

Thermotropic polyesters and polylactide

Citation for published version (APA):

de Kort, G. W. (2021). *Thermotropic polyesters and polylactide: a route to sustainable and reprocessable reinforced composites*. [Doctoral Thesis, Maastricht University]. Maastricht University. <https://doi.org/10.26481/dis.20210125gk>

Document status and date:

Published: 01/01/2021

DOI:

[10.26481/dis.20210125gk](https://doi.org/10.26481/dis.20210125gk)

Document Version:

Publisher's PDF, also known as Version of record

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

Propositions

Belonging to the dissertation:

Thermotropic polyesters and polylactide: a route to sustainable and reprocessable reinforced composites

1. Growth can never be limitless in a system that knows boundaries.
2. Both the use and end-of-life should be considered when developing materials.
3. A high melting temperature can be a blessing and a curse.
4. Relaxing is great unless it involves LCPs and fibrils.
5. Longer is better, especially for fibrils.
6. Used PLA is the most efficient feedstock to produce new PLA.
7. Maybe we should investigate if this is the case in other materials (in relation to proposition 6).
8. Circles are great, but they should either be closed, or interconnected and well balanced.
9. No matter how much time you put in, there are always more mistakes to fix.
10. Preposterous plans can become reality with time.
