

Thrombin generation: innovations and clinical applications

Citation for published version (APA):

Ninivaggi, M. (2014). *Thrombin generation: innovations and clinical applications*. Maastricht University.

Document status and date:

Published: 01/01/2014

Document Version:

Publisher's PDF, also known as Version of record

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

Thrombin generation: innovations and clinical applications

1. You only need a small volume of blood for thrombin generation in whole blood, this will decrease the number of mice needed to conduct a study (this thesis).
2. Hypoxia affects the blood cells converting them into thrombophilic cells (this thesis).
3. The difference in bleeding phenotype between two severe hemophiliacs is independent of their FVIII level (this thesis).
4. Both thrombin generation and thromboelastography measurements should be performed to achieve a complete image of the coagulation status of a bleeding patient (this thesis).
5. Platelets are able to compensate for a mild blood dilution (this thesis).
6. It is more efficient to close the tap than to mop the floor (Hemker, 2008).
7. Those who cannot remember the past are condemned to repeat it (George Santayana, 1905).
8. It always seems impossible until it's done (Nelson Mandela).
9. Het tromboserisisco wordt mede bepaald door genetische factoren (Italië), omgevingsfactoren (België) en werkomstandigheden (Nederland).
10. Het inhaleren van Xenon mag niet aangemerkt worden als een dopingsmiddel ter bevordering van topsportprestaties.
