

Bayesian optimal designs of binary repeated measurements

Citation for published version (APA):

Abebe, H. T. (2014). *Bayesian optimal designs of binary repeated measurements*. Boekenplan.

Document status and date:

Published: 01/01/2014

Document Version:

Publisher's PDF, also known as Version of record

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

Propositions belonging to this thesis

Bayesian Optimal Designs of Binary Repeated Measurements

1. Bayesian optimal design with a weakly informative prior distribution (large prior variance) is robust against a change of the prior mean (this thesis).
2. PQL1 and extended GEE estimation methods give approximately the same Bayesian optimal designs (this thesis).
3. Bayesian optimal designs are hardly affected by the choice of the covariance structure of the random effects if there is autocorrelation (this thesis).
4. The choice between a normal and a uniform prior distribution has hardly any effect on the Bayesian optimal designs (this thesis).
5. Do not expect to enjoy the PhD project. Do expect to go mad. If you do enjoy your PhD project, you are probably already mad.
6. The best thing about being a statistician is that you only have to be right approximately.
7. Far better an approximate answer to the right question, which is often vague, than an exact answer to the wrong question, which can always be made precise (J.W. Tukey (1962), The future of data analysis, The Annals of Mathematical Statistics, 33(1), p.13).
8. Thursday is better than Sunday, as on Thursday tomorrow is Friday and on Sunday tomorrow is Monday.
9. Too many supervisors are a waste of time and resources.
