**Please check the document version of this publication:**

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

## CASE REPORT

A 34-year-old man with an unremarkable medical history (except for surgical repair of an inguinal hernia several years ago) was referred to the emergency department because of sudden, severe, colicky pain in his back and right flank. Intramuscular injection with diclofenac 75 mg by his general practitioner had no effect on his symptoms. He used no medication, denied traumatic injury, and had no gastrointestinal complaints. At physical examination his blood pressure was 135/85 mmHg, pulse 80 beats per minute, and temperature 36.2° Celsius. Deep palpation of the abdomen, flank, and back was not painful. Laboratory tests revealed slightly elevated inflammatory parameters (i.e., C-reactive protein 49 mg/l, leukocyte count  $11.4 \times 10^9/l$ ) and an elevated lactate dehydrogenase level of 783 U/l. Urine analysis showed microscopic haematuria ( $> 200$  erythrocytes/ $\mu l$ ). The patient was admitted to the urology ward under suspicion of urolithiasis. An abdominal ultrasound and abdominal X-ray, however, showed no

abnormalities of the kidneys or urinary tract. Therefore, a computed tomography (CT) scan was performed (figure 1).

## WHAT IS YOUR DIAGNOSIS?

See page 46 for the answer to this photo quiz.
