Document Version:

Publisher's PDF, also known as Version of record

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

Heterogeneity in the experience of chronic pain

Unravelling the biopsychosocial context and the quantification of treatment success

Door Sophie Waardenburg

1. The influence of sociocultural status on pain outcomes is, in general, more pronounced in men than in women. Chapter 3 - this thesis
2. Being a complex pain patient, with pain severity, pain catastrophizing and depression or anxiety, affects possibilities to improve on pain outcomes after treatment. Chapter 4 - this thesis
3. When women experience fear-avoidance, their pain intensity increases; this does not happen in men. Chapter 5 - this thesis
4. Many chronic pain patients are not satisfied with a two point decrease on the Numeric Pain Rating Scale as clinically important improvement. Chapter 6 - this thesis
5. There is no 'one size fits all' in chronic pain.
6. Assessing chronic pain patients with the experience sampling method, is a demanding technique that needs to be well reasoned before being applied. (Discussion - this thesis)
7. "The more you know about chronic pain, the more you realize you don't know about chronic pain." Adapted from Aristotle
8. Incorporating social workers in the multidisciplinary care of chronic pain patients can improve healthcare decisions on the psychosocial aspect of pain (Discussion - this thesis)
9. Quien no arriesga, no gana!
