403
- US – Offset Act (Byrd Amendment)* Appellate Body Report, *United States – Continued Dumping and Subsidy Offset Act of 2000*, WT/DS217/AB/R, WT/DS234/AB/R, adopted 27 January 2003, DSR 2003:I, 375
- US – Shrimp* Appellate Body Report, *United States – Import Prohibition of Certain Shrimp and Shrimp Products*, WT/DS58/AB/R, adopted 6 November 1998, DSR 1998:VII, 2755
- US – Shrimp (Article 21.5 – Malaysia)* Appellate Body Report, *United States – Import Prohibition of Certain Shrimp and Shrimp Products – Recourse to Article 21.5 of the DSU by Malaysia*, WT/DS58/AB/RW, adopted 21 November 2001, DSR 2001:XIII, 6481
- US – Softwood Lumber IV* Appellate Body Report, *United States – Final Countervailing Duty Determination with Respect to Certain Softwood Lumber from Canada*, WT/DS257/AB/R, adopted 17 February 2004, DSR 2004:II, 571
- US – Stainless Steel (Mexico)* Appellate Body Report, *United States – Final Anti-Dumping Measures on Stainless Steel from Mexico*, WT/DS344/AB/R, adopted 20 May 2008
- US – Wool Shirts and Blouses* Appellate Body Report, *United States – Measure Affecting Imports of Woven Wool Shirts and Blouses from India*, WT/DS33/AB/R and Corr.1, adopted 23 May 1997, DSR 1997:I, 323

#### **Awards/Decisions of Arbitrators**

- Australia – Salmon (Article 21.3(c))* Award of the Arbitrator, *Australia – Measures Affecting Importation of Salmon – Arbitration under Article 21.3(c) of the DSU*, WT/DS18/9, 23 February 1999, DSR 1999:I, 267

- EC – Hormones*  
(Article 21.3(c))
- Award of the Arbitrator, *EC Measures Concerning Meat and Meat Products (Hormones) – Arbitration under Article 21.3(c) of the DSU*, WT/DS26/15, WT/DS48/13, 29 May 1998, DSR 1998:V, 1833
- EC – Hormones (US)*  
(Article 22.6 – EC)
- Decision by the Arbitrators, *European Communities – Measures Concerning Meat and Meat Products (Hormones), Original Complaint by the United States – Recourse to Arbitration by the European Communities under Article 22.6 of the DSU*, WT/DS26/ARB, 12 July 1999, DSR 1999:III, 1105
- Indonesia – Autos*  
(Article 21.3(c))
- Award of the Arbitrator, *Indonesia – Certain Measures Affecting the Automobile Industry – Arbitration under Article 21.3(c) of the DSU*, WT/DS54/15, WT/DS55/14, WT/DS59/13, WT/DS64/12, 7 December 1998, DSR 1998:IX, 4029

- Vienna Convention on the Law of Treaties*, U.N. Doc A/CONF.39/27, 8 I.L.M. 679, concluded in Vienna 23 May 1969.

## Curriculum Vitae

Marie Denise Prévost was born on 6 March 1971, in La Paz, Bolivia and immigrated to South Africa in 1974. She matriculated with distinction from Clapham High School in 1988. Supported by the Attorney's Fidelity Fund Merit Bursary, she studied law at the University of Pretoria, South Africa (BLC *cum laude* 1992, LL.B *cum laude* 1994). In 1995 and 1996, she worked as a researcher at the University of South Africa, where she also obtained an LL.M degree with a focus on international economic law. She was admitted as an advocate of the High Court of South Africa in December 1996. Subsequently, she followed the Magister Iuris Communis programme at Maastricht University (LL.M *summa cum laude*, 1998).

Since August 2007, Denise Prévost is Assistant Professor (*universitair docent*) in international economic law at Maastricht University. She is also the Academic Coordinator of the Institute for Globalisation and International Regulation. Previously (2004-2007) she worked as Assistant Professor in international economic law at Utrecht University, where she coordinated and lectured courses in this field at Bachelor's and Master's level and conducted research on WTO law issues. From 1998 to 2004, she worked as a research associate in the Department of International and European Law, at Maastricht University, where she lectured courses on the external relations of the European Union, legal English and international trade law, and conducted research towards her PhD.

In 2001, Denise Prévost interned at the Legal Affairs Division of the Secretariat of the World Trade Organization. She has also done consulting work for the European Commission and the Brussels law firm Vermulst, Waer and Verhaeghe on WTO law matters. She regularly gives capacity-building workshops for the European Commission, the Asser Institute, UNCTAD and the Trade Law Centre for Southern Africa on sanitary and phytosanitary issues and WTO dispute settlement.
